the Abbot of Dumfermling, was secretly trafficking with Morton and the regent; and so far succeeded, that on the 9th of October a conference on the proposed execution of Mary was held at Dalkeith, in Morton's bed-chamber, he being still confined by sickness. None were present but the regent, Mar, and Killigrew; who immediately communicated the result to Cecil and Leicester in the following letter:—'My singular good lords,—What has passed here since my last, touching the common cause, I have written to Mr. Secretary at length. Now for the great matter ye wot of. At my being at Dalkeith with my lord regent's grace, the Earl of Morton and he had conference, and both willing to do the thing you most desire; howbeit, I could have no answer there, but that both thought it the only way and the best way to end all troubles, as it were, in both realms. They told me, notwithstanding, the matter was dangerous; and might come so to pass, as they should draw war upon their heads, and in that case, or rather to stop that peril, they would desire her majesty should enter in league defensive, comprehending therein the cause of religion also. We came (he continued) to nearer terms,—to wit, that her majesty should, for a certain time, pay the sum that her highness bestoweth for the keeping of her in England, to the preservation of this crown, and take the protection of the young king. All this I heard, and said,—If they thought it not profitable for them, and that if they meant not to will me to write earnestly as their desire, I would not move my pen for the matter; whereat the Earl of Morton raised himself in his bed, and said, that both my lord regent and he did desire it as a sovereign salve for all their sores; howbeit it could not be done without some manner of ceremony, and a kind of process, whereunto the noblemen must be called after a secret manner, and the clergy likewise, which would ask some time. Also that it would be requisite her majesty should send such a convoy with the party, that in case there were people would not like of it, they might be able to keep the field; adding farther, that if they can bring the nobility to consent, as they hope they shall, they will not keep the prisoner three hours alive, after he come into the bounds of Scotland\*. But I, leaving of these devices, desired to know, indeed, what they would have me write; and it was answered, that I should know farther of my lord regent's grace here; so as, this morning, a little before dinner, going to take my leave of him, as he was going towards Stirling, he told me, touching that matter which was communed upon at Dalkeith, he found it very good, and the best remedy for all diseases, and willed me so to write unto your honours; nevertheless that it was of great weight, and, therefore, he would advise him of the form and manner how it might best be brought to pass, and that known, he would confer more at length with me in the same. Thus took I my leave of him, and find him, indeed, more cold than Morton, and yet seemed glad, and desirous to have it come to pass.' Killigrew proceeded to say, in the same letter, that some were of opinion the queen could not be executed without the meeting of parliament, which might be called suddenly, and under pretence of some other business. The reason assigned was, that the Scottish queen had only been condemned as worthy of deposition on the ground of her accession to the murder of her husband; she had not yet been judged to die. This proposition met with no encouragement from the English envoy; a

\* "Sic in original."

clear proof that a secret and speedy death was the object desired by Elizabeth. The proposal was, as he hinted, an excuse to delay time; and to agree to it, would have been to act contrary to his instructions. The conclusion of his letter I must give in his own words:—'Although there be that do assure me that the regent hath, after a sort, moved this matter to nine of the best of their party, to wit, that it were fit to make a humble request to the queen's majesty to have hither the cause of all their troubles, and to do, etc., who have consented to him; and that I am also borne in hand, that both he and the Earl of Morton do, by all dexterity, proceed in the furtherance thereof, yet can I not assure myself of anything, because I see them so inconstant, so divided. \* \* \* I am also told that the hostages have been talked of, and that they shall be delivered to our men upon the fields, and the matter despatched within four hours, so as they shall not need to tarry long in our hands; but I like not their manner of dealing, and, therefore, leave it to your wisdom to consider if you will have me continue to give ear, and advertise [if] I shall: if not, I pray your lordships let me be called hence.' In this last sentence it is impossible not to see that the emphatic 'to do, et cetera,' the delivery of the Scottish hostages for the performance of the agreement upon the fields, and the 'despatching the matter'—that is, having the queen put to death—'within four hours,' all shew that both the regent and Morton had given their full consent to the proposal. Measures were to be taken to have the sentence pronounced (if, indeed, any ceremony of a sentence was seriously contemplated) and the execution hurried over with the utmost expedition and economy; and the only cause of delay on the part of the regent and his brother earl was the selfish wish of making the most profit of this cruel bargain. Four days after this, on the 13th of October, Killigrew sent another secret packet to Leicester and Burghley. He had again been at Dalkeith, and found not only Morton 'very hot and earnestly bent in the matter,' but 'the two ministers' equally eager in the business. From the cautious manner in which the English envoy wrote, the names of these two ministers are suppressed, and in such a case conjecture is unsatisfactory. We know that Mr. Nicholas Elphinstone, and Pitcairn, the abbot of Dumfermling, were the instruments already employed by Morton and Killigrew in this dark negotiation, and it is possible that they are here meant. Two other facts also are certain, from a letter of the English envoy; the one that Cecil had enjoined him to avail himself of the co-operation of the kirk in accomplishing the objects of his negotiation, the other that he had already consulted John Knox, who, even in 'extreme debility,' and, as he describes it, 'with one foot in the grave,' was, in mind, as active as ever. From a letter already quoted, we have seen his convictions of Mary's guilt, and wishes for her execution; he may, therefore, have been one of the ministers to whom allusion was made. But this is speculation; and, after all, it might be argued that, from the words of Killigrew, the matter he spoke of to Knox was not the execution of Mary, as the former private interview may have solely related to the best method of exciting the people against France and the Romish faction in Scotland. However this may be, the English ambassador was informed by Morton, that if Mar shewed coldness, or delayed to execute the matter, it should be done without him; and he added, that as he was lieutenant-general of the whole king

dom on this side Tay, he had power to carry it into execution. He hinted, however, that if Elizabeth hoped to gain this great object, she must be more cordial in her support, and more generous in her advances. Her refusal to assist them and her coldness had already, he said, alienated some hearts, though not his. To this Killigrew shrewdly replied, that if Morton could, at this moment, have given some good assurance that Mary should be executed, or, as he expressed it in his dark language, for the performance 'of the great matter,' that he might safely reckon on the Queen of England for the satisfying his desires: but he must recollect, that its accomplishment was the sole ground on which a defensive league between the two countries could be negotiated. Without it 'a man could promise nothing.' From the ambassador's next letter, however, any anticipated coldness or disinclination on the part of Mar appears to have entirely vanished. It was written from Stirling, and informed Burghley and Leicester that the regent, after some general observations on the subject of the peace, began to speak, 'touching the great matter, wherein,' said he, 'I found him very earnest.' 'He had sent,' he said, 'his resolute mind to the Lord Morton by the abbot, and desired him (Killigrew) to write speedily to Burghley and Leicester, that they might further the same by all possible means, as the only salve for the cure of the great sores of the commonwealth.' 'I perceive,' added Killigrew, 'that the regent's first coldness grew rather for want of skill how to compass so great a matter, than for lack of good will to execute the same. He desired me, also, to write unto your honours to be suitors unto your majesty for some relief of money towards the payment of his soldiers.' It is very striking, that in the midst of these dark practices, and when he had not only consented to Mary's death, but pressed that it should be speedy, Mar was himself struck with mortal sickness, and died at Stirling (on the 28th of October), within ten days after his interview with the English ambassador. Previous to this event, however, he and Morton had sent to Killigrew by the Abbot of Dumfermling, the conditions on which they were ready to rid Elizabeth of her rival. They stipulated that the Queen of England should take the young king their sovereign under her protection; they demanded a declaration from the English parliament, that his rights should not be prejudged by any sentence or process against his mother; they required that there should be a defensive league between England and Scotland; and that the Earls of Huntingdon, Bedford, or Essex, accompanied with two or three thousand of her majesty's men of war, should assist at the execution. These troops were afterwards to join the young king's forces in reducing the Castle of Edinburgh. This fortress, when recovered from the enemy, was to be delivered to the regent, and all arrears then due to the Scottish forces were to be paid by England. With these conditions Killigrew was grievously disappointed. He instantly, however, sent them by Captain Arrington, a confidential messenger, to Burghley, accompanied by a letter, in which he mentioned Mar's extreme danger, but gave some little hope of life. At the moment, however, when this was written at Edinburgh, the regent had expired at Stirling, and Burghley received the account of his death, and the 'articles of agreement, touching the great matter,' almost at the same instant. Although commonly of a calm and collected temper, his agitation on the

present occasion seems to have been extreme. The articles, themselves, were such as he had little expected; the price of blood demanded by the Scottish earls was unreasonably high, and he felt indignant at Killigrew that he should ever have received such proposals; but even if it had not been so, the death of Mar rendered it impossible to carry them into execution with the speed the necessity required; and he immediately wrote to Leicester, informing him of the total failure of their Scottish project, and emphatically remarking that the queen must now fall back upon her last resource for the safety of herself and her kingdom. What this was, he shrunk from stating in express words; but he knew that Leicester could supply them, and there is not the slightest doubt that he alluded to the execution of Mary in England. His letter, however, is too characteristic to be omitted. It is wholly in his own hand:—  
 'My Lord,—This bearer came to me an hour-and-a-half [alf] after your departure. The letters which he brought me are here included. I now see the queen's majesty hath no surety but as she hath been counselled, for this way that was meant for dealing with Scotland is, you may see, neither now possible, nor was by their articles made reasonable. If her majesty will continue her delays, for providing for her own surety by just means given to her by God, she and we all shall vainly call upon God when the calamity shall fall upon us. God send her majesty strength of spirit to preserve God's cause, her own life, and the lives of millions of good subjects; all which are most manifestly in danger, and that only by her delays, and so, consequently, she shall be the cause of the overthrow of a noble crown and realm, which shall be a prey to all that can invade it. God be merciful to us.' Thus was Burghley and Leicester's project for Mary's secret execution by the hands of her own subjects destroyed by the death of Mar, at the moment he had consented to it; and the scheme which these cruel and unscrupulous politicians conceived themselves to have so deeply laid, on which they pondered, as Cecil owned, 'daily, and almost hourly,' entirely discomfited and cast to the winds. Mary, in the meantime, was herself unconscious of the danger she had escaped; and, indeed, it is worthy of observation, that so well had the English ambassador kept his counsel, and so true were the conspirators to their secret, that after a concealment of nearly three centuries, these dark intrigues, with all their ramifications, have now, for the first time, been made a portion of our national history.\* Another base transaction stains the history of this year. During Morton's exile in England the Earl of Northumberland had been his kindest friend. Northumberland himself was now a captive in Scotland, under the charge of Morton;—but instead of a return of benefits, this base and avaricious man sold his unhappy prisoner to Elizabeth, who shortly after had him executed at York."

The historical importance of the subject will justify this long extract.

\* Dr. Robertson, not having access to the St. P. Off. had not seen the letters of Killigrew and Burghley, which unveil this part of Mary's history. He consequently falls into the error of stating that Mar, from his honourable feelings, instantly rejected Killigrew's proposal of bringing Mary to her trial in Scotland, pronouncing her guilty, and executing her. All subsequent historians, amongst the rest the acute and learned Lingard, have been misled by this view of the transaction. Killigrew's and Burghley's letters have at length given us the truth. No trial, it appears to me, was ever contemplated; and Mar, though at first cold in the matter, at last gave his full consent to Mary's being put to death as speedily and secretly as possible."

#### MISCELLANEOUS.

*Directions for Using Philosophical Apparatus in Private Research and Public Exhibitions.*  
 By Edward M. Clarke, M.S.A. &c. Pp. 72.  
 London, 1840. No. 428 Strand.

THE author is a manufacturer of mathematical, philosophical, and optical apparatus, and he states candidly that his remarks do not refer to the apparatus of other manufacturers, but that they are strictly confined to the productions of his own workshop. This, of necessity, gives to his publication a character of self-interest and an apparent egotism, which, in future numbers, it would be as well to obviate as much as possible, by suppressing in every case, where practicable, "I" and "mine." The present number treats of the gas microscope only, and is most complete; a single perusal will enable any one to prepare the gases, adjust the instrument, produce and regulate the light, and give full effect to the wonder-stirring visions of the microscopic world, animate or inanimate. The "directions," in themselves clear, are rendered still more so by numerous woodcuts, illustrating and making familiar the several parts of this rather complicate apparatus, and the ends they serve. If the future numbers be put together with the same care and ability the present evinces, and contain, as set forth, "Directions for the Use of every Article of Philosophical Research," they will form a valuable acquisition to the rising scientific inquirers. A word or two upon the several additions and improvements in the instrument the first number explains, and its adjuncts, invented and adapted by Mr. Clarke, would well conclude this notice, did we not feel satisfied that, by a reference to the work itself, they would be better understood, and their utility more fully appreciated. The second number of the series is to describe the polariscope, and the various and splendid phenomena of the polarization of light.

*A New and Enlarged Edition of the "Annals of the Coinage of Great Britain and its Dependencies."* By the late Rev. Roger Ruding, B.D. 3 vols. 4to. London, 1840. Hearne.

MR. HEARNE has most faithfully and honourably fulfilled every promise of his prospectus in producing this important work; and has given the public as handsome and complete a book of reference to the coinage of Britain and its dependencies as there are materials in existence to frame.

The text of Ruding has been judiciously retained in its strict integrity, but much has been added in the shape of notes throughout the whole, which have greatly augmented the intelligence of the text, and improved its value. There are also copious corrections and elucidations of many doubtful and conflicting accounts, which the editor has been enabled to bring forward since the previous editions appeared. For our readers are aware that new discoveries are being continually made, which either bring to light unknown types, or others imperfectly known, the comparisons of which satisfactorily rectify points of difficulty and clear up errors of long standing.

This edition also puts forth pre-eminent claims to our eulogy from its presenting an excellent index, whereby the numismatist may at once refer to any coin on the plates, and likewise to the description of it in the letterpress. This we consider to be a feature of prime recommendation, and a prodigious advantage, such as the work never before possessed.

Among the new plates we observe some

unique coins, and others of great rarity; and some which have never been described. These include the Hexham treasure trove of stycas; some extremely rare coins of Alfred and Edward the Confessor. One unique piece of Horthacnut (now in the possession of Colonel Durand), a noble of Henry VIII. (in the British Museum), and others of almost equal interest, enrich the collection.

To the historian and the antiquary we consider this publication to be altogether one of the foremost order; and it is but justice to its enterprising publisher to hope that the labour and expense bestowed upon it will meet their reward in a very extensive sale. We had almost omitted to specify the care with which the Oriental coins have been engraved. Their inscriptions appear to us to be perfect. But we again repeat that the same praise is due to the entire work, which is really a credit to all who have been concerned in its completion,—editors, artists, and publisher.

#### ARTS AND SCIENCES.

PREPARATIONS FOR THE MEETING OF THE BRITISH ASSOCIATION.

THE preparations for the meeting are now in a considerable degree of forwardness; and, in the course of yesterday, three of the Sub-Committees met at different hours in the Exchange Rooms for the despatch of business. The Finance Committee, Mr. Leadbetter in the chair, met at twelve o'clock. From the proceedings here, we understand that 2000*l.* out of the 3000*l.*, which is the estimated amount of the expenses, have been raised,—still leaving, of course, a deficit of 1000*l.*, which will be raised by the sale of ladies' tickets, or the voluntary subscriptions of the citizens. This is applicable to the local fund, the objects of which are entirely temporary and local; and, in the present instance, to provide for the preparatory outlay,—such as the collection of a mineral museum, of which Glasgow has hitherto been destitute, notwithstanding the rich field for geological research presented by the district; the exhibition of arts and manufactures, the rent of the theatre, the fittings up, &c. &c. It is a rule that members residing more than fifteen miles from Glasgow are entitled to claim one ticket for a lady of their family accompanying them; but as it is known that a large number of them will be accompanied by all the ladies of their families, fears were expressed that the fair ones of Glasgow may be, to a considerable extent, excluded by the necessary preference thus shewn to strangers. The Committee had no doubt of being able to raise the requisite sum; and they resolved that the citizens should be called on to aid by subscriptions, and the purchase of ladies' tickets, until the number of the latter which are allowed to be sold should be exhausted. At the Model Committee, of which Mr. Hussey is chairman, it was explained that 600*l.* had been granted them by the Finance Committee; and there was every reason to believe that the collection would be worthy of this great manufacturing capital. The Committee had not decided upon a large room for the exhibition; but they were in treaty, and powers were granted to a Committee to come to an arrangement immediately.—Mr. Edington was chairman in the Museum Committee, in which details were given of the advanced state of their proceedings; and the members spoke with much interest of the geological excursion to Arran, on Saturday, the 19th of September. The Directors of the Glasgow and Ayr Railway have offered accommodation on that occasion for se-

venty-two gentlemen (as great a number as the directors can accommodate without breaking faith with the public), who will be conveyed free to Ardrossan in the morning, at which place a steamer will be in waiting to take them to Arran. At the island a number of ponies, belonging to the tenantry of the Duke of Hamilton, will be in readiness to carry the members wherever the strata is interesting and the footing sure; others will sail round the shore in the steamer, and a third party, mayhap, may be pleased to ascend the summit of the lofty Goatfell. The party will be entertained to breakfast and dinner by the princely hospitality of his Grace, and all will have the opportunity of returning to Glasgow in the evening. The arrangements for the accommodation and convenience of the strangers are, we understand, of a very complete kind. On Friday and Monday evenings there will be promenades in the Royal Exchange Rooms. On Tuesday, the Association Dinner will be held in the Theatre Royal. It is presumed that it will dine fully 1000; and the ladies will be admitted to the boxes. We believe there will be an ample supply of venison from the moors and parks of Breadalbane. The concluding general meeting will take place on Wednesday evening. Such are a few of the arrangements which have been made for an occasion on which Glasgow will receive a greater number of distinguished strangers than have ever been within her bounds. The following are amongst the foreigners who have accepted the invitations of the Association:—The American Ambassador; Professor Quetelet, of Brussels; Professor Lamont, Royal Observatory, Munich; Dr. Mohr, Professor of Natural Philosophy, Coblenz; Dr. Etting of Giessen; Professor G. R. Bunson, University of Marburg, Dr. Kurschner, University of Marburg; Professor Schubart, of Berlin; Mons. Lecanu, Professor of Practical Pharmacy, Paris; M. Elie de Beaumont, Paris; and probably M. le Duc de Decazes. The French Ambassador has also expressed his wish to be present, if public business will permit. Almost all the public buildings, &c. of Glasgow will be open to the inspection of the members, and various private establishments, which may well repay a visit. We understand, too, that the Duke of Hamilton, the Marquess of Breadalbane, and the Earl of Eglinton, will grant permission to all the gentlemen who may wish to see their grounds and policies. The Duke and the noble Marquess have been at much pains of late in collecting mineral specimens for the exhibitions from all that is rare, interesting, and valuable in their respective districts; and part of these have already been received by the Secretary.—*Glasgow Herald, August 28.*

## GEOLOGICAL SOCIETY.

JUNE 10. Rev. Dr. Buckland, President, in the chair.—Various communications were read.—1. A notice, by the Rev. D. Williams, of an intrusive mass of trap in the mountain limestone at the western extremity of Bleadon Hill, and laid open by the excavations for the Bristol and Exeter Railway. This is the first discovery of trap in the line of the Mendip Hills; and the only igneous rock hitherto detected in Somersetshire, with the exception of the syenite of Hentertombe, north of Taunton, described by Mr. Horner; and a slaty porphyry, observed by Mr. Williams, a little north of Simmons-birth, in Exmoor.—2. 'A Memoir, descriptive of a Series of Coloured Sections of the Cuttings on the Birmingham and Gloucester Railway,' by Mr. H. E. Strickland. The author commences by regretting that geologists have not

availed themselves more extensively of the opportunities afforded during the progress of the different railways, and by dwelling on the advantages which would have accrued, had a geologist been permanently attached to each line. He then states that his memoir originated in a request by Captain Moorson to undertake an examination of the Birmingham and Gloucester railway; and he expresses his great obligations to that gentleman, and to Captain J. Vetch, for the valuable assistance which they afforded him. This line was also surveyed during the first operations, and before the cuttings were commenced, by Mr. F. Burr; and the report which was made by him to the Society is very favourably noticed by Mr. Strickland. The formations intersected by the railway are the new red sandstone with the red marl, lias, and superficial deposits, and the fullest details are given, both of their composition, and attendant phenomena. The new red sandstone and marl afforded no additional features deserving of particular notice. The junction beds of the red marl and lias are well displayed at Dunhamstead, and consist in descending order of lias clay, with contorted beds of lias limestone, white micaceous sandstone, two feet; lias clay, six feet; grey marl, thirty-five feet; red marl. A similar section is exposed at Horton. The fossils of the lowest beds of the lias are stated to differ essentially from those which occur in a higher series of strata at Bredon, and those again to be distinct from the fossils in the neighbourhood of Cheltenham. At Hewletts, east of the town, the lias near the base of the marlstone presents another series of peculiar fossils; so that, adds Mr. Strickland, in the lower lias there are at least four well-marked successions of molluscous animals ranging through a vertical height of 400 or 500 feet, and unaccompanied by any change in the mineral character of the deposit. The superficial accumulations or detritus received a very minute examination, and the author states that the cuttings have fully confirmed his previous views respecting the origin of these deposits. He divides them into fluviatile and marine; and the latter, according to its origin, into local and erratic; and the last again, according to its composition into gravel, with flints and without flints, the latter being destitute of mammalian remains. The marine erratic gravel without flints occurs extensively around Birmingham; at Mosely, on the line of the railway, it is upwards of eighty feet thick; the ridge of the Lickey is covered with considerable accumulations of it; and at Sngar's Brook, as well as to the east of Abbot's Wood, are other beds of this gravel. The marine erratic gravel with flints commences where the railway crosses the Avon, abounding in the neighbourhood of Bredon. It is stated to be without mammalian remains. The fluviatile gravel occurs only on the two flanks of the Avon at Delford and Eckington; it abounds with mammalian remains, and is overlaid by ten feet of gravel, precisely similar to the marine erratic gravel of Bredon. The most abundant shells found in this deposit are *Cyclas amnica*, and *C. cornea*; and the bones are referable to *Elephas primigenius*, *Hippopotamus major*, *Bos urus*, and *Cervus giganteus*? also *Rhinoceros tichorhinus*. In endeavouring to account for the presence of bones and freshwater shells at this locality only, Mr. Strickland repeats his former explanation; namely, that after the beds of marine gravel had been deposited and been laid dry by the elevation of the land, a large river or chain of lakes extended down the valley of the Avon; and that

the marine gravel having been remodified by the fluviatile current, was mixed up with remains of mammalia and mollusca, which remained its banks or its waters. Local gravel occurs abundantly at Cheltenham, and is composed of lias and oolitic detritus. No terrestrial remains have been noticed in it; and it is, therefore, referred by Mr. Strickland to a marine origin. *Modern Alluvia*.—The only deposits belonging to this class on the line of the railway are the peaty accumulations on the banks of the Avon and its tributaries. The memoir was accompanied by a copy of the engineer's sections, coloured geologically by the author; who, in conclusion, expresses a hope that the time is not far distant when the Society may possess a set of coloured sections of every railway in the kingdom.—3. A letter addressed to Mr. Murchison, by Captain Lloyd, 'On the Occurrence of Coral Rocks in the Mauritius, at a considerable Distance from the Shore, and at Heights varying from Ten to Twenty-five Feet.' The Mauritius is belted by an enormous coral reef throughout its whole circumference, except for about ten miles along the extreme southern side, where the coast is bold, and consists of basalt. Two of the masses of coral rock described by Captain Lloyd are situated in the valley of Petite Savanne, and form remarkable points, or headlands, from twenty to twenty-five feet above the present level of the sea; and they present the same marks of abrasion as the existing barrier reef. The observatory, Port Louis, is built also on a stratum of very hard coral rock, ten feet above the level of the sea. There are, besides, in several parts of the island enormous blocks of coral surrounded by the debris of oysters, and other shells and corals. Appended to the letter are communications from Mr. Hill and Mr. Sherlock, agents employed by Captain Lloyd, containing measurements of blocks near Souillac and on the Black River.—4. 'A Notice on the Mineral Veins of the Sierra Almagrera, in the Province of Almeria, Spain,' by Mr. Lambert. The *Sierra Almagrera* is exclusively composed of clay slate. The first-discovered vein, the *Barranco jaroso*, is rich, and has been excavated more than 200 yards in length, in a direction of north to south, between one and one and a half hours of the compass, the inclination being from 65° to 70° east. It commenced with half a yard at the surface, and has increased to three yards, at a depth of forty yards. Its mineral contents are arranged in parallel divisions, and consist of different varieties of galena, carbonate of lead, argillaceous iron ore, carbonate of iron, carbonate of copper, sulphate of barytes, and gypsum. Old workings, supposed to have been conducted by the Romans, occur in great numbers, principally at the mouths of the ravines. Upon the edges of the sierra reposes a tertiary formation, forming the bed of the river Almanzora, and extending to the Sierras Cabrera, Alhamilla, and Filabres. The upper portion consists of an arenaceous conglomerate alternating with marls, gypseous clay, and sand, and contains numerous organic remains. The formation is stated to have been greatly disturbed by trap-rocks.

[To be concluded in our next.]

## CURE OF SQUINTING.

A PAMPHLET of sixteen pages, by C. W. G. Guthrie, jun. (apparently a worthy scion of the parent stock), is upon our table, and presents his Report to the Royal Westminster Ophthalmic Hospital on the cure of squinting, by "the division of one of the straight muscles of the

eye," &c. &c. This operation, so recently introduced amongst us, and most successfully practised, was, it appears, proposed by Dr. Stromeyer of Hanover, but first carried into effect by Dr. Dieffenbach of Berlin, in January last. It was brought to England in April, but has since been so much improved upon with finer instruments, that it is readily performed in two minutes with precision and safety: with a small curved knife it can be accomplished in a few seconds. Mr. Guthrie very clearly describes the operation, and, by means of three simple representations of the eye, shews how it is accomplished. He also states nearly forty cases which have been submitted to it, where the deformity has been utterly extirpated without the slightest ill consequence. The whole is highly honourable to the young surgeon's talents.

#### FORMATION OF MOUNTAINS.

NOTWITHSTANDING the late rapid progress of geology, it still remains a problem whether the mountains of the earth have been formed by volcanic forces, such as exist at the present time, or by the agency of a central fire.

The majority of modern geologists, with Monsieur Cordier at their head, have adopted the latter opinion, because the temperature of the earth has been found to increase in some proportion as we descend below the surface, that in deep mines the water issuing from the surrounding strata is from  $20^{\circ}$  to  $30^{\circ}$  warmer than that of superficial springs. From such data it has been inferred that the temperature of the earth augments about  $1^{\circ}$  for every  $45^{\circ}$  degrees of descent, making  $212^{\circ}$  at the depth of two miles, and increasing in the same ratio to the centre, where every thing is in a state of fusion and incandescence; and that all mountains have been upheaved by the expansive force of this immense furnace.

But with due deference to the high authorities in support of this hypothesis, I shall venture to offer a few brief observations with a view of shewing its insufficiency to explain the more important phenomena of geology.

In the first place, if the mountains of the globe were elevated by the agency of a central fire, they ought to be much higher than they are.

Secondly. All the loftiest mountains of our planet are confined to the tropical regions, and diminish in magnitude on to the polar circles, where their average height is from four to five times less than in equatorial India, Africa, and South America, as may be shewn by an appeal to the best recent works on physical geography. But if the vast chains that girdle our planet were upraised by a central fire, it is impossible to comprehend why the polar mountains should not be as high as those of the tropics, for the former are actually nearer the centre of the earth.

Thirdly. It has been supposed by geologists that the earth originally existed in a state of red-hot fusion throughout, and has been cooling down ever since, because the fossil organic remains of the older sedimentary formations, in the northern hemisphere, indicate a much higher mean temperature than exists at present. To this hypothesis it may be answered, that a gradual change in the inclination of the earth during long geological epochs would explain the phenomena in a more satisfactory manner; and even admitting that we have no actual proof of such a change, the predominance of land in the tropical, and of water in the polar regions, would so far modify the physiological conditions of the globe as to permit the

existence of plants and animals in high latitudes, the representations of which are now found only in the torrid zone, as mentioned by Mr. Lyell. Besides, it is admitted by Fourier, that if the earth had been projected into a medium  $58^{\circ}$  below zero, at any given temperature, it would not cool more in 1,800,000 years than a globe of one foot in diameter, composed of the same materials, and placed in like circumstances, would in a second of time.

Fourthly. That the volcanic action by which mountains are elevated, is generated by chemical actions at no great depths beneath the surface, would appear from the well-known fact, that all the volcanoes now in existence are found to be submarine, or situated in the vicinity of the ocean, and abound with marine salts, which clearly shews that the presence of sea-water is essential to their activity; and if so, it is evident that they cannot be owing to central fire.

It is also worthy of notice, that volcanoes are far more numerous and active in the tropical, than middle and higher latitudes. From which we are authorised to conclude, that the subterranean action by which they are generated, like all the chemical and vital transformations on the surface of the globe, are governed by temperature.

The vast importance of mountains in the economy of Nature, would appear from a variety of considerations; they are not only the source of rivers, but of the precious metals and gems, which are forced up from the inferior portions of the earth to its surface, and placed within the reach of man.

What can be more grand and impressive than the immense chains of granite and porphyry that extend for hundreds and thousands of miles in length, while they modify the direction of winds, the temperature of climates, and seem to be the boundaries of nations? Were it not for mountains the sea would everywhere prevail, causing a gloomy waste of land and water. There could be no rivers or springs, nor any of that beautiful variety of hill and dale that now adorn the earth's surface, and render it the delightful abode of sentient beings. As the composition of organised beings is renewed by their absorption into the general circulation, so is the surface of the earth perpetually renovated by the disintegration of mountains, which are gradually worn away by the action of running waters, and transported to valleys, lakes, and seas—forming new lands:—"Old things pass away, and all things become new." The air, the ocean, and the earth, are for ever in motion, under the government of wise and beneficent laws, which pervade the whole system of nature, in a state of undecaying vigour and youthful beauty.

EDWARD BENTLEY.

#### PARIS LETTER.

Academy of Sciences, Sept. 1, 1840.

SITTING of August 24.—Several geological reports of minor interest were presented to the Academy; the most important of which was an account of the present state of the boring for the Artesian well in the abattoir of Grenelle (Paris). The present depth attained is 500 metres, or 1640 feet 5 inches; and the last thermometrical observation made at the bottom of the bore gave 26 degrees of the centigrade scale.

Report on the Voyage of the *Venus* Frigate in the South Seas, under Capt. Dupetit Thouars.—M. Arago, in the name of a committee named to this effect, read a very long report on the principal scientific results attained by this ex-

peditionary voyage, which terminated a year ago. At several important points, the longitude had been carefully verified by distances of the moon from the sun. Thus at Monterey, the mean result of the observations exceeded the longitude assigned in the "Connaissance des Temps" by  $2^{\circ}5'$  in time. At Acapulco, the observations gave a diminution of  $12^{\circ}5'$ ; at Valparaiso,  $27^{\circ}5'$ ; at Kororareka, in New Zealand,  $18^{\circ}7'$ . The advantage of this method of distances was strongly pointed out, and contrasted with the defective results of the chronometers taken out by the expedition. Out of the six which the *Venus* possessed, No. 75, by Berthoud, was unfit for use by the time the vessel had left Callao for Honorourou; No. 9, by Breguet, stopped on June 12, 1837; No. 76, by Berthoud, which at the time of departure lost  $5'$  per diem, when at Callao gained  $8'$ , at Honorourou,  $3^{\circ}4'$ , at Valparaiso,  $5'$ , and at Port Jackson,  $7^{\circ}2'$ . Nos. 175 and 186, by Mottel, varied still more. Several interesting observations were made on the temperature, force, &c. of the streams of cold water from the Antarctic regions setting along the west coast of South America. On 15th July, 1838, an observation under the equator, and in long.  $94^{\circ}$  W. of Paris, gave 23 degrees of the centigrade scale for the temperature of the sea; whereas, without the presence of the stream, it would have been four degrees higher. On the 16th and 17th of the same month the observations gave  $22^{\circ}4'$  and  $22^{\circ}8'$ ; the last being in  $1^{\circ}30'$  south latitude. On the 16th April, 1837, to the S.E. of Chiloe, the sounding-line, with the thermometer attached, attained 1100 fathoms without bottom, and appeared perfectly vertical. Hence it followed, that the depth of the stream, since the vessel was moving northwards with the velocity of the stream, was at least 1100 fathoms; but it was believed, by other experiments, to have an average depth of 1780 metres. Two series of observations, made in the full current of the stream, gave the following thermometrical results:—At the surface of the sea, S.W. of Chiloe,  $+13^{\circ}$ ; at 500 fathoms,  $+4^{\circ}1'$ ; at 1100 fathoms (no bottom),  $+2^{\circ}3'$ . Off Pisco, S. of Lima, at surface,  $+19^{\circ}1'$ ; at 130 fathoms,  $+13^{\circ}1'$ . There was reason to believe that the *Venus* had traversed a hot stream to the S.S.E. of Van Diemen's Land, since the observations made between 6th and 9th January, 1839, had shewn great increases of temperature. Numerous observations had been made to determine the general temperature of the ocean, independent of any currents. The depths at which the experiments with thermometers had been made varied from 30 to 1150 fathoms. Beyond this last depth the pressure had been so great as to break all the instruments which had attained it. It was shewn that, at 1000 fathoms, the thermometer indicated only  $3^{\circ}$  or  $2^{\circ}5'$  of the centigrade scale, while the heat at the surface was  $26^{\circ}$  to  $27^{\circ}$ . The operations for ascertaining the depth of the ocean, which are exceedingly laborious, had been made at various spots. The greatest depth attained was at 140 leagues south of Cape Horn, where 2500 fathoms, or 4000 metres, of line ran out without touching the bottom. Another observation, at 23 leagues south of Bunker Island, gave 3790 metres without a bottom. Numerous observations on terrestrial magnetism had led to the inference that the dip of the needle was not affected by earthquakes. The observations made on the height of waves south of Cape Horn, where they are supposed to be the highest, shewed that they were never more than 7 metres, or 21 feet.

Currents of the Ocean.—A bottle was picked

up on March 16, 1840, in a creek of Petit Cayenne, which contained a paper stating that it had been thrown overboard from the bark *Duchess of Kent*, Capt. Newby, on July 8, 1838, in 0° 10' N. lat. and 31° 45' long. W. of Greenwich (chronometrical reckoning), on a voyage from Sidney to London. The paper bore the signatures of the captain and of D. Allan, passenger. The ship had left Sidney on 8th April, 1838, and had gone round by Cape Horn.

*Sciara da.*  
Sul primo ogni ente  
Sì stà vivente:  
Se morto, osservalo  
Fra il primo stà.  
Finisce il mondo  
Se il mio secondo  
Soltanto un attimo  
S' arresterà.  
Che sia l' intero  
Tremendo, e fiero,  
Sebben lo sentano  
Nessun lo sà.

Answer to the last :—Fillo-mela.

### FINE ARTS.

#### TRAFALGAR SQUARE.

THE continuation of the Nelson Column is now in abeyance; and we earnestly hope that our efforts may have had the effect of stopping altogether the consummation of this monstrous blunder. If all our arguments had failed, we should now simply appeal to the judgment of every person in London who have eyes in their heads; for, in consequence of the progress made in raising the Square foundations of the Column, they have all the means of forming a correct opinion for themselves. Let them go to the centre of the portico of the National Gallery and look upon the site, and if vexation at the committal of such an act of national shame does not prevent them, they must laugh at the grossness of the absurdity. The Pillar would stand on the right of the vista down to Whitehall, cutting off the view of a building from which no one would like to be cut off, viz. Messrs. Drummond's banking-house; and leaving a glimpse of King Charles's statue over the left shoulder of the pedestal, with the fine street, down to Parliament Street, all askew and on one side. It is impossible to conceive anything more ludicrous; and glad we were, yesterday, to see that the work was not going on. Better sacrifice all the bricks and mortar which Mr. Secretary Scott hurried to the spot, so as to defeat the Parliamentary Committee, than persevere in so inexcusable an outrage upon taste and propriety. There is the centre of Greenwich Hospital, which courts such a monument; the fittest place in the kingdom, both from position and association with the surrounding objects. In Heaven's name, do not let the country be disgraced in this manner for a few paltry pounds; but at once determine on leaving the Square to Mr. Barry's operations, and the half-dozen of labourers who are pottering about to reconcile this stubborn piece of ground, shapeless and level-less, to some order of ornament and beauty. But away with these foundations for the pillar—even without it, and as yet only six or eight feet in height, they are absolute deformity.

#### PHOTOGENIC ETCHING.

PROFESSOR BERRES, of Vienna (whose experiments in this art we lately recorded), in a very recent letter, says:—

"Ever since the discovery of the representation of objects on iodined silvered plates, I felt a constant desire to render durable these representations, so delicately portrayed by nature, and to endeavour to discover some method by

which they might be rendered available for printing from, and by this means be multiplied to any extent. I at last struck out a plan which brought me very near the desired end. I began my experiments without any previous knowledge of the art of etching, and without any experience whatever in the use of the acids necessary for the fixing of the daguerreotype, which rendered my undertaking certainly much more difficult, but at the same time more original.

"During my experiments I learned, by a paper communicated to the 'St. Petersburg Gazette' by M. Hammel, that M. Donné, in Paris, was also occupied with the same object, viz. that of endeavouring to etch the heliographic pictures; and that he had laid the proof sheets of a plate, from which he had taken twenty impressions, before the Institute at Paris and the Imperial Academy at St. Petersburg. From the same journal I also learned that M. Daguerre had loudly expressed his displeasure upon the subject; and that he had declared, at a meeting of the Institute, the utter impossibility of ever attaining any perfection in etching, and, consequently, in multiplying, his pictures.

"Although this opinion, from a man of so much experience in heliography, was not encouraging, nevertheless it did not depress me, but excited my zeal and determination to use my utmost energy in endeavouring to obtain a perfect etching.

"Very shortly after this, on the 5th April last, I completed my first picture, which was the representation of a section of a plant, which I had obtained by means of the hydro-oxygen-gas microscope. On the 11th April I succeeded in representing a female figure, taken by the same means from an engraving. And the following day I etched another upon plated copper, representing the engraving of 'The Smugler,' and where I had the pleasure of seeing the features of a man particularly sharply etched. The experience I had already acquired now taught me that the plated copper-plates, such as are used for the daguerreotype, were not fitted for producing perfect etchings, and, on account of the different properties of the silver and copper, would completely spoil the pictures. On this account I began to use silver plates (chemically pure). The success of my method was now much more complete; and I succeeded in producing a number of good, but still weak engravings. In the meantime the success of my undertaking was so certain, that I laid it before the scientific public, through the medium of the 'Vienna Gazette,' on the 18th April last.

"On the 30th April I at last succeeded in producing a good heliographic etching of Stuber's engraving of the 'Girl with the Butterfly.' And upon the same day, at the meeting of the Imperial Society of Physicians in Vienna, I communicated my method without the slightest reserve; and, according to my desire, it was published in almost all the leading literary publications in Europe.

"It was only at the latter end of May we were informed that M. Donné had sent a sealed packet to the Institute in Paris, containing his secret of etching from the daguerreotypic plates, but accompanied by the condition that the packet should not be opened until the French government had informed him what remuneration he was to receive for his discovery; so that the public is still in ignorance as to the degree of perfection which M. Donné has reached in his invention.

\* See No. of *Literary Gazette* of 23d May past.

"Since the publication of my discovery, I have prepared many pictures, and always with increasing success. Amongst them are different views of the city of Vienna.

"The last deeply etched specimen, which represents the Cathedral of St. Stephen's, and several hundreds of which have been struck off, I venture to lay before the public,\* as the point of perfection to which I have at present carried the process.

"The advantages of the path which I have now opened to the art of engraving are incalculable:—

"1. Every outward object can by a clear light be correctly represented and etched. Thus all views of towns, landscapes, military encampments, &c. can be taken, etched, and printed without delay.

"2. By the assistance of the hydro-oxygen microscope, every object too minute for the human eye can be magnified, etched, and multiplied to any extent desirable.

"3. Engravings can be represented and multiplied in the same size and form, or either increased or diminished to any form which may be most convenient.

"4. The same also holds good with respect to maps and charts of every description, handwriting, and printing; also old copperplates and typographical works can be copied and multiplied without injuring the original in the slightest degree.

"5. Also oil-paintings, portraits of living persons, and representations of the manifold objects appertaining to natural history, can be taken, etched, and printed from to any extent, and their utility thus increased. There can be no question but that through my discovery alone has daguerreotypy obtained the stamp of utility. Nevertheless, this new plant, which promises to produce such valuable fruit, has scarcely passed the tender age of childhood, and still requires the most nurturing protection. In order to bring it to perfection quickly, according to my ideas, the following points are requisite:—

"1. A government, or some scientific individual possessing knowledge, enterprise, and pecuniary means, should undertake the carrying forward of this method of etching engravings.

"2. The preparation of the silver plates must be watched with the greatest care and knowledge of the business, only to be gained by experience. It is indispensable that the plates should be of the most pure chemical silver, firm and close, so that there shall be no impediment to the etching power, and that the surface of the plate shall be brought to the highest possible degree of polish of which silver may be capable.

"3. The improvement of the camera, in relation to power of extension on all sides, and great brightness, that moving objects may be quickly caught and fixed with the necessary degree of accuracy.

"4. The heliographs must be sharp, and cleansed as much as possible from iodine.

"5. An improved and remarkably fine printing ink.

"6. A peculiar description of printing-press. As the whole process of my discovery is purely chemical, and when the pictures are examined through a microscope they will return the objects, it is necessary that a new, soft, but powerful printing-press, should be invented, which

\* Copies of nearly all the engravings hitherto made are in the possession of my friend, Dr. R. H. Mackenzie, of London, who will be kind enough to shew and explain the process of engraving to any scientific individuals interested in the art.

shall act on all sides with equal power, and impart to the paper sufficient of the printing-ink, which must be laid on with the greatest care.

"As none of these points present much difficulty, and as we live in an enterprising and richly gifted age, I look forward to see my hopes and wishes realised.

"I, as a practising physician, as professor in the university, and author, can only in future give short glances to my offspring; and must also, for pecuniary reasons, recommend and leave it to the care of those who have the enterprise, capital, and time to attend to it.

"My printed heliographic pictures have a singular character. The resemblance to the daguerrotype is extreme; and, like them, they have no inward shadow, although much gradation of shade. The principal difference between these pictures and those engraved by the hand of man is the great correctness in the drawing, and the proportion and relative size of the objects, and that most important of requisites, perspective. They are drawn by a process of nature which knows no trouble, and finds no task too intricate or too extensive for her capabilities—that can enter into the most minute details, and can reflect them truly, and according to fixed laws.

"The most accurate engravings, performed by the most skilful engraver, appear poor when minutely examined, and at last leave us dissatisfied; while those produced by this new science continually afford new objects of admiration to our most severe tests with the magnifying glass, through which its usefulness and beauty increases by our examination.

"Dr. JOSEPH BERRES,  
Professor of Anatomy in the University  
of Vienna."

"Vienna, 3d August, 1840."

#### NEW PUBLICATIONS.

*Edward Denison, D.D. Lord Bishop of Salisbury.* Painted by H. W. Pickersgill, R.A.; Engraved by G. R. Ward.

THIS is a fine and dignified whole-length portrait of the Bishop of Salisbury, painted for Merton College, Oxford, in Mr. Pickersgill's most successful manner. The engraver, Mr. Ward, has entered fully into the character of the original, and executed his task with equal fidelity and effect. It is, altogether, an excellent specimen of art.

*Picturesque Sketches in Scotland; being Views of its more remarkable Ancient and Modern Edifices, Lakes and Mountain Scenery, &c.* Edinburgh, Menzies; London, Tilt and Bogue.

PART I. containing a view of Princes Street and drawings of Dryburgh and Melrose Abbeys, introduces us to this pleasant work. They are very prettily executed in tinted lithography by Mr. Nichol of Edinburgh, and the first rendered interesting by the introduction of the Scott Monument, the foundation-stone of which was laid the other day. The spots are thus all intimately connected with his honoured name—Melrose, which he so nobly sung; and Dryburgh, where his mortal remains are laid. We look forward for the ensuing numbers with the anticipation of being much gratified by them, as forming a national work.

*Heath's Waverley Gallery.* Part VI.  
Tilt and Bogue.

EDITH BELLENDEN and Jenny Dennison, from "Old Mortality," and Rowena, from "Ivanhoe," are the portraits of this part, and

are fair specimens of the Gallery. The first does not agree with the story in the quoted text, being without an attendant to lean upon.

Alfred Bunn, Esq. On Stone, by Lane.  
Mitchell.

BURLY and ruffianish; but, strange to say, not very like.

#### BIOGRAPHY.

*Tragical Death of Mr. Simpson, one of the Discoverers of the North-west Passage.*—Our readers are familiar with the history of the recent solution of this interesting geographical problem, by the enterprise and boldness of Messrs. Simpson and Dease, two gentlemen connected with the Hudson's Bay Company, of which the account was given in the *Literary Gazette*. It now appears from late American journals, that a sad catastrophe has terminated the life and labours of Mr. Simpson. From the accounts we learn that, having separated from his companion, with the view of proceeding to England (where he would have found himself appointed to another exploratory journey, agreeably to his dearest wishes), Mr. Simpson, accompanied by Mr. Bird, Mr. Legros, and twenty or thirty of the colonists, struck off for St. Peter's, to push on for New York by the Lakes; whilst Mr. Dease, with another party, set out for Canada. About the 20th of June, Mr. Simpson's expedition encamped on Turtle River for the night, when, in a moment of frenzy, that gentleman turned round, and first shot Mr. Bird through the heart, and instantly after mortally wounded Mr. Legros by a shot from his second barrel. It seems, from some conversation with the dying man, that Mr. Simpson accused the parties of a design to assassinate him—a pregnant proof of insanity in himself; but be that as it might, his associates (including a son of Legros) fled from him, and on their return next day to capture him, the unhappy man committed suicide by blowing his head to pieces at the door of his tent. He is stated to have been about twenty-eight years of age, a Scotman, and native of Dingwall, nephew of the Governor of the Hudson's Bay Company, of the most amiable character, and highly esteemed.

#### THE DRAMA.

*Covent Garden*, again under the auspices of Madame Vestris, has summoned its forces together, and announced the opening of the season for next Monday. From the list of the company, which is published we observe that it is much the same as last year, and consists of a strong comic corps, with a very fair musical one. We may therefore expect the performances to be pretty much of the same kind.

*Haymarket.*—On Monday Mr. Wallack, after an absence of six years, made his appearance in the character of *Don Felix in The Wonder*. He was much applauded throughout, and played to the evident satisfaction of the audience, who called him before the curtain at the end of the play. We are rejoiced to see so valuable an addition restored to our stage; and there are a multitude of characters in which we should in vain look for his equal. The female parts were sustained by Miss Helen Faucit, as *Violante*: this is not in her style, and we never saw her to less advantage;—her *Violante*, like her *Rosalind*, wants nature and buoyancy; by Miss Travers, as *Donna Isabella*, who did little more than repeat her rôle; by Miss Charles, as *Flora*, who played archly and cleverly; and by Miss Matley, as *Inez*. Where

was Mrs. F. Matthews? Mr. J. Webster, as *Colonel Breton*, looked and played well; Mr. O. Smith, as *Gibby*, made the audience roar whenever he spoke, in a lingo of the most *bizarre* description; and Mr. Webster, as *Lissardo*, was full of quiet humour. The other parts were very fairly supported by Messrs. Strickland, Gough, Howe, &c. &c. On the same evening Mrs. Stirling, in one of her old and well-known characters, *Angeline*, made her courtesy, and a very graceful one it is. The smiles and tears of her hearers gave flattering evidence of her charming acting.

*English Opera.*—On Thursday two new ladies made their *début* here: a Miss Darcus, from York, lively enough in *Nina*, in the *Irishman's Fortune*; and Miss Lacy, from Bristol, an extremely pretty girl, who played *Clari*, in the *Maid of Milan*, acting with considerable success and promising more, though her singing, probably from nervousness, was not very effective.

#### ORIGINAL POETRY.

"Tiefere bedeutung  
Liegt in dem Märchen meiner Kinderjahre  
Als in der Wahrheit die das Leben lehrt."—  
SCHILLER: *Die Piccolomini*.

"In the background is a boy riding on a tiger, which is the moral of the piece."—*Shoeman of Daniel in the Lion's Den*.

STRANGE were the tales of fays and men

That used to charm my ear:

With simple mind I listen'd then,

In boyish hope and fear:

Now, wiser grown, I see the truth

Each fable strives to paint to youth.

The maiden with the scarlet hood,

The wolf's unthinking prey,

Shews that to grandmammas we should

But small attention pay,

And shun, as far as in us lies,

Old women with great teeth and eyes.

The damsel who was raised from soot

And cladders to a throne,

Proves clearly that a pretty foot

Ought always to be shewn:

A crown would ne'er have deck'd her brow,

Had dresses then been long as now.

The dog who laugh'd, when deem'd a corse,

In Mrs. Hubbard's face,

Through all his life display'd the force

Of acting and grimace:

A companion to an old ladye

A hypocrite should always be.

When Homer, with complacent speech,

The flum pick'd from the pie,

The spot he chose was meant to teach

Where one can best be sly:

A corner is the place most meet

For more than one forbidden sweet.

But small was the Giganctide,

Yet slew he Cormoran,

And consolation thus supplied

To every little man:

Hence men of five feet mought, like John,

Such very fierce looks all put on.

The diamonds and pearls that fell

From the good virgin's lips,

Were types of each small syllable

That from a wise man slips:

How precious, then, these words of mine!

Be thankful, reader, they are thine! R. H. G.

#### THE GLADIATOR.

He stood in the arena, sword in hand,  
To slay a brother, or himself be slain.  
His foot was firm, though, as he trod, the sand  
Bore evidence of where the dead had lain,  
By the dull oozing of a crimson stain.  
He gazed around him; and his free lip curl'd  
With the nobility of his disdain,  
To see the Roman conquerors of the world  
Twice triumph o'er a foe whose banners they had fur'd.  
Tier above tier, in majesty of state,  
Sat prince, and peer, and page, and lady fair,  
And scar-seam'd heroes grown effeminate;  
Philosopher, and gallant debonnaire,  
Artist, and artisan; all Rome was there,  
In loftiest pride of boastful bravery,  
Eager, as with one interest, to share  
The gladiator's dying agony—  
All these the Dacian saw: all these he smiled to see.

"A deeper import  
Lurks in the legend told my infant years,  
Than lies upon that truth we live to learn."  
CORRESPONDENT: Translation of the same.

The trumpet calls him to himself: that sound,  
When last he heard it, summon'd to the field  
Of battle; then he stood on Dacian ground;  
Arm'd, e'en as he is now, with sword and shield,  
Honest to strike, and bold to die the yield.  
Alas! his country, 'twas not his to save—  
A Roman faulchion struck his helm—he reel'd—  
Say, was it mercy held him from the grave,  
And gave him life, to call him—gladiator, slave?  
And is he now to stand as then he stood,  
Arm'd and resolved against his country's foe,  
And bathe his good sword in a brother's blood  
To make a spectacle for Romans? No!  
Look! on his cheek the colours come and go—  
He cries, and dashes down the proffer'd knife,  
"Give me a Roman mate; and blow for blow  
I'll deal, while Heaven makes strong my arm for strife;  
But think not Dacian blood shall ever buy me life!"  
Erect and mute he stands awhile, and eyes  
With folded arms that motley multitude—  
But vain his hope to stir their sympathies:  
No heart among them but is all too rude  
To rock of pity, when it came for blood.  
He combats, or must die—ignobly die;  
He sees it, sorrowful but unshook;  
And grasps his sword again, while scornfully  
Flashing fierce looks of hate from either swollen eye.  
"Avant ye slaves! I toss ye back the name—  
A Dacian captive flings a taunt on Rome—  
A Dacian chief ye idly thought to tame,  
To play the puppet in this cursed dome,  
While he had memory of his flaming home.  
His children slain, his country sack'd, oppress'd,  
Dares ask: Who here to such resolve could come  
To cheat his victors of a bloody jest,  
As use the sword they gave to plunge it in his breast?"  
He spoke: and straight his noble bosom gored,  
While wonder held all silent at the deed;  
Then, drawing from his heart the reeking sword,  
Look'd calmly for the gaping wound to bleed,  
And died, the noblest of his stubborn breed.  
And surely this some mercy might have wrought,  
But mercy was not in the Roman creed;  
And straight—as though the scene had passed was  
nought—  
Another slave was found, another combat fought.  
J. N. O.

### VARIETIES.

*Professor M. Müller*, of Gottingen, died recently at Athens, of a fever caught whilst exploring the remains of Delphi.

*Coins of the twelfth and thirteenth centuries*, belonging to Brabant, Hainault, and Flanders, have been found in the walls of a cellar in the Fishmarket of Louvain. They amount to some 5000 small silver pieces, are in fine preservation, and of much interest to numismatologists.

*Auroch Horns*.—A pair of these enormous horns, held to be of the primitive bull, have been found in a very curious place and way, viz. in the river Seille, near Tournon, by some fishermen, in casting their nets. Though broken at the tips, they are three-quarters of a yard long, and five inches in diameter at the base.

*Pierce's Patent Identifying Detector Lock*.—We have been much interested with a sight of this ingenious improvement on Chubb's patent lock, which, as is truly declared by the inventor, possesses, in addition to the most perfect security, a means of identifying any person who attempts to open it by any improper means whatever. "Its construction is simple, its parts accurate, its action peculiarly pleasant, remarkably strong; and, above all, it is so perfectly secure that it defies the most ingenious attempt to open it, by any kind of instrument that can possibly be applied. The combination upon which this security is founded admits, also, of such an infinite number of changes, that every lock differs, and can be opened only by its own proper key. Locks, known by the name of Detector-Locks," adds Mr. Pierce, "have long been before the public; but as they merely apprise the owner of an attempt having been made, without presuming to identify the guilty one, anxiety and suspicion are the natural results; and not unfrequently have the innocent been made to suffer with

the guilty." As a remedy for this evil, the present invention marks the offender with an unexpected stamp, which cannot be removed for weeks, and thus detects the perpetrator alone, without the possibility of misleading suspicion. We cannot tell whether we most admired the ingenuity or the certainty of this piece of mechanism, which may, indeed, be described not only as a secure lock to our doors and chests, but a key to those who would try to pick them.

*American Punning*.—A recent American paper states "that a poor drunken loafer was last Monday night picked up in the streets, with no sense in his head or cents in his pocket; but having a powerful scent of spirits in his breath, he was sent to the watchhouse to conclude the celebration of Saint Monday."

### LITERARY NOVELTIES.

In the Press.

The History and Antiquities of Syon Monastery, Isleworth Parish, and of the Chapel of Hounslow, is announced by G. J. Augier, to be published by subscription.

### LIST OF NEW BOOKS.

A Treatise on Geometry, and its Application to the Arts, by D. Lardner, LL.D. fcap, 6s.—Maunsell and Evanson on the Diseases of Children, new edition, 8vo, 12s. 6d.—Parliamentary Speeches during the Session 1840, 8vo, 8s.—Oliver Cromwell, an Historical Romance, edited by Horace Smith, 3 vols. post 8vo, 11. 11s. 6d.—Rose's New Biographical Dictionary, Vol. II. 8vo, 18s.—The Fine Arts in England, by E. Edwards, 8vo, 8s. 6d.—Sir H. Davy's Works, Vol. IX. (conclusion), 8vo, 10s. 6d.—Religion and Education in America, by J. D. Lang, D.D. fcap, 7s.—Tales of Travel, by F. B. Miller, 18mo, 2s. 6d.—True Politeness; or, Etiquette for Every Body: Part I. Gentlemen; Part II. Ladies, 1s. each.—Descriptive Sketches and Tales of Barbadoes, fcap, 5s.—Sporting Oracle, 1841, 2s. 6d.—A Commentary on the Epistle of James, by the Rev. T. Mantou, D.D. 8vo, 5s.—Greek and English, and English and Greek Lexicon, by G. Dunbar, 8vo, 2s.—Bible Stories for very Little Children, first series, square, 2s. 6d.—Lieutenant Bacher's Tables for Reducing Foreign Linear Measure into English, first series, 8vo, 2s. 6d.—Allies' Antiquities of Worcestershire, 8vo, 5s.—The Return to England; a Tale of the Fourth Year after the Battle of Waterloo, 2 vols. post 8vo, 18s.—Plain Parochial Sermons, by the Rev. September.		
Tuesday .. 1	.... 58 .. 77	29.96 .. 29.81
Wednesday 2	.... 58 .. 75	29.71 .. 29.63

Wind, south-west on the 27th and following day; east on the 29th; south-east on the 30th; north-east on the 31st ult.; east on the 1st inst., and south-west on the 2d.

The morning of the 27th, overcast, with rain, afternoon and evening clear; the 28th, morning cloudy, otherwise clear; the 29th, generally cloudy; the 30th, generally clear, except the evening, when a little rain fell; the 31st ult., morning cloudy, otherwise clear; the 1st inst., generally clear; the 2d, afternoon and evening cloudy, with rain, otherwise clear.

Rain fallen, .015 of an inch.

Edmonton.

CHARLES HENRY ADAMS.

### TO CORRESPONDENTS.

"Gulielmus" will not do.

In our reviews of the works relative to the East Indies we have not endeavoured to reconcile the varieties of spelling of native names, whether of men or places, which not only differ in these publications, but often in the same volume. They are, we trust, sufficiently near to be understood.

### ADVERTISEMENTS.

Connected with Literature and the Arts.

BRITISH ASSOCIATION FOR THE ADVANCEMENT OF SCIENCE.

THE next (Tenth) Meeting of the British Association for the Advancement of Science will be held in Glasgow, during the Week commencing on Thursday, the 17th of September, 1840.

JOHN TAYLOR, F.R.S. General Treasurer.

JAMES YATES, F.L.S. Secretary to the Council.

Gentlemen attending the Meeting at Glasgow are requested on their arrival to call, for information, at the Hall of Hutcheson's Hospital.

London, July 17, 1840.

### ROYAL INSTITUTION OF GREAT BRITAIN, Albemarle Street, Sept. 1, 1840.

The extended and practical Course of Chemical Lectures and Demonstrations for Medical and General Students, delivered in the Laboratory of this Institution, by Professor Brande, will commence on Tuesday, the 6th of October, at Nine in the Morning, and be continued on Tuesdays, Thursdays, and Saturdays, at the same hour. The Course terminates in May.

A Prospectus and further Particulars may be obtained on application to Mr. Brande, or Mr. Finch, at the Royal Institution. JOSEPH FINCHER, Assistant-Secretary.

### PNEUMATIC or ATMOSPHERIC

RAILWAY, under Patents granted to Henry Pinks, Esq. the Inventor, dated in the Years 1834 and 1836.—To Railway and Canal Companies, Trustees of Turnpike Trusts, and others, Licenses to use the above important Invention, which is now clearly demonstrated, can be had either in Parts of Great Britain, in France, or Belgium, or the United States; or the Patent Rights will be disposed of in Part or in Whole.

N.B. The Invention is applicable to Railroads already constructed.

Amongst the advantages attending this Invention are the following:—

1. That of saving one-half of the ordinary expenses in the construction of railroads.
2. That of enabling railroad companies to traffic at one-third of the annual expense attendant on steam locomotive power.
3. The getting rid of all nuisance attendant on locomotive steam-engines.
4. The affording greater protection to life, and avoiding those fatal accidents and losses arising from the destruction of property by fire.
5. The immense saving to canal companies, by dispensing with horse power and increasing the speed on canals.
6. The enabling turnpike trusts to compete with the present increasing railroad transit.

The public are cautioned against entering into contracts with any party or parties who, under a colourable variation, are endeavouring to pirate the present patents.

PINNIER and WESTMACOTT,  
1 Gray's Inn.

### BOOKS PUBLISHED THIS DAY.

13 Great Marlborough Street, Sept. 5.

## NEW AND INTERESTING NOVEL.

In 2 vols. post 8vo. 18s. boards.

## THE RETURN TO ENGLAND. A Tale of the Fourth Year after the Battle of Waterloo. Founded in Facts.

By a FRIEND of the SERVICE.

"Teeming as it is with interest, stirring yet unexaggerated, the 'Return to England' can scarcely fail to please the lovers of this species of composition."—*Sun*.  
"The volumes before us evince great observation of life by the writer, and great power of bringing the results of that observation before his readers in the simplest and most natural manner."

—*Argus*.  
"It has an air of originality, truth, and freshness, which is truly delightful, after those wretched caricatures of life and manners which we have been accustomed to read under the title of 'Fashionable Novels.' Such a work is really a novelty in these days of artificial feeling. The story is crowded with incidents, and full of interest."—*Edinburgh*.  
London: T. Cadell; and W. Blackwood and Sons, Edinburgh.

Price 10s. 6d. bound.

## ARNOLD'S THUCYDIDES, Vol. I.

Illustrated by Maps, Notes, &c.  
London: Whittaker and Co. Oxford: J. H. Parker.

Printed by HANNAH PAGE MOYES, of Brook Green, Hammer-smith, and GEORGE BARCLAY, of Number 2 Pullin's Place, Islington, both in the County of Middlesex, Printers, at their Printing Office, Number 86 Castle Street, Leicester Square, in the said County; and published by WILLIAM ARMIGER SCRIPPS, of Number 13 South Molton Street, in the Parish of Saint George, Hanover Square, in the County aforesaid, at the LITERARY GAZETTE OFFICE, Number 7 Wellington Street, Waterloo Bridge, Strand, in the said County, on Saturday, September 5th, 1840.

No. 1234.

THIS is a curious Number for a periodical above a daily issue. One, two, three, four! One is a nervous number. By the time of one, two—*alias* 12—we are getting firm in the saddle, and (like a jockey whose start is so good that he feels pretty sure of running a fair winning race) looking complacently about at the public, a little more at our ease. By the date of one, two, three—*alias* 123—there is nothing but liveliness and vitality; we are in full force, swinging away like giants refreshed, and fancying that there will never be an end to our vigorous course. One, two, three, four—*alias* 1234—we ought to be steadier as we are older, wiser as we are more experienced, and not less hopeful and healthful, though a few years have passed over our heads. Well, it is for the public to judge, and we have no cause to complain.

But the retrospect and the prospect may be worthy of a few words. A.D. 1817 witnessed the *début* of No. 1 of the *Literary Gazette*, an entirely new experiment in the periodical literature of England; in which it soon happily established a character and influence which have not departed from it.

Growing up, it reached No. 12 in the same year; and within three years, *naturally*, advanced to No. 123.

No. 1234, at the distance of three-and-twenty years, has seen many striking changes, observed thousands and tens of thousands of novelties in literature and the arts, mighty improvements in sciences, and prodigious alterations in every thing. Still we are well satisfied; so well that we begin to look forward to our next figure,—we mean No. 12345!! We trust our readers will all abide by us till then. It is not very much to add only one figure more to our long and agreeable connexion. *Only two hundred and thirteen years and thirty-five odd weeks!* Somewhere about the middle of the year 2054; though it is not easy to predict what sort of a world it will be then.

At the same distance of time behind us, viz. 1626, a wise king, James I., reigned (or rather had lately ceased to reign) in England; who knows but another wise monarch may, though it is not likely, be reigning when our No. 12,345 is published? It is painful to think that, as there was no *Literary Gazette* in those days, there may not be one in the equidistant future. At any rate we do not expect to be editor, or Moyes and Barclay printers, or Scripps (already venerable) publisher. The Longmans may have had their day, and the Colburns be almost forgotten. Paternoster Row may be a railroad, with St. Paul's as a booking-place; Great Marlborough Street an obscure alley; and the site of our own office, near Waterloo Bridge (supposing the Thames not to have been drained), a balloon station.

Perhaps some antiquary, fond of old trifles, may fall in with this page, and illustrate it with notes in some little read repository; or even, wondering at his discovery, print an essay, *reliquiæ a nugæ antiquæ*, on the subject. We thank him *now*, *a priori*, because we should not like the sin of ingratitude to be laid upon our heads. And we beg to inform him, and through him the posterity that shall succeed the eight or nine generations which have passed away between us (passed away, and are remembered only as a dark intervening space and succession of nameless beings), that we wrote this paper, after dinner, on the eve of departure for Glasgow, in Scotland, where there was about to be assembled a congregation of persons who have met annually for the last nine years, under the title of the "British Association for the Advancement of Science;" and that if he dig carefully into the records which may happen to have escaped the ravages of time, respecting the proceedings of this august (this year September) Institution, he may bring to light many things worthy of his research, and the applause of his fellow antiquaries.

But, alas! we have wandered from our direct line of subject, and our ideas are confused and rambling. There are the electric telegraph and the indomitable Wheatstone, the last glass of champagne and the transit to the north, the transit of one of Jupiter's satellites and the

glorious voyage now making (Heaven give it prosperity!) by Captain James Ross to the Southern Pole, the magnetism of the Scottish Highlands and the whole terrestrial *ditto* of Sabine (for which, large as it is, we would not exchange the former); the hospitalities of Glasgow with bailies like Nicol Jarvie and honest citizens like his father "afore him;" the cradle of Scotch manufacturing enterprise and its honourable results, increasing wealth, knowledge, and spirit; the Breadalbane, a powerful chief of the Campbells presiding, near a million of looms, over the peaceful and friendly intercommunication of improvements in the arts and sciences most precious to civilised man; the Clyde and Thames, united by a few hours of magic transport in the noblest of steamers—the grand "Monarch" of the General Steam Navigation Company,—the annihilation of space and time—But halt! if time and space were annihilated, what is the use of our troubling ourselves to tell these things to our antiquarian friend of A.D. 2054? he will be quite as well informed as, at this period, is he, and (barbarous style for 1840) the reader hereof's, wellwisher—*The Editor of the Literary Gazette.*

REVIEWS OF NEW BOOKS.

*The Thames and its Tributaries.* By Charles Mackay. 1840. 2 vols. 8vo. Bentley.

IN the midst of wars and rumours of wars, of dry science and drier philosophy, of mechanics and steam, of manufacturing and shipping, of every-day occupation, business, and turmoil, it is most pleasing to walk out with a companion like Mr. Mackay, loiter with him up the lanes and through the green fields, saunter along the river-side, and peer into every object of art and nature, near, which can court the contemplation of intelligent minds. His volumes are, indeed, very agreeable and refreshing. There is no poring over insignificant and trifling things; no dwelling upon objects of small or even of larger interest; but a fine vein of observation, minute enough in description, and lighting up into feeling and poetry when solicited by greatness or beauty, runs through and vivifies the whole.

The papers occupying the first half of the first volume have already appeared, and been deservedly popular, in "Bentley's Miscellany." They extend the rambles from London Bridge to Hampton Court: all the rest is new, and, after ascending to the source of the Thames, returns to the old starting-place, explores the river thence down to the Nore, and then does as much for its chief tributary, the Medway, and concludes with a retrospect of frost fairs on the Thames.

Whilst we advise readers of every class to recreate themselves with Mr. Mackay's book, we must not deny our distant friends, many of them "groaning and sweating" under tropic skies, the gratification of a glance back at native land, as sweetly pictured by his pen. It is no matter where we dip,—Open sesame! We fall into a charming country, and it leads us to an interesting memoir:—

"The village of Mickleham, at the foot of Boxhill, is a sweet rural spot, with a modest and venerable church. To the man who delights in recollections of the past, it offers few attractions; but to the man who wishes to enjoy the present, there cannot be many more attractive spots in all England. Norbury Park, adjoining, is one of the finest seats in the county. The river Mole runs through the grounds; and although occasionally, in very

hot weather, its channel is almost dry, it generally contains sufficient water to be the most pleasing ornament of the landscape. The views from the windows of the dwelling-house are exceedingly beautiful; and the walls of the saloon, painted by Barrett, are so managed as to appear a continuation of the prospect. About three miles to the south-east rises Boxhill, nearly five hundred feet above the level of the Mole, and from whence the windings of the river may be traced for many miles. Just below is seen the solemn-looking town of Dorking, with the commanding eminence of Leith Hill, about six miles beyond it. To the right, the range of hills leading to Guildford and Farnham; and on the left, Betchworth, Reigate, and all that beautiful country. Descending this hill, we cross the Mole and arrive at Dorking. This little town, famous for its poultry and butter, has a remarkably neat and clean appearance. It is situate on a tract of soft sandy rock-stone, in which cellars are dug, noted for their extreme coolness, and very valuable for the preservation of wine. These cellars are very numerous. The most remarkable is on the side of an eminence called Butter Hill, the descent to which is by a sort of staircase, containing upwards of fifty steps. Dorking is mentioned in the 'Domesday Survey,' and is said to have been destroyed by the Danes, and rebuilt in the time of William the Conqueror. The manor is now the property of the Duke of Norfolk, and the church is one of the burial-places of that noble family. A curious custom prevails, or until very lately did prevail here, that if the father dies intestate, the youngest son succeeds to the estate. This custom is stated, with great probability, to have arisen in the feudal ages, when the barons were free to claim and enforce that detestable right of passing the first night with the newly married bride of any of their vassals; the '*respectable droit de jarnage*,' as the French songster calls it in his admirable satire, entitled the 'Projects of a good old Baron.' It does not appear that the right was often enforced; it was too atrocious, and affronted the common sense of even the feudal age. The good people of Dorking were, however, quite right in taking the means they did, to insure their estates to their own offspring. The stranger at Dorking will find much to interest him; the walks in the neighbourhood are fine and the air bracing. But the ramble among the hills over the Hog's-back, to Guildford, is the most delightful of all. We now lose sight of the Mole, and approach its pleasant sister, the Wey; less beautiful, it is true, and passing through a country less picturesque, but still worthy of a visit, and offering many reminiscences to the man who takes pleasure in local histories and traditions. The distance is not above eight miles between the Mole and the Wey, and the road is for the most part on a beautiful ridge, from which, at every turn, some pleasant view may be obtained. Guildford is situated upon the Wey, and its antiquities alone afford ample materials for a volume. It has a solemn and venerable air—a demure grace about it, which bespeak it as a place that was once of historical importance. It contains

three parish churches,—Trinity, St. Mary, and St. Nicholas. Great part of the first-mentioned fell down in 1745, but was afterwards rebuilt. It contains several monuments, by far the most remarkable of which is to the memory of a very remarkable man, a native of the town, George Abbot, who was Archbishop of Canterbury at the commencement of the seventeenth century. He was the son of a poor cloth-worker of Guildford, and had five brothers, most of whom rose to distinction; one, Robert, being Bishop of Salisbury; and the youngest, Maurice, Lord-mayor of London, and the first person who received the honour of knighthood from King Charles the First. A singular story is told of the cause of the good fortune of these brothers. When the mother was five or six months advanced in pregnancy with George, she dreamed that an angel appeared to her, and told her that if she caught a jack in the river Wey, and ate it, the child in the womb would be a boy, who would rise to the highest dignities in the state. The poor woman told her dream to her neighbours, and was advised to try and catch a jack in the river, and see what would come of it. She paid no attention to the advice; but, some days afterwards, as she let down a pail into the stream to procure water for domestic uses, she, to her great surprise and delight, brought up a very fine jack, which, says the story, 'she cooked for her dinner that very day.' When her son was born, all the gossips of Guildford looked upon the promise of the dream as half accomplished, and amused themselves by speculating whether the greatness of the 'little stranger' would be achieved in the law, the church, or the army. The circumstance being the general topic of conversation in the county, two gentlemen of wealth and station offered to stand sponsors for the child, and look to his future fortunes, if they found him worthy. He was found worthy. He made great progress in his studies, and conducted himself most creditably in every situation in which he was placed. He was sent to the University of Oxford, where he distinguished himself as one of the first scholars of the time. His mother's dream was producing its good effect; the fire of ambition was kindled in his soul; and being endowed with genius, and with another quality which is often a great deal more valuable—perseverance, he rose gradually to renown and advancement. In 1599, being then in his thirty-seventh year, he was made Dean of Winchester; and in the year following, Vice-chancellor of the University of Oxford. He was one of the divines employed in the reign of King James in the new translation of the Bible, and by the interest of his friends, the Earls of Dorset and Dunbar, was advanced to the dignity of Bishop of Lichfield. He was shortly translated to the see of London, and lastly, in 1611, to the archiepiscopal see of Canterbury, which he occupied for twenty-two years. It was chiefly by his interest that his brother attained a dignity almost equal to his own; and that another brother, Maurice, established himself as a merchant in London, where the highest honour that his fellow-citizens could bestow was conferred upon him. Many persons have treated this story as apocryphal. Without entering the lists either for or against it, we can only say, that marvellous as it appears, it is not improbable. Predictions are very often the cause of their own fulfilment. Many circumstances as trifling as this dream of a jack have had a powerful influence upon the fate of men who have achieved greatness. Many, perchance, if we knew the secret

history of their hearts, might have remained sluggards or quite inert, and never have achieved greatness at all, if it had not been for the fond prediction of some doting mother or nurse, enraptured with their ruddy cheeks and their curly hair. Who can deny, that to a youth of high capacity, the prophecy of his pre-ferment would lead him in after-life to struggle for it? There have been many such instances both before and since the time of George Abbot. Guildford abounds in reminiscences of this prelate."

Again we dip:—

"It was to Chertsey that the poet Cowley retired in a fit of disgust at the unmerited neglect of royalty. Hope deferred had made his heart sick; he had taken a physician's degree, and fully qualified himself for the office of master of the Hospital of the Savoy, which had been promised him both by Charles the First and Charles the Second, but his claims were passed over at the Restoration. In a querulous poem, written at this time, he says,—

'Kings have long hands, they say, and though I be  
So distant, that may reach at length to me!'

Broad as was the hint, the court took no notice of him. To add to his vexation, his old and favourite comedy of 'The Guardian,' which he had remodelled, under the title of 'Cutter of Coleman Street,' and produced upon the stage, was treated with great severity, and alleged by his enemies to be a satire upon that court from which he still expected favours. He was taunted at the same time in some satirical verses, on the choice of a laureate, as the 'Savoy-missing Cowley, making apologies for his bad play;' and as the author, and, still worse, the printer of those pitiful verses, inscribed to 'His Melancholy.' The desire of solitude came strongly upon him; he pretended that he was weary of the 'hum of men,' satiated with the vile arts of courtly life, and anxious to inhale the fresh breezes of the fields, and to live a life of study and seclusion, among hills, and woods, and pleasant streams. He, therefore, withdrew from London; first to Barnes Elms, where he caught a violent cold that never left him, and then to Chertsey. But 'O fallacem hominum spem!' he carried with him into his retirement the discontent which is the bane of society, and, in a still greater degree, that of seclusion; he forgot that happiness was in the mind, and not in circumstances; and the consequence was, that he was more miserable than before. He had changed all the habits of his previous life, and was too old to acquire new ones; he had left his former friends, and was too morose and unaccommodating, too ill at ease within himself, to take the trouble of attracting others, and he pined away daily. In a letter to Dr. Sprat, quoted by Dr. Johnson, as a warning to all those who may pant for solitude, while led away by florid and poetical descriptions of its charms, he says that the first night he settled in Chertsey he caught a violent cold that confined him to his chamber for ten days; and that he afterwards bruised his ribs by a fall in his fields, which rendered it difficult for him to turn in his bed. He could get no money from his tenants, and his meadows were eaten up every night by cattle turned in to prey upon him by his neighbours. After a discontented residence of two years, during which, however, he composed his two last 'Books of Plants,' and planned several other works, he died of a violent defluxion and stoppage in the throat, which he caught by staying too long in the evening among his haymakers in the meadows. Charles the Second, true to the character so well and

wittily bestowed upon him, of 'never doing a wise thing, nor ever saying a foolish one,' neglected Cowley, and broke his repeated promises to him during his life; but said, on the news of his death reaching him, 'That Mr. Cowley had not left a better man behind him in England.' And this was the poet's reward—not worth having, even had it not been posthumous! The house where Cowley died still exists. It is called the Porch House, from its former projecting entrance. The late Alderman Clark, of London, long inhabited the place, and took great care to preserve it. The porch was taken away by his direction, but the following inscription, now placed over the door, explains the cause of the alteration. 'The porch of this house, which projected ten feet into the highway, was taken down, in the year 1786, for the safety and accommodation of the public.' Immediately underneath is the quotation from Pope:—

'Here the last accents flowed from Cowley's tongue.'

Every where we meet with equally mingled reminiscences and interesting matter:—

"Egham races are annually held here in the beginning of September, and are thought by many to have originally given name to this famous meadow. The name of Runny, or Running-mead, may or may not have been applied to it as a race-course. Horse-racing was practised to some extent in England prior to the reign of King John; as we learn, from Fitz-stephen's account of London in the time of Henry II., that Smithfield was a great market for fine horses, and that races not unfrequently took place in London. Returning towards Egham we cross the bridge connecting it with the populous town of Staines in Middlesex. The name is generally allowed to be derived from the Saxon *staine* or stone; but whether from the stone which marks the jurisdiction of the lord-mayor of London upon the Thames, or from the old Roman milliarium which is plausibly conjectured to have stood near the same spot, is still a matter of dispute. Traces of a Roman road passing through Staines have been discovered. The London stone is still remaining, and is a remarkable piece of antiquity. It stands northward of the bridge, near the junction of the little river Colne, and bears on a moulding round the upper part the inscription, 'God preserve the city of London—A. D. 1280.' Before the time of Richard I. the jurisdiction of the magistracy of London over the Thames was supposed to extend westward as far as the river bore that name, but by a charter granted in the eighth year of that monarch's reign, it was attempted to define the limits with more accuracy. Although Staines was not mentioned either in this charter or in that of King John, it was generally considered as the extreme western limit of the lord mayor's jurisdiction. Several attempts were made to extend it towards Oxford; but the corporation met with so much opposition, that they at last relinquished the claim, and were content to allow custom to stand instead of law.

"Proceeding up the Thames from Windsor and Eton, towards Maidenhead, Marlow, and Henley, we approach that part of the river which is universally allowed to be the most lovely of all its course. From Cotteswold down to the sea it presents no scenes equal in rural loveliness to these. Its banks, if not lofty, are high enough to be imposing, and are altogether sylvan and beautiful, offering, it is true, no rocks, no mountains, no torrents, to the gaze of the traveller; but, instead, pellucid waters,

verdurous hills, and solemn woodlands, with here and there glimpses of waving corn-fields and pasture-lands dotted with cattle. Here, at all seasons, may be seen the Eton scholars, fishing, or rowing, or bathing, as the weather invites; and many, perchance, like their predecessor, the old and now neglected poet, Phineas Fletcher, learning to 'weave the rhyme.' Fletcher, the author of 'The Purple Island,' a poem upon the anatomy of the human frame, and a remarkable specimen of talents misapplied, wrote several lyrical pieces upon the pleasures of angling. He was bred at Eton, and thus, in his first 'Piscatory Eclogue,' describes the pleasures of the school-boys there in the days of Elizabeth:—

'When the raw blossom of my youth was yet  
In my first childhood's green enclosure bound,  
Of Aquadune I learned to fold my net,  
And spread the sail, and beat the river round,  
And with labyrinth in straits to set,  
Or guide my boat where Thames and Isis' heir  
By lowly Eton glides, and Windsor proudly fair.  
There, while our thin nets dangle in the wind,  
Hung on our oar-tops, I did learn to sing,  
Among my peers, apt words to flitly bind  
In numerous verse; witness thou crystal spring  
Where all the lads were pebbles wont to find,  
And yon thick hazels that on Thames' brink  
Did oft with dallying boughs his silver waters drink.'

"Bisham Abbey, on the opposite bank, stands close to the water's edge, and was formerly occupied by, and is still the property of, Lord Bexley. This abbey was one of those suppressed by Henry VIII., who retained it for a time for his own residence. One of the rooms in it goes by the name of Queen Elizabeth's Council Chamber, from the supposition that she occasionally resided here after her accession. The truth is, however, that in her time Bisham Abbey was no longer royal property, having been granted by Edward VI. to the Hoby family. It is curious to note how fond the populace are of connecting the name of some great personage with the spots they themselves inhabit. Many of these traditions set probability at defiance, yet will they linger in the popular mind, and no refutation can eradicate them. Thus the people of Bisham believe to this day that Queen Elizabeth resided among them, and insist, notwithstanding the opinion of all the world to the contrary, that she died no maid. They point out in their church a small monument with the sculptured figures of two children, which they assert was erected by that princess, in memory of twins, of which she was delivered in that village. Of course they are but the old women of both sexes who believe this story; but it has been current for nearly two centuries and a half."

(To be continued.)

*Speculi Britannia Pars: an Historical and Chorographical Description of the County of Essex, by John Norden, 1594.* Edited from the Original Manuscript in the Marquess of Salisbury's Library at Hatfield, by Sir Henry Ellis. London, 1840. Printed for the Camden Society.

We find this thin volume rather a dry chip in the plum porridge of the Camden; and so local as hardly, we think, worthy to have merited their publication, or the editing of Sir H. Ellis,—though, in truth, he has not bestowed his usual painstaking and intelligence upon it. A map of old Essex, and mere tables of places and proprietors, though perhaps of individual, cannot be of general interest. An introduction contains a brief memoir of John Norden, on which much research does not appear to have been wasted; and from the notices of London, &c. in his time, we select a few passages which, by

the contrast their descriptions afford to ours, may amuse the reader and exemplify the better portions of the volume. In Norden's "Speculum" (Part I. Middlesex, published 1593), Sir H. Ellis finds and quotes the following:—

"Of Osterley (now Lord Jersey's residence) he says, 'The place where the howse standeth was a ferme howse, purchased by the seyd Sir Thomas Gresham, graced now with a howse beseming a prince.' Under Paucraa, 'And although this place be as it were forsaken of all, and true men seldome frequent the same but upon devyne occasions, yet is it viayted and usually haunted of roages, vagabondes, harlettes, and thieves, who assemble not ther to pray, but to wayte for praye; and manie fall into their hands clothed, that are glad when they are escaped naked. Walke not ther too late. Thistleworth, or Istleworth, h. 12, a place scituate upon the Thamise. Not farr from whence, betwene it and Worton, is a copper and brasse myll; where it is wrought out of the oar, melted, and forged. The oar, or earth, whereof it is contrived, is brought out of Somersetshire, from Mendipp; the most from a place called Worley Hill. The carriage is by wayne, which can not but be very chargeable. The workmen make plates both of copper and brasse of all scyces litle and great, thick and thyn, for all purposes. They make also kyttles. Their furnace and forge are blown with great bellows, rayased with the force of the water and suppressed agayne with a great poyes and weyght. And the hammers wherwith they worke their plates are very great and weightie, some of them of wrought and beaten iron, some of cast iron, of 200, 300, some 400 weight, which hammers so massyve are lifted up by an artificial engine, by the force of the water, in that altogether semblable to the Iron myll hammers. They have snippers wherwith they snyppe and pare their plates, which snippers being also of a huge greatnes, farr beyond the powr of man to use, are so artificially placed, and such ingenious devises therunto added, that by the motion of the water also the snippers open and shut and performe that with great facilitie, which ells were very harde to be done."

And enumerating the bridges of most use in the country, he thus specifies:—

"Kingsbridge, comonly called Stone Bridge nere Hyde parke corner, where I wish noe true man to walke too late without good garde, unles he can make his partie good, as dyd S<sup>r</sup> H. Knyvet, knight, who valiantly defended himselfe, ther being assailed, and slawe the master theefe with his own handes."

Of the memoir, the following is the passage most pertinent to the part now edited, and to our purpose; and so we conclude with copying it:—

"Gough says, that Norden wrote an Account of the Estates of the Duchy of Cornwall, the right by which the Duke holds his estates, and many of the customs of the manors, which was once reposed in the Duchy Office. Other surveys of English counties, prepared by Norden, but never published, were those of Essex (which forms the subject of the present volume); Kent, which Gough ('Brit. Top.' i. 441) assures us still exists in manuscript; and Surrey. 'A survey of this county,' says Rawlinson ('Engl. Topogr.' p. 228), 'was drawn up by John Norden, which fell into the hands of a curious Hollander, who gave generously for it, soon after the Restoration, when it was offered to sale, as the notes of an eminent antiquary tell me. The map for this work was

drawn by Mr. Norden, engraved by Charles Whitwell, at the expense of Mr. Robert Nicolson, Gent., and is much larger, more exact, and curious than any of his former maps. In it are the arms of Sir William Waade, Kt., Mr. Nicolson, and those of Isabella, countess-dowager of Rutland, who died in 1605.' Dr. Rawlinson shewed this map to the Society of Antiquaries, as appears by their minutes, in 1746. The maps designed by Norden, of Hampshire, Hertfordshire, Kent, Middlesex, Surrey, and Sussex, appeared upon an enlarged scale, with his name, in the sixth edition of Camden's 'Britannia,' fol. Lond. 1607, the first edition of the 'Britannia' which had maps. The same counties, with the exception of Kent, but with Cornwall added, appeared upon a still larger scale, augmented by Speed, in his 'Theatre of the Empire of Great Britaine,' fol. Lond. 1611. In a 'Portfolio of Topography' in the British Museum is a map of 'Hampshire,' in folio, of a smaller size than either of those in Camden or Speed, at the bottom of which are the words 'Johes Norden descripsit,' published by Overton; Peter Stent's name, as the previous publisher, having been erased. Hearne, in a letter dated Sept. 26th, 1727, states that in his time this map was rarely to be seen. Beside a map of the county, Norden's Middlesex contains separate plans of London and Westminster. That of London has the arms of the twelve companies at the sides. Gough ('Brit. Top.' i. 747) says, 'It reaches from St. Catherine's E. to Leicester House W., which was without Temple Bar, with a description of all the outlets or ways into the fields; and at that time Shrewsbury House, next on this side to the Old Swan, was in being. This was first engraved 1593, but has since fallen into the hands of Peter Stent,' who added the names of churches, streets, lanes, &c., with letters and figures of reference, which are inserted in the last edition of the book, 1723, and were copied into the map of Middlesex, 1611, by Speed.' Gough adds, 'There is another copy of Norden's map of London, by Pieter Vanden Keere, engraver, 1623, wherein Norden's name is retained, and the title is 'A Guide for Countrymen in the famous Citiey of London, by the helpe of which plot they shall be able to know now farr it is to any street, as also to go unto the same without forder trouble. A. 1613.' Norden published also a view of London in eight sheets, having at bottom a representation of the lord-mayor's show, all on horseback, and the aldermen in round caps. Bagford says, this view is singular, and was taken from the pitch of the hill towards Dulwich College, going to Camberwell from London, about 1604 or 1606, and that he had not met with any other of the kind. He adds, that he saw it on the staircase at Dulwich College, and that Secretary Pepys went afterwards to see it, and would have purchased it, but that since it is quite decayed and destroyed by the damp of the wall. It was given to the College with the library, by William Cartwright, an eminent comedian and bookseller, a friend of the founder's.' Norden's maps of his own publication are the first in which the roads were inserted. In his Middlesex he marks eleven different roads from London. His maps, as published by Camden and Speed, have no roads. Among the surveys made by Norden, not so much of a topographical as a professional kind, which remain in manuscript, one of the most splendid is the

'... Later printers added the E. and W. views pasted at the sides, and called it 'The Countrymen's Travelling Guide through the City of London' with figures engraved 1, 2, A, B, but seldom added notes.—Bagford, p. lxxviii.'

Harleian volume, 3749, on vellum, in large folio. 'A Description of the Honour of Windsor, namelie, of the Castle, Foreste, Walkes, Parkes, Rayles, Lodges, Townes, Parishes, Hamletts, Howses of Note, Woodes, Riuers, Rilles, Brookes, Bridges, Hill, Highwaies, and all other thinges memorable, within or belonging unto the saide Honor and the Liberties of the same, linyne within, and extending into the Counties of Bark, Surrey, and Buckingham, taken and performed by the perambulation, view, and delineation, of John Norden. In Anno 1607.'

'Suaula post laborem finis.'

*Lives of the Queens of England, from the Norman Conquest, &c.* By Agnes Strickland. Vol. II. 12mo. pp. 431. London, 1840. Colburn.

MISS STRICKLAND goes on faithfully and ably with her interesting task. This second volume is a sequel worthy of the first, and does great credit to the industry and talent of the author.

The subjects (if queens are subjects) are—Berengaria of Navarre, queen of Richard I.; Isabella of Angoulême, queen of John; Eleanor of Provence, queen of Henry III.; Eleanor of Castile, and Marguerite of France, queens of Edward I.; Isabella of France, queen of Edward II.; Philippa of Hainault, queen of Edward III.; and Anne of Bohemia, the first queen of Richard II. Of all these, the memoirs are full of excellent matter, and whether called "la belle," "the faithful," "the fair," "the good," or the nothing at all, we have read all their various chances with much gratification.

It is hardly necessary that we should support these opinions by extracts; but we select a few pages in honour of our usual custom towards productions which possess novelty and merit. When King John died (on whom our author is rather severe), it is stated:—

"Although so recently a widow, the extreme exigencies of the times forced Isabella to assist at her child's coronation. The regal diadem belonging to his father being lost in Lincoln Washes, and the crown of Edward the Confessor being far distant in London, the little king was crowned with a gold throat-collar belonging to his mother. A very small part of England recognised the claims of Isabella's son: even Gloucester was divided, the citizens who adhered to the young king being known by the cross of Aquitaine, cut in white cloth on their breasts. Henry was then just nine years old; but though likely to be a minor for some years, it must be observed that the queen-mother was offered no share in the government; and as queens of England so frequently acted as regents during the absence of their husbands or sons, this exclusion is a proof that the English held Isabella in little esteem. London and the adjacent counties were then in the hands of Louis of France. Among other possessions, he held the queen's dower-palace of Berkhamstead, which was strongly garrisoned with French soldiers. However, the valour and wisdom of the Protector Pembroke, and the intrepidity of Hubert de Burgh, in a few months cleared England of these intruders."

Miss Strickland adds, in a note on the first paragraph:—

"Reports were circulated in Norfolk that the royal circlet of King John was certainly found in the late excavation for the Eau Brink drainage, near the spot indicated by chroniclers as the scene of this loss. And a well-sinker, who knew nothing of history, informed a gentleman of a curious discovery he made when

digging for a well in the same neighbourhood. 'I found,' said he, 'in the course of my well-digging, a king's crown.' On being desired to describe it, he declared that it was not larger than the top of a quart pot, but cut out in ornaments round the top; that it looked black, and that he had no idea of the value, for when a Jew pedlar offered him three pounds ten shillings, he was glad to accept it, but he afterwards heard that the Jew had made upwards of fifty pounds by the speculation. This was most likely one of the gold coronals or circlets fixed at the back of the king's helmets, as its size shews that it was not the regal crown."

Our next example is from the account of the good Queen Anne, the wife of Richard II.:—

"Some days after the marriage of the royal pair, they returned to London, and the coronation of the queen was performed most magnificently. At the young queen's earnest request, a general pardon was granted by the king at her consecration.\* The afflicted people stood in need of this respite, as the executions since Tyler's insurrection had been bloody and barbarous beyond all precedent. The land was reeking with the blood of the unhappy peasantry, when the humane intercession of the gentle Anne of Bohemia put a stop to the executions. This mediation obtained for Richard's bride the title of 'the good Queen Anne;' and years, instead of impairing the popularity, usually so evanescent in England, only increased the esteem felt by her subjects for this beneficent princess. Grand tournaments were held directly after the coronation; many days were spent in these solemnities, wherein the German nobles, who had accompanied the queen to England, displayed their chivalry to the great delight of the English. Our chroniclers call Anne of Bohemia 'the beauteous queen.' At fifteen or sixteen a blooming German girl is a very pleasing object, but she could not have been even passable, for the features of her statue are homely and undignified; a narrow, high-pointed forehead, full cheeks, and lamp-shaped face, with no expression, excepting good temper, are scarcely entitled to claim a reputation for beauty. At her marriage festivities the head-dress she wore must have neutralised the defects of her face in some degree, by giving an appearance of breadth to her narrow forehead. The horned cap constituted the head-gear of the ladies of Bohemia and Hungary, and in this 'moony tire' did the bride of Richard present herself to the astonished eyes of her female subjects.† Queen Anne made some atonement for being the importer of these hideous fashions by introducing the use of pins, such as are used at our present toilets. Our chroniclers declare that, previously to her arrival in England, the English fair fastened their robes with skewers,—a great exaggeration or misrepresentation of these monkish writers; for even as early as the Roman empire the use of pins was known, and British barrows have been opened wherein were found numbers of very neat and efficient little ivory pins which had been used in arranging the grave-clothes of the dead: and can

these irreverent chroniclers suppose that English ladies used worse fastenings for their robes in the fourteenth century? Side-saddles were the third new fashion brought into England by Anne of Bohemia; they were different from those used at present, which were invented or first adopted by Catherine de Medici, queen of France: the side-saddle of Anne of Bohemia was like a bench with a hanging step, where both feet were placed; this mode of riding required a footman or squire at the bridle-rein of a lady's palfrey, and was chiefly used in processions. According to the fashion of the age, the young queen had a device, which all her knights were expected to wear at tournaments; but her device was, we think, a very stupid one, being an ostrich with a bit of iron in his mouth.\* At the celebration of the festival of the Order of the Garter, 1384, Queen Anne wore a robe of violet cloth dyed in grain, the hood lined with scarlet, the robe lined with fur. She was attended by a number of noble ladies, who are mentioned 'as newly received into the Society of the Garter.' They were habited in the same costume as their young queen.† The royal spouse of Anne was remarkable for the foppery of his dress; he had one coat estimated at thirty thousand marks. Its chief value must have arisen from the precious stones with which it was adorned. This was called apparel 'broidered of stone.'‡ Notwithstanding the great accession of luxury that followed this marriage, the daughter of the Cæsars (as Richard proudly called his bride) not only came portionless to the English throne matrimonial, but her husband had to pay a very handsome sum for the honour of calling her his own; he paid to her brother 10,000 marks for the imperial alliance, besides being at the whole charge of her journey. The jewels of the duchy of Aquitaine, the floriated coronet, and many brooches in the form of animals, were pawned to the Londoners, in order to raise money for the expenses of the bridal.

"Anne of Bohemia died at her favourite palace of Shene; the king was with her when she expired. He had never given her a rival; she appears to have possessed his whole heart, which was rent by the most acute sorrow at the sudden loss of his faithful wife, who was, in fact, his only friend. In the frenzy of his grief, Richard imprecated the bitterest curses on the place of her death, and, unable to bear the sight of the place where he had passed his only happy hours with this beloved and virtuous queen, he ordered the palace of Shene to be levelled with the ground. The deep tone of Richard's grief is apparent even in the summons sent by him to the English peers, requiring their attendance to do honour to the magnificent obsequies he had prepared for his lost consort. His letters on this occasion are in existence, and are addressed to each of his barons in this style:—'Very dear and faithful cousin,—Inasmuch as our beloved companion, the queen (whom God has hence commanded), will be buried at West-

\* "Tyrrell. Walsingham. Rymer."

† This cap was at least two feet in height, and as many in width; its fabric was built of wire and paste-board, like a very wide-spreading mitre, and over these horns was extended some glittering tissue or gauze. Monstrous and outrageous were the horned caps that reared their heads in England, directly the royal bride appeared in one: these formidable novelties expanded their wings on every side, till at church or procession the diminished heads of lords and knights were eclipsed by their ambitious partners. The church declared they were the 'moony tire' denounced by Ezekiel—Ilkely enough, for they had been introduced by Bohemian crusaders from Syria."

\* "Camden's 'Remains.' It is possible this was not a device, but an armorial bearing, and had some connexion with the ostrich plume the Black Prince took from her grandfather at Cressy."

† See Sir Harris Nicolas's 'History of the Order of the Garter.'

‡ In this reign the shoes were worn with pointed toes of an absurd and inconvenient length. Camden quotes an amusing passage from a quaint work, entitled 'Eulogium on the Extravagance of the Fashions of this Reign.' 'Their shoes and pattens are snowed and piked up more than a finger long, which they call Cracowes, resembling the devil's claws, which were fastened to the knees with chains of gold and silver; and thus were they garmented which were Lyons in the hall and hares in the field.'

minster, on Monday the third of August next, we earnestly entreat that you (setting aside all excuses) will repair to our city of London the Wednesday previous to the same day, bringing with you our very dear kinswoman, your consort, at the same time. We desire that you will, the preceding day, accompany the corpse of our dear consort from our manor of Shene to Westminster; and for this we trust we may rely on you, as you desire our honour and that of our kingdom. — Given under our privy seal at Westminster, the 10th day of June, 1394.' We gather from this document, that Anne's body was brought from Shene in grand procession, the Wednesday before the 3d of August, attended by all the nobility of England, male and female; likewise by the citizens and authorities of London, all clothed in black, with black hoods; and on the 3d of August the queen was interred. The most memorable and interesting circumstance at the burial of Anne of Bohemia is the fact, that Thomas Arundel, afterwards archbishop of Canterbury, who preached her funeral sermon, in the course of it greatly commended the queen for having caused the Holy Scriptures to be translated into English and disseminated through the land, adding that she daily read a portion of them herself. This very prelate was in the next reign a cruel persecutor of the infant reformed church. Richard's grief was as long enduring as it was acute. One year elapsed before he had devised the species of monument he thought worthy the memory of his beloved Anne, yet his expression of tenderness regarding her pervaded his covenant with the London artificers employed to erect this tomb. He took withal the extraordinary step of having his own monumental statue made to repose by that of the queen, with the hands of the effigies clasped in each other."

[We have had this review in type for some weeks; and the third volume, which concludes the series of the Anglo-Norman and Plantagenet Queens, has just reached us as a refresher. We therefore hasten to make way for it, by discharging our debt to its precursor. — *Ed. L. G.*]

*Sir E. L. Bulwer's Works: Eugene Aram.*  
London, 1840. Saunders and Otley.

THIS volume is admirably embellished by G. Cattermole, whose frontispiece, engraved by Greathach, is an honour to the arts "in little." The vignette, by T. Creswick, engraved by J. Brain, is no less sweet and illustrative of the part of the story to which it relates. Of that story we have nothing now to say. We did consider it to be a triumph of the author's skill, and we still consider it so. To invest a familiar plot and an anticipated catastrophe with so deep an interest, and to lead us step by step, in doubts and fears, though we previously know all, is no mean exercise of the power of genius; and there is not a reader of *Eugene Aram* who must not confess this potency in Bulwer's conduct and execution of his tragic theme. We have only to notice Sir Edward's preface to this edition, which we find so full of literary matter that we make no apology for transferring it to our pages, where we are sure it will be acceptable to every reader:—

"The strange history of Eugene Aram had excited my interest and wonder long before the present work was composed or conceived. It so happened, that during his residence at Lynn, his reputation for learning had attracted the notice of my grandfather—a country gentleman living in the same county, and of more intelligence and accomplishments than, at that day, usually characterised his class. Aram frequently visited at Heydon (my grandfather's house), and gave lessons, probably in no very elevated branches of erudition, to the younger members of the family. This I chanced to hear when I was on a visit in Norfolk, some two years before this novel was published, and it tended to increase the interest with which I had previously speculated on the phenomena of a trial which, take it altogether, is perhaps the most re-

markable in the register of English crime. I endeavoured to collect such anecdotes of Aram's life and manners as tradition and hearsay still kept afloat. These anecdotes were so far uniform that they all concurred in representing him as a person who, till the detection of the crime for which he was sentenced, had appeared of the mildest character and the most unexceptionable morals. An invariable gentleness and patience in his mode of tuition—qualities then very uncommon at schools—had made him so beloved by his pupils at Lynn, that, in after-life, there was scarcely one of them who did not persist in the belief of his innocence. His personal and moral peculiarities, as described in these pages, are such as were related to me by many who had heard him described by his contemporaries—the calm benign countenance—the delicate health—the thoughtful stoop—the noiseless step—the custom, not uncommon with scholars and absent men, of muttering to himself—a singular eloquence in conversation, when once roused from silence—an active tenderness and charity to the poor, with whom he was always ready to share his own scanty means—an apparent disregard to money, except when employed in the purchase of books—an utter indifference to the ambition that usually accompanies self-taught talent, whether to better the condition or to increase the repute;—these, and other traits of the character portrayed in the novel, are, as far as I can rely on my information, faithful to the features of the original. That a man thus described—so benevolent that he would rob his own to administer to the necessities of another, so humane that he would turn aside from the worm in his path—should have been guilty of the foulest of human crimes, a murder, for the sake of gain; that a crime thus committed should have been so episodic and apart from the rest of his career, that, however it might rankle in his conscience, it should never have hardened his nature; that, through a life of some duration, none of the errors, none of the vices, which would seem essentially to belong to a character capable of a deed so black from motives apparently so sordid,\* should have been discovered or suspected;—all this presents an anomaly in human conduct so rare and surprising, that it would be difficult to find any subject more adapted for that metaphysical speculation and analysis, in order to indulge which, fiction, whether in the drama or the higher class of romance, seeks its materials and grounds its lessons in the chronicles of passion and crime. The guilt of Eugene Aram is not that of a vulgar ruffian; it leads to views and considerations vitally and wholly distinct from those with which profligate knavery or brutal cruelty revolt and displease us in the literature of Newgate and the Hulks. His crime does, in fact, belong to those startling paradoxes which the poetry of all countries, and especially of our own, has always delighted to contemplate and examine. Whenever crime appears the aberration and monstrous product of a great intellect, or of a nature ordinarily virtuous, it becomes not only the subject for genius, which deals with passions, to describe, but a problem for philosophy, which deals with actions, to investigate and solve:—hence the *Macbeths* and *Richards*, the *lago*s and *Othellos*. My regret, therefore, is not that I chose a subject unworthy of elevated fiction, but that such a subject did not occur to some one capable of treating it as it deserves; and I never felt this more strongly than when the late Mr. Godwin (in conversing with me after the publication of this romance) observed that 'he had always thought the story of Eugene Aram peculiarly adapted for fiction, and that he had more than once entertained the notion of making it the foundation of a novel.' I can well conceive what depth and power that gloomy record would have taken from the dark and inquiring genius of the author of '*Caleb Williams*.' In fact, the crime and trial of Eugene Aram arrested the attention and engaged the conjectures of many of the most eminent men of his own time. His guilt or innocence was the matter of strong contest; and so keen and so enduring was the sensation created by an event so completely distinct from the ordinary annals of human crime, that even History turned aside from the sonorous narrative of the struggles of parties and the feuds of kings, to commemorate the learning and the guilt of the humble schoolmaster of Lynn. Did I want any other answer to the animadversions of commonplace criticism, it might be sufficient to say that what the historian relates, the novelist has little right to disdain. Before entering on this romance, I examined with some care the probabilities of Aram's guilt; for I need scarcely, perhaps, observe, that the legal evidence against him is extremely deficient—furnished almost entirely by one (Houseman) confessedly an accomplice of the crime, and a partner in the booty; and that, in the present day, a man tried upon evidence so scanty and suspicious would unquestionably escape conviction. Nevertheless, I must frankly own that the moral evidence appeared to me more convincing than the legal; and, though not without some doubt, which is common with many, I still entertain of the real facts of the murder, I adopted that view which, at all events, was the best suited to the higher purposes of fiction. On the whole, I still think that if the crime were committed by Aram, the motive was not very far removed from one which led recently to a remarkable murder in Spain. A priest in that country,

\* "For I put wholly out of question the excuse of jealousy, as unsupported by any evidence—never hinted at by Aram himself (at least on any sufficient authority)—and at variance with the only fact which the trial establishes, viz. that the robbery was the crime planned, and the cause, whether accidental or otherwise, of the murder."

wholly absorbed in learned pursuits, and apparently of spotless life, confessed that, being deterred by extreme poverty from prosecuting a study which had become the sole passion of his existence, he had reasoned himself into the belief that it would be admissible to rob a very dissolute, worthless man, if he applied the money so obtained to the acquisition of a knowledge which he could not otherwise acquire, and which he held to be profitable to mankind. Unfortunately, the dissolute rich man was not willing to be robbed for so excellent a purpose: he was armed and he resisted—a struggle ensued, and the crime of homicide was added to that of robbery. The robbery was premeditated: the murder was accidental. But he who would accept some similar interpretation of Aram's crime, must, to comprehend fully the lessons which belong to so terrible a picture of frenzy and guilt, consider also the physical circumstances and condition of the criminal at the time: severe illness—intense labour of the brain—poverty bordering upon famine—the mind preternaturally at work, devising schemes, and excuses, to arrive at the means for ends ardently desired. And all this duly considered, the reader may see the crime bodying itself out from the shades and chimeras of a horrible hallucination—the awful dream of a brief but delirious and convulsed disease. It is thus only that we can account for the contradiction of one deed at war with a whole life—blasting, indeed, for ever the happiness; but making little revolution in the pursuits and disposition of the character. No one who has examined with care and thoughtfulness the aspects of Life and Nature, but must allow that, in the contemplation of such a spectacle, great and most moral truths must force themselves on the notice and sink deep into the heart. The entanglements of human reasoning; the influence of circumstance upon deeds; the perversion that may be made, by one self-palting with the Fiend, of elements the most glorious; the secret effect of conscience in frustrating all for which the crime was done—leaving genius without hope, knowledge without fruit—deadening benevolence into mechanism—tainting love itself with terror and suspicion;—such reflections—leading, with subler minds, to many more vast and complicated theorems in the consideration of our nature, social and individual—arise out of the one great moral of man's energy to purpose and nothingness to will, which the story of Eugene Aram (were it but adequately treated) could not fail to convey."

#### TYTLER'S HISTORY OF SCOTLAND.

[Third notice.]

THE second division of Mr. Tytler's volume, which we shall now, after the anticipation of our last, bring under the notice of our readers, relates to various important events in the career of the unhappy Mary, which occurred during the eventful years that succeeded the assassination of Riccio, from 1565 to 1574, the regency of Murray. The queen's escape to Dunbar after that cruel act, and return upon Edinburgh with 8000 men, which caused the flight of Morton, Ruthven, and others, to England, the asylum of all her rebel subjects and enemies, and the concealment of Lethington, Knox, and the rest, in several wild and inaccessible retreats in Scotland, were followed by the birth of her son James VI., and a number of changes in the complicated relations of her nobles, both to herself and each other, principally owing to the new course pursued by Darnley, and to the influence exercised over her acts by the restored Regent Murray. Both well now rose rapidly into favour and power, and the murder of Darnley was perpetrated. Of this tragedy Mr. Tytler relates all the incidents, with several additions, and offers, among others, the following observations:—

"Had the queen entertained any serious idea of discovering the perpetrators of the murder, the steps to be pursued were neither dubious nor intricate. If she was afraid to seize the higher delinquents, it was at least no difficult matter to have apprehended and examined the persons who had provided the lodging in which the king was slain. The owner of the house, Robert Balfour, was well known, her own servants who had been intrusted with the keys, and the king's domestics who had absented themselves before the explosion, or were preserved from its effects, were still on the spot, and might have been arrested and brought before the privy council. But nothing of this kind took place, and in this interval of delay and apparent indecision many

persons from whom information might have been elicited, and some who were actually accused, took the opportunity of leaving the country. On the 10th of February, only ten days after the explosion, Sir W. Drury addressed an interesting letter to Cecil from Berwick, in which he mentioned that Dolu, the queen's treasurer, had arrived in that town with eight others, amongst whom was Bastian, one of those denounced in the placards. Francis, the Italian steward, the same person whose name had been also publicly posted up as engaged in the murder, was expected, he added, to pass that way within a few days, and other Frenchmen had left Scotland by sea. In the midst of these events the Earl of Bothwell continued to have the chief direction of affairs, and to share with Lethington, Argyle, and Huntly, the confidence of the queen. The Earls of Murray and Morton, who were absent from the capital at the time of the murder, shewed no disposition to return; and Lennox, when requested by Mary to repair to court, dismissed her messenger without an answer. Meanwhile rumour was busy, and some particulars were talked of amongst the people, which, if any real effluence on the subject had existed, might have still given a clue to trace the assassins. A smith was spoken of in a bill fastened on the Tron,\* who had furnished the false keys to the king's apartment, and who, on due security, promised to come forward and point out his employers. A person was said to be discovered in Edinburgh, from whom Sir J. Balfour had purchased a large quantity of powder, and other placards and drawings appeared, in which the queen herself and Bothwell were plainly pointed at. But the only effect produced by such intimations was to rouse this daring man to a passionate declaration of vengeance. Accompanied by fifty guards, he rode to the capital from Seton, and with furious oaths and gestures declared publicly, that if he knew who were the authors of the bills or drawings, he would 'wash his hands in their blood.' It was remarked, that as he passed through the streets, his followers kept a jealous watch, and crowded round him as if they apprehended an attack, whilst he himself spoke to no one of whom he was not assured without his hand on the hilt of his dagger. His deportment and fierce looks were much noted by the people, who began, at the same time, to express themselves openly and bitterly against the queen. It was observed, that Captain Cullen and his company were the guards nearest her person, and he was well known to be a sworn follower of Bothwell's; it was remarked, that whilst all inquiry into the murder appeared to be forgotten, an active investigation took place as to the authors of the placards, and minute circumstances were noted, which seemed to argue a light and indifferent behaviour, at a time when her manner should have been especially circumspect and guarded. It did not escape attention, that scarce two weeks after her husband's death, whilst in the country and in the city all were still shocked at the late occurrences, and felt them as a stain on their national character, the court at Seton was occupied in gay amusements. Mary and Bothwell would shoot at the butts against Huntly and Seaton; and on one occasion, after winning the match, they forced these lords to pay the forfeit in the shape of a dinner at Tranent. On the evening of the day in which the earl had exhibited so much fury in the

streets of the capital, two more placards were hung up. On the one were written the initials M. R., with a hand holding a sword; on the other, Bothwell's initials, with a mallet painted above, an obscure allusion to the only wound found upon the unhappy prince, which appeared to have been given by a blunt instrument. These symptoms of suspicion and dissatisfaction were not confined to the people. Movements began to be talked of amongst the nobles. It was reported that Murray and some friends had held a meeting at Dunkeld, where they were joined by Caithness, Athol, and Morton; and as this nobleman had absented himself from court, and kept aloof amongst his dependants, the queen became at length convinced that something must be done to prevent a coalition against her, and to satisfy the people that she was determined to institute a public inquiry into the murder."

These proceedings are sufficiently known: Bothwell was tried (apparently) and acquitted; and as a band, or bond, had been signed by the conspirators to the deaths of Riccio and Darnley, so was there at this time another band signed to urge the marriage of the queen to the assuaged criminal.

From this fatal step, the declension of Mary into misery was most rapid. From Carberry Hill, where she surrendered to the confederate lords, she was conducted prisoner to Edinburgh, and thence to Lochleven Castle, which the romance of her escape has invested with a memorable interest. As there is some novelty in the annexed description, we copy it with pleasure:—

"Since her interview with Murray, the captive queen had exerted all the powers of fascination which she so remarkably possessed to gain upon her keepers. The severe temper of the regent's mother, the lady of the castle, had yielded to their influence; and her son, George Douglas, the younger brother of Lochleven, smitten by her beauty, and flattered by her caresses, enthusiastically devoted himself to her interest. It was even asserted that he had aspired to her hand; that his mother talked of a divorce from Bothwell; and that Mary, never insensible to admiration, and solicitous to secure his services, did not check his hopes. However this may be, Douglas for some time had bent his whole mind to the enterprise, and on one occasion, a little before this, had nearly succeeded; but the queen, who had assumed the dress of a laundress, was detected by the extraordinary whiteness of her hands, and carried back in the boat which she had entered to her prison. This discovery had nearly ruined all, for Douglas was dismissed from the castle, and Mary more strictly watched; but nothing could discourage her own enterprise, or the zeal of her servant. He communicated with Lord Seaton and the Hamiltons; he carried on a secret correspondence with the queen; he secured the services of a page who waited on his mother, called Little Douglas; and, by his assistance, at length effected his purpose. On the evening of the 2d of May, this youth, in placing a plate before the castellan, contrived to drop his napkin over the key of the gate of the castle, and carried it off unperceived. He hastened to the queen, and, hurrying down to the outer gate, they threw themselves into the little boat which lay there for the service of the garrison. At that moment Lord Seaton and some of her friends were intently observing the castle from their concealment on a neighbouring hill; a party waited in the village below; while nearer still, a man lay watching on the brink of the lake. They could see a female

figure with two attendants glide swiftly from the outer gate. It was Mary herself, who, breathless with delight and anxiety, sprang into the boat, holding a little girl, one of her maidens, by the hand; while the page, by locking the gate behind them, prevented immediate pursuit. In a moment, her white veil with its broad red fringe (the concerted signal of success) was seen glancing in the sun, the sign was recognised and communicated, the little boat, rowed by the page and the queen herself, touched the shore, and Mary, springing out with the lightness of recovered freedom, was received first by George Douglas, and almost instantly after by Lord Seaton and his friends. Throwing herself on horseback, she rode at full speed to the ferry, crossed the Firth, and galloped to Niddry, having been met on the road by Lord Claud Hamilton with fifty horse. Here she took a few hours' rest; wrote a hurried despatch to France; despatched Hepburn of Riccarton to Dunbar, with the hope that the castle would be delivered to her, and commanded him to proceed afterwards to Denmark, and carry to his master, Bothwell, the news of her deliverance. Then again taking horse, she galloped to Hamilton, where she deemed herself in safety. The news of her escape flew rapidly through the kingdom, and was received with joy by a large portion of her nobility, who crowded round her with devoted offers of homage and support. The Earls of Argyle, Cassilis, Eglington, and Rothes, the Lords Somerville, Yester, Livingston, Herries, Fleming, Ross, Borthwick, and many other barons of power and note, crowded to Hamilton. Orders were sent by them to put their vassals and followers in instant motion, and Mary soon saw herself at the head of six thousand men."

The battle of Langside, however, ended the dream of this romantic adventure, and poor Mary fled to the protection of her cousin, the Queen of England. What immediately ensued, as far as we observe, without entering into minute comparison, is all matter of previous history. Perhaps the following will be found otherwise: it occurs after the seizure of the Earl of Northumberland, at Hector Armstrong's, at Harlaw, by the Regent Murray:—

"Although this new act of severity and corruption increased the regent's unpopularity in Scotland, it being suspected that he meant to give up his captive to Elizabeth, his zeal and activity completely restored him to the good opinion of this princess; and he had the satisfaction to learn that she had warmly commended him to his ambassador, the Abbot of Dumfermling. This emboldened him to make a proposal on which he had long meditated, and for which the English queen was by no means prepared. It was no less than that she should surrender Mary into his hands to be kept safely in Scotland, a solemn promise being given by him, 'that she should live her natural life, without any sinister means taken to shorten the same.' It was added that a maintenance suitable to her high rank should be provided for her, and the arguments addressed to Elizabeth upon the subject, in a paper intrusted to Nicholas Elphinstone, who was sent with the request to the English court, were drawn up with no little art and ability. After an enumeration of the late miseries and commotions in England, it stated, that 'as Mary was notoriously the ground and fountain from whom all these tumults, practices, and daily dangers, did flow,' and as her remaining within the realm of England undoubtedly gave her every opportunity to continue them, there was no more certain means to provide a remedy,

\* "A post in the public market where goods were weighed."

and bring quiet to both countries, than to bring her back into Scotland, thus removing her to a greater distance from foreign realms, and daily intelligence with their princes or their ambassadors.' In this petition Murray was joined by Morton, Mar, Glencairn, Lords Lindsay, Ruthven, and Semple, with the Masters of Marshall and Montrose. At the same time Knox addressed a letter to Cecil. He described himself as writing with one foot in the grave, alluded to the late rebellion, and recommended him to strike at the root, meaning Mary, if he would prevent the branches from budding again. It appears to me that the expressions of this great reformer, whose stern spirit was little softened by age, go as far as to urge the absolute necessity of putting Mary to death, but his words are somewhat dark and enigmatical. The letter, which is wholly in his own hand, is too remarkable to be omitted. 'Benefits of God's hands received crave that men be thankful, and danger known would be avoided. If ye strike not at the root, the branches that appear to be broken will bud again, and that more quickly than men can believe, with greater force than we would wish. Turn your een unto your God. Forget yourself and yours, when consultation is to be had in matters of such weight, as presently ly upon you. Albeit I have been fremedly handled, yet was I never enemy to the quietness of England. God grant you wisdom. In haste, of Edinburgh, the 2d of Janur. Yours to command in God,—John Knox, with his one foot in the grave.—No days than one would not suffice to express what I think.' Murray despatched Elphinston on the 2d of January; and as Knox's letter was dated on the same day, and related to the same subject, it is probable he carried it with him. The envoy, who was in great confidence with the regent, and a man of talent, received full instructions for his secret mission, which fortunately have been preserved. He was directed to impress upon Elizabeth, in the strongest manner, the difficulties with which Murray was surrounded; the daily increasing power of his and her enemies, who supported the cause of the captive queen both in England and Scotland; the perpetual tumults and intrigues of the Roman Catholics in both realms; their intercourse with Philip of Spain and the Pope, who were animating them at that very moment to new exertion; the succours hourly looked for from France; and the utter impossibility of the regent keeping up the struggle against his opponents, if Mary was permitted to remain in England, and Elizabeth did not come forward with more prompt and effectual assistance. It was necessary, he said, to prevent the ruin of the cause, that the queen of England and his master should distinctly understand each other. She had lately urged him to deliver up her rebel the Earl of Northumberland, to pay the penalty of a traitor. It was a hard request, and against every feeling of honour and humanity, to surrender a banished man to slaughter; but he was ready to consent, if in exchange the Queen of Scots were committed into his hands; and if, at the same time, Elizabeth would support the cause of his young sovereign, and the interests of true religion, by an immediate advance of money, and a seasonable present of arms and ammunition. If this were agreed to, then he was ready to continue his efforts for the maintenance of the government in Scotland against the machinations of their enemies; he would not only preserve her amity, but 'would serve her majesty in England, as they are accustomed to do their native princes

in Scotland, and out of England, upon reasonable wages.' If she would not consent to this, then he must forbear any longer to venture his life as he had done, and it would be well for her to consider what dangers might ensue to both the realms, by the increase of the factions which favoured Papistry and the Queen of Scots' title. Above all he entreated her to remember (alluding, as it appears to me, to the subject of Knox's letter), that the heads of all these troubles were at her commandment, that this late rebellion was not now ended, but had more dangerous branches, for which, if she did not provide a remedy, the fault must lie upon herself. These secret negotiations were detected by the vigilance of the Bishop of Ross, and he instantly presented a protest to the Queen of England against a proposition, which, if agreed to, was, he said, equivalent to signing Mary's death-warrant. He solicited also the ambassadors of France and Spain to remonstrate against it, and La Motte Fénelon addressed an earnest letter to the queen-mother upon the subject. Some little time, too, was gained by the refusal of the Scottish nobles to deliver up Northumberland, and Elizabeth had despatched Sir Henry Gates and the Marshal of Berwick with a message to the regent, when an appalling event suddenly interrupted the treaty. This was the murder of Murray himself in the town of Linlithgow by James Hamilton of Bothwellhaugh. The assassination is to be chiefly traced to the influence of private revenge; but there is no doubt, also, that the author of the deed was the tool of a faction which had long determined on Murray's destruction. He was a gentleman of good family, had been made prisoner at Langside, and, with others, was condemned to death; but the regent had spared his life, and been satisfied with the forfeiture of his estate. His wife was heiress of Woodhouselee, a small property on the river Esk, to which she had retreated, under the mistaken idea that it would be exempted from the sentence of outlawry which affected her husband's estate of Bothwellhaugh. But Bellenden, the justice clerk, a favourite of Murray's, who had obtained a grant of the escheat,\* violently occupied the house, and barbarously turned its mistress, during a bitterly cold night, and almost in a state of nakedness, into the woods, where she was found in the morning furiously mad, and insensible to the injury which had been inflicted on her. If ever revenge could meet with sympathy it would be in so atrocious a case as this; and from that moment Bothwellhaugh resolved upon Murray's death, accusing him as the chief author of the calamity. It is affirmed by Calderwood, that he had twice failed in his sanguinary purpose, when the Hamiltons, who had long hated the regent, encouraged him to make a third attempt, which proved successful. \* \* "I will not attempt (the author sums up) any laboured character of this extraordinary man, who, coming into the possession of almost uncontrolled power, as the leader of the Reformed party, when he was little more than a youth, was cut off in the midst of his greatness before he was forty years old.† Living in those wretched times, when the country was torn by two parties which mortally hated each other, he has come down to us so disfigured by the prejudices of his contemporaries that it is difficult to discern his true features. As to his personal intrepidity, his talents for state affairs, his military capacity, and the general purity of his private life, in a corrupt age and court,

there can be no difference of opinion. It has been recorded of him, that he ordered himself and his family in such sort, that it did more resemble a church than a court; and it is but fair to conclude that this proceeded from his deep feelings of religion, and a steady attachment to a reformation which he believed to be founded on the word of God. But, on the other hand, there are some facts, especially such as occurred during the latter part of his career, which throw suspicion upon his motives, and weigh heavily against him. He consented to the murder of Rizzio; to compass his own return to power, he unscrupulously leagued himself with men whom he knew to be the murderers of the king; used their evidence to convict his sovereign; and refused to turn against them till they began to threaten his power, and declined to act as the tools of his ambition. If we regard private faith and honour, how can we defend his betrayal of Norfolk, and his consent to deliver up Northumberland? If we look to love of country—a principle now, perhaps, too lightly esteemed, but inseparable from all true greatness—what are we to think of his last ignominious offers to Elizabeth? If we go higher still, and seek for that love which is the only test of religious truth, how difficult is it to think that it could have a place in his heart, whose last transaction went to aggravate the imprisonment, if not to recommend the death, of a miserable princess, his own sister and his sovereign. All are agreed that he was a noble-looking personage, of grave and commanding manners. His funeral, which was a solemn spectacle, took place on the 14th of February, in the High Church of St. Giles, at Edinburgh, where he was buried in St. Anthony's aisle. The body had been taken from Linlithgow to Stirling, and thence was transported by water to Leith, and carried to the palace of Holyrood. In the public procession to the church it was accompanied by the magistrates and citizens of Edinburgh, who greatly lamented him. They were followed by the gentlemen of the country, and these by the nobility. The Earls of Morton, Mar, Glencairn, and Cassilis, with the Lords Glamis, Lindsay, Ochiltree, and Ruthven, carried the body; before it came the Lords of Grange, and Colvil of Cleish; Grange bearing his banner, with the royal arms, and Cleish his coat armour. The servants of his household followed, making great lamentation, as Randolph, an eye-witness, wrote to Cecil. On entering the church the bier was placed before the pulpit, and Knox preached the sermon, taking for his text, 'Blessed are the dead that die in the Lord.'

[To be concluded in our next.]

#### HAVELOCK'S WAR IN AFGHANISTAN. [Second notice: conclusion.]

WE broke off last week 'i' the imminent deadly breach' of Ghuznee, with a promise of some of the incidents in that gallant affair, which we now proceed to fulfil:—

"The stormers under Colonel Dennie rushed, as soon as they heard the bugle signal, into the smoking and darkened opening before them, and found themselves fairly opposed, hand to hand, by the Affghans, who had quickly recovered from their surprise. Nothing could be distinctly seen in the narrow passage, but the clash of sword blade against bayonet was heard on every side. The little band had to grope its way between the yet standing walls in darkness, which the glimmer of the blue light did not dissipate, but rendered more perplexing. But it was necessary to force a passage; there was neither time nor space, indeed,

\* "The forfeited property."

† "He was born in 1530, and slain in 1669-70."

for regular street firing, but, in its turn, each loaded section gave its volley, and then made way for the next, which, crowding to the front, poured in a deadly discharge at half pistol shot amongst the defenders. Thus this forlorn hope won gradually their way onward, until at length its commanders and their leading files beheld, over the heads of their infuriated opponents, a small portion of blue sky, and a twinkling star or two, and then, in a moment, the headmost soldiers found themselves within the place. Resistance was overborne, and no sooner did these four companies feel themselves established in the fortress, than a loud cheer, which was heard beyond the pillars, announced their triumph to the troops without. But, oh! the fugitive character of human success, even in its brightest moments! How nearly was all ruined by the error of an instant! Brigadier Sale, whilst his skirmishers were closing by sound of bugle, had steadily and promptly pressed forward to support the forlorn hope. As he moved on he met an engineer officer, evidently suffering from the effects of the recent explosion, and anxiously inquired of him how the matter went beyond the bridge. This gallant person had been thrown to the ground by the bursting of the powder; and though he had not received any distinct wound, fracture, or contusion, was shaken in every limb by the concussion. His reply was, that the gate was blown in, but that the passage was choked up, and the forlorn hope could not force an entrance. Brigadier Sale was too cool and self-possessed not to be able at once to draw the inference that to move on under such circumstances was to expose his troops to certain destruction. He ordered the retreat to be sounded. The tempestuous character of the weather, and the noise of the fire of all arms did not prevent this signal from being heard even by the reserve; but it conveyed the order which British soldiers are always slowest in obeying. The column, however, made a full halt in the path of victory. But the check was not of long duration. The brigadier, perfectly calm at this moment of supposed difficulty, addressed himself to another engineer officer, with whom he happily fell in at this interesting moment. He assured him that though the passage of the gateway was much impeded, the advanced stormers, under Colonel Dennie, had already won their way through it. The brigadier promptly gave the signal to move on. But the delay, short as it had been, was productive of mischief. It had left a considerable interval between the forlorn hope and Brigadier Sale's column; and just as the latter, in which the Queen's regiment was leading, had pressed into the gateway, a large body of Affghans, driven headlong from the ramparts by the assault and fire of Colonel Dennie's force, rushed down towards the opening, in the hope of that way effecting their escape. Their attack was made upon the rear company of the Queen's, and the leading files of the Bengal European regiment. The encounter with these desperate men was terrific. They fiercely assaulted, and for a moment drove back, the troops opposed to them. One of their number, rushing over the fallen timbers, brought down Brigadier Sale by a cut in the face with his sharp shumsheer.\* The Affghans repeated his blow as his opponent was falling, but the pummel, not the edge of his sword, this time took effect, though with stunning violence. He lost his footing, however, in the effort, and Briton and Affghan rolled together amongst the fractured timbers. Thus situated, the first care of the brigadier was to

master the weapon of his adversary. He snatched at it, but one of his fingers met the edge of the trenchant blade. He quickly withdrew his wounded hand, and adroitly replaced it over that of his adversary, so as to keep fast the hilt of his shumsheer. But he had an active and powerful opponent, and was himself faint from loss of blood. Captain Kershaw, of the 13th, aide-de-camp to Brigadier Baumgardt, happened, in the *mêlée*, to approach the scene of conflict; the wounded leader recognised, and called to him for aid. Kershaw passed his drawn sabre through the body of the Affghan; but still the desperado continued to struggle with frantic violence. At length, in the fierce grapple, the brigadier for a moment got uppermost. Still retaining the weapon of his enemy in his left hand, he dealt him, with his right, a cut from his own sabre, which cleft his skull from the crown to the eyebrows. The Moohummedan once shouted '*Ue Ullah!*' and never spoke or moved again. The leader of the column regained his feet, and feeling himself for the moment incapable of personal exertion, yet calmly directed the movements of his men, who, after a fierce struggle, in which many ghastly wounds were exchanged, had now established themselves within the walls. Substantive success began to shew itself on every side, and the commander-in-chief, who had taken his station with his staff near the higher *ziyarat* gah, being assured from the prolonged shouting and sustained fire of British musketry within the area of the fortress, that the walls were won, had ordered every gun of the batteries on the heights to be aimed at the citadel. To that point, also, Brigadier Sale, quickly recovering his strength, began to direct his personal efforts. Meanwhile, the support under Colonel Croker was slowly winding its way through the gateway, obstructed by the ruins and by the doolies, by means of which the surgeons were collecting, and carrying to the rear, the wounded of the Queen's and Bengal European regiments. The reserve, also, had closed up to the walls; and so long as its advance was checked by the unavoidably slow progress of the troops before it, necessarily had to endure the fire of screened and hidden marksmen on the ramparts. At length the support, coiling in its whole length, disappeared within the fortress, and then, and not till then, the reserve, seeing the gateway cleared of troops, marched steadily forward. Whilst this was enacting near the portal, the anxious glances of the commander-in-chief and his staff were directed towards the citadel, from which a prolonged resistance might yet be expected; but here the assailing force was signally favoured by the course of events. Moohummud Hyder, surprised by the sudden onset which had wrested from him the walls that he had deemed impregnable, abandoned, in despair, the mound, on which he might have renewed the contest, and when the British had ascended the winding ramp, which led to the Acropolis of Ghuznee, they found the gates yield to the slightest impulse from without, and, in a few minutes, Sir John Keane had the satisfaction to see the colours of the 13th light infantry, and of the 17th regiment, waving and flapping in the strong breeze on the ramparts of the Affghan's last stronghold.† Brigadier Sale, notwithstanding his wound, had climbed up to

this scene of interest, and was guiding every where the exertions of the soldiers, who now, however, found little occupation beyond arresting the flight of the fugitives, and giving assurance and protection to the shrieking women of the harem. The reserve, too, was now fairly within the walls; and no sooner did it feel its footing to be secure, than it wheeled to its left and ascended the eastern rampart, from which a galling fire had been directed against it whilst it was detained under the walls. As its files penetrated within the houses in that direction, driving before it all who resisted, a new character was imparted to the scene by its activity; for a body of concealed Affghans, perceiving that their hiding places were explored in this unwelcome manner, rushed out madly, sword in hand, and endeavoured to cut a passage for themselves to the gateway. At this moment groups of fatigued soldiers were resting on their arms in the low ground below the citadel, and many of the wounded had been collected there preparatory to their being carried to a place of security, whilst hundreds of horses of the vanquished Affghans, frightened by the fire, were galloping wildly about the area. Down with surprising activity came this troop of desperate fugitives amongst these detached parties, who sprang on their feet in a moment, and directed a fire against them. The Affghans, as they rushed furiously on, cut right and left with surprising force, and swords as sharp as razors, not only at armed and active soldiers and sipahees, but at the wounded as they lay, at their own terrified animals, at every object which crossed their path. A wild fusillade was opened upon them by the troops on the slopes of the citadel; and, in the midst of a scene of indescribable confusion, the native soldiers, gathering in threes and fours around each furious Affghan, shot and hunted them down like mad dogs, until the destruction of the whole party was completed. The writer of this narrative happened to have an opportunity of observing closely the effect of one of the swords of these desperate men. A soldier of the Queen's had received a bullet through his breastplate. His blood had flowed in a crimson stream down to his very boots as he lay, apparently in a swooning state, in a dooley, with his right arm extended over the side of it. An Affghan, in his progress towards the gate, nearly severed with one blow the exposed limb from the body of the prostrate and defenceless soldier. He arose, supporting it with the other hand, and staggered against the wall in speechless agony; but the balls of numerous assailants soon took vengeance for their comrade's sufferings. The scene now excited feelings of horror, mingled with compassion, as one by one the Affghans sunk under repeated wounds upon the ground, which was strewed with bleeding, mangled, and convulsed and heaving carcasses. Here were ghastly figures stiffly stretched in calm, but grim repose; here the last breath was yielded up through clenched teeth in attitudes of despair and defiance, with hard struggle, and muttered imprecation; and there a faint '*Ue Ullah!*' or '*burace Khooda,*' addressed half in devotion to God, half in the way of entreaty to man, alone testified that the mangled sufferer yet lived. The clothes of some of the dead and dying near the entrance had caught fire, and, in addition to the agony of their wounds, some were enduring the torture of being burnt by the slow fire of their thickly wadded vests, and singed and hardened coats of sheep-skin. There was throughout the affair no fair struggle for mastery excepting within, or in the

\* "Oh, God!"

† The narrator must be allowed to indulge the partiality of friendship in recording that the first standard that was planted on the rampart of the citadel was the regimental colour of the 13th light infantry, carried on that occasion by Ensign R. E. Frere, nephew of the Right Hon. John Hookham Frere."

\* "Asiatic sabre."

immediate vicinity of the gateway; but as portions of Brigadier Sale's column, and afterwards of the reserve, traversed the town and swept its narrow streets, a desultory fire was kept up against them, which occasioned loss. It was whilst engaged in this part of the duty of the assailants that Major Warren, of the Bengal European regiment, who had shed his blood thirteen years ago in the escalade of Bhurtpore, was here again severely wounded. He was hit by three balls out of several which were fired at the same moment from one of the houses. One bullet struck him obliquely in the breast, touching in its passage a lobe of the lungs; a second penetrated his left wrist, and the third passed through the biceps muscle, and fractured the bone of his right arm. Lieutenant Haslewood of the same regiment survived some of the deepest wounds which were inflicted by the Affghan swords in the gateway on this morning of bloodshed. The detached tower, from which so sharp a fire had been kept up on our parties during the reconnoissance of the 21st, was carried by the gorge by a small party of the 13th, under Lieutenant Wilkinson. And now resistance seemed to be every where overpowered, and the commander-in-chief and his staff having entered by the Cabool gate, gazed upon the scene with feelings of self-gratulation, meditating on the important results of the exertions of two hours and a quarter, from the opening of the artillery at three, to the cessation of all continued firing at a quarter past five. Shah Shooja-ool-Moolk, the personage most deeply interested in the issue of the struggle, was conducted up the ramp of the citadel by Sir John Keane and the envoy. His majesty had ridden down to the memorable portal before the contest was at an end within the walls; and it was an affecting sight to see this old man, so long familiar with agitations and vicissitudes, climb, under the influence of evident emotion, up to the summit of this celebrated hold, which he now once more felt to be his own. 'Thus was' Ghuznee 'lost and won'; thus, in little more than two short hours, a garrison plausibly estimated at 3500 men was dispossessed of a fortress, the walls of which, up to the moment of attack, had scarcely been grazed by cannon-shot, the fire of the works being as entire as in the first hour of investment. This had been done without a ladder being raised in escalade. The enemy, convinced that the place could only fall after a protracted siege, had provisioned it for six months, and the plan of national defence of the Ameer of Cabool had been based upon the assurance of our being detained under the walls until the snows of winter, the hostility of the irregular hordes collected on the various ranges of mountain around us, and the appearance in the field of the main forces of eastern Afghanistan, would have rendered us happy to decamp in any direction which we might have found open."

Our subsequent march to Cabool, and all the rest of our doings, and even our triumphant return, must be left to the readers of Captain Havelock's volumes. The only enemies encountered during the latter part were the Khyberes, a warlike tribe of mountain desperadoes, who will probably soon be tamed or hunted down; and we conclude with the notice of a new-fashioned Cabool ornament for the ear, or ear-ring, invented by Dost Mahommed before he was superseded by Shah Shoojah:—

"The Barukzye Ameer knew the art of winning golden opinions, and the general impression among his late subjects appears to be, that he was substantively just in his decisions

between man and man. The following anecdote does not impugn his equity, but exhibits an instance of rather whimsical severity. It appears that at the time the line of the Khyber was assailed by the combined force of the British and the Sikhs, the ex-ameer detected the wealthiest banker in Cabool in a correspondence with Colonel Wade. It came to his knowledge that a bill of exchange was in his possession, which he desired to wrest from him. He summoned the Hindoo to his presence, who, of course, denied all knowledge of the matter. Dost Moohummud calmly directed one of his Kuzzilbash guards to attach his musket to the ear of the Affghan Rothschild, by lusting down the lock upon its pendant lobe. Anxiety to get rid of this troublesome ornament soon produced the desired effect, and the *hoondie*\* was delivered up in full durbar."

*Sailing Directions from Point Lynas to Liverpool; with Charts, Coast-Views, River-Sections, Tidal Courses, and Tide-Gauge Table, for Navigating the Dee and Mersey: including the latest Alterations.* By Commander H. M. Denham, R.N. F.R.S. 8vo. pp. 169. 1840. London, Bate; Liverpool, Walker.

ENGLAND abounds in seamen of every grade, who are her pride and boast, and who constitute her strength; but pre-eminently prolific is she in that class to which her naval heroes do or have belonged. British officers are as eminent as they are numerous, in war and in peace. When duty calls their energies and dauntless courage into action to resent insult, to redress their country's wrongs, or to uphold justice and freedom, they have always and ever will be ready to "fight and to conquer again and again," backed by the devoted bravery of British tars. When soft luxurious peace succeeds to war's alarms, they sink not into inglorious inactivity; but their well-strung minds still vibrate to their country's touch, and play for her profit. They become useful members and bright ornaments of the civil polity and of the social community; as numerous scientific and literary works, and our own experience, do fully testify.

The present work, local in its influence, is of the utmost value, taking into consideration only the sailing directions therein contained. But when we reflect upon the labour and indefatigable exertions the survey evinces; when we examine the charts, coast-views, river-sections, tidal courses, &c., laid down, and think of the multitudinous parts of this complete whole; and when we remember that since the New Channel in the Liverpool port avenue, the work of Commander Denham, has been developed, lighted, and buoyed, out of 29,000 vessels in the two last years, only nineteen have got into difficulties, whilst only two were wrecked; and the tidal detentions of her majesty's packets to Ireland have been reduced from two hundred and sixty-one to thirty instances in a year, we cheerfully bestow our most cordial praise. The author has, however, already, during the progress of his labours, received honours from the municipal body, whose interests he has promoted; rewards from the Admiralty, whose discernment in selection he has established; and applause from the British Association, the importance and utility of which, and the value of its peripatetic character, his recorded communications prove.

We select, as a specimen of the seamanlike "directions," the rules for working into the Mersey by the New Channel Cut of 1839 in a gale at north-west at night:—

\* "Bill of Exchange."

"You are not to expect a glimpse of any objects but the lights—enough! You positively see the two northern lights of the bay, a steady red light, higher than the floating bright light; you dare not round-to for a cast of the lead to ascertain how far you are outside the bar; you are flying over the ground upon a succession of crested seas; the red light is the distant one of the two; that decides which way you must yaw to bring the lights one over the other—it is done—they bear S.E. by E.  $\frac{1}{2}$  E. that clinches the question. You are satisfied the rise of the tide, allowing six or eight feet 'send,' accords with your draft. All now depends on a well-trimmed storm-canvas—faithful helmsmen—and your so cunning her as to inspire those hardy fellows at helm and look-out with the calm, firm confidence you feel yourself." You have brought the leading lights a-head, S.E. by E.  $\frac{1}{2}$  E. A bulky frame-work Floating Bell beacon lies (unluckily for night intercourse) upon the fairway line, three quarters of a mile outside the bar; it is well to say 'keep clear of it;' but it is hit or miss, in utter darkness of night and storm; the beacon gets the worst of it, at the expense of your copper. The sea running in a more regular trough will be the chief indication of your being within the bar; and as the distance to the floating light is but two miles, you are approaching so rapidly, that all attention must be alive to your starboard helm, to sheer north-eastward of her as you near upon the line, and then port helm for rounding up four points; you will be prepared for doing so by opening the lights sufficiently eastward when you observe the farthest and red light become the lowest of the two; on rounding this floating light close upon your starboard beam, steer S.S.E.  $\frac{1}{2}$  E. The Rock Light (revolving red and white) ought now to be just over your starboard fore-chains, and the Formby Floating Light, just passed, right astern, bearing N.N.W.  $\frac{3}{4}$  W.; keep an eye, also, over your larboard beam, on Crosby Light, and by the time you have run three miles, it will disappear (bearing N.E. by E.  $\frac{1}{2}$  E.), telling you to haul  $1\frac{1}{2}$  point more southward (S. by E.  $\frac{1}{2}$  E.), when the Rock Light should be kept over the starboard cat-head; preserve this course until the Rock Light draws upon your starboard beam (three miles more run); coax up to the western shore, and anchor as close to it as the depth and rise of tide agrees with your draft; the sooner the better, to avoid drifting into some ship's hawse; and when brought up, shew a light at the fore-stay or rigging; don't spare the cable, or begudge letting go a second anchor as soon as the first is well down, for the ground is steep, and very bad for 'bringing-up.'"

In conclusion, we may state that, from the brief account given of the locality of Port Fleetwood, whither the author's labours have been transferred, apparently to the discredit of Liverpool, that New Port is likely to become, ere long, a resort of great importance. In short, the managing folks of Liverpool were ungrateful to their ablest ally; and the wiser

"I cannot commit such hints for vital exigency to paper, without fancying myself at the elbow of the intensely anxious mariner, whilst jumping down to his cabin light—or between the lurches and flying quarter seas—he scans the page at his binnacle lamp. If he believes in the fruits of my experience, and gives me credit for the solicitude which prompts the desire to be of service in the hour of need, he will forgive my whispering to his almost scared senses, how even a forlorn hope depends upon the voice, as well as countenance, of the commander,—on the very tone in which, 'Very well, thus!'—'Steady, so!'—'Now we have it, my boys!' or how one faltering order, or exclaiming, 'Starboard!'—'Port!'—'Where are the lights?'—'What shall we do?'—all in a breath, has paralysed the hardest crew, whose wistful alacrity brought the tottering bark to the threshold of hope. All then is dismay and fruitless anguish."

folks of Fleetwood have got him to raise their rising port into great capabilities and importance. We have not entered into the accounts of Mr. Denham's admirable designs and works, because they have been noticed under other circumstances; but we feel justified in saying, that the ruling authorities at Liverpool shewed neither wisdom nor gratitude in their treatment of this gentleman, to whom their port and navigation owed so much; and that those concerned in Fleetwood are fortunate in securing his services.

*Abridgement of Sir Fowell Buxton's Work on the African Slave-Trade and its Remedy.* Pp. 68. London, 1840. Murray.

READERS who may not be inclined to go through the original work of Sir T. F. Buxton will find here a concise and clear abridgement of its contents, which will enable them to appreciate the data, understand the design, and estimate the prospects, of the plan for the civilisation of Africa, the first national step towards which will be taken by the Niger Expedition, now rapidly accomplishing its preparations.

A Mr. Jamieson, of Liverpool, an African merchant, has published a pamphlet (which we have not seen) against the scheme, and contends not only that it will thwart and demolish individual enterprise and exertions in that quarter, which would gradually lead to the same end, but will be nugatory in itself. Not having read his arguments, we shall only say that, if we were to wait for the improvement of Africa, and the abolition of the slave-trade, till they were effected by private traders, even though, like Mr. Jamieson, they may send steam vessels to the Niger, our great-grand-children's great-great-grand-children would never see that issue.

In the meantime, Sir George Stephen has addressed an answer to Mr. Jamieson, in a "Letter to Lord John Russell" (pp. 36. Saunders and Otley), in which he treats the Liverpool merchant cavalierly enough. We do not very much approve of the tone of this Reply, for in such questions the affectation of ridicule is not so well adapted to convince as dry facts and plain conclusions. Sir George Stephen, it is true, does occasionally refer to these, and overbears Mr. Jamieson where he has shewn a deficiency in logical deduction; but he appears to us to rely too often on the *argumentum ad absurdum* in treating his opponent's merely mercantile and business-like statements. The commercial interests have always been jealous of government attempting to alleviate the miseries and horrors of Africa. We suspect, strongly, that this does not spring from philanthropy, but from a dread of loss in a traffic carried on with a great profit, and without a thought of its effect upon the country.

*Thoughts on Physical Astronomy, with Practical Observations thereon.* By Frances Barbara Burton. Pp. 30. London, 1840. Smith, Elder, and Co.

PLANETARY influence, its nature, its modes of action, and its regularity to foretell atmospheric changes, form the subject of this clever pamphlet. Every man his own weather-prophet is the doctrine it teaches; few will be, however, the followers of the converts to such a faith. The uncertainty of the weather to the minds of the mass is as certain as the uncertainty of the law; both are the fruits of long experience, and both have become proverbial. That the trackless and silently moving masses of the solar system affect each other, observation has proved, and it is believed

that gravity and its laws operate throughout the boundless universe; but who can tell the nature thereof? Whether there is other than this one connecting link between the heavenly bodies,—whether "planetary influence (according to Miss Burton's view) consists in maintaining an universal circulation of vitalic principles through ceaseless transmissions of elementary properties," acting and reacting in endless interchange,—or whether each planet be isolated and distinct with regard to its inherent organisation, are questions that may not be solved during man's occupancy of earth. But if invariably when these bodies in certain relative positions produce known results, certain changes in the atmosphere of our globe, and these relations are ascertained, and constantly recurring, and their times calculated, what is to prevent the foreknowledge of a state of weather for any given period? The author of the *Thoughts* contends that physical astronomy is a predictory as well as demonstrative science; and the directions given for framing atmospheric predictions according to the laws of physical astronomy are to define, "1st. the relative position of the earth towards all the solar planets at the given time; 2dly. the number of the actual aspects together with the class of each aspect, and its degree of angular power, or directness in that class; and, 3dly, the inherent nature of each planet thus in aspect, or in relative position."

#### MISCELLANEOUS.

*Jem Bunt.* By the Old Sailor. No. I. London, 1840. Sherwood, Gilbert, and Piper. THE Old Sailor is too old a favourite with the public to stand in need of our recommendation. We rejoice to see him enter the lists again with a sea story (for none can tell one better), and promise us a monthly supply of the adventures of Jem Bunt. Of the first number, we shall only say that the *début* of the hero is both new and entertaining. To be at once the cause of an inter-parochial quarrel is some distinction to begin with; and the Orphan of "Nobody's Hole" bids fair to be somebody. The return of a frigate from a long Oriental sojourn is full of feeling, and, at the close, launches into sea-faring humour. The embellishments are suitable and good.

[The other Number publications belonging to the class of polite literature continue to appear with unabated attractions. Tom Hood has rejoined our ranks in full force in the "New Monthly Magazine." "Master Humphrey's Clock" strikes weekly, and all the world deprecates the most distant idea of a whinding up. Ainsworth not only illumines "Beetley" with the fire of Guy Fawkes,\* but in his "Tower of London" increases the interest; whilst Cruikshank outdoes himself in the plates, the effects of some of which are quite extraordinary. Stanfield's beautiful drawings continue to adorn "Poor Jack" (who is rich in matter), and are now transferred to the wood in a superior manner. The "Old Monthly Magazine" maintains an elevated literary stand, worthy of the best of magazine times; and O'Malley, and we know not how many others, afford us every month a copious *mélange* of pleasant reading. We ought not, among them, to forget the "Heads of the People," a characteristic and well-written work; nor the "Robinson Crusoe," "Devil on Two Sticks," and other highly embellished publications, with their numerous and admirable cuts. Surely, there is plenty of choice for the most fastidious public.—*Ed. L. G.*]

*Nouveau Magasin des Enfants.* 3 vols. 16mo. Paris, 1838. Risler.

THIS very nice collection for children has fallen into our hands by accident, and we cannot let slip the opportunity of recommending it to the

\* We should also notice Crowquill's humorous whims.

numerous families in England whose children are instructed in the French language, more or less, almost from their infancy. It is very difficult to find good children's books in French. Either they are manufactured in England, and written in bad, crabbed French; or, if made abroad, they are not so well suited to English taste. The present volumes are, we understand, composed by an accomplished lady, who is a Protestant, and governess in the family of one of the most distinguished men of France. They are written in a style that is simple and pure, and, with much popular instruction, fit for children; they inculcate pious and moral lessons of a very high order, and in a manner well adapted to those for whose use they were written.

*The Monitor.* By Timothy Tickle. Nos. I. and II. London, 1840. Cunningham.

ANOTHER issue of a monthly publication, addressed to passing circumstances, and with illustrations by the author, executed by Robert Cruikshank. There are also accompanying illustrations in quarto size; and all of them extremely comic. We cannot say that we have yet discovered much humour or point in the text, as far as it has gone; but in the engravings there is more of originality, fun, and drollery, than we have been accustomed to see from this quarter. George Cruikshank is alone; and all imitations of him must fail: it is, therefore, judicious, as in the present instance, to strike at something new. The consequence is an amusing and laughable set of cuts.

*The Return to England; a Tale of the Fourth Year after the Battle of Waterloo.* By a Friend of the Service. 2 vols. 1840.

London: Cadell. Edinburgh: Blackwood. THE date is particular, and the designation or description of the writer not so clear. Of what service is he a friend—Army, navy, literature, ladies? There is no saying. The heroes are soldiers, the story of the novel class, with an assurance that the characters are drawn from life; and what with courtships, intrigues, seductions, elopements, marriages, and other botherations, all we can do is to express a hope that female readers, who like to dip into such matters, may like the performance of a "Friend of the Service."

#### ARTS AND SCIENCES. WOODCUTTING.

IN this age of mechanical ingenuity and improvement, when every few weeks bring forth something new and valuable, we have been very much pleased to witness an invention, patented by Mr. Taylor and Mr. Wilmot (we believe), for cutting wood into staves for all kinds of cooperage, shingles, park-pales, and, in fact, every use to which the material can be put. What we saw cut at the manufactory in the Borough Road were staves for casks and circular tops; the machines for larger pieces not being at work. Nothing can be more simple than the process, nothing more effectual, nothing so economical. The block of wood is submitted to steam for half or three-quarters of an hour, and softened; which not only does not injure the fibre, but by destroying animal life and vegetable fungi greatly improves the substance, and renders it more durable. It is then presented to the knives, either acting in a perpendicular direction and chopping right down, or set in circular iron plates, and working with immense velocity as they go round, cutting the block into the required forms in length, breadth, and thickness, with perfect accuracy. The stroke, or the circular

cut (as either machine is employed), are as easy as if it were slicing butter, and there is not a particle of sawdust, or chipping, or waste, of any kind. It is evident that an immense saving must thus be made in time, in manual labour, and in quantity of material. We should say that it cannot amount to less than thirty or forty per cent. Altogether the invention is one of extraordinary simplicity and universal usefulness for articles of every day consumption, such as wainscotting, box-making, joiners' and carpenters' work, &c. &c.; besides the other crafts and purposes we have already noticed. We congratulate the patentee on having devised what is so likely to be beneficial to the trade of his country and to himself.

## GEOLOGICAL SOCIETY.

[Concluded from our last.]

JUNE 10. Rev. Dr. Buckland, President, in the chair.—1. 'Notice on the Sierra de Gador and its Lead Mines,' by Mr. Lambert. The Sierra de Gador, well known for its rich lead mines, is situated between the Sierra Nevada and the Mediterranean, extending nearly forty miles from west to east, and varying in breadth from five to ten miles. Its highest point is upwards of 6000 feet above the level of the sea. The southern face is precipitous, and has at its base a plain composed of tertiary rocks. The western flank is also steep, but the northern rises more gently from the Almeria river, which separates it from the Nevada chain. The principal mass of the Sierra is composed of limestone, which rests on clay-slate, and is overlaid by calcareous conglomerates. The limestone is generally traversed by veins of calcareous and fluor spar, frequently so disposed as to resemble the stripes on the skin of a zebra. It is also sometimes magnetic, on account of disseminated magnetic iron. The prevailing strike of the beds is from east to west; but the strata are frequently much disturbed, and dip in opposite directions. Mr. Lambert considers the limestone to belong to the most inferior of the transition series, because its stratification is conformable to that of the old rocks, constituting the nucleus of the Sierra Nevada, and because no organic remains have been yet discovered in it. At the eastern extremity the limestone is overlaid by beds of gypsum, containing masses and strings of native sulphur. There is no doubt the mines were worked by the Romans. The ore is generally found in nests, or masses, of considerable size, being largest where the strata are much disturbed; also in veins and branches of limited extent, which cross each other, and generally form a communication between the nests. In these cases the ore is accompanied by fluor spar. At the mine of Arnabe, on the western side of the Sierra, a vein, or mineral bed, occurs between two strata of limestone, conforming to them in strike and dip; and other similar instances are mentioned in the paper. Mr. Lambert is of opinion that these metallic deposits were of contemporaneous origin with the limestone; and he conceives that they are to a certain extent superficial, as there is no instance of ore having been found at a greater depth than 200 yards from the surface. Fragments of galena occur in the lower part of the open fissures, enveloped in a red earth, which also contains rounded or angular fragments of limestone: they have been also found in the alluvial detritus of the valleys and dry ravines, often in considerable quantities, and, in one instance, to an extent of more than 100,000 tons. Galena is contained in the mountain chains to the east and west of the Sierra de Gador, but in less abundance.—2. 'On the

Constant Presence of Polished and Striated Surfaces on the Rocks which form the Beds of Glaciers in the Alps,' by Professor Agassiz, of Neuchatel. The phenomena described in this paper occur not only at the lower extremity, where they are exposed by the melting of the glaciers, but wherever the subjacent rock may be examined by descending deep crevices in the ice; and they are ascribed to the abrading action of grains of quartz, and other rocks moved by the glacier. That they were not produced by causes in operation anterior to the formation of the glacier, is evident from the scratches being constantly parallel to the direct movement of the ice, and sharp and fresh beneath existing glaciers, but less distinct in surfaces which have been for some time exposed to atmospheric influence. If an attempt were made to account for these scratches by the action of water, it would be necessary to imagine currents of enormous depth filling the highest Alpine valleys, and descending in opposite directions from the narrow crests which lie between them. In the upper part of the valley of the Visch, a rapid torrent runs beneath a glacier, corroding the bottom of the valley, and polishing the sides of its bed; but the polish is of a different description from that assigned to the action of the ice, and the detritus associated with it. The sides of the valleys adjacent to the actual glaciers are often polished and scratched at great heights above the ice, in a manner identical with the surface beneath it, and different from the polish of the bed of the torrent. The paper was accompanied by a series of lithographic sketches illustrative of the phenomena described by the author.—3. 'On the Occurrence of a Bed of Lignite near Messina,' by Dr. R. Calvert. This bed of lignite occurs up a fumera to the left of Fort Gonzago, and about a quarter of a mile from Messina. It was applied by the English troops, during their occupation of Sicily, to culinary purposes, and the cavalry used it in their forges. The bed was about a yard thick.—4. A letter from Mr. Greaves, 'On the Discovery of Bones of Fishes, Birds, and Mammalia, in a Limestone Cliff at Eel Point, in Caldey Island, and Eighty Feet above the Sea.'—5. A letter from Mr. W. J. Hamilton, 'On the Occurrence of Rounded Fragments of Rock Crystal in the Hasting Sands, near Tunbridge Wells,' and calling attention to the inquiry whence the fragments were probably derived.—6. A letter addressed to Dr. Fitton, by M. Roemer, of Hildesheim, 'On the Formations between the Chalk and the Portland Beds in the North of Germany.' Chalk with flints, exactly agreeing with the chalk of England, occurs only in the Isle of Rugen, where it also assumes the character of a white limestone, with numerous layers of flint and the same fossils. M. Roemer considers it to be of the age of the Maestricht beds, although generally believed to be younger. In the north of Germany are also very thick deposits of sandstone and sandy marls, corresponding to the upper subdivision of the chalk. Characteristic fossils: *Pagurus Faujasii*, *Belemnites mucronatus*, and small corals. No ammonites have been noticed. Localities: Gehrden, near Hanover, Goslar, Quedlenberg, Halberstadt. Chalk without flints, agreeing externally with that of England, occurs at Peina and Luneberg; but it is replaced by sandy marls and sandstones near Ilseburg, Lemförde, and Dulmen. It contains *Belemnites mucronatus*, many scyphia, some species of ammonites, &c. Chalk-marl (Planer kalk) is extensively exhibited, and has every where the same characters as in England. It

contains no *Belemnites mucronatus*, but *Ammonites varians*, *A. Mantelli*, *Turritites costatus*, *T. undulatus*, *Plicatula inflata*, &c. The upper green sand occurs only near Dresden, and near Worl in Westphalia. Its fossils are *Ammonites falcatus*, *Terebratula bicipitata*, *Ostrea carinata*, &c. The Gault has not been clearly detected, but M. Roemer believes that a marl between Hanover and Hildesheim, and the blue clay near Otterbergen, may represent it. The lower green sand occurs in Saxony, near Celsfeld, near Bilefeld, near Nattern in Westphalia, and near Aix-la-Chapelle. Its fossils are not very numerous. *Hilsconglomerate*.—This formation, first described by M. Roemer, consists of a yellowish or brownish marl containing quartz, schist, oxide of iron, and in some localities rich iron ores. It is found near Brunswick, Goslar, and near Essen on the Rhur. Its fossils are very numerous, and agree in part with those of the lower green sand of England. M. Roemer considers that it may be the *neocomien* of the French geologists. *Hilsclay*.—This deposit, also first distinguished as a separate formation by M. Roemer, is a pure blue clay, 100 feet thick; and it is believed to be the equivalent of the Speeton clay of Yorkshire, as it contains many of the fossils of that bed described by Mr. Phillips. It occurs near Hildesheim, near Celsfeld, at the foot of the Deister, near Hanover, and near Nenndorf. The weald clay of the north of Germany seldom includes strata of limestone and sandstone. Its fossils, without exception, agree with those of England. *Hastings Sandstone*.—This formation contains in the upper part beds of coal from one to three feet thick. The total thickness of the deposit is from 500 to 800 feet. It has yielded every species of fossils enumerated by Dr. Fitton in his paper on the strata below the chalk. The Purbeck beds consist of shelly limestones alternating with sandstones and concretions of grit. M. Roemer has noticed two "dirt beds," but has not yet found any remains of *Cycadeoidea*. The shells are partly freshwater, partly marine. The wealden group has been observed near Helmstedt; and M. Roemer hoped it would be laid open near Hildesheim. Farther westward it ranges from Hanover, by Mindon, to Iburg and Rhine, near Munster, yielding almost every where very good coal.—7. A letter to Dr. Fitton from Mr. Mackeson, of Hythe, 'On the Discovery, near the bottom of the Green Sand in the vicinity of that town, of portions of a large Saurian, supposed to be an *Iguanodon*.' These remains were first noticed by Mr. Mackeson in May, since which he has superintended the development of other parts of the animal, and he has carefully preserved every fragment for the purpose of their true nature being rigidly determined.—This being the last meeting of the session, the Society adjourned at its close to November the 4th.

## PARIS LETTER.

Academy of Sciences, Sept. 8, 1840.

SITTING of August 31.—M. Tassan, in reverting to the results of the voyage of Captain Dupetit Thouars, mentioned another warm current that had been met with in the Northern Pacific. The ship being in 41° north latitude, at 200 leagues from the Kurile Islands and 320 leagues from Japan, found the temperature of the sea at the surface to be 26° 7' of the centigrade scale, or at an equatorial heat; a change of 2° 40' in latitude, and of 1° in longitude, gave a diminished temperature of 13°. This current of warm water gave rise to fogs, such as attend the gulf stream.—M. Arago

laid before the Academy the cases of the thermometrographs of the Venus, used to ascertain the temperature at great depths; though a third of an inch in thickness, the brass had been completely flattened by the pressure of the ocean.

**Geology of Algeria.**—M. Boblaye addressed to the Academy some observations on the geology of the French provinces in the north of Africa. Two series of formations, observed at different points, stretched from the coast into the interior. The first was composed of the lias, oolitic, and cretaceous series, up to the tertiary Parisian strata inclusively; the latter extremity of this series having been observed in the plains S.E. of Constantina towards Aures. The other series, taking it from the interior to the coast, comprised the older tertiary strata, the large band of the middle tertiary, the sub-Apennine series, and the most recent formations of the latest tertiary epoch; these latter were on the immediate coast. On the coast, however, some older rocks appear; but it is evident that the carboniferous series, if there be one, is not in Algeria, but under the Mediterranean. In the interior of Algeria the summits of the mountains (tertiary strata) were 3600 feet above the level of the sea.

M. Pelouze communicated the results of an analysis of camphor from Borneo, sent to him by Mr. Christieson, of Edinburgh. It was produced by the *Dryobalanops*. The solid camphor produced the following formula,—C 20, H 36, O 2; the liquid camphor gave C 20, H 32, O 4.

M. Delafosse read a memoir on the mathematical and physical construction of crystals. He shewed that it was important to establish a difference between the integral molecule and the physical molecule; and observed that the true molecule has often a perfectly different form from that given by the cleavage.

A most extraordinary operation was performed the other day by Dr. Jules Guérin, on a young gentleman twenty-two years of age, who had all his muscles and tendons so dreadfully contracted that his knees were drawn up to his chin, his arms contorted, and his body the picture of most hideous deformity. The Doctor determined, after studying the case, to operate upon him by the sub-cutaneous section of his muscles; and a large party of the most eminent medical men of the capital, as well as some from Russia and Germany, were invited to be present at the operation. The patient, it may be at once premised, bore the whole with the greatest fortitude. [In giving the following enumeration of the muscles and tendons cut, we beg leave to remind our readers that we are no doctors ourselves, and that a geological section is much more in our way than a muscular one.]

<i>Muscles and Tendons cut at the Elbows.</i>	
The two brachial biceps .....	2
The round pronators .....	2
The two radial anterior .....	2
The two common superficial flexors .....	2
The two small palmaries .....	2

<i>Ditto ditto in the Forearm.</i>	
The isolated tendons of the two cubital anterior .....	2
The isolated tendons of the large and small palmaries .....	4
The isolated tendons of the two large abductors of the thumb .....	2

<i>Ditto ditto at the Knees.</i>	
The sartorial .....	2
The two crural biceps .....	2
The two demi-membranal .....	2
The two demi-tendinous .....	2
The two right internal .....	2
The fascia lata .....	1
The lateral external ligaments .....	2

<i>Ditto ditto at the Feet.</i>	
The two tendons Achilles .....	2
The two anterior leg-muscles .....	2
The two common extensors .....	2
The two extensors of the great toe .....	2
The two anterior peroneal .....	2

<i>Ditto ditto in the Body.</i>	
The grand pectoral muscle .....	1

Forty-Two!

The operation was conducted throughout with the greatest *sang froid* and courage: nothing but the *eric eric* of the bistouri was heard, or a faint sigh from the patient. When the poor fellow was thus *untied*, his limbs were stretched out, and his course of clinical treatment commenced. In the evening he slept soundly, had no fever, and is now nearly recovered from his wounds.

The Minister of Public Instruction has formed into one joint committee the four *Comités Historiques* of, 1. *Langues et Littérature Françaises*; 2. *Chartes et Chroniques*; 3. *Sciences Physiques*; 4. *Sciences Morales et Politiques*. The new committee is to be called "*Comité pour la Publication des Documents Ecrits de l'Histoire de France*." The Minister himself is always to be President: M. Mignet, the historian, has been appointed Vice-President. All foreign and corresponding members of either of these committees become members of the joint committee. The first monthly meeting was held on the 31st ult. The *Comité Historique des Arts et Monuments* remains untouched, and is daily extending its sphere of utility, both as a stimulative and a conservative body.

In consequence of the lamented decease of M. Huyot, the architect who was charged with the restorations and the additional works voted by the municipality of Paris for the Palais de Justice, it became necessary to name some one who should be able to carry them on. M. Dommey, architect of the Palais, has been appointed, and M. Duc has been adjoined to him. A commission is to report on the actual state of M. Huyot's plans and drawings.

M. Neuman, Conservator of the Royal Library at Munich, has arrived in Paris, on his way to London.

The Eighth Scientific Congress of France was opened on the 1st inst. in the buildings of the Academy of Besançon. M. Tourangin, Prefect of the Department (Doubs), was elected President; M. de Caumont, first Vice-President; and M. Julien, of Paris, second Vice-President.

In the Faculty of Arts at Strasburg, during the August examination for degrees, forty-four candidates offered themselves for the degree of *Bachelier-en-Lettres* (bachelor of arts):—twenty-six were admitted, and eighteen had their degrees adjourned. In the Faculty of Arts of Caen, at the same time, fourteen candidates were examined; of whom twelve were admitted, and two adjourned.

Professor Strauss has announced a new system of Dogmatic Theology for publication. Two editors have offered him 2400*l.* for the work.

Counsellor-of-State Collins, of the Russian Academy of Sciences, died at St. Petersburg on August 4, 1840, aged forty-nine.

The King of Prussia has written an autograph letter to the poet Tieck, granting him an annual pension of 4000 thalers, or 560*l.*

The Emperor of Austria has conferred the order of Leopold on the celebrated traveller Charles Hugel.

The Italian Society of Sciences at Modena has elected Humboldt and Decandolle to be foreign members, in the room of Olbers and Poisson deceased.

On August 27th a shock of earthquake was felt at Milan. It came from N.N.E. to S.S.W. The magnetic needle was agitated before the shock actually occurred, and, after it had hap-

pened, remained at a considerable increase of inclination. On the same day, a shock was felt at Venice, from north to south. It lasted five seconds, and happened in both places at fifty-two minutes past noon. The motion was undulatory at Venice. The barometer in that city stood, at the time, at 28 inches, 4 lines: the thermometer was at 24.9 of the centigrade scale: the atmosphere was cloudy.

*Secondo,* Sempre diversi.  
*Intero,* Italico scrittore.

Di prose e versi.

Answer to the last:—Terre-moto.

## FINE ARTS.

### DIORAMA.

THE subject of the new picture, "The Shrine of the Nativity at Bethlehem," besides its great inherent interest, affords ample range for the contrast and changes of light and shade—the peculiarities of the dioramic exhibition. The ever-burning lamps in the shrine, and those in the recess, marking the spot where the star rested, throw around their bright influence day and night; subdued, however, in the first view, and thrust back to their own immediate and narrowed circle by the glorious sunlight which streams through the windows of the church built over the hallowed stable. As day declines, and artificial light appears to gain the victory through patient perseverance, chasing away its powerful, and for a time overwhelming, antagonist, and widening its sphere of influence, the shadows gradually yield, and change their allegiance. Whereupon, as if to celebrate the favourable issue of the contest, lamp after lamp, and candle after candle, contribute to the splendour of the triumph. But now breaks upon the spectator's view a celebration of a more imposing character,—evening mass by the Franciscan monks in the church before him, whilst on either side are seen figures in the act of devotion before the holy shrine and altar. The prostrate monk at the golden star appeared to us peculiarly fine. Indeed, the whole is admirable, with, perhaps, one slight exception. And this would not have been remarked upon did we think that the notice of it would diminish in the least degree the richly deserved popularity of the beautiful picture, painted by M. Renou, from a sketch on the spot by D. Roberts, which we saw at the private view on Thursday, and which was exhibited to the public yesterday. The altarpiece over the recess, "The Mother presenting the Child to the Wise Men," is, in the night view, thrown into the deepest shade: in fact it entirely disappears. In spite, however, of the fourteen lamps burning underneath, which we are aware tend to deepen the shadows above, still we think there is sufficient light around to bring it somewhat into view; not, of course, so prominently as the picture of the "Virgin Mary and Infant," before which a lamp is suspended, but still sufficient to bespeak its existence. With this reserve we award the new work our cordial praise.

## MUSIC.

### CHAPELL'S COLLECTION OF NATIONAL ENGLISH AIRS.

[Second notice.]

On the tune called "The Carman's Whistle" we have a very descriptive and characteristic note, which, though of length rather incompatible with our limits, we must quote for the mass of information it contains. This tune was—

"Arranged by Byrde, Queen Elizabeth's music-master, and contained in her 'Virginal Book'; the words from a black-letter reprint of the original ballad, in the possession of J. Payne Collier, Esq. This song is mentioned in a letter, with the signature of T. N., to his good friend A[nthony] M[unday], prefixed to the latter's translation of 'Gerleion of England,' part ii. 1592, 4to. black letter. This letter was probably levelled at Thomas Deloney. 'I should hardly be persuaded, that anie professor of so excellent a science (as printing) would bee so impudent to print such ribauldrie as 'Watkin's Ale,' 'The Carman's Whistle,' and sundrie such other.' The carmen of this age appear to have been singularly famous for their musical talents. Falstaff's description of Justice Shallow is, that 'he came ever in the rear-ward of the fashion, and sung those tunes to the over-scutched huswives that he heard carmen whistle, and sware they were his Fancies, or his Good-nights.'† ('Henry the Fourth, part ii. act iii. scene ult.'). Again, in Ben Jonson's comedy of 'Bartholomew Fair,' Wasse says: 'I dare not let him walk alone, for fear of learning of vile tunes, which he will sing at supper, and in the sermon times! If he meet but a carman in the street, and I find him not talk to keep him off of him, he will whistle him and all his tunes over at night, in his sleep.' (Act i. scene i.). In the tract called 'The World runnes on Wheels,' by Taylor, the water-poet, he says: 'And if the carman's horse be melancholy or dull with hard and heavy labour, then will he like a kinde piper whistle him a fit of mirth, to any tune from above Eels to below Gammoth; of which generosity and courtesie your coachman is altogether ignorant, for he never whistles, but all his musick is to rap out an oath.' And again he says:—'The word carmen (as I find it in the dictionary) doth signifie a verse or a song; and betwixt carmen and carman there is some good correspondence, for versing, singing, and whistling, are all three musically.' Henry Chettle, in his pamphlet entitled 'Kind Hart's Dreame,' says:—'Now ballads are abusively chanted in every street; and from London this evil has over-spread Essex and the adjoining counties. There is many a tradesman, of a worshipfull trade, yet no stationer, who after a little bringing uppe apprentices to singing brokerie, takes into his shoppe some fresh men, and trustes his olde servantes of a two months' standing with a dosen groatesworth of ballads. In which, if they prove thrifitle, he makes them prety chapmen, able to spred more pamphlets by the state forbidden, than all the booksellers in London.' He gives the names of several of the songs, which are 'Watkin's Ale,' 'The Carman's Whistle,' 'Chopping Knives,' and 'Friar Fox-taille.'§ Burton, too, in his 'Anatomy of Melancholy,' says:—'As car men, boyes, and prentises, when a new song is published with us, go singing that new tune still in the streets.' That music was formerly much more cultivated in England than now, as well as much more common as an amusement with the

lower classes, is a fact of which the most abundant proof can be adduced. From Chaucer's 'Tale of the Prioress,' it appears that, in the fourteenth century, 'to singen' was as much an established branch of the education of 'small children,' as 'to rede;' and Sir John Hawkins (vol. ii. p. 260), speaking of the religious houses, says that, besides being schools of learning and education, all the neighbours might have their children instructed in grammar and music, without any expense. Gayton, in his 'Festivous Notes upon Don Quixote,' 4to. 1654, enumerates, with others, barbers, cobblers, and plowmen, as 'the heires of music;' and the following extract from 'Orders appointed to be executed in the Cittie of London, for setting roges and idle persons to worke, and for releefe of the poore,'\* proves not only that music was taught in Bridewell and Christ's Hospital, but that it was considered an almost necessary qualification for servants, apprentices, or husbandmen. 66th (the last) Order. 'That the Preachers be moved at the sermons at the Crosse, and other convenient times, and that other good notorious meanes be used, to require both citizens, artificers, and other, and also all farmers and other for husbandry, and gentlemen and other for their kitchens and other services, to take servants and children both out of Bridewell† and Christ's Hospitall at their pleasures, &c., 'with further declaration that many of them be of toward qualitties in reading, wryting, grammer, and musike.' One of the earliest songs in the English language is on the difficulty of learning music;‡ and when minstrels had decayed, every event, however trifling, become instantly the subject of a ballad: 'In a word, scarce a cat can looke out of a gutter, but out starts a halfe peny Chronicler, and presently a proper new ballet of a straunge sight is ended.'§ Nothing is more common in old plays than such passages as this:—

'Dandolo. News! what news?  
Morello. Do you not hear on't yet? Why, 'tis in a Ballad already.'

SHIRLEY'S *Bird in a Cage*, 1633, act iv. sc. 1.

And in a pamphlet intended to ridicule the follies of the times, in 1591, we are told, that if men that are studious would 'read that which is good, a poore man may be able' (not to obtain bread the cheaper, but, as the thing beyond all most desirable) 'to buy three ballets for a halfe penny.'|| The custom of pasting them on the walls of rooms is also well known, and a subject of constant allusion:—'I'll now lead you to an honest alehouse, where we shall find a cleanly room, with lavender in the windows, and twenty ballads stuck about the walls.'¶

'Come, buy all my ballads, I have no more;  
Rich hangings for walls, or your chamber door.'\*\*

And from the time of the last of the minstrels, in the reign of Elizabeth, down to that of Charles the Second, there were a succession of writers who found it more profitable to turn every piece of news, and every political event, into a ballad, than to attempt the higher flights

\* "At London, printed by Hugh Singleton, dwelling in Smith Felde, at the Signe of the Golden Tunne," 4to. n. d.; and reprinted in the 'British Bibliographer.'

† Bridewell is a foundation of a mixed and singular nature, partaking of the hospital, prison, and workhouse. It was founded in 1553 by Edward VI. Youths are sent to the Hospital as apprentices to manufacturers who reside there, and, on leaving, receive a donation of 10*l.* each, and their freedom of the city."

¶ "From Walton's 'Angler,' 1633."

\*\* "From 'Folly in Print; or, a Book of Rhymes,' 1667."

of poetry. In 'The Actor's Remonstrance,' 1643, the author, speaking of the probable fate of our ablest poets, says, 'Nay, it is to be feared that shortly some of them (if they have not been forced to do it already) will be incited to enter themselves into Martin Parker's\* society, and write ballads.'

\* And tell prose writers, stories are so stale,  
That pennie ballads make a better sale.'  
PASQUILL'S *Madness*, 1600.

The amusements of the ladies are thus described in an old song, about 1600:—

'This is all that women do,  
Sit and answer them that woo;  
Deck themselves in new attyre,  
To intangle fresh desire;  
After dinner sing and play,  
Or, dauncing, passe the tyme away.'

And none could pretend to the character of a gentleman who was unable to sing a song, or take his part in a glee, catch, or madrigal.† Morley thus quaintly mentions it in his Introduction, 1597: 'But supper being ended, and musicke bookes, according to custom, being brought to the table, the mistresse of the house presented me with a part, earnestly requesting me to sing; but when, after many excuses, I protested unfainely that I could not, every one began to wonder; yea, some whispered to others, demanding how I was brought up: so that upon shame of mine ignorance, I goe now to seeke out mine old friend, Master Gnorrimus, to make myself his scholler.' Every barber's shop had its lute, or cittern, for the amusement of waiting customers, instead of a newspaper, as at present; and Sir Richard Steele mentions the custom as still prevailing in his time: 'To this day the barber is still the same; go into a barber's any where, no matter in what district, and it is ten to one you will hear the sounds either of a fiddle or of a guitar, or see the instruments hanging up somewhere.' The barber, in Lyly's 'Midas' (1592), says to his apprentice,—'Thou knowest I have taught thee the knocking of the hands, like the tuning of a cittern;' and Morley, in the third part of his Introduction, says: 'Nay, you sing you know not what; it should seeme you came latelie from a barber's shop, where you had 'Gregory Walker,' or a *curranta*, plaide in the

\* "Martin Parker wrote the famous song, 'The King enjoys his own again' (No. 234), 'You Gentlemen of England,' and many others."

† "A century before this, serenading appears to have been as common in England as it is now in any part of Europe. This custom is satirised with great bitterness in the 'Stultifera Navis; or, Ship of Fools,' originally written in Dutch, by a lawyer named Sebastian Brant, and afterwards translated into English, and turned into a satire upon the vices and follies of his own countrymen, by Alexander Barclay, in 1508. From the following humorous and descriptive lines, it appears to have been the practice even in the winter:—

'The furies fearful, sprong of the floudes of hell,  
Bereth these vagabondes in their minds, so  
That by no means can they abide ne dwell  
Within their houses, but out they nedde must go;  
More wildly wandring than either bucke or doe.  
Some with their harpes, another with their lute,  
Another with his bagpipe, or a foolish flute.  
Then measure they their songes of melody  
Before the doores of their lemmans deare;  
Howling with their foolish songe and cry,  
So that their lemmans may their great folly heare:  
And till the Jordan maketh them stande arreare,  
Cast on their head, or till the stones bee.  
They not depart, but coveyt there still to bee.

But yet, moreover, these fooles are so unwise,  
That in colde winter they use the same madnes:  
When all the houses are lade with snowe and yae,  
O madde amased, unstable, and wilde!  
What pleasure take you in this your foolishness?  
What joy have ye to wander thus by night,  
Save that ill doers alway hate the light?  
But foolishhe youth doth not alone this use,  
Come of lowe birth, and simple of degree,  
But also stales themselves therein about:  
With some yonge fooles of the spirituality:  
The foolish pipe without all gravitie  
Doth eche degree call to his frantic game;  
The darknes of night expelleth feare of shame."

\* "A copy of this ballad is in the possession of G. Daniell, Esq. The tune is in Queen Elizabeth's 'Virginal Book,' arranged by Byrde; also in Dr. Bull's manuscript, before quoted."

† "Good-Nights are 'Last dying Speeches' made into songs; such as 'Essex's last Good Night,' &c."

‡ "In abusing coaches, just then introduced, which injured his trade as a waterman, he says:—'Besides, the cart-horse is a more learned beast than the coach-horse; for scarce any coach-horse in the world doth know any letter in the book, when as every cart-horse doth know the letter G most understandingly.'"

§ "Friar Fox-taille" is another name for 'The Friar and the Nun.'"

new proportions by them lately found out.' And in a marginal note upon 'Gregory Walker,' he says, — 'That name in division they have given this 'Quadrant Pavan,'\* because it walketh amongst the barbers and fiddlers more common than any other.' In 'The Trimming of Thomas Nashe,' 1597, speaking in praise of barbers, the author says, — 'If idle, they passe their time in life-delighting musiqua.' And among the woodcuts in Burton's 'Winter Evening's Entertainments,' 1687, is one representing the interior of a barber's shop, with a person waiting his turn, and amusing himself in the interim by playing on the lute; and on the side of the shop hangs another instrument, of the lute or cittern kind. In Ben Jonson's 'Silent Woman,' act iii. scene 5, Morose cries out, — 'That cursed barber! I have married his cittern, that is common to all men;† which one of the commentators, not understanding, altered into, 'I have married his cisteru,' &c. Again, 'Lord Faulkland's Wedding Night:—

'He has travelled, and speaks languages  
As a barber's boy plays of th' gittern;†

And Warde, in his 'London Spy,' says he had rather have heard an old barber ring 'Whittington's Belles'‡ upon a cittern, than all the music houses afforded. There are numberless other quotations to the same purport; but we fear it will be thought that too many have been adduced already.§ The music of the barbers began, however, to decline about the commencement of the last century. In one of Dr. King's 'Useful Transactions,' he speaks of the castanets used in dances, and says: 'They might keep time with the snap of a barber's fingers, though at the present day, turning themselves to perriwig-making, they have forgot their cittern and their music; I had almost said, to the shame of their profession.' But independently of the growing rivalry of the newspaper, the barber's shops were then no longer visited by the same class of customers as the barber-surgeons of former days, who set their apprentices to play and sing to their patients, while they were letting blood, or binding up a wound. The recreation of music was, however, by no means confined to carmen and barbers; as many quotations might be adduced to prove the musical qualifications of cobblers, ploughboys, tinkers, blacksmiths, sailors, and even beggars and professed fools. In the second part of Deloney's 'History of the Gentle Craft,' 1598, he thus describes the meeting of a party of shoemakers:—'And coming in this sort to Gifford, they were both taken for shoemakers, and verie hartlie welcomed by the jorneyemen of that place, especially Harry, because they never saw him before; and at their meeting they askt him and if he could sing, or sound the trumpet, or play upon the flute, or recon up his tooles in rime, or manfully handle his pike-staffe, or fight with sword and buckler?

\* 'The "Quadrant Pavan" is in Queen Elizabeth's 'Virginal Book,' in Morley's 'Consort Lessons,' &c.  
† 'The gittern was strung with gut; the cithren, or cittern, with wire. There are also many allusions to the grotesque heads of the cittern, as in Ford's 'Lover's Melancholy':—

'Barbers shall wear thee on their citterns.'—*Act II. sc. 1.*  
And in 'Love's Labour Lost,' act v. scene 2, Boyet, alluding to Holofernes' grotesque appearance, compares him to a cittern head. 'The distinction between the gittern and cittern has hitherto been little observed; but that they were different instruments, although of the same class, is easily proved. Laneham, in his 'Letter from Kenilworth,' says: 'Sometimes I sent it with dancing, now with my gittern, or else with my cittern, then at the virginals.'

§ 'A tune in 'The Dancing Master' is called 'Turn again, Whittington.'

¶ 'We refer the curious to Henry Bold's 'Epitaph upon a Barber, who became a great Master of Music,' 1685; to Jonson's 'Vision of Delight;' to 'The Mayor of Quinborough,' &c.

'Believe me,' quoth Harrie, 'I can neither sound the trumpet nor play on the flute; and beshroe his nose that made me a shoemaker, for he never taught me to recon up my tooles in rime nor in prose.' Not being able either to sing, to play upon the trumpet or flute, Harrie was immediately detected as an impostor, as no true shoemaker could be so ignorant of music. We have already spoken of the 'Master Setter of Catches,' used to be sung by Tinkers, as they sit by the fire, with a pot of good ale between their legges,' at p. 131; and we have abundant proof of their musical acquirements in the number of songs particularly applying to their trade, and which must have been written expressly for tinkers to sing.\* The songs in praise of begging are equally numerous;† and that it was one of the necessary qualifications for the fool or jester to 'bear his part' in a song, appears from the character of Autolycus, in the 'Winter's Tale.' Our old English tars had a great variety of songs, many of the earliest of which had one favourite chorus or burden: 'Heave and howe, rumbelowe.' Fabian says of John Norman, mayor of London, that he was the 'first of all Mayres who brake that auncient and olde continued custome of ryding to Westminster upon the morowe of Symon and Jude's daye;' he 'was rowed thither by water, for the which the watermen made of hym a roundell, or songe, to his great prayse, the which began, 'Rowe the bote, Norman, rowe to thy Lemman,' and so forth.' This very song appears to be quoted by Skelton, laureat, in 'The Bowge of Court:—

'Holde up the helme, loke up, and let God stere,  
I wolde be merle what wind that ever blowe,  
Heave and how, rumbelow, row the bote, Norman, rowe.' Bishop Hall thus censures the number of ballads published in his time (1597):—

'Some drunken rhymer thinks his time well spent,  
If he can live to see his name in print;  
Who, when he once is fished to the presse,  
And sees his handell have such faire success,  
Sung to the wheele and sung unto the payle,  
He sends forth thraves of ballade to the sale."

#### THE DRAMA.

We see it stated in the newspapers that *Drury Lane* is expected to open on the 3d of October; and Mr. Ellison as lessee, immediately expected from Germany, where he has been engaging performers.

*Covent Garden*.—This theatre opened on Monday with *The Merry Wives of Windsor* and the *Sleeping Beauty*, cast as last season, with the exception of Mr. Binge for Mr. Harrison, indisposed. Mr. Sheridan Knowles's play of *John of Procida* is announced in the bills as being in preparation, and to be produced immediately. The plot is connected with the memorable Sicilian Vespers; and the hero has already appeared in the Italian drama. No doubt Knowles will treat him and the story very differently. We also hear of another piece being forthcoming.

On Tuesday, Douglas Jerrold's *Rent Day* (we wish he had as many of them, we mean in the character of receiver, as his talents deserve) was

produced at "the Little Theatre" in excellent style. Mr. Wallace, as *Martin Heywood*, gave all the freshness of the English rustic farmer—one might have fancied he had never crossed the Atlantic, or gathered histrionic laurels in another world; and all we could have wished was, that the gist of his strong and natural personation had not been in favour of an erroneous principle. But an author to be popular must please the people; and it is much easier to abet a public voice than resist a misrepresentable opinion. The stage is not the place for judgment but for passion; and the *Rent Day* is a stirring appeal to the heart. Mrs. Stirling, as the wife, acted charmingly; and Miss P. Horton, as *Polly Briggs*, afforded another instance of the pathetic combined with familiar life, which rendered both these characters very effective. In the *comique*, Strickland's *Crumbs* was a humorous delineation of the part; D. Rees excited laughter in *Bullfrog*, not without reminding us of the creature, whence his name, by his facial exercises; and J. Webster wanted only a little *spunk* to do full justice to *Toby*. The piece was altogether well performed, and met with the applause it merited.

The front houses of the *Adelphi Theatre* towards the Strand are levelled with the ground, so we may expect new entrances, and possibly more room and better accommodation. We have not, however, heard aught of the next campaign.

*English Opera House*.—The English Opera House announces the termination of its season at the end of next week; so that, at least for a while, Covent Garden will have all the playing to itself, always excepting the Haymarket, whose enterprising manager advertises several novelties, including an original five-act play. We are also told that Mr. Maywood is about to appear in a series of Scotch characters, which will be new to the majority of playgoers, it is so long since we had any representative of the *Sir Pertinax* and *Sir Archys* who used to adorn the stage in our younger days.

*The Strand Theatre*.—We were much amused one evening this week with Mr. Harper, who, as *Jim Crow*, gave us 'Such a Gittin' up Stairs' in inimitable style, and was deservedly encored. He is, we are informed, the great original imitator of the *nigger* character in America, and certainly it is a unique performance. He has not only a wilder "jump about" than Mr. Rice, but relies more on flexibility and capacity of mouth for the expression of negro humour, which, with the accompanying rolling of the eyes, is ludicrous beyond description. His "Coon" song is also good, but not so laughable. Mr. Hammond, we see, is announced to appear on Monday next.

*Surrey*.—Mr. Jones's tragedy of *Spartacus* was produced here, a short time since, with considerable success, and has been played to very full houses; but has been suddenly withdrawn by the author in consequence of the management refusing to play it more than three times a-week.

#### VARIETIES.

*Landslip: Mount Ararat*.—News has been received from Teflis, that at the end of June the whole of the upper part of the celebrated Mount Ararat, in Armenia, had sunk down. For some days before the phenomenon a hollow noise was heard in the interior of the mountain, which was clearly perceived in all the neighbourhood of the settlement on the extensive periphery of the mountains. It is said that only a large village and an Armenian monastery, dependent on the celebrated Etchmi.

adzin, are buried, with their inhabitants. The official accounts have not been received.

**Niger Expedition.**—The second iron vessel has been launched at Liverpool and christened the *Albert*. The other two are to be called the *Wilberforce* and *Soudan*; the latter has received her machinery on board, and is about to be tried at sea. On the Admiralty is the announcement that they are to be commissioned for this service by Captain H. D. Trotter, Commander William Allen, and Commander Bird Allen; that petty officers, including artificers of all kinds, will be entered on board the *Britannia*, at Portsmouth; the *Impregnable*, at Plymouth; the *William and Mary*, at Woolwich; and the *Redwing*, at Liverpool. "None will be entered but those who can produce testimonials of unexceptionable character. Double pay on leaving England. Well-qualified engineers of first and second class, and engine-drivers or stokers, may apply at her majesty's dockyard Woolwich, and at Captain Bevis's office, Liverpool."

**North-west Coast of New Holland.**—A letter from Lieutenant Stokes, surveying officer in the *Beagle*, conveys the following important geographical intelligence:—

"H.M.S. *Beagle*, Swan River, Feb. 24, 1840.

"We have had a most successful cruise on the north-west coast, having discovered three large rivers. By one of them, named after the Queen, I penetrated within 500 miles of the centre of this vast continent. Just as we were leaving the coast I was speared by the natives. The spear entered my left breast, slightly touching my lungs. It was all but up with me. I am now, however, thank God, much better; and, when well, the ship returns to the north-west coast." [Some remarks are added to recommend this coast for colonisation as far superior to New Zealand. It is to be observed that we can hardly get any account from these quarters but what is coloured by parties deeply interested in opponent colonisation schemes and companies.—*Ed. L. G.*]

**Pulla Fishing.**—In our second notice of Dr. Kennedy's work we quoted his account of the Pulla fishing (see page 526), which seemed to us so primitive that we wished, at the time, to illustrate it by a cut. We are now enabled to do so, and beg to shew this curious method to our piscatorial friends.

*The Palamede.*—Mr. Huttman has made

one of his two little chess publications under this title, and now not only gives an extra curious problem, but many quaint and antiquarian miscellanies connected with this fascinating game. The price (2d.) will tempt many to purchase *The Palamede* who are not chess-players; and if the matter be always as entertaining as in the present number, we are greatly mistaken if some of them do not become so.

**G. L. Archbold, Esq.**—This gentleman, for many years connected with the periodical press, and chiefly with "The Times" newspaper; died on Thursday.

**Roman Antiquities.**—We observe that a very curious piece of Anglo-Roman sculpture has lately arrived at St. John's College, and been placed in the entrance to the new bridge. It is fixed on a pedestal, which has the following inscription:—

APOLLINIS ARAM  
PROPE COCCIVM IN AGRO LANCASTRIENSIS  
REPERTAM  
TESTAMENTO LEGAVIT  
THOMAS DUNHAM WHITAKER, LL.D.  
HUIUS COLLEGIUM ALUMNUS.

Several other specimens of Roman art have been deposited in the library of the college, bequeathed to the master and fellows by the celebrated antiquary, Dr. Whitaker; all of which, we are informed, were dug up, at great expense and labour, from the site of the temple of Minerva at Ribchester, in Lancashire. Since the Romans deserted Britain A.D. 410, these interesting relics cannot be less than about 1500 years old.—*Cambridge Chronicle.*

#### LITERARY NOVELTIES.

*In the Press.*

The History of the Early and Present State of Syphilis Examined; wherein is shown that Mercury never was necessary for its Cure, as well as the injurious consequences that result from its employment. By Dr. Hume Weatherhead.—Also, by the same Author, a Second Edition of a Treatise on Headachs.

#### LIST OF NEW BOOKS.

John Murray, Albemarle Street.

#### BOOKS IN THE PRESS.

8 New Burlington Street, Sept. 19, 1840.

MR. BENTLEY will immediately publish the following NEW WORKS:—

I.

The Life, Journals, and Correspondence, of Samuel Pepys, Esq. F.R.S.

Secretary to the Admiralty in the Reigns of Charles II.

and James II.

Including a Narrative of his Voyage to Tangier. The whole now first published from the Originals.

2 vols. 8vo. with Plates.

II.

The Dowager;

Or, the Modern School for Scandal.

By Mrs. Gore.

Author of "Mothers and Daughters," "Seckashin Place," &c.

3 vols.

III.

Memoirs of the Colman Family.

By R. B. Poole, Esq.

Including their Correspondence with the most distinguished

Personages of their Time.

2 vols. 8vo. with Portraits.

IV.

The Clandestine Marriage;

A Story of the Present Day.

2 vols.

Also, now ready,

I.

The Thames and its Tributaries.

By Charles Mackay, Esq.

2 vols. 8vo. bound, with numerous illustrations.

"Two very amusing and very instructive volumes, abounding in anecdote."—*The Times*.

II.

Narrative of the Campaign of the Army of the Indus in Sind and Kaubool, in 1838, 1839.

By Richard Hartley Kennedy, M.D.

Late Chief of the Medical Staff of the Bombay Division of the

Army of the Indus.

2 vols. post 8vo. with numerous illustrations.

"These volumes are crowded with anecdotes and descriptions; they are extremely entertaining, and written in a spirit of vivacity unusual in narratives of this class. The work presents a vivid and interesting history of one of the most important campaigns in which our Indian army has ever been engaged."—*The Atlas*.

Richard Bentley, New Burlington Street, Publisher in Ordinary to Her Majesty.

## BOOKS PUBLISHED THIS DAY.

In 4 large vols. 8vo. price 2l. 2s. in boards.  
**ECCLESIASTICAL BIOGRAPHY; or,**  
 Lives of Eminent Men connected with the History of Religion in England: from the Commencement of the Reformation to the Revolution. Selected and illustrated with Notes, by the Rev. CHRISTOPHER WORDSWORTH, D.D. Master of Trinity College, Cambridge; and Rector of Buxted with Uckfield, Sussex.  
 3d edition, with a large Introduction, some new Lives, and many additional Notes. Printed uniformly with the "Christian Institutes," by the same Editor.  
 J., G., F., and J. Rivington, St. Paul's Churchyard, and Waterloo Place, Pall Mall.

**WILBERFORCE'S PRIZE ESSAY.**  
 In 12mo. price 9s. 6d. boards, the 2d edition of  
**THE PAROCHIAL SYSTEM.** An Appeal to English Churchmen. By HENRY WILLIAM WILBERFORCE, M.A. Perpetual Curate of Bransgore, Hants.  
 \* \* \* To this Essay the Prize of Two Hundred Guineas, offered by the Christian Influence Society, has been adjudged, by the Rev. Dr. Deastry and the Rev. Professor Scholefield.  
 J., G., F., and J. Rivington, St. Paul's Churchyard, and Waterloo Place, Pall Mall.

Rev. C. Girdlestone's Commentary on the Bible, In 8vo. price 9s. boards, the Fifth Part (containing Job and the Psalms, i.—lxxxii.) of  
**THE OLD TESTAMENT, with a Commentary,** consisting of Short Lectures for the daily Use of Families. By the Rev. CHARLES GIRDLESTONE, M.A. Rector of Alderley, Cheshire.  
 In this edition of the Holy Bible, it has been the chief object of the Editor to furnish families with an exposition for daily reading. The Scripture is divided into paragraphs of a convenient length, and the explanatory and practical matter is digested under each portion, into one consecutive lecture, so as to demand of the reader no previous study or attention.  
 Rivington, St. Paul's Churchyard, and Waterloo Place, Pall Mall; and J. H. Parker, Oxford.

Also, lately published,  
**Volume the First (containing the Pentateuch), price 18s.; and**  
**Volume the Second (Historical Books), 18s.;**  
 or in Parts, at 9s. each.

And, by the same Author,

By D. LARDNER, D.C.L.  
 Forming Vol. 137 of "The Cabinet Cyclopædia."  
 \* \* \* Whilst demonstrating the properties of Geometry in a concise, simple, and elementary manner, it has been the object of the Author to give the subject a practical bearing in its various applications to the Arts.  
 London: Longman, Orme, and Co.; and John Taylor.

Price 1s.  
**HIND'S ATMOSPHERIC ALMANAC**  
 and HERALD of the STORMS for 1841. Containing the general Features of the Weather in Great Britain, with its Local Characteristics; the Hurricanes and Gales of Wind on the Coast of England and the Continent, the West Indies and North Atlantic Ocean, the Mediterranean and Black Seas, on the Southern Shores of Europe, &c. &c.  
 J. S. Hodson, Publisher, 115 Fleet Street.

In post 8vo. price 4s. embossed cloth,  
**ROSABEL; or, the Sonnambulist; and HELVETIA. Poems.**  
 By THOMAS CHARLES CATHREY, Esq. Of the Inner Temple.

Also,  
**Bennett's Sermons.**  
 2 vols. small 8vo. price 14s.  
 London: W. J. Cleaver, Baker Street, Portman Square.

Handsome printed in 4 vols. 8vo. with Portrait, price 2l. 16s. cloth, lettered,

**THE WHOLE WORKS of the late RICHARD GRAVES, D.D.** late Dean of Ardagh, Rector of St. Mary's Parish, and Regius Professor of Divinity in the University of Dublin. Now first collected. To which is prefixed the Life of the Author, by his Son, RICHARD HASTINGS GRAVES, D.D.

Contents:—  
 Vol. I. Memoir, and Essay on the Character of the Apostles and Evangelists, designed to shew that they were not Enthusiasts.  
 Vol. II. Lectures on the Last Four Books of the Pentateuch, designed to shew the Divine Origin of the Jewish Religion, chiefly from internal evidence.  
 Vol. III. First Proposition as Professor of Divinity—Select Scriptural Proofs of the Trinity, in Four Discourses, with Notes and Illustrations—Absolute Predestination compared with the Scripture Statement of the Justice of God.  
 Vol. IV. Sermons on various Occasions.  
 Whittaker and Co. Ave Maria Lane, London; Curry and Co. Dublin.

Printed by HANNAH PAGE MOYES, of Brook Green, Hammermith, and GEORGE BARCLAY, of Number 2 Pall Mall, Place, Islington, both in the County of Middlesex, Printers, at their Printing Office, Number 28 Castle Street, Leicester Square, in the said County; and published by WILLIAM ARNHEIMER SCRIPPS, of Number 13 South Molton Street, in the Parish of Saint George's, Hanover Square, in the County aforesaid, at the LITERARY GAZETTE OFFICE, Number 7 Wellington Street, Waterloo Place, Strand, in the said County, on Saturday, September 12th, 1840.

**THE BRITISH ASSOCIATION.**  
TENTH MEETING: GLASGOW.

THE time of meeting at Glasgow (the middle of the week) and the distance from London, notwithstanding Rowland Hill's penny accommodation, gives us, on the Saturday, little more to do than announce the initiative proceedings of the meeting. [The influx of visitors appears to be very considerable, and the preparations for their reception very complete. Not that our countryman, Sanders, does not seem disposed to make the strangers "birle their bawbees;" for the hotel and lodging charges are on the highest possible scale; but the local and provisional government have done every thing to make it convenient for the members of the Association, and the rest depends not on them but on private interests: and when did any interests in a commercial community fail to take advantage of an increased demand?]

But to the little business we have before us for No. 1235.

On arriving in Glasgow, which it is a striking thing to do at night, with the palatial factories all lighted up, and a wealth beyond royal residences, one is rather surprised at the dimness of the streets, where coal, and consequently gas, can be so cheaply employed. But, truth to say, the hard-working factories look brilliant, and the idle streets miserable. Well, after the meeting of the British Association it is to be hoped the ancient city will be more enlightened.

On Wednesday the first Committee Meeting was held in the Faculty Hall, College, the most noble the Marquess of Breadalbane, President, in the chair. Among the staff around we noticed the Marquess of Northampton, the most constant friend of the Association, and a number of men whose names in science need no additions to particularise them; though, before the meeting ended, we felt puzzled, as in old clannish affairs, with the iteration of the same Robertsons, Thomsons, Grahams, &c. &c., with different modes of spelling, introduced by civilisation and learning!! There were, however, Sir J. Robison, Murchison, Sabine, Whewell, Forbes, Sykes (Colonel), Yates, Delabeche, Scott Russell, Griffiths, Phillips, T. Thomson, J. Thomson, Stevely, Turner (of Newcastle), Lyell, Wallace, and others, whom we have thus arranged in no order, for we hate etiquette in such enumerations, and hold Science to be better served by equalities than elaborate order of precedence.

The Marquess of Breadalbane having taken the chair, the minutes of the last (Birmingham) meeting were read and confirmed.

The Report of the Council for 1839 was read, the chief points in which related to the grant of £250l. in addition to the local expenses at Birmingham, and 300l. for the present meeting at Glasgow. Mr. Yates (the Secretary to the Council), in conclusion, stated that in consequence of the increased and vigorous prosecution of the scientific objects adopted by the Association, the call upon the fund had been greater than was calculated, and that in order to meet the expense they had sold out 500l. three per cent consols. He also noticed a re-

quisition, signed by five members, relative to the terms of admission; the result of which was that the Council had determined to abide by the rules agreed to last year (i. e. 2l. the first subscription), but to allow lapsed members to return on paying the single pound sterling.

The next portion of the Report referred to the publication of the Association's "Transactions;" and it was resolved to publish the annual volume within four months of the close of the meeting, within which time the corrected papers of the contributors should be furnished for the printer. Those that came later to be postponed to the next year's volume. The Birmingham Report to be expedited. [It has been published.] The succeeding volumes not to be numbered as in series, and 750 copies to be published: the last, we did not hear distinctly.

The next part of the Report mentioned a difference of opinion between Professor Owen and Mr. Nasmyth, on papers respecting the Structure of the Teeth; which had led to a suspension of the publication of Mr. Nasmyth's papers in the "Transactions" of the Association. Upon this subject we are, at present, unprepared to make any remark. Mr. Nasmyth's papers appeared in the *Literary Gazette*, No. 1183, and an extreme pressure of occupation unfortunately prevented our answering a letter from Mr. Owen, previous to leaving town. In this position (with an apology due to the latter gentleman) we are silent. The whole matter is referred back to the Medical Section at Birmingham.

Professor Daubeny's Report on the Connexion between Agriculture and Chemistry is promised for the meeting of 1841, as it could not be ready for the present.

Some beneficial arrangements were announced, in respect to issuing the lists of papers to be read daily in the Sections, those withdrawn, and other useful temporary information.

Mr. Phillips noticed Mr. Kingsley's suggestions at the close of the last meeting, which seemed to be indefinitely postponed.

The Officers for the meeting were then announced as follows:—

**SECTION A.—Physics, &c.**  
President.—Professor Forbes. Vice-Presidents.—Professor Airy, Professor Whewell, Dr. James Thomson. Secretaries.—Professor Stevely, Dr. Forbes, A. Smith, Esq.

**SECTION B.—Chemistry.**  
President.—Dr. Thomas Thomson. Vice-Presidents.—Professor Graham, Professor Johnston. Secretaries.—Dr. R. D. Thomson, Dr. Clarke, Dr. Playfair.

**SECTION C.—Geology.**  
President.—C. Lyell, Esq. Vice-Presidents.—Dr. Buckland, H. F. Delabeche, Esq., J. Smith, Esq.—Secretaries.—D. Milne, Esq., H. E. Strickland, Esq., —Scoular, Esq. Geography (attached to this Section); Mr. Greenough, President. Vice-Presidents.—Captain Washington, H. Murray, Esq.

**SECTION D.—Zoology and Natural History.**  
President.—Sir W. Hooker (whose attendance is, however, not expected). Vice-Presidents.—Sir W. Jardine, Professor Graham of Edinburgh, Dr. Fleming, Prideaux Selby, Esq. Secretaries.—R. Paterson, Esq., E. Forbes, Esq.

**SECTION E.—Medical.**  
President.—Dr. James Watson. Vice-Presidents.—Dr. Buchanan, Hodgkins, Macfarlane. Secretaries.—Drs. Cooper, J. Brown, and Rees.

**SECTION F.—Statistics.**  
President.—Lord Sandon. Vice-Presidents.—Sheriff Alison, Dr. Chalmers, Colonel Sykes. Secretaries.—Messrs Ramsay, Rawson, Baird.

**SECTION G.—Mechanics.**

President.—Sir J. Robison. Vice-Presidents.—Dr. Robinson (Armagh), Duke of Argyll (a volunteer offer in aid of the Meeting, the announcement of which met with great applause), Messrs. J. Taylor, James Walker. Secretaries.—Messrs. Scott Russell, Vignoles, James Thomson, and James Todd.

Dr. Abercrombie was added, in a complimentary manner, to the Medical Section as a V.P.

The Secretaries, &c. were requested to stop after the Meeting, and prepare the business for the ensuing day.

The appointment of the Committee of Recommendations was next made; and this is the moving wheel of the whole, as the members are elected to represent the various Sciences and Sections which form the pursuits and the directing powers of the Association. For this body were named and approved, A.—Forbes, Airy, Whewell, Wheatstone. B.—J. Thomson, Graham, Johnston. C.—Lyell, Buckland, Delabeche. Geography.—Greenough. D.—Jardine, Graham, Fleming. E.—James Watson, Hodgkins, Brown. F.—Lord Sandon, Sykes, Heywood. G.—Robison, Robinson, J. Walker.

The official members also belong to this Committee; and the Marquess of Northampton's name was most properly retained upon it.

Some minor details were agreed to, and the Treasurer's Report was received. It was from 15th Aug. 1839, to 31st Aug. 1840:—

The balance in hand, 460l. 13s. 4d.	
1535l. 2s., compositions for subscriptions, dividends, &c. in all, a fund of 3054l. 18s. 1d.	
The expenditure at Birmingham, 250l.	
Incidents, 103l. 11s. 1d.	
Salaries, 247l. 10s.	
Grants for scientific purposes already paid, 1548l. 4s. 4d.	
Printing volume, lists, &c., 521l. 19s. 4d.	
Value of property, 17th September:—	
Balance.....	£309 11 6
In the Funds.....	4425 0 0
Stock (at a low valuation) ..	1160 0 0
	£5894 11 6

There was therefore a considerable reduction; but it was accounted for by the deficiency of receipts at Birmingham, and the increased amount of advances for scientific purposes.

Monday next was appointed for the arrangement of place, president, &c. for the ensuing year. And, on the motion of the Marquess of Northampton, thanks were voted to the President, and acknowledged.—Adjourned.

Of the preparations for the Glasgow meeting, the details are given in the subjoined directions:—

**OFFICE-BEARERS, 1840.**

President.—The Marquess of Breadalbane. Vice-Presidents.—The Very Rev. Principal Macfarlan; Major-General Lord Greenock; Sir D. Brewster; Sir T. Brisbane. General Secretaries.—R. I. Murchison, Esq., and Major E. Sabine. General Treasurer.—J. Taylor, Esq. Assistant General Secretary.—J. Phillips, Esq. Secretaries for Glasgow.—Professor J. P. Nichol; A. Liddell, Esq.; J. Strang, Esq. Treasurer for Glasgow.—C. Forbes, Esq. Secretary to the Council.—J. Yates, Esq.

**PROGRAMME OF THE PROCEEDINGS OF THE MEETING.**

Meetings.—The General Committee will hold its first meeting on Wednesday, 16th September, at one o'clock, in the Faculty Hall of Glasgow College, and will meet afterwards according to adjournment.

The Sections will assemble for the reading and discussion of reports and other communications on Thursday, 17th September, at 11 A.M.; and afterwards, at the same hour, daily, during the week of the meeting, excepting Wednesday the 23d, in the following rooms of Glasgow College:—

Sect. A. Mathematics and Physics	Greek Class Room.
B. Chemistry and Mineralogy	Chemistry Class Room.
C. Geology and Physical Geography	Common Hall.
D. Zoology and Botany	Divinity Class Room.
E. Medical Science	Latin Class Room.
F. Statistics	Logic Class Room.
G. Mechanical Science	Anatomy Class Room.

In case of the subdivision of any of the Sections, rooms will be appointed for the purpose.

The Sectional Committees will meet on Thursday, 17th, at 10 A.M., and afterwards at the same hour, daily, during the week of the Meeting, in rooms adjacent to the Section Rooms, for the transaction of the business specified in instructions delivered to the Secretaries of each Section.

The Model Rooms in Buchanan Street and the Arcade will be open during the whole week of the Meeting, from 8 A.M. to 10 P.M.

**Evening Meetings at Eight P.M.**—On Thursday Evening, the 17th of September, the first General Meeting of the Association will be held in the Theatre Royal; when the Marquess of Breadalbane, F.R.S. the President elect, will take the chair, and the Address of the General Secretaries will be read by R. I. Murchison, Esq. F.R.S.

On Friday and Monday Evenings, Promenade in the Royal Exchange Rooms, at 8 P.M.

**The Concluding General Meeting** will take place on Wednesday, 23d, at 3 P.M., in the Theatre, when the proceedings of the General Committee, and the grounds of the several grants of money sanctioned by them, will be explained.

**Ordinaries, &c.**—Breakfast will be provided daily during the week of the Meeting, from 8 to 10 A.M., in the Trades' Hall, Glassford Street.—Ticket, paid at the door, 1s. 6d., including servants.

The Members of the Association will dine together on Tuesday, 22d, in the Theatre, at half-past 5 P.M.—Ticket, including wines, 12s. 6d.

Ladies having right of admission through gentlemen present at this dinner, will be accommodated with seats and refreshments in the boxes or galleries.

An ordinary will be provided on the other days of the week in the Trades' Hall, Glassford Street, at 5 P.M.—Ticket, including servants, 3s. 6d. each.

Plans of the dinner and of each day's ordinary (on a large scale) will be placed in the Reception Room, Hutchesons' Hospital, where attendance will be given daily, on and after Monday, 7th September, for the purpose of entering the Names of Members as they secure their places, and receive payment for their dinner tickets.

No place for any of the ordinaries can be taken by Members resident in, or within fifteen miles of, Glasgow, until 9 A.M. on each respective day; but Members coming from a greater distance have the privilege of securing, in addition to their own ticket, another for a friend, whether resident or not.

**Excursions, &c.**—Excursions to Arran, and to the mineral districts of Scotland, are proposed. Details of which will be published after the Sections meet.

A Promenade in the Botanic Garden, on Saturday, 19th September, at 2 P.M.

*List of Places and Objects to which Members will be admitted on producing their Tickets, on every day of the Meeting; Sundays, and in a few cases, other days that are named, excepted.*

**News Rooms, &c.**  
Royal Exchange, from 7 A.M. till 10 P.M.  
Tontine, from 7 A.M. till 10 P.M.  
Library of Chamber of Commerce, Royal Exchange, from 9 A.M. till 4 P.M.

**Institutions.**  
Hunterian Museum, College, from 8 A.M. till dusk.  
Museum of Minerals found in the West of Scotland, College Library Hall, from 8 A.M. till dusk.  
Anderson's University, Library and Museum, George Street, from 8 A.M. till dusk.  
Mechanics' Institution, North Hanover Street, from 8 A.M. till dusk.  
Botanic Gardens, Sandyford Road, 6 A.M. till dusk.  
Deaf and Dumb Institution, Barony Glebe, every day except Saturday and Sunday, from 10 to 12 A.M., and from 2 to 4 P.M.  
Normal Seminary, Dundas Vale, every day except Saturday and Sunday, from 9 till 12 A.M.  
Asylum for the Blind, from 10 A.M. to 6 P.M. Rehearsal of Music, Reading, and Geography, by the Blind, from 2 to 4 P.M.  
House of Refuge for Boys, Duke Street, from 2 to 5 P.M.  
Night Asylum for the Houseless, 11 St. Enoch's Wynd, from 8 A.M. to 6 P.M.

**Public Buildings, &c.**  
The County and City Bridewell, Duke Street, from 8 A.M. to 6 P.M.  
The Town Hall, Cross, from 8 A.M. till 6 P.M.  
The Cathedral, in Kirk Street, from 8 A.M. till dusk.  
The Necropolis, Do. do. from 8 A.M. till dusk.  
Edinburgh and Glasgow Railway Tunnel, Parliamentary Road, and Station, head of Queen Street, from 8 to 12 A.M.

We have only to add that privilege (red) tickets have, with great propriety, been presented to the members of the Glasgow college, and foreigners, and Americans, and that the first (Wednesday's) day is of the West-country kind—dampish.

#### REVIEWS OF NEW BOOKS.

**A Volume of Lyrics.** By Mrs. Cornwell Baron Wilson. 12mo. pp. 407. 1840. London, Cunningham; Edinburgh, Anderson.

THIS lady is so well known through her numerous contributions to the periodicals, we need only to announce that she has "called home" her wanderers, dressed and arranged them becomingly, and sent them once more into the world by themselves; where they will, we doubt not, find many new admirers. We wish the fair authoress had distinguished the new pieces from those which have before appeared: she has, however, arranged the volume carefully under the different heads of odes; anacronitics (which we like best, although it is a lady who says "Drink man, drink"); elegies, serious and domestic; lyrical pieces; lays of the passions; songs of the hours; songs of the olden time; Welsh melodies; ballads; miscellaneous pieces, &c.

At the risk of repetition (though we think we have steered clear of it), we venture to quote several specimens, which, were it needed, would prove Mrs. Wilson's claim to a distinguished place among the poets of the day:—

#### "Ye Burning Stars.

Ye burning stars! that float in ether free,  
Answer, oh! answer to my anxious quest!  
Reveal, reveal the wondrous tale to me—  
Where doth the disembodied spirit flee?  
Is't to your distant realms of endless rest?  
Answer, oh! answer me!

Thou blazing orb that rul'st the glorious day,  
Answer, oh! answer to my anxious thought;  
Illume my darkness with thy Heaven-lit ray—  
Doth the soul wend to thee its trackless way,  
When it hath rent the veil that earth has wrought?  
Answer, oh! answer me!

The burning stars, the blazing sun's reply  
Echoes the human heart:—"To us unknown,  
And but reveal'd to One immortal eye.  
Closed from all else, is the great mystery,  
The wondrous mystery of spirits flown!  
We cannot answer thee!"

The following is a sweet piece:—

#### "Stanzas.

Is it a phantasy, that we shall greet  
The loved of earth in that far spirit-land

The weary sigh for? If it be, 'tis sweet,  
And vision fair as poet's eye e'er scan'd;  
And life were worthless, if we had not this  
Bright iris of the soul, and glimpse of future bliss.

But 'tis no dream! To doubt were to destroy  
The only balsam for the mourner's wound;  
To dash from thirst parch'd lips the draught of joy,  
When the worn pilgrim hath the well-spring found;  
The arid waste of life's lone desert past,  
To tear away the bowers Hope builds for him at last.

We defy the dead!—and make their tombs  
The shrine wherewith the bruised heart may pay  
Its mournful homage;—memory's rose-leaf blooms,  
And sheds sweet fragrance round their sleeping clay;  
And wither'd hopes their faded garlands bring  
To deck the spot where those we loved lie slumbering.

The dead! the lost!—their shadow o'er our path  
Steals at the peaceful hush of twilight's hour,  
When passion's storms have quench'd their fiery wrath,  
And gentle memories reign with fairy power;  
Falling like dewy showers on nature's bed,  
Reviving hearts like flowers—by the world withered.  
And can we think, that those the clouded eye  
Beholds in earth's low vale as things of light,  
And beacons for us here—"It will not decay  
When Heaven hath lit its darkness,—and made bright,  
And clear as noon, all that is now obscure?  
Ah! yes! those ties of love hereafter must endure.

We shall be known and know!—though atheists scoff,  
And sceptics doubt, and jeering cynics chide,  
When we this "mortal coil" of flesh throw off,  
The bridegroom shall again embrace his bride,—  
The child shall meet the parent's fond caress,  
And re-unite earth's link of sever'd happiness!"

Notwithstanding its length, and the subject having often invited the muse before, there is so much originality and feeling in the last composition we cite, that we must find room for

#### "Death's Progress.

Death wander'd through this vale of tears,

And land of mortal birth

To mark the feelings and the fears

His presence sheds o'er earth.

To see how the victims doom'd his prey

Would make excuses all:—

And seek to put off the reckoning day,

When the steward's voice should call.

A little longer to drag the load,

And carry the weight of years,

Though cheerless and sad life's rugged road

To the traveller appears.

He met a maiden with flow'rets fair,

Twin'd round her graceful brow;—

While the laughing spirit of hope shone there,

And Death whisper'd, "My bride art thou!"

But the maiden smiled, for beauty's light

Was sparkling in her eye,

And cried, "Hence, hence, thou grisly sprite!—

Youth is no time to die!

For I have hearts to win and wear,

'Mid a path with roses strown;

And love, and joy, and bliss to share,

Ere I can be thy own."

And Death laugh'd and said, "Poor silly maid,

I'll aim no dart at thee;

For Pleasure's self, without my aid,

Will claim mine own for me!

And in the hectic of thy cheek,

And the lustre of thine eye,

Consumption's subtle workings speak,

Death's trusty firm ally.

And thou shalt wear my bridal shroud

Ere autumn's red leaves fall;

And fade away from life's glittering crowd

Like a wreath from the banquet hall!"

Death came to a roofless haven, where

Pale Misery's daughter lay;

Beside her stood the fiend Despair,

Companion of her way:—

Lost one!—for her Death had no dread.

But with a welcome sigh

She flung her down beneath his tread,

And eager sought to die!

For she had drain'd the poison'd cup

Of early shame and crime,

And she render'd her broken spirit up

Ere Death had cried, "T is time!"

Next he visited the battle-plain,

Where the red Conqueror strode,

And Death felt his zeal was weak and vain

To that the hero shew'd;

Who 'neath the shelter of glory's wing,

Letting war's blood-hounds free;

Saw the warm blood of his brother spring.

And call'd it—victory!

And Death let him 'twine new wreaths to twine,

Gom'd by the widow's tear;

For he own'd no mortal hea'd his shrine

Like the laurel'd conqueror here.

He took his seat at the Rich Man's board,

When the mirth grew loud and high;

But the rich man laugh'd, for the wine was pour'd—

Was that an hour to die?

And he said, 'I have barns to build and fill,  
And vassals to command;  
Vineyards to reap—and fled to till—  
I pray thee stay thine hand!  
But Death replied, 'Pescce, heedless one!  
This night thou must depart;  
Cast from thee, ere life's thread is spun,  
These mammons of the heart!'

But he would not, and still held his state  
With his flattering followers round;  
The feast was long, and the guests stay'd late,  
But Death was the last guest found!  
For he linger'd, unwilling to strike the blow  
'Mid the shinner's mad career  
(For Death at least is no coward foe,  
But warns ere he points his spear);  
Yet he grappled at length the heedless fool,  
By wealth and splendour curst;  
As he drain'd a last cup in vain—to cool  
His parch'd tongue's slakeless thirst!

He paus'd where a child 'mid the young spring flowers  
Of a valley was at play,  
And beckon'd him thence to other bowers  
Ere life's morning had dawn'd to-day!  
And the boy was fain to go with him  
To that land of hope and bloom  
Death promis'd—where no shadows dim  
O'er childhood's path can come;  
For the summer doth'd his terrors all  
To that pure and stainless child,  
And wore a lillied coronal,  
And like cherub-playmate smiled.

Death journey'd on, and in his way  
Stood rising Manhood's form;  
His cheek glow'd fresh with health's bright ray,  
His breast with hope was warm;  
And Manhood said—'My brow is wreath'd  
With the rich and purple vine,  
There love's voluptuous rose hath breath'd  
My festal crown to twine:  
Bid me not hence!—the world for me  
Is fill'd with radiant things,  
And glimpses of pleasures yet to be  
Flit round on rainbow wings.'

He stopp'd where Age on its crutch reclined  
And rested upon its way,  
Tott'ring beneath the paining wind  
That lifted its locks of grey;  
And Age drew forth its hoarded wealth  
(As the visitor surmised),  
And proffer'd it all for that squander'd health  
Manhood had little prized.  
But Death refused the idol—gold,  
From the miser's shrivel'd palm;  
And his victim's shriek too sadly told  
For Death wealth has no balm.

He stood at last by the Christian's bed,  
With a kneeling group around;  
There nature's holy drops were shed,  
But no murmuring lip was found;  
And the good man said with a placid tone  
(For he knew his race was run),  
'Friend! art thou come to bear me home?  
His will, not mine, be done!  
And Death bore him thence on a seraph's wing  
To his Father's high,  
And the Christian felt 'Death hath no sting,  
The Grave no victory!'

*Casarea: the Island of Jersey, its History, Peculiar Privileges, Produce, Antiquities, &c. &c.* Pp. 330. London, 1840. Baker; Simpkin and Marshall.

WE have elsewhere noticed a guide to the Channel Islands, by Mr. Mudie. The present is a production of more consequence as relates to Jersey, and is replete with every kind of information which can be desired respecting that island. From the yet more elaborate works of Falle and Pless, as well as from Inglis and the minor and local compilers of intelligence, the author has made a volume of sufficient compass and merit; and, by adding memoirs of the eminent natives, has given a new feature of considerable interest. A tour round the coast and into the interior, illustrated by engravings, satisfactorily completes the whole design. We need not go through a performance of this class; but two or three selections are due to it, and to those who may now, by the readiness of transit, be induced to visit: as we find many persons have done this summer, and are doing this autumn.

"Private gardens yield every natural luxury that the climate can produce; and from this source the market is principally supplied. The

peach-apricot is remarkable for its size and beauty. Melons are in profusion, and strawberries have been noticed for superiority of flavour. Of winter fruits, the pearmain is here a very good eating apple, and reckoned to keep longer than almost any other. But the pride of this island is the chaumantelle, which is a pear sometimes nearly a pound in weight. This delicious fruit frequently sells on the spot for five guineas per hundred, and is sent to English friends as a choice present. The colmar, though in less general estimation, is by many considered as even a superior kind. Both these species keep for several months; but they require great care and almost daily attention. Formerly, when a very considerable quantity both of mead and perry was made in the island, bees were a particular object of attention; from the honey were made two kinds of mead, called vittee and boschet, and so strong was the former, that when any one in his libations had exceeded the bounds of moderation, the taunt was '*vous êtes envittoé*;' but a comparatively small quantity of either of these is now made, although the Jersey honey is still in high estimation in the English market; and if the islanders adopt the suggestion of the Agricultural Society, it may yet be an important article of Jersey produce and profitable trade. In the MS. account of Jersey, it is stated that hemp and flax were formerly grown and dressed on the island; during the time that these were cultivated tillage declined, as 'a painful occupation.' The islanders have, however, become more industrious, and are now willing to endure the pain of cultivating their land, for the sake of the profit it affords them. From the trifling difference between the latitude of Jersey and that of the southern coast of England, and from its proximity to the Continent, by which it is embraced on three sides, an Englishman would not be led to expect any great variation between the climate of Jersey and that of his own country. There is, however, a sensible difference, particularly with respect to the season of winter, for the climate of islands is always more temperate than that of continents in the same parallel. Frost is rarely of any continuance: snow seldom lies more than two or three days on the ground; and shrubs that require to be sheltered, even in Devonshire and Cornwall, are here exposed without any covering, and seldom receive much injury. We see also carnations, pinks, and others spring flowers, blowing, during winter, in the open air, in a favourable aspect; and, with a little shelter, even the Chinese rose. Rains are indeed more frequent in the island: fogs that rise from the sea, and spread themselves over the land, are not uncommon; and Jersey is subject to boisterous gales of wind, especially from the western quarter, from whence it blows more frequently than from any other point of the compass. The weather is, occasionally, very warm in summer; but that oppressive sultriness, sometimes experienced in England and on the Continent, in hot summers, is seldom felt."

The explication of this does not appear to us to be very conclusive. The author says:—

"This nearer approach to equality of temperature is the natural consequence of Jersey being completely open, on one side, to the Atlantic Ocean, and to its comparative minuteness, whereby every part receives a portion of the vapours exhaled from that immense body of water."

With regard to trade we are told:—

"A sensible writer, in reference to the trade of Jersey, has made the following judicious remark: 'During the last war privateering of-

fered to capitalists of these islands the hope of a speedy fortune; and, indeed, the privateers of the Channel Islands were very successful, and brought large sums to many persons who were interested in them. But when peace was proclaimed, several who had made a fortune withdrew from business, especially in Guernsey, whose trade, not being established on sure or permanent ground, declined. The Newfoundland trade offered a substratum to our industry; and, since the war, the profits to the principal merchants on each commercial transaction may have been less, but industry has increased, and with it our wealth, our commerce, and our prosperity.' The island has a direct trade with Sweden and Norway for timber, which, owing to the great increase of buildings, has of late years been considerable. The average annual importation for the last few years has been above 1400 loads of fir, and about 500 loads of oak timber. The exports to that kingdom, which are trifling, consist principally of coffee and sugar, the produce of the Brazils. From Russia are imported cordage, hemp, tallow, and linen. Wheat and barley are the principal articles from Prussia: the average annual importation of the former for the last three years was 15,000 quarters, and of the latter somewhat more than 1500 quarters. Denmark also supplies the island with grain; which, added to the former quantity, would make the importation of wheat to be about 20,000 quarters annually, and of barley about 2000. Timber and grain are also brought from Hamburg, but not in any great quantities. Salt provisions and flour are imported from the two latter countries. The principal articles supplied to these countries are coffee and sugar, mostly shipped immediately from the Brazils. With Holland the trade is considerable, consisting in the importation from that country of Geneva, cheese, hoops, and tiles. The quantity of Geneva imported into the island depends in a great measure on the price of brandy; but it averages 45,000 gallons annually. The exports to Holland are the same as to the other kingdoms of the Continent, above alluded to. The imports from Spain and Portugal are wine, brandy, fruit, and salt. Wine and brandy are also imported from Sicily. The average annual importation of the three kingdoms is about 70,000 gallons of wine, and considerably more than 100,000 gallons of brandy. The island is principally supplied with oranges and lemons from Sicily. At Honduras, the Jersey merchants have two establishments in the mahogany trade, which employ five ships, together of upwards of 1400 tons burthen. The mahogany is mostly sent to England: the island consumption is not large. The exports to Honduras are flour, potatoes, printed cotton, linen, stockings, and Geneva, but only a small quantity of each. The trade to the Brazils is not only considerable, but very important. That country consumes a great quantity of the fish furnished by the Jersey trade, and supplies the island in return with sugar and coffee; a portion of which, as has already been observed, is sent to the Continent in exchange for its timber and corn. This trade alone employs twenty vessels, of a total of about 4000 tons. The annual import is about 600 tons of sugar, and upwards of 600,000 lbs. of coffee. The quantity varies annually, through a variety of causes; for sometimes it may be more convenient to a merchant to land a cargo, and send a part in another vessel to the north, or even the whole, if he require his vessel to proceed forthwith on another voyage; or the season may be too late for a ship to proceed, and the cargo is stored

for the winter, till the navigation with the northern ports is open. The trade with France, compared to that of England, is not great, and the exports very inconsiderable: they consist principally of coals, bricks, and potatoes. French wines, brandies, and live stock, form the principal articles of import: an average of three years would give about 70,000 gallons of the former, 50,000 gallons of the latter, and about 2500 head of oxen. Fruit also is supplied from France. A few thousand yards of linen and cotton are annually brought over, probably more on account of the superior taste which the French display in their patterns, than from any advantage in quality or price. Muslins and silks are also articles of import. French pottery is much esteemed in Jersey; and a considerable quantity is brought to the island, which is considered preferable to the English for the use of the dairy, though stone ware and red-pottery are mostly brought from England. The trade with England need scarcely be specified: it supplies a large proportion of the island consumption—whether raised from her soil or formed by her industry—coals, iron, sail-cloth, hardware, every article to be made up for clothing; indeed, England is the general merchant that sells to Jersey. The supply from France, with the exception of wine, brandy, and live stock, is rather incidental than otherwise. The average importation of coals is about 20,000 tons, of which a few tons are reshipped for France."

Of the antiquities, some Druidical monuments called *poquelays* are the most remarkable; but we must refer the reader to the detailed accounts of them in the work, or to one of these temples not far from London, having been transported from the island by General Conway, and re-erected in his grounds near Henley-on-Thames. Of the name itself the following notices occur:—

"The different kinds of temples, or, as it is sometimes the case, the different parts of the same temple, known in England by the term *cromlech*, or *cairn*, are in Jersey expressed by one general name—all are called *poquelays*, of whatever character or dimensions. Neither Mr. Falle, nor any other author who has written on the island, has even hazarded a conjecture why they were so called, and the French word *dolmen*\* does not bear any affinity to the name; it must, therefore, be left in its native obscurity. It may, however, be observed, that the termination of the word is the same as the English *cromlech*; *lech*, *leh*, or *les* in Celtic, meant a stone—so doubtless *laye*, in *poquelaye*, has the same meaning; as, likewise, *carnlèh* in Scotland, and *cromlèh* in Ireland."

And another interpretation is thus supplied:—"This seems to be a British compound word; for, in Cornwall, we still call a heap a *pook*, as a pook of hay, a hay-cock; and *laye* is nothing but *leh* in Amorric and Cornish, signifying a flat stone; so that *pook-leh* (Gallic, *poquelaye*) means a heap of stones."—BORLASE'S *Antiquities of Cornwall*. As we should, however, look for its derivation rather from a Gallic than a British source, it may, with more probability, come from *pouqua*, or *pouqui*, which in old French means a *fairy*; and as, since the times of the Druids, their temples have been supposed to be visited by these elfs, *poquelays* may mean the resort of fairies."

\* We believe this is a name applied to a variety of the *cromlech*, with the differences of which our author does not appear to be conversant.—Ed. L. G.

*Lives of the Queens of England from the Norman Conquest, &c.* By Agnes Strickland. Vol. III. 12mo. pp. 448. London, 1840. Colburn.

THIS volume completes the first series of Miss Strickland's design, commencing with the first Anglo-Norman and concluding with the last Plantagenet queen. When the work appeared, we offered our testimony much in its favour, and, more lately, we spoke of the second volume in terms of yet warmer approbation; and now that we are enabled to view it as a whole, it is with pleasure that we can give our opinion that the farther the author has proceeded the better she has succeeded. The last volume is incomparably superior to the others, both in materials and execution;—the execution, we fancy, improving in consequence of the materials possessing so much greater interest.

Our praise, therefore, is very sincere; but Miss Strickland has received her meed from a much higher authority,—one of the most sagacious and brilliant historians of the age—M. Guizot; and when she can refer to such, she may care the less for tribute from us. We will, nevertheless, pay what is due to her; and, what is more, carry along with us the kind and liberal encouragement of our illustrious contemporary. In her preface, Miss S. writes:—

"Many apologies are due to an indulgent public for the tardy appearance of the third and concluding volume of the first series of the *Lives of the Queens of England*. The cause of this delay will be best explained by a letter which I had the honour of receiving from his Excellency Monsieur Guizot in May last, and which I avail myself of his courteous permission to publish, as affording not only a cogent reason for the postponement of the present volume, but a testimonial of those preceding it, of which I can scarcely be too proud.

"Londres, Mai 17, 1840.

"Mademoiselle,—Je réponds bien tard à la honte que vous m'avez témoignée en m'envoyant vos *Vies des Reines d'Angleterre*. Je n'ai pas voulu vous en parler sans les avoir lues, et jusqu'ici j'ai eu bien peu de temps disponible. J'ai lu enfin, mademoiselle, et avec un bien vif plaisir. C'est un ouvrage charmant, plein d'un intérêt sérieux et doux. Vous avez étudié les sources, et vous savez présenter les faits simplement, bien que sans sécheresse. Ma lecture finie, j'ai envoyé votre livre à mes filles, qui sont encore à Paris, et qui le lisent à leur tour avec le vif amusement de leur âge. Agréez, je vous prie, mademoiselle, tous mes remerciemens et l'hommage de mon respect.

"GUIZOT."

"P.S.—J'ai écrit à Paris pour demander s'y existent quelques documents particuliers et inédits sur l'histoire de Marguerite d'Anjou. Si on m'en envoie, j'aurai l'honneur de vous les transmettre."

"I had been so materially indebted, in the first and second volumes of the *Lives of the Queens of England*, to the invaluable documents which the research of this illustrious statesman-historian has been the means of rescuing from oblivion, that I was naturally anxious to avail myself of his friendly assistance in writing the memoir of Margaret of Anjou; and as Monsieur Michelot, the president of the Historical Society at Paris, M. Lefrevoit, M. Abel Hugo, Mademoiselle Fontaine, and several learned friends besides, were most kindly engaged in exploring the treasures of the Royal Archives of France, and the MS. collections of Normandy and Lorraine, with reference to the same object, I considered the delay of a few weeks in the publication of the present volume

as a matter of duty. The result will, I trust, sufficiently justify me for having ventured to depart from my original plan of presenting these volumes in monthly succession."

Let Miss Strickland be assured that her apology is more than sufficient; and that the public would rather wait many months to have such a production enriched with new facts and illustrations, as this has been, than have a crude and hurried compilation of commonplaces presented to them like number-work, on the last or first of every moon.

The volume contains memoirs of Isabella, the child-queen of Richard II.; Joanna, the mature queen of Henry IV.; Katherine, the Shaksperian queen of his warlike son; Margaret, the queen of Henry VI.; Elizabeth Woodville, queen of Edward IV.; and Anne of Warwick, the queen of Richard III. If we cast a retrospect upon their lives, how little reason have we to envy their fate in that troubled age! Heaven grant that in our time, at least, one Queen may enjoy a larger share of happiness! Those had all their full lot of human and female misery, with, perhaps, the exception of Isabella, whose early death, in childhood, at the age of twenty-two, after losing Richard and wedding her accomplished cousin Orleans, saved her from the calamities of a lengthened life. About this little lady we shall repeat only one descriptive passage, which shews how soon the puppets can be taught to move, whether in royalty, in lower ranks, or on the stage:—

"When the English embassy arrived at Paris, they were lodged near the Croix du Tiroir, and their attendants and horses, to the number of five hundred, in the adjoining streets. The King of France resided at the Louvre, and the queen and her children at the Hôtel de St. Pol, on the banks of the Seine; and the better to please the English lords, their request was granted to visit the queen and her family, and especially the little princess they were soliciting to be the wife of their king, as they were impatient to behold her. This had been at first refused, for the French council excused themselves by observing, 'That she was as yet but eight years; how could any one know how so young a child would conduct herself at such an interview?' She had, however, been carefully educated, as she proved when the English nobles waited upon her; for when the earl marshal dropped upon his knee, saying, 'Madam, if it please God, you shall be our lady and queen.' She replied instantly, and without any one prompting her, 'Sir, if it please God and my lord and father that I be queen of England, I shall be well pleased thereat, for I have been told I shall then be a great lady.' She made the earl marshal rise, and, taking him by the hand, led him to Queen Isabeau her mother, who was much pleased at her answer, as were all who heard it."

In the memoir of Joanna of Navarre, afterwards the widow of the fierce and barbarous Duke of Bretagne, and married to our fourth Henry, Miss Strickland states that when Henry was set out from Vannes, on his invasion of England, "he was conveyed by three of the duke's vessels of war, freighted with men-at-arms and cross-bows. This royal adventurer, the banished and aspiring Lancaster, appears to have been the person who gave to the *myosotis arvensis*, or, 'forget-me-not,' its emblematic and poetic meaning, by uniting it, at the period of his exile, on his collar of SS, with the initial letter of his *mot*, or watchword, '*Souveignous de moy*;' thus rendering it the symbol of remembrance; and, like the subsequent fatal roses of York, Lancaster, and Stuart, the lily

of Bourbon, and the violet of Napoleon, an historical flower. Poets and lovers have adopted the sentiment which makes the blue myosotis plead the cause of the absent by the eloquence of its popular name, 'Forget-me-not;' but few, indeed, of those who, at parting, exchange this simple touching appeal to memory, are aware of the fact, that it was first used as such by a royal Plantagenet prince, who was, perhaps, indebted to the agency of this mystic blossom for the crown of England. We know not if Henry of Lancaster presented a myosotis to the Duchess of Bretagne at his departure from the court of Vannes, but he afforded a convincing proof that his fair hostess was not forgotten by him, when a proper season arrived for claiming her remembrance.

"Joanna put her son in possession of the duchy at so tender an age, as a preliminary to her union with Henry of Lancaster, who had been in a great measure indebted to the good offices of her late lord for his elevation to the throne of England. Henry was at that time a widower; his first wife was Mary de Bohun, the coheir of the Earl of Hereford, lord constable of England. Joanna, to whom the proposal of a union with this prince appears to have been peculiarly agreeable, being aware that a serious obstacle existed on the important subject of religion, kept the affair a profound secret, till she could obtain from the Pope of Avignon a general dispensation to marry any one whom she pleased within the fourth degree of consanguinity, without naming the person; Henry, who had been educated in Wickliffite principles, being at that time attached to the party of Boniface, the pope of Rome, or the antipope, as he was styled by those who denied his authority. Joanna's agents negotiated this difficult arrangement so adroitly, that the bull was executed according to her desire March 20, 1402, without the slightest suspicion being entertained by the orthodox court of Avignon that the schismatic King of England was the mysterious person within the forbidden degrees of consanguinity, whom Benedict had so obligingly granted the duchess-dowager of Bretagne liberty to espouse. When Joanna had thus outwitted her pope, she despatched a trusty squire of her household, named Antoine Riczi, to conclude her treaty of marriage with King Henry. After the articles of this matrimonial alliance were signed, Joanna and her royal bridegroom were espoused by procuracy at the palace of Eltham, on the third day of April, 1402, Antoine Riczi acting as the proxy of the bride. What motive could have induced the lovely widow of John the Valiant of Bretagne to choose a male representative on this interesting occasion it is difficult to say; but it is certain that Henry promised to take his august *fiancée* to wife in the person of the said Antoine Riczi, to whom he plighted his nuptial troth, and on his finger he placed the bridal ring. This act was performed with great solemnity in the presence of the Archbishop of Canterbury, the king's half-brothers, the Beaufort princes, the Earl of Worcester, lord chamberlain of England, and other officers of state. Riczi had previously produced a letter from the Duchess Joanna empowering him to contract matrimony with the King of England in her name, on which the trusty squire, having received King Henry's plight, pronounced that of Joanna in these words: 'I, Antoine Riczi, in the person of my worshipful lady Dame Joanna, the daughter of Charles, lately king of Navarre, Duchess of Bretagne and Countess of Richmond, take you, Henry of Lancaster, king of England and lord of Ireland, to my husband;

and thereto I, Antoine, in the spirit of my said lady, plight you my troth.' No sooner was this ceremony concluded, than the rigid canonists represented to Joanna that she would commit a deadly sin by completing her marriage with a prince attached to the communion of Pope Boniface. The case, however, not being without precedent, the court of Avignon thought it better to quiet the conscience of the duchess, thinking it possible that great advantages might be derived from her forming an alliance with the king of England, whose religious principles had hitherto been any thing but stable. She obtained, July 23, permission of her pope to live with the schismatic Catholics, and even outwardly to conform to them by receiving the sacraments from their hands, provided that she remained firmly attached to the party of Benoit XIII."

The sorrows of her later years when her son-in-law, Henry V., seized her property and imprisoned her, making tardy and incomplete restitution when on his death-bed, are well told by our author, and thus summed up:—

"Henry V.'s letter of restitution of the lands of Queen Johanne, 13th of July, 10 Henry V., 1422.\* 'Right worshipful fathers in God, our right trusty and well-beloved,—Howbeit we have taken into our hand till a certain time, and for such causes as ye know, the dowers of our mother Queen Johanne, except a certain pension thereof yearly, which we assigned for the expense reasonable of her and of a certain Meinie† that should be about her: We, doubting lest it should be a charge unto our conscience for to occupy forth longer the said dower in this wise, the which charge we be advised no longer to bear on our conscience, will and charge you, as ye will appear before God for us in this case, and stand discharged in your own conscience also, that ye make deliverance unto our said mother, the queen, wholly of her said dower, and suffer her to receive it as she did heretofore; and that she make her officers whom she list, so they be our liegemen and good men, and that therefore we have given in charge and commandment at this time to make her full restitution of her dower above said. Furthermore, we will and charge you that her beds and all other things movable that we had of her, ye deliver her again. And ordain her that she have of such cloth and of such colour as she will devise herself v. or vi. gowns, such as she useth to wear. And because we suppose she will soon remove from the palace where she now is, that ye ordain her horses for eleven chares,‡ and let her remove them into whatsoever place within our realm that her list and when her list, &c. Written the thirteenth day of July, the yeare of our reign tenth.' In common justice, Henry ought to have made this *amende* perfect, by adding a declaration of his royal step-mother's innocence from the foul charge which had been the ostensible pretext for the persecution to which she had been subjected. His letter contains in effect, however, if not in words, a complete exoneration of Queen Joanna; and it appears unaccountable that any apologist should be found to justify the conqueror of Agincourt for acts which were so sore a burden to his departing spirit, and which he himself confesses in this memorable letter, 'that he had been advised no longer to bear on his conscience,' lest he should rue it hereafter. The spoliation of the queen-dowager had extended,

we find, even to the sequestration of her beds and rich array. Whether the peace-offering of five or six new gowns, with the royal permission for the injured lady to consult her own taste in the colour, material, and fashion of the same, was considered by Joanna as a sufficient compensation for the wrong, and robbery, and weary imprisonment she had undergone, is doubtful. But be this as it might, and even if the gowns which the warlike majesty of England so solemnly enjoins his chancellor and the other lords spiritual and temporal of his council to endow her with, were promptly rendered, it is certain she could not have enjoyed the satisfaction of appearing in them, courtly etiquette compelling her, within seven weeks after the date of Henry's letter of restitution, to assume the mockery of mourning weeds for his decease. This event occurred August 31, 1422. But it appears that some private amelioration had taken place in regard to Joanna's captivity, for by a document pertaining to the times, it is evident she had been removed to Leeds Castle the same summer, as the following entries appear in her household book, dated July 14th, first year of Henry VI. It is to be observed, that first the Duke of Gloucester, and then Cardinal Beaufort, certainly visited her just before the formal official notice of Henry's penitence, and assuredly brought her private intelligence of the change in her favour. For on June the 12th is an item that the duke dined with her at Leeds, and went away after dinner—expenses for the feast, 4*l.* 2*s.*; and on the 2d of the next month Cardinal Beaufort dined with her at a cost of 4*l.* 14*s.* 2*d.* Her oblations and arms at the cross of the chapel within Leeds Castle came to 6*s.* 8*d.*; but she laid in a stock of Gascon (claret), Rochelle, and Rhenish wines, at the cost of 56*l.* 0*s.* 4*d.* Her alms seem influenced by her usual avarice, for if she could find money to buy so much wine, she might have commemorated her signal deliverance from captivity and obloquy by a larger outlay than 6*s.* 8*d.* All her recorded donations appear despicably mean. Indeed, this precious historical document singularly confirms our estimate of her character, that grasping avarice was the chief source of her misfortunes. Her clerk, Thomas Lilbourne, proceeds to note the expenses of her mourning dresses for the death of her persecutor, as well for her own person as the maids of her chamber. There are some odd notices of the price of making court dresses, which may be amusing to the ladies of the present day. There are charges for seven yards of black cloth for a gown for the queen at the feast of Easter, at 7*s.* 8*d.* per yard, and for making a gown for her, 1*s.* 6*d.*; for one cape of black, for black silk loops, and for 400 clasps, possibly hooks and eyes; for 7½ yards of black cloth, at 7*s.* per yard, for the queen's person; for making a cape for the queen; for black satin; for grey squirrel fur, 23*s.* 4*d.*; for fur for a collar, and mantle for the queen; for 1 oz. of black thread, 1*s.* 6*d.*; three dozen shoes, at 6*d.* per pair. Likewise to Agnes Stowe, of the family of Lady Margaret Trumpton, for her good services to the queen, as a gift, 6*s.* 8*d.* To two sergeants-at-law to plead for the queen's gold, 6*s.* 8*d.* To Nicholas, minstrel, a gift of the queen, 6*s.* 8*d.* None of Joanna's gifts exceed this sum. Some miscellaneous articles are curious *notitia* of the times,—as one pot of green ginger, 9*s.* 6*d.*; for rose-water, 7*s.* 6*d.*; to Master Laurence, for cinnamon, 7*s.* 10*d.* The queen gives 6*d.* per pair for her maids' shoes, and 7*d.* for those of her own wearing. Notwithstanding the car-

\* "We have modernised the orthography of this letter, to render it intelligible to young readers."

† "Body-guards or retainers."

‡ "Cars or chariots."

neat desire of Henry V. for the restoration of Joanna's dower, the matter was attended with great difficulty, on account of the manner in which he had disposed of his property. He had, in fact, sold, mortgaged, and granted it away to a variety of persons, besides endowing his own queen, now also a queen-dower, with the town and appurtenances of Hertford, and many other manors which had been settled on Queen Joanna by his father, King Henry IV. The smoothing of such a ravelled skein caused much delay and trouble to all parties; and we find in the second of Henry VI., that a petition was presented from the noble Lady Joanna, queen of England, requiring all the grants made by the late King Henry V. to be quashed by parliament, that she might receive her revenues. The answer to the petition was, 'that the same should be granted in all points, provided that those persons who had laid out money upon the queen's lands should have the option of taking the same under her at the same term, or rent, at which they then held the same under grants from the crown.' Joanna of Navarre survived her restoration to liberty, wealth, and royal station, many years,—'living,' says Weever, 'in all princely prosperity.' Her favourite residence was the sylvan retreat of Havering Bower. She also kept her state sometimes at Langley, where her retirement was enlivened occasionally by shows, as the rude theatrical entertainments of the fifteenth century were designated."

In enumerating her Bretagne children (for she had none to Henry), and telling what became of them, we are puzzled between the text and the note, p. 135; the former stating that Jules, the third son, died in England in 1412, and the note that "this prince was afterwards murdered by his elder brother Francis," &c.—which Francis is not mentioned in the list of her offspring, and though she had nine, eight only are named.

[To be continued.]

*France: its King, Court, and Government.*

By an American. 8vo. pp. 191. 1840. New York and London: Wiley and Putnam.

By an American, and one with about as many prejudices as commonly fall to the lot of any one individual of any nation. Hurt by the bitter satire of Mrs. Trollope, and the wittier quips of Captain Marryat, the writer endeavours to prove that these acute observers were so easily imposed upon that the Americans resolved to gratify their gullibility to its fullest extent. In the present account of France, he frequently travels out of his way to say pitiful things of the English; and, to shew how carefully he has observed their manners and customs, gives the following authentic information:—

"That the fashion of this world passeth away, is early impressed upon every reflecting mind. But I do not know a better proof of the truth of this remark, connected with the present subject, than is furnished by the revolution in the history of toothpicks. Lord Chesterfield was the *arbitrarius elegantiarum* of his day, and his book was long the code of fashionable ethics. During the sway of this legislator, the picking of the teeth at table was the unpardonable sin in the *haut ton*, the one great offence which excited the liveliest indignation of the modern Minos, and against which he launched his heaviest denunciations. But how are the mighty fallen—or rather how are the fallen raised up! The little reviled and denounced instrument now makes its appearance at all tables, being as regularly placed beside the

plate of each guest as the knife, fork, and spoon,—ay! and as regularly used too! The Americans use steel forks, and knives also, and, therefore, have no claim to be civilised. What miserable affectation all this is! Who has not seen the knife used sometimes in the best company in Europe? For myself, when put upon my gentility, I can manage to tear my meat with a fork, and to convey it to my mouth, calling in the aid of a little piece of bread scarcely sufficient to preserve my fingers from the plate. But I have found the old process a very comfortable one, and I have ate many a meal in the woods without a fork, and never a more pleasant one than when cutting a piece of venison rib from the stake, upon which I had watched it and roasted it before the fire. When I first arrived in Europe, I was so forcibly struck with the many outlandish things I saw and heard, that I commenced a kind of commonplace-book, in which I entered the most prominent of these aberrations from the true standard of civilisation, as the code is taught by the English travellers who visit the United States. I entitled my collection of curiosities 'Trollopiana; or, Things I have seen in Europe, to be appended to the next edition of Trollope, Hall, Hamilton, *et id genus omne*.' The task, however, was not to my taste, and I soon abandoned it. But I will give you a specimen of the nature of these collections and recollections, to shew how easily national recriminations may be found for national criminalities; and how fallacious and unjust must be any general deduction of the character of a great people from facts which form the exceptions, and not the rules, of their life and conversation. A Hannibalian warfare may be a good system of tactics in contests for national power; but in the adjustment of these moral differences, the cause of truth is not promoted by pursuing a course of operations with respect to another, which you accuse of injustice when applied to yourself. My object is to prove the palpable iniquity of our traducers by shewing the bearing of the principles they have adopted when applied to their own country,—a country whose moral standard is high in the estimation of the world, and to which we can look with pride as the birthplace of our ancestors; and a country, too, with which we have many associations to bind us in lasting friendship. Now to my *argumenta ad homines*. I will tell what I have seen, read, and heard. I saw the door-keeper of the House of Lords, on the 21st of June, 1838, in a state of intoxication upon his post, and exhibiting a disgusting spectacle to every observer. I have seen the members of the House of Commons guilty of that most abominable of all vices, and heretofore described as a peculiarly American one, sitting with their feet raised and resting on the benches before them. I saw the passengers on board an English steamboat from London to Antwerp, called the 'City of Hamburg,' on the 1st of July, 1838, being almost all English, seat themselves at table without being called, and take possession of almost all the places, there awaiting the dinner; and I saw three or four of the Americans help some of the ladies to seats, while many others were compelled to wait for a second table. I have seen the published report of a trial, in which the premier baron of England, Lord de Roos, was convicted of cheating at cards; and one of the witnesses, a gentleman of high family, avowed that he examined the cards and found them marked, and afterwards played with De Roos and visited him; and that he (the witness) made card-playing his principal occupation. And another witness, a com-

mander in the navy, acknowledged he had gained 10,000*l.* by play. And another, an officer in the army, that he had played with De Roos after the cheating. And another, a baronet, who, though he had seen De Roos cheat four years before, was unwilling to mention it, because De Roos was popular, and a favourite with the club,—and then he was a peer, too! And another, Lord Bentinck, who confessed he played with De Roos after he knew he cheated. And another, George Payne, who played with, and betted on, him. I have seen that an impostor, calling himself Sir William Courtenay, pretended to divine inspiration, and that he selected for the theatre of his performances the archiepiscopal see of the primate of all England. And this man, claiming to be the Saviour of the world, collected round him many disciples, and, finally, resisting the civil authority, perished, with many of his followers and opponents, in the effort to establish his power. And crowds of people flocked to see him after his death; and large sums of money were given for locks of his hair, and for his clothes, and for rags dipped in his blood. I have seen an English marquess (Waterford) engaged in a disgraceful contest with Norwegian police officers, and rendering himself contemptible for what we should call blackguard breaches of the peace wherever he went. I have seen an earl (Roscommon) fined for being drunk, and unable to take care of himself in the street. I have seen a marquess (Huntley) declared a bankrupt. I have seen a member of the House of Commons accuse the Committee of Elections of perjury. And I have seen a distinguished Reviewer, the 'Edinburgh,' fortify the accusation, by asking what would be thought if committees of Congress were stained with a hundredth part of the suspicions under which the election committees of the House of Commons labour."

Is this the retort courteous?

TYTLER'S HISTORY OF SCOTLAND.  
[Fourth notice.]

WE now resume and conclude our notice of this interesting volume. The next regent after Murray was Lennox, whose fate in the civil war which ravaged the land is another melancholy picture of the condition of the times:—

"Grange now determined to hold a parliament in Edinburgh, whilst the regent and the king's lords resolved to assemble the three estates in Stirling. On the queen's side sentences of forfeiture and treason were pronounced against Lennox the regent, Morton, and Mar, the Lords Lindsay, Hay, Cathcart, Glamis, Ochiltree, Makgill, clerk-register, the Bishop of Orkney, and a long list of the king's faction, amounting nearly to two hundred persons. The assembly, however, which was only attended by two of the spiritual, and three of the higher temporal lords, was scarcely entitled to the name of a parliament. On the other hand their opponents, with a greater attendance of the nobility, and a more solemn state, met at Stirling. Here the young king, then an infant of five years, was invested in his royal robes, and carried from the palace to the parliament by his governor the Earl of Mar, where he read a speech which had been prepared for him. The doom of treason was then pronounced upon the Duke of Chastelherault, the Earl of Huntly, Sir William Kirkcaldy of Grange, Lord Claud Hamilton, the Abbot of Arbroath, Sir James Balfour, Robert, afterwards Sir Robert Melvil, and many others; whilst it was determined to despatch imme-

diately an embassy to Elizabeth for the purpose of concluding a more intimate alliance, and assuring her of their speedy triumph over the faction of the Scottish queen. Before the parliament separated, a slight circumstance occurred which was much talked of at the time. The little king, in a pause of the proceedings, turning to his governor asked him, what house they were sitting in? On being answered that it was called the parliament house, he looked up to the roof, and pointing to a small aperture which his quick eye had detected, observed, that there was a hole in that parliament. People smiled, but the superstitious declared that it augured disaster to the regent, whose death occurred only five days after, in an enterprise which seemed likely at first to have brought the war on Grange's side to a fortunate and glorious conclusion. This able soldier, having learned the insecurity with which the regent and his friends were quartered at Stirling, concluded that it would not be difficult by a rapid night march to surprise the city. Huntly, Lord Claud Hamilton, Buccleugh, Spens of Wormiston, one of the bravest and most successful captains who had been bred in these wars, Car of Farnyhurst, and two officers named Bell and Calder, were the leaders whom he selected. Their force consisted of sixty mounted hackbutters, and three hundred and forty border horse; and as Bell had been born in Stirling, and knew every lane and alley, no better guide could have been chosen. This little force rode out of Edinburgh in the evening of the third of September, some horsemen having been previously sent to the ferry and other parts between Stirling and the capital to arrest all passengers, and prevent any information being carried there. They first took the road towards Peebles, and it was reported in the enemy's camp at Leith, that they meditated an attack upon Jedburgh. Favoured by the night, however, they wheeled off in the direction of Stirling, and having left their horses about a mile from that city, entered it on foot by a secret passage in the grey of the morning before the inhabitants were stirring. So complete was the surprise, that they occupied every street without difficulty, broke up the noblemen's houses, and in an incredibly short time took prisoners the regent himself, the Earls of Morton, Glencairn, Argyle, Cassillis, Eglinton, Montrose, and Buchan, with the Lords Semple, Cathcart, and Ochiltree. These were placed under a guard in their houses, and at this moment, had the borderers kept together, the victory was complete; but the Liddesdale men went to the spoil, emptied the stables of their horses, broke up the merchants' booths, encumbered themselves with booty, and dispersed in the lanes instead of watching the prisoners. It happened here, too, as is often the case in an action of this kind, that a few minutes are often invaluable. Morton, before he was taken, had blockaded his house, and refusing to surrender till it was set on fire, his resistance gave the townsmen time to recover themselves. Mar, in the meantime, rushing from the castle with forty soldiers, commenced a fire from an unfurnished lodging which still fronts the High Street, and drove Huntly and Buccleugh with their prisoners from the market-place to another quarter where they were assailed by the citizens on all sides; whilst Lennox, Morton, and the rest of the noblemen so lately captives, snatched up such weapons as were at hand in the confusion, and soon put their enemies to flight. In the midst of this confusion and struggle, Captain Calder, rendered furious by the disappointment, de-

termined that the regent at least should not escape, and coming up behind, shot him through the back; Lennox had been made prisoner by Spens of Wormiston, and this brave and generous man perceiving Calder's cruel intention, threw himself between them, and received the same shot in his body, and was then hacked to pieces by the soldiers, Lennox faintly imploring them to spare one who had risked his life in his defence. Calder afterwards confessed that he was instigated to this savage deed by Lord Claud Hamilton and Huntly, before they took the town, in revenge for the death of the Archbishop of St. Andrew's, whose ignominious execution the Hamiltons had sworn to visit to the uttermost upon the regent. A swift vengeance, however, overtook his assassin; for he and Bell, the chief leader of the enterprise, having fallen into the hands of the enemy, were instantly executed; Bell being hanged, having first been put to the torture, and Calder broke upon the wheel.\* Buccleugh was taken, only nine of the queen's party slain, and sixteen made prisoners. The loss would have been much greater, but that the Liddesdale and Tiviotdale borderers had stolen every hoof within the town, and not a horse could be found to give the chase. It was certainly, even with its half success, a daring exploit; and Grange, in a letter written a few days after, whilst he deplored the fate of the regent, could not refrain from some expressions of exultation: 'In their parliament time (said he) when all their lords being twenty earls and lords, spiritual and temporal, were convened in their principal strength, wherein there were above two thousand men, three hundred of ours entered among them, were masters of the town, at least for the space of three hours, might have slain the whole noblemen if they had pleased, and retired themselves in the end with a rich booty, and without any harm.' The unfortunate regent was able to keep his seat on horseback, till he entered the castle of Stirling, but the first view of his wound convinced every one that it was mortal, and his own feelings telling him he had but a few hours to live, he begged the chief nobles to come to his bed-side. Here he recommended the young king, his grandson, to their affectionate care, reminded them that as he had been faithful to his office, and had sealed his services with his blood, so he trusted they would fill his place by a man that feared God and loved his country. For his servants, they knew he had been cut off before he could reward them, so he must leave their recompense to his friends; for himself, he would only ask their prayers; and for my poor wife Meg, said he, turning to Mar and wringing his hand, you, my lord, must remember me lovingly to her, and do your best for her comfort. He died that same evening, the 4th of September; and, on the succeeding day, the Earl of Mar, governor to the young king, was chosen regent. His competitors for the office were Argyle, whom Morton had induced to join the king's faction, and Morton himself, who was supported by English in-

\* Second examination of Bell, St. P. Off. 6 September, 1571. George Bell \* being put to pains, declares he came running down the gate for Huntly and Claud, and cried, 'Shoot the regent! the traitor is coming upon us, and ye will not get him away.' Declared, also, that Claud enquired of this deponent where is the regent? who answered again, he is down the gait, who gave commandment to him to follow, and gar slay him, and so past down and bad shoot him as he else said. In the meantime Warmestoun bad seek a horse to carry him away. There is, also, in the St. P. Off. the examination of Captain Calder or Cadder, who confesses that he shot the regent, and before coming to Stirling, that he had received orders from Huntly and Lord Claud Hamilton to shoot both the regent and the Earl of Morton.—MS. St. P. Off. 6 Sept. 1571."

fluence; but the majority declared for Mar, whose character for honesty in these profligate times stood higher than that of any of the nobles."

Mar consequently succeeded to the troubled and dangerous regency. In England, the Duke of Norfolk was executed; in France, the massacre of St. Bartholomew was horribly committed. It was a frightful and ferocious age, and sweet religion infinitely worse than a mockery of words.

The Appendix contains proofs and illustrations of the text; and, among the rest, a strong evidence of John Knox being privy to the murder of Riccio. It is found in a letter from Randolph, Queen Elizabeth's agent, to Cecil, within eleven days of the assassination (Berwick, 21 March, 1565-6), and vouched for by the Earl of Bedford, the governor of Berwick; who writes:—

"Their king (i. e. Darnley) remaineth utter enemy to these lords now abroad, notwithstanding his former doings with them. Hereof and for that Mr. Randolph writeth also more at large of the names of such as now be gone abroad, I shall not trouble you therewith."

"This letter (Mr. Tytler continues) is accordingly in the State Paper Office, and pinned to it I found the promised list of names. I shall first give the letter, and then the 'list.' The letter, which is addressed to Cecil, is wholly in Randolph's hand; the list is in the hand of a clerk who I find at that time was employed in his confidential correspondence by Bedford. The letter, which is addressed to Cecil, is as follows:—

"Randolph to Cecil.

"Berwick, 21st March, 1565-6.

"May it please your honor,—Since Mr. Carew's departure hence, this hath happened. The queen, to be revenged upon the lords that gave the last attempt and slew David, is content to remit unto the former lords, with whom she was so grievously offended, all that they had done at any time against her, who, seeing now their liberty and restitution offered unto them, were all content, saving my Lord of Murray, to leave the other lords that were the occasion of their return, and took several appointment as they could get it; of which the first was the Earl of Glencairn, next Rothes, Argyle, and so every one after other, saving, as I said, my Lord of Murray, with him Patarro and Grayne [Grange], who, standing so much upon their honours and promise, will not leave the other without some likelihood to do them good. The lords of the last attempt, which were these: Morton, Ruthven, Lindsay, and Liddington, finding these men fall from them whom they trusted so much in, and for whose cause they had so far ventured themselves, found it best to save themselves in time, and, therefore, upon Sunday last, every one of the four above-named departed their several way: my Lord of Morton towards the west borders; my Lord Ruthven through Tivdale, and so came to Wark, and yesterday to this town. The Lord Lindsay, into Fife; Liddington, to Athol, to my L. there, either to be saved by him, or to purchase his pardon of the Q. which is thought will be so hard as may be, and, therefore, is he looked for very shortly to be in this country, if he can escape. Besides these that were the principal takers in hand of this matter, there are also these, the Laird of Ormiston, Hawton, his son-in-law, Cawder, his nephew, Brunston, Whyttingham, Andrew Car of Fawlsyde; Justice Clerk, brother; George Douglas, and some other. Of the town of Edinburgh divers, so that as I judge, there

are as many like to take hurt in this action, as were in the former. What is become of any of these I know not as yet, saving Andrew Car that came to this town with the L. Ruthven and his son. The Q. upon Monday last returned to Edinburgh. In her company the Earls Bothwell, Huntly, Marshall, Hume, Seton, with as many as there [they] were able to bring with them. Where she was wont to be carried in a chair by four of her guard, she is yet able to ride upon a horse, though by her own account she hath not six weeks to her time. She lodgeth not in the Abbey, but in a house in the town in the High-street. Her husband hath disclosed all that he knew of any man, and yet hath given his hand, and subscribed divers bands and writings, testifying that to be his own deed, and done by his commandment. It is said, that he gave him one blow himself, and to signify that the deed was his, his dagger was left standing in his body after he was dead. Their mind was to have hanged him, but because business rose in the court between the Earl Bothwell, and such as were appointed to keep the house, they went the next way to work with him. \* \* \* At Berwick, the 21st March, 1566. This letter explains itself, and needs no comment. The list of the names which was pinned to it is as follows. It bears this indorsement in the hand of Cecil's Clerk :—

\* Martii, 1565.

'Names of such as were consenting to the death of David.

'The Earl Morton.	Lochleven.
'The L. Ruthven.	Elphinstoun.
'The L. Lindsay.	Patrick Murray.
'The Secretary.	Patrick Ballentyne.
'The Mr. of Ruthven.	George Douglas.
Lairds	Andrew Kar of Fawdonsyde.
Ormiston.	John Knox } Preachers.*
Brunston.	John Crag }
Haughton.	

'All these were at the death of Davy and privy therunto, and are now in displeasure with the Q. and their houses taken and spoiled.† The inference from all this seems to me inevitable; namely, that in an authentic list sent to Secretary Cecil by Bedford and Randolph, the name of John Knox is given as one of those who were privy, and consenting to the death of David Riccio. Now that these two persons, the Earl of Bedford and Randolph, were intimately acquainted with the whole details of the conspiracy, has been proved in the text. To the proof there given I shall merely add part of a letter of Bedford to Cecil, written, it is to be observed, on the 11th of March, the unhappy man having been murdered on the evening of the 9th of March. 'After my hearty commendations—yesterday in the morning the Earl of Murray and the other lords, and the rest entered into Scotland, and went that night to Edinburgh. \* \* These lords make account to find great aid in Scotland, so as shortly things will fall out in more open sort than as yet, whereof from time to time you shall be advertised. \* \* Since the writing hitherto certain advertisement is come that David is despatched and dead. That it should be so you have heard before. The manner and

circumstances thereof I will not now trouble you withal. By my next I hope I shall have somewhat else to say, and then will I write more at large. \* \* \* F. BEDFORD.'

'From Berwick, this 11th March, 1565.'

'The evidence, therefore, is direct and clear, and comes from those who must be esteemed the best witnesses in such a case.'

On the actual particulars of the murder of Darnley, another document throws the light which appears in Mr. Tytler's narrative, who says:—

'I have stated the fact of the king having been strangled, and have added some new particulars regarding the murder, not only on the authority of a letter of Drury to Cecil, but from what I consider a still more unexceptionable piece of evidence, the assertion of Morett, the Savoy ambassador, who was on the spot, and had an opportunity of making himself acquainted with all the circumstances. As this point has been controverted, and some obscurity still hangs over the mode in which the murder was completed, I am happy to be able to publish the following curious and authentic extract from a letter dated at Paris, 16th March, 1567. It forms part of the collections of Prince Labanoff, the original being amongst the Medici papers, to which the prince had access. The letter was written by the Papal Nuncio at Paris to the Grand Duke; and after stating the arrival of Father Edmonds and Monsieur de Morett, the ambassador at Paris, with some other particulars, which I need not mention, it proceeds thus.' [As we embodied it in our quotations, we will not here repeat it in "choice Italian."]

'The following is a yet more interesting illustration: it is the sixth of the Appendix:—

'*Mary's Marriage with Bothwell.*—It is remarked in the text, p. 123, that the queen, although making a show of contentment, was really wretched. The following letter of De Croc, the French ambassador, was written three days after her marriage with Bothwell, but recounts an interview which the ambassador had with Mary on her marriage day. It is taken from the MSS. collections of Prince Labanoff. The original is in the Bibliothèque Royale at Paris, collection of Harlay, No. 218.

'*Dépêche de Monsieur de Croc à Catherine de Medicis, du 18 Mai, 1567.*

'"Madame,—Les lettres que j'escris à V. M. par le dit Evesque (de Dumbane) sont pour estre leues; Vous pouvez penser que je ne me fye à lui quoi que je vous escrive. Vos Majestes ne sauraient mieux faire que de luy faire mauvaise chere, et trouvez bien mauvaise le mariage, car il est très malheureux, et desja l'on n'est pas à s'en repentir. Leudi, Sa majeste m'envoya querir, on je m'appereus d'une estrange façon entre elle et son Mary, ce que elle me voullut excuser, disant que si je la voyois triste, c'estoit pour ce qu'elle ne voullait se rejoyr comme elle dit ne le faire jamais, ne desirant que la mort." Hier estant renfermez tous deux dedans un cabinet avec le Comte de Bodwell, elle cria tout hault, que on luy baillast ung couteau pour se tuer. Ceux qui estoient dedans la chambre, dans la piece qui precedoit le Cabinet, l'entendirent. Ils pensent que si Dieu luy aide qu'elle se desespera. Je l'ay conseillé et confortée de mieux que j'ay peu ces trois fois que je l'ay veu. Son Mary ne la fera pas longue, car il est trop hay en ce royaume et puis l'on ne cessera jamais que la mort de Roy ne soyt seüe. Il n'y a ici pas un

\* "This conversation, it is to be particularly noted, occurred on the very day of Mary's marriage to Bothwell, the 16th of May."

seul Seigneur de Nom, que le dit Comte de Bodwell, et le Comte de Craffort; les autres sont mandés, et ne veulent point venir. Elle a envoyé qu'ils s'assemblent en quelque lieu nommé, et je les aille trouver pour leur parler au nom du Roy, et voir si je y pourrez faire quelque chose. Si advient j'y ferez tout ce qu'il me sera possible, et après, le meilleur est de me retirer, et comme je vous ayt mander, les laisser jouer leur jeu. Il n'est point séant que je y sois au nom du Roy; Car si je favorise la Roynie l'on pensera en ce Royaume, et en Angleterre, que le Roy tient la main à tout ce qui se fait, et si ce n'eust esté le commandement que V. M. me feyrent, je fust party huit jours devant les nopces. Si est ce que j'ay parlez bien hault, dequoy tout ce royaume est assez abberverez,\* et je ne me suis point voullu brasser† à ses nopces; ni depuis ne l'ay point voullu reconnoistre comme Mary de la Roynie. Je crois qu'il escriira à V. M. par le dit Evesque de Dumbane; Vous ne luy devez point faire de responce,\* &c. &c."

#### MACKAY'S THAMES AND ITS TRIBUTARIES. [Second notice.]

ON setting out again from London Bridge, Mr. Mackay, as we have observed, descended the stream, now losing its woodland beauties in a forest of masts, its silvery current in a turbid sea, its pastoral villas in crowded docks, and all its sylvan characters of quiet and repose in the bustle and turmoil of never-resting commerce. Still our author is happy in his descriptions, and by now and then dashing up a tributary from Kent or Essex, makes a pleasing contrast to his more stirring scenes. At St. Mary Overy's, he tells us:—

'Leaving this ancient building and its poets, we turn to the other side of the stream, where Billingsgate, a more renowned spot, claims our attention. The contrast is certainly great enough between poetry and Billingsgate. Topographers, however, cannot help these violent transitions; they do not make their subject, but take it as they find it. Billingsgate is a spot famous wherever English literature is cultivated, or its language spoken. The name has become synonymous over nearly one half of the civilised world with foul and violent language. It is the chief fish-market of London, and the peculiar phraseology and the frequent quarrels of its female merchants have procured for it this unenviable notoriety. The ward in which it is situated, and from which it takes its name, is one of the oldest in the city. Fabian, Grafton, and others, maintain it to have been built by and named after a British king, called Belyn, who reigned more than three hundred years before the Christian era. According to tradition, there was a pinnacle over the gate, surmounted by a vessel of burnished brass, in which the ashes of King Belyn were inclosed after his body had been burned, in conformity with the usage of those times. The place appears to have been known as a fish-market so early as the time of King Ethelred in 1016. In the reign of Edward I. an ordinance was published, regulating the prices at which the fish might be sold. It may not be uninteresting to cite a few of the items. Twenty herrings were to be sold for a penny; a dozen of the best soles for threepence; the best mackerel a penny each in Lent, and one halfpenny out of Lent. Salmon and pike were exceedingly dear. From Christmas to Easter the price of the best salmon was five shillings, and after Easter three shillings. A pike was sold for the lawyer's fee, six and eightpence.

† "It is certain that this cannot mean that all whose names are to be found in this list were personally present at the act of the murder; it should be understood to mean that 'all these were at the murder of Davy or privy thereto.'"

Eels, lampreys, and oysters, were cheap; a gallon of oysters being sold for twopence, and eels and lampreys from sixpence to eightpence a hundred. Some further regulations with respect to Billingsgate were published in the reign of Edward III., who claimed a variety of taxes from every ship that discharged its cargo at that place."

Talking of fish, by the way, it may be new to most of our readers, and even to Mr. Mackay, with all his observant talent, to be told that in all the streams which flow into the Thames on the north side are to be found *cray-fish*, whilst there is not one of the species in any of the tributaries which join the river on the south side. To what is this owing? Can the naturalist inform us if it is from the difference of soil—say of chalkiness on one hand, and not on the other? for we have not time to examine the geological formation. But to return to our author:—

"Opposite to Woolwich, in the marshes of the Essex coast, but in the county of Kent, stands a solitary house, called by the vulgar the Devil's House. It formerly belonged to the family of Devall, whose patronymic has been thus perverted by the populace. This plot of land; consisting of about five hundred acres, has belonged to the parish of Woolwich and county of Kent from time immemorial; and tradition accounts for its severance from Essex in the following manner:—The body of a man having been cast ashore there by the tide, was found by a fisherman of Woolwich, who immediately gave notice to the authorities of Essex. The latter refused to bury it; upon which, that duty was performed by Woolwich, whose magistrates sued those of Essex, to recover the charges. The Essex magistrates were condemned to pay, but refusing to do so, the patch of land in question was seized by a royal order, and from that time incorporated with Woolwich. Tradition, in this instance vaguer even than it is wont to be, has not informed us of the name of the monarch, or given us any clue by which the date might be discovered.

On the other side of the river, beyond Woolwich, is the rural village of Plumstead, passing which, we traverse two reaches of the stream, called Gallions and Barking Reach. Beyond the latter, on the Essex coast, commences Dagenham Breach, at a place where several small streams, traversing a low marshy country, fall into the Thames. Two of these streams, the Ingerbourn and the Bourne Brook, rise in the beautiful neighbourhood of Havering atte Bower, from whence they run in tortuous courses for about twelve miles. That picturesque spot was the favourite retirement of King Edward the Confessor, who so delighted in its solitary woods, that he shut himself up in them for weeks at a time. Old legends say, that he met with but one annoyance in that pleasant seclusion—the continual warbling of the nightingales pouring such floods of music upon his ear during his midnight meditations, as to disturb his devotions, and draw his thoughts from God. He therefore prayed, that never more within the bounds of that forest might nightingale's song be heard. His prayer was granted,—and during his whole life, the sweet birds disappeared from the spot, and left him in peace to his unloving and austere devotions. Another legend connected with this place, and with the same king, is, that an old beggar came and asked alms of him, to whom he gave a small gold ring, as the only gift his poverty allowed him to bestow. This beggar was a departed saint;—no less a personage

than St. John the Evangelist, who had assumed this disguise to put his charity to the test, and discover, whether he, a monarch, was indeed a despiser of the world's wealth, and so poor as to possess no coin. Some years afterwards, two pilgrims presented themselves at his quiet bower in Havering, and gave him back the same ring, with an intimation that they were sent from heaven to warn him that, within six months, he should be called from this world to enjoy eternal felicity in the bosom of his God."

A similar story is told of St. Thomas à Becket at Havering atte Bower, and likewise of Thomas Aquinas and Albertus Magnus, who also, "by the aid, not of prayer but of the devil, stopped the sweet bird's song that interrupted them in their study of the secret sciences, and also placed an enchanted horse-shoe under ground in the street of Cologne where they resided. By this means no horses could ever be prevailed upon to pass the spot, and disturb with their clattering hoofs, or the rumbling of wheels behind them, the pursuits of these famous alchemists and necromancers."

We come to—

"Greenhithe, situated on the bank of the river, has a ferry into Essex for horses and cattle, which formerly belonged to the nunnery at Dartford, but is now an appurtenance to the manor of Swanscombe, immediately behind it. The hamlet, at one time, was chiefly supported by the profits of its immense chalk-pits, several of which are considerably below the level of the Thames. Great quantities of the chalk are consumed in the potteries of Staffordshire; the flints also, which abound in the pits, are a profitable article of commerce, being collected and shipped for China, where they are used in the manufacture of pottery. The place is but a hamlet to Swanscombe. The latter is written Swinescamp in 'Domesday Book' and was so named from Sweyn the Danish king, the father of Canute, who erected a castle here to preserve a winter station for his ships, during his piratical incursions into England. The remains of this castle were said, by Philipot, who wrote in the beginning of the seventeenth century, to be visible in his time. Swanscombe was long a cherished spot by all the people of Kent, on account of a fabulous story related by a monkish historian, and too readily believed by the Kentish men, whose self-love was flattered by it. When William the Conqueror, says the tradition, was advancing from Hastings to London, he endeavoured to force himself through Swanscombe (a place which was rather out of the direct line, it must be confessed), but was valiantly opposed by the men of Kent, who advanced towards him, each bearing leaves and branches of trees, so that their army appeared like a moving wood. Suddenly they threw down their leafy screens, to the great alarm of the conqueror, and appeared an imposing multitude of warriors, well armed with arrows, spears, and swords, and demanded the confirmation of all their ancient laws and privileges, before they would acknowledge him as their sovereign. William at once consented, and in consequence, says the tradition, the men of Kent enjoy to this day the ancient custom of *gavelkind*, almost peculiar to their county, and inscribe on their arms the proud motto 'Invicta.' The first writer who mentions this story is Thomas Sprot, a monk of Canterbury, who lived more than two centuries after the Norman invasion. It is not until comparatively recent times that its truth has been called in question. Like many other common stories, it will not bear examination,

and is already exploded by all who have bestowed a thought upon the matter. The white spire of Swanscombe Church, about a mile distant, is visible from the Thames at high-water on a clear day. There was formerly an altar in the church famous for the cure of madness, and to which vast numbers of pilgrims were conveyed by their friends. There are no monuments of particular notice. In the nave are to be seen the relics of a rare and affecting custom in this county, namely, funeral garlands, which are borne before the corpse of a virgin, placed upon the coffin during the service in the church, and afterwards hung up as memorials."

[To be concluded in our next.]

#### SEVILLE AND ITS VICINITY. [Second notice.]

GOING through all the parishes of Seville and describing their prominent features, Mr. Stansh has, of course, much to say on the Spanish School of Fine Arts; and all who are interested in it will read the following extracts with profit:—

"The private cabinets of paintings have almost all disappeared. The Canon Siero has a fine 'Crucifixion,' by Cano. Mr. Williams has two pictures by the same master, a 'Holy Family,' and a repetition, borrowed, but varied, from the Flemish Rubens. In the house of the late prebendary Pereira are a 'Saint Francis, with the Stigmata,' of the early time of Murillo; and the first picture of the master, rude, but not without grace, representing the Virgin and St. Francis inviting a monk of that order to embrace the doctrine of St. Thomas; it came from the Regina Angelorum Convent. The collection of Don Joaquim Cortes has disappeared. The Canon Maestre has the two finest Murillos now in private hands; the one represents Saint Francis kneeling, with extended arms, his face directed towards heaven in the attitude of prayer, amidst a landscape, with a lay-brother reading in the second term: this painting is vigorous, and approaches to hardness, but is in imitation of Guido, or from his conception. The second borders equally on the style of the same painter, and represents Saint Catharine, a half figure, with a sword in one hand and a palm-branch in the other: but this is of Guido's softest and richest manner. In the Saint Francis, Murillo has borrowed the ideal sentiment of the Italian, and coloured it in his own way; while in the Saint Catharine he has adopted both the sentiment and the colour. In the house of the Count of Mejorada are three pictures by Murillo, worthy of attention: a small 'Virgin and Child,' on wood; 'Saint Antonio kneeling and receiving Jesus in his arms;' and 'Our Saviour Crucified.' The first and third of these are the best. The 'Nativity' of Velasquez, and the Virgin 'de la Faga,' by Murillo, belonging once to Count Aguila, are now in the gallery of the Louvre; they were sold, as report goes, for 30,000 dollars. In what has yet been said, remarkable pictures only have been noticed; for Bravo, Señor Cortino, and others, have all something; indeed, a 'Christ with the Sheep,' by Cano, in the possession of the latter gentleman, is a very pleasing picture. The visitor, however, will be overwhelmed with Velasquez and Murillo, by all who have pictures, with the exception of Mr. Williams. The worthy owners believe what they hope; they buy an old painted cloth, clean it, and dub it what they please. Many good painters lived at the time of these two great men, so that their repetitions are not easily distinguished from originals by those un-

accustomed to the Sevillian school, and who judge only from colour. It is from drawing, and drawing alone, we must hope to fix the identity of Murillo. Any one curious to observe the great loss which has taken place of pictures, since the entry of the French into Spain, has only to turn from the lists of Ceán Bermúdez and Pons, to the churches themselves, where he will not find one-fourth part remaining of those enumerated by these writers. The pictures thus abstracted are not, however, lost to the world; the greater number are now floating about in different directions, and have the effect of stimulating the curiosity of those who see them, and induce them to make inquiry into the state of the art in the country from whence they came. Thus also new ideas are communicated to those artists who have no means of travelling to foreign countries to improve their style and enlarge their conceptions. Indeed, when Napoleon took away the Corregios from Parma and Modena, he committed no sin either against justice or civilisation, for the poverty was that of a foe applied to benefit a great nation, and ceded according to treaties which guaranteed their possession. The three painters whose names have immortalised the Spanish school are Murillo, Velasquez, and Zurbaran. The first was born in 1618, in Seville; the second in 1599, in the same city; and the third in the village of Fuente de Cantos, in Extremadura, in 1598. They were, therefore, contemporaries, and all lived to a good age. Murillo died in his sixty-sixth year, and would, probably, have lived longer, had not his death been hastened by a fall from the scaffolding whilst painting in the Franciscan convent of Cadiz. Velasquez died at the age of sixty-one, and Zurbaran at that of sixty-four. The merit they possessed is the important one of originality; the first of them, however, Murillo, has proved the justice of a remark of Voltaire, that he who copies best is the best original: for, perhaps, no one imitated so many masters as Murillo, and yet no one can mistake his style for that of any other painter. We have his imitations of Herrera, of Titian in his portraits, of Guido in his Magdalena, of Velasquez in his beggar-boys and fancy subjects, of Zurbaran in his saints; and yet he shines out in all as peculiarly Murillo, and it seems as if he imitated others only to surpass them. His animals are admirably drawn, but he never appears to have loved landscape-painting. His sea-views are of extreme rarity, and are spirited, but inferior to those of the high Dutch school. This was not the case with Velasquez, who was, perhaps, the most universal genius we have known; he could paint animals, landscapes (the knowledge of which he had probably acquired from Herrera el Viejo, his master), the sea, and fancy subjects and historical pieces, with equal ease. In vigour and versatility of genius he equalled Rubens, and drew largely from him. A residence in Italy did not, however, induce him to change his style; and the works of his later years differ little from those of an earlier period, save in a less attention to the minute parts of drawing, and a greater endeavour at effect. No painter managed light better. The aerial perspective of the 'Surrender of Breda,' and of the picture of the artist himself working for Philip the Fourth, and surrounded by his family, is not exceeded by De Hooze, Rembrandt, or the most skilful Dutchman; yet he had not the grace or tenderness of Murillo,—he surprises, but does not woo you into admiration. Much of his time was unfortunately lost in attending on

Philip the Fourth, who invested him with the office of chamberlain at court; and the last public act of his life was that of accompanying the Infanta Maria Teresa to Iran, on her marriage with Louis the Fourteenth of France. The wife of Velasquez only survived her husband seven days. The life of Zurbaran presents us with one of the numberless histories of men who, born in situations apparently unpropitious for the development of talent, have, nevertheless, attained to the highest glory in their profession. He was the son of a country proprietor, and any who are acquainted with the state of that class in Spain (had as it is now, it was worse then), will consider the eminence to which he advanced as almost a work of magic. He was born a painter; and his early efforts attracted so much notice, that his parents sent him to Seville to study under Rodela. Before attaining the age of thirty, he had completed the chapel of St. Peter in the cathedral, and the famous altar-piece for the collegiate church of Saint Thomas Aquinas; the latter of which is considered his masterpiece. The paintings of the Carhuja, at Xerez, were executed in his thirty-fifth year. Neither Murillo nor Zurbaran ever left Spain, and yet their notions of the art were strikingly opposed. Zurbaran copied nobody, Murillo everybody. The first was satisfied to spend days over a white mantle fixed on a model, and occupy himself on a single figure; Murillo was grouping, and varying, and catching at every new form and expression, trusting to his own genius to improve upon nature. Zurbaran threw a strong contrast of light and darkness on the principal figure in the first term, and went no farther. Murillo aimed at, and succeeded, in conveying aerial perspective to the farthest distance in the sky, and sought to make his outlines melt into the air. Two paintings for the Geronomite convent of Bourne, by Zurbaran, one of which is in my possession, had the outline of the figures rigidly marked on the plain side of the canvass; so hard and inflexible was the system of the painter. Both were fine colourists, and both true to nature; but Murillo toned down his pictures by glazing, and Zurbaran passed a wash over the strong blue and white he employed, and detached the figures by painting the distances lightly. In point of composition, Zurbaran was inferior to Murillo or Velasquez; an observation which the reader may readily verify by turning to the 'Bavaria Sacra,' with the plates of Sadeler (wrongly quoted in my 'Notices of the Northern Capitals,' as 'Batavia Rediviva'), where he will find the subjects of many of the pictures of the two first masters, and particularly that of 'Saint Isabel washing the Child afflicted with the Soury,' by Murillo. According to my own taste, the order of precedence I should give to these three great painters, is as I have placed them in the text: others, however, and particularly the French, reverse the order, and quote Zurbaran, Velasquez, and Murillo. Indeed, in England and at Madrid, Velasquez is generally put before either Murillo or Zurbaran."

A great many names of painters, architects, sculptors, and carvers in wood, some hardly, and others not at all, known to the English amateur, are brought forward by Mr. Stendish, and their productions critically described; but these we must pass over, and, indeed, wind up as briefly as we may with a few further extracts. Here is an interesting notice of the son of Columbus. Outside the Puerta Real:—

"On an eminence, and without the walls,

was the college of Ferdinand Columbus, son of the great navigator, where, in 1535, he caused to be painted the figure of St. Ferdinand, the conqueror of the city, mounted on horseback, with a sword in his hand, and the following inscription:—

'Ferrea Ferdinandus perfremit claustra Sibille,  
Fernandi et nomen splendet ut astra poli.'

Ferdinand Columbus had travelled far and wide; he had visited Asia and Africa, and after collecting 20,000 volumes, desired to found a college and school of mathematics on this spot. But let no one count upon the gratitude of posterity: although at his death he bequeathed his library to the cathedral, part of it was dispersed during the process of a lawsuit between his heirs and the chapter, and the chart of the famous navigator, which probably belonged to it, was offered for sale here, a few years ago, in an obscure book shop; whither it has gone no one knows, and I regret, whenever I recall the circumstance, not having been on the spot to secure it. Ferdinand Columbus, himself, died in 1539, before he was able to complete what he purposed, and the college of Saint Elmo took place of the one he had intended to found. His oratory, which remained, served for the use, as has been already mentioned, of the devout body who worshipped our Lady 'de la Villaviciosa,' and the 'Holy Interment of our Saviour!'"

[To be continued.]

*The New General Biographical Dictionary, &c. &c. Part VIII. London, 1840. Fel-  
lowes, and all Booksellers.*

In a recent *Literary Gazette* we reviewed the preceding seven parts of this *Dictionary* (see *Literary Gazette*, No. 1231), to which we beg to refer. The present Part completes the second volume, and fully sustains the improvements we noticed in the Parts immediately preceding. Its concise biographies of the name of Bacon are fair specimens of its general merits and of the talent bestowed upon it. But we need not again dilate on these, and shall content ourselves with quoting a portion of the preface, which says all that is requisite in the way of further explanation:—

"It has been considered that a work of reference, like the present, would be rendered useful rather by increasing the number than the length of the articles; and the editor feels some satisfaction in stating that the number of lives in the *New Biographical Dictionary* is now nearly double that of those of the 'Biographie Universelle,' hitherto by far the most copious work of the kind, and that a large portion of the additional lives are names of considerable importance. In the selection of articles, and the proportional length which has been given to them, the plan pursued in the first volume has been strictly persevered in, of being influenced more by the particular utility of each, than by any previously established rule or measure. It seems desirable that a General Biographical Dictionary should contain, as far as it is practicable, all names that occur in Literature, Science, or History, concerning which the general reader is likely to want further information than is found in the particular works in any of these classes where they are mentioned. In many names of minor importance, it is sufficient to know who the person was, and the dates of his birth and death. It is necessary, indeed, in order to keep within the limits which will render the work generally useful and accessible, that we should give very brief notices of such unimportant individuals; and this principle has been acted upon more strictly, that we may have space to treat important characters at greater length. A few lives in the present volume may, perhaps, be considered to have run out to an undue extent; yet few readers would be satisfied to find, in a work of this character, a mere commonplace notice of such men as Aristotle or Bacon, Augustus Cæsar, Athanasius, or Arius, or to have the articles on such names shortened in order to give a detailed account of some obscure writer, or of a political character of narrow or temporary influence. It is impossible that a work like the present can be in every respect perfect. In such a mass of matter, brought together from so many widely scattered sources in every language, an error or omission of minor importance must from time to time escape observation till it is too late to remedy it. Every care has, however, been taken to ensure accuracy; and the high character of the different

contributors is a sufficient guarantee for the originality and correctness of their contribution. It may be right to add, that every measure has been taken to ensure regularity in the publication of the work, and to complete it as nearly as possible within the limits originally proposed."

## MISCELLANEOUS.

*Washington.* By Monsieur Guizot. Translated by Henry Reeve, Esq. Pp. 230. London, 1840. Murray.

THIS eloquent treatise, not "*Mylogé*," breathes so much of the comprehensive spirit of the philosophical statesman, that we are glad to see it in an English garb, though much of its original force and raciness is lost in translation. Language involves a strange problem. The very same thought conceived in the mind of a Frenchman, an Englishman, and a German, would, by the mere difference of expression, be moulded into different forms; and a word, or even an accent, would convey different ideas and feelings to the reader or hearer. Fully to enjoy M. Guizot's *Washington*, it must be read in the language in which it was written; though we are not insensible to the service Mr. Reeve has rendered to a multitude of his countryfolks by giving them a faithful version of the original in their mother tongue.

M. Guizot does not fall into the absurd mania of making his subject a god. He shews him to have been a very great man; and he shews how great men are brought out, or created, by circumstances, without being the controllers of events, beyond the able use they make of what inevitably happens by their prudence, sagacity, and genius. Thus, instead of drawing an imaginary being, we have the real Washington presented to our eyes; and we see him amid the many fortuitous occurrences that shaped and chequered his career, turning them with the skill and wisdom of a superior mind to the high ends he had in view. The volume is altogether a study in biographical composition, personally interesting, and displaying a comprehensive judgment and much discrimination in the impartial treatment of a favourite theme—giving due honour, and not overstepping the modesty of nature and truth.

*The Isle of Wight.* By R. Mudie, Esq. 8vo. pp. 226. Winchester, 1840. Gilmour.

*The Channel Islands.* The same. Pp. 98. THESE volumes may be traced to the opening of the railway line to Southampton, which has made a visit to the Isle of Wight so prompt and so easy (barring accidents); and Mr. Mudie has performed his task with much credit to himself. As guide-books, the tourist is seldom accommodated with any either so well put together or so handsomely illustrated; and whoever wishes to see either the beautiful and interesting English island, or those of the Channel, to advantage, and preserve agreeable recollections of what they have seen, will do well to become proprietors of these publications.

*Nouvelles Annales des Voyages.* Quatrième Série. Nos. I.—V. 8vo. Paris, 1840. Bertrand.

THIS well-known periodical, which has outlived twenty years, has been purchased by Arthur Bertrand, one of the most enterprising booksellers in the French metropolis, who has been long and widely celebrated for the publication of important works connected with geographical science. With the commencement of the present year, M. Bertrand began the publication of a fourth series, of which we have before us the first five numbers. We think the work is much improved, both in outward appearance and in interior utility. Its contents are arranged monthly under the heads of

original articles, reviews, chronicle of the various events which are daily adding to our geographical knowledge or affecting the ethnographical divisions of the globe, and lists of new publications connected with geography published in all parts of the world. Among the original articles in these numbers we may indicate a very interesting paper on the ancient Mexican theogony, by M. Fernel-Compans; another on the Khan of Khiva, whose petty domain has been made important by recent events; an historical sketch of the relations between France and Morocco; some interesting letters from Dr. Petit, giving an account of his progress in Abyssinia; and essays on several other subjects. Among the contributors to this new series of the *Annales des Voyages* we observe some of the first scientific men in France, such as Arago, Humboldt, D'Avezac, Ietronne, Walckenaer, Saint-Hilaire, Eyriès, Fernel-Compans, &c.

Since writing the above we have received Nos. VI. and VII. (for June and July), the latter containing the report of the South-Polar Expedition of the French ships *Astrolabe* and *Zélée*, with a map of their route.

*The Visitor's Hand-Book for Cheltenham.* Pp. 78. 1840. Cheltenham, H. Davies. London, Longman and Co.

THERE are not many places of resort which, in themselves and their environs, present more varied attractions for visitors than Cheltenham; and we are glad to see so agreeable a guide to them as this—Mr. Davies' *Hand-Book*. The spas, pump-rooms, resorts for amusement, public buildings, and institutions, are all described in a suitable manner; and notices of historical events connected with it fill up the measure of a small, but very useful, publication. It is embellished by woodcuts and illustrated by maps.

*Mandeville; or, the Lynmouth Visitor.* By a Lady. Pp. 164. (London, Longman and Co.; Exeter, Roberts; Plymouth, Nettleton.) The beauties of the beautiful coast scenery about Linton furnish a pleasing ground on which to construct this instructive moral tale.

## ARTS AND SCIENCES.

## PARIS LETTER.

Academy of Sciences, Sept. 15, 1840.

SITTING of September 7. *Temperature of the Ocean at great depths.*—It was mentioned at the last sitting, that the thermometograph, with its case, employed by Captain Dupetit Thouars, during his voyage in the *Venus* in the South Sea, to obtain the temperature of the sea at very great depths, had been broken by the enormous pressure of the water; and it therefore became an object of interest to know at what precise point of the scale the index had stopped, when the compression took place. The case itself had a diameter of thirty-three millimetres internally, and the sides, in the best brass, were fifteen millimetres and a half thick. The action, however, of the ocean had squeezed the case completely flat. M. de Tesson, of the engineers, had been commissioned to open the thermometograph with due precautions; and the result of his examination was now communicated to the Academy. It appeared that the index had marked 1·6 to 1·7 above zero of the centigrade scale, at the moment of the instrument breaking; and the depth at which it had occurred must have been somewhere about 3800 metres. This exact indication of the great cold of the water at such immense depths excited much sensation among the members present.

*Fossil Reindeer.*—M. de Blainville read a report on two memoirs by M. Puel, on some reindeer bones found in the Faille de

Brengues. About 600 bones belonging to twelve or thirteen individuals of the same species had been obtained at this spot, and they were enough to form a complete skeleton. They were all covered with a reddish argillaceous earth; and among them, besides numerous fragments of horns, there was a skull sufficiently complete to shew the extreme narrowness of the parietal bone, and the circular space occupied by the horns. These bones, and the skull in particular, had enabled M. Puel to affirm that the fossil and living species of reindeer were identical. Among the bones found in that locality, there were many of hares, horses, asses, oxen, the auroch or urus, and the rhinoceros, together with those of a stag as large as the stag of Canada, as well as bones of partridges and other birds. No bones of any carnivorous animal whatever were found in the Faille de Brengues. In this cavern, the rolled gravelly fragments contained rocks from very distant localities; and there was a chance of the direction of the current which filled it being discovered.

SCIENTIFIC CONGRESS OF FRANCE.—*Meeting of 1840.* Besançon. *Sitting of September 1.*—M. de Canmont read an account of the receipts and expenditure of last year, when the meeting was held at Mans. The Secretaries announced that a pressing invitation had been received for next year's meeting to be held at Angers. Several memoirs and papers, addressed to the Society, were distributed among the Sections. M. de Canmont pronounced a brilliant harangue on the objects and advantages of scientific associations.

*Sitting of September 2.*—The Secretary-General, M. Weiss, Librarian of Besançon, gave the Congress an *aperçu* of the various memoirs, &c. sent in. M. Parandier then gave a long account of the geological structure of the surrounding district. M. Vuillemin, of Lausanne, communicated a notice upon his continuation of Müller's "History of Switzerland;" and M. Porchat, of Lausanne, read to the Congress some political fables of his own composition.

*Sitting of September 3.*—M. Lecerf proposed that the Congress should take into consideration the best means of extinguishing mendicity in France. The question was referred to the Section of Agriculture and Manufactures. Professor Bourgon read a memoir by M. Baile, 'On the Influence of the Intellectual Movement in France since 1789, on the Fine Arts, and especially on Architecture.' Ordered to be published. MM. Parandier and Morin then went into a long discussion of the best line for a railroad, that should join the Basle and Strasburg line with that from Paris to Lyons. M. Parandier was for a line by the valley of the Doubs and that of the Ognon to the Saône at Pont-tailier, and so to Dijon. M. Morin preferred a line by the valley of the Saône.

*Sitting of September 4.*—M. Maillard de Chambure mentioned the labours of the Departmental Commission of Antiquities in tracing out the Roman roads that traversed the territory of the Côte d'Or. M. de Dieu d'Isabé addressed a memoir to the Congress, 'Upon the best means of Emancipating the Provinces of France from the Intellectual Yoke of the Capital.' The Count de Coetlosquet read a memoir 'On the Philosophical Studies of Establishments for Public Education in France.' M. Porchat read some more verses. (We have not received any report of the proceedings in the sections.)

A munificent present of 50,000 francs has just been made to the Faculty of Law of Paris, by a lady named Beaumont, for the founding of

medals, to be given to the best candidate at the examination for the Doctorate and the Licence of Law. Two gold, two silver, and two bronze medals, with prizes of books, have in consequence been founded. They are to be called the Beaumont medals: and those in gold are to be of 500 francs' value each.

M. Ravaisson, Inspector-General of Libraries, has given notice to the Minister of Public Instruction of the existence of numerous MSS., either unknown or forgotten. Among others is an inedited work of Duns Scotus Erigena; an Universal History of Julius Florus; a fragment of D'Arenzo; a formula for the ordeal by water, of the 11th century; twenty-four inedited letters of Voltaire to Turgot, &c.

The Chevalier d'Artaud has announced a "History of the Life and Works of Dante:" from the known talent of the author a good deal is expected from it.

Dr. Robertson died on the 11th inst., at his residence in the Rue du Bac. His loss is felt not only by a numerous circle of friends in this capital, but also by the scientific world, both British and foreign. He had the happy knack of knowing how to bring scientific and literary men together, and his *soirées* were always very agreeable.

M. Van der Palm, Professor of Theology at Leyden, died there a few days ago, aged seventy-seven. He was one of the most eminent of the Dutch divines of the present day.

A Faculty of Sciences has just been founded at Rennes. It is to comprise the five following chairs:—Mathematics; Physics; Chemistry; Zoology and Botany; Geology and Mineralogy.

The seventh and eighth numbers of M. César Daly's "Revue Générale de l'Architecture et des Travaux Publics," contain beautiful engravings of a very ugly object—the Column of July on the Place de la Bastille. There is a continuation in these numbers of M. Lenoir's valuable papers 'On Early Christian Architecture;' with a very full account of M. Chevreul's theory of the contrast of colours.

The exhibitions of the works of pupils of the Ecole Royale des Beaux Arts, who are competing for the annual grand prizes, are now going on. Those in engraving and sculpture have already taken place: the former has been a very tame affair this year; the latter has been rather better. The subject given was "Ulysses Bending his Bow," to be executed in *ronde bosse*; and some highly spirited, though rather theatrical, works were sent in. The Academy of Fine Arts has, however, decided that no *grand prize* shall be given this year; so there will be no sculptor sent to the Academy at Rome.

We learn from Vienna that four smart shocks of earthquake were felt at Ariach, near Villach, and at many other points of the adjacent districts, on the 27th of August, the same day as the shocks occurred at Milan and Venice. Their direction was from north-west to south-east (see our last Number). The thermometer stood at 25 degrees of the centigrade scale.

Sciarada.  
Di casta Ninfa  
Presso il Ladone  
Il mio primiero  
S'innamorò:  
Se varco l'altro  
Italia addio:.....

Ti rivedrò!  
Conobber gli uomini  
Nel mondo il male  
Quando Prometeo  
Schiuso al totale  
L'urna che Egioco  
Le consegnò.

Answer to the last:—Lin-neo.

## FINE ARTS.

*Studies and Examples of the Modern School of English Architecture: the Travellers' Club-House.* By Charles Barry, Architect. Illustrated by Drawings made by Mr. Hewitt, and Engraved by Mr. J. H. Le Keux. Accompanied by an Essay on the Present State of Architectural Study, and the Revival of the Italian Style. By W. H. Leeds. Folio, pp. 35. London, 1839. Weale.

THIS is the commencement of a publication calculated to vindicate the character of English architects, and to advance the science of architecture itself. "One material difference," says the preface, "between it and previous works of the kind which have been brought out in this country, whether as collections of buildings by different architects, or the designs of an individual, is the completeness with which the building selected for the purpose is illustrated and elucidated, not only with regard to sections, as well as plans and elevations, but also by details and parts at large; without which latter the other drawings lose much of their value, perhaps are in some degree rather injurious to the youthful student, because only the general forms are presented to him; the consequence of which is that sufficient attention is not paid by him to that kind of character, and to that finish, which depend upon detail."

Mr. Leeds begins his "Essay on Modern English Architecture" by adverting to "the peculiar, not to say equivocal, position of architecture, occasioned by its compound character of a mechanical and a fine art," and to the disadvantages to which it has been subject in consequence. He proceeds to observe that, "looking at what has been done within the last twenty or five-and-twenty years, although among the buildings erected within that period we meet with many of considerable merit, we also encounter not a few that are quite the reverse—certainly, very far inferior to what they might have been rendered by more diligent study and more artistlike treatment." He urges, as a stimulus to exertion on the subject, that "it should be borne in mind that the eyes of foreigners are upon us, who, while they contemplate with astonishment of one kind our works of utility, our bridges, canals, tunnels, railroads, and constructions of that class, generally regard with astonishment of a very different kind those of our buildings in which, if any where, grandeur and refined taste might be expected to display themselves." Mr. Leeds attributes the existing evil, in the first place, to the defective system of architectural competition, and, in the second place, to the general ignorance of the public on the subject. Of competition, with pre-exhibition of the designs, he is a warm advocate; and he expresses his opinion that it would not be difficult to enlighten the public mind on the subject of architecture by the dissemination of judicious publications. "To what," he observes, "if not the indifference and incapacity of the public, is to be attributed the mixture of meanness and absurd pretension which is allowed to disfigure many buildings, that might by different management have been rendered at least pleasing? To what, if not its wayward capriciousness, that sudden veering about, and abandoning one style just at the point where we ought to carry it on and develop it more fully, in order to take up another, which may in its turn be dismissed as soon as the most obvious modes of imitation it affords have been tried? No sooner have we made some tolerable progress in Gothic architecture, than it is renounced, either for

impooverished copies of the first rude attempts in it, or for tasteless mimicking of the most tasteless qualities of the extravagant Elizabethan style. After being studied with almost painful diligence, and gaining such footing among us as to supersede every other columnar style, Grecian architecture is beginning to lose our favour; and though there is no reason to apprehend that it will be entirely supplanted, it must be content to forego its claim to supremacy, and consent to share its authority with a rival."

This decadence of the Grecian style Mr. Leeds attributes to the defective and mechanical manner in which, in many instances, it has been introduced in this country. He then adverts to the revival of the Italian style of architecture. After speaking very contemptuously of that mode of it termed "Palladian," Mr. Leeds proceeds:—

"Notwithstanding, however, that the epithet *Palladian* has been adopted as expressing almost the quintessence of what is excellent in Italian architecture, it were an injustice to the latter to estimate it as a style by Palladianism, which is only one, and if not the very worst, by no means the very best branch of it; one, moreover, that in all probability would never have obtained anything like the vogue it has done, to the exclusion of infinitely better models, were it not that the writings and published designs of that master have been widely disseminated, together with his instructions, his principles, and his taste, while models far more worthy of being studied have remained comparatively unknown, for the reason that they have not been promulgated, to any extent at least, in a similar form. Italian architecture comprises so many diversities, that it is hardly possible to affix to it any thing like a precise character, except by limiting it to a particular epoch or school, or to one special class of buildings; and even then the exceptions may be more numerous than the examples referred to as a standard. With many vices and defects, it possesses many excellences and recommendations, and a variety of resources, which render it capable of being turned to far greater account than hitherto has been done. But if, on the one hand, it affords much scope to the architect, it calls, on the other, for the exercise of discriminating taste; one that not only rejects what is positively bad, but is capable of recombining all the better elements of the style, so as to impart to them originality and freshness, without forfeiting what is valuable in and characteristic of the style itself; so that, instead of appearing contrary to its genius, the novel forms and effects that may be produced shall seem to be beauties, which have merely been lying latent, and waiting for a discoverer to bring them to light. A style is to be judged of, not only retrospectively by what it has produced, but prospectively also, according to what it is capable of supplying."

The distinguishing characteristics of the best Italian style are then described. Of the edifice which it is the especial object of the volume to illustrate, Mr. Leeds says:—

"A more tasteful exemplification of *astylar* Italian architecture, than is the production of Mr. Barry's here delineated, is not to be met with in this country; at least, we know of none equally beautiful: and if it be objected that it is, after all, inconsiderable in point of size, we reply, that so much the more credit is due to the architect who has displayed so much in a comparatively limited space, while so many others, who have had a much wider field to work upon, have not produced any thing at all

approaching to it. The general idea, or *motif*, as the French express it, of the Pall Mall front, appears to be derived from that of the Palazzo Pandolfini at Florence, the design of which is attributed to Raphael. Instead, however, of at all derogating from the originality of the English building, the resemblance that may be traced between the two serves only to shew how much the beauties of a model may be improved upon by a free imitation of it in the hands of a master. There is a *sveltezza* in the English palazzo, which the Italian one does not possess, and more variety in its individual features; it has also more unity of character. It is free from that heaviness in its general proportions, and from dryness of style in the details, which mark its archetype; and it further derives no small degree of additional elegance from the terracellike screen to the area, which converts into a positive beauty—a graceful, as well as a picturesque accompaniment—what is almost invariably allowed to be more or less a blemish. While it accords so perfectly with the other in its taste, that it would be impossible not to recognise it immediately as the production of the same mind, even were it not known that the two elevations belong to the same building, the garden façade bears the impress of greater originality. The piquant effect produced by grouping together the three centre windows of each floor is as happy as it is unusual: this composition has an indefinable charm, an attractive *non so che* of sentiment, infinitely more captivating than that mere pomp of architecture, which is frequently to be met with in designs that, nevertheless, betray complete inanity of ideas. Those who may be so disposed as at liberty to say that there is not much in it, after all—merely a few windows and rustics, and some other members of detail; in short, nothing more than what any one else might have done. Very true: but, then, how are we to dispose of the untoward question, Why have they not done so? Why should they—those, at least, who have practised the Italian style—have forborne to avail themselves of it to the extent we now perceive it was possible for them to have done, had they been capable of bringing to it that geniality of feeling and taste, without which a work of architecture can never be a work of art, except of art at second-hand; whatever it may be as a production of manual labour and mechanical skill?

“One quality in which this building is pre-eminent, and at present stands almost alone, is the perfect *finish* bestowed on every part. There is not a single member, let its situation be what it may, which is not most carefully studied and worked up, as will be evident on examining the plates of details; and, unless they are carefully looked at, the merit of the elevations, particularly of that of the garden front, cannot be fully appreciated in all their particulars. This quality of finish can hardly be too strongly insisted upon, because it is precisely the very one of which we are apt to be careless. Hence the almost inexcusable inequalities which offend the eye in so many structures otherwise not devoid of merit: paltry and misplaced economy in one part is suffered to interfere with the embellishment bestowed on others, and which is thereby sometimes rendered little better than trumpery and misplaced ostentation. No doubt, some parts of a composition, particularly where the design is of considerable extent, ought to be treated as subordinate to others; but that is a very different thing from neglecting them, because the last serves only to render them all the more conspicuous and obtrusive as

blemishes and scars in the design, whereas careful finish would have brought them into proper keeping with the rest.”

The plates are beautifully executed.

#### NEW PUBLICATIONS.

*Dresses and Decorations of the Middle Ages, from the Seventh to the Seventeenth Centuries.* By Henry Shaw, F.S.A. Pickering. WHEN the first Part of this very beautiful work appeared, we described the splendour of its embellishments and the interest of its text. Since then (*Literary Gazette*, No. 1220, June 6th) Parts II. III. and IV. have issued from the press, and more than confirmed the highly favourable opinion we formed of the publication. Many of the engravings are equal to the finest illumination of the old psalters, &c.; and we regret much that we cannot lay a specimen of them before our readers. John Talbot, earl of Shrewsbury, presenting his book to Queen Margaret is a curious and splendid print,—rich in costumes and armorial emblems. The initial letters and borders are superb, and the woodcuts replete with characters and characteristics of our ancestors in these distant ages. Queen Margaret and her court is another of the ornaments of Part II.; and a *titled* carriage, or rather wagon of the time, mortal combats of knights (not tilting, but) fighting to the *outrance*, singular pictures of towers besieged with the instruments of war, both for offence and defence, and a remarkable family group of a merchant and his wife (Thomas Poynder, bailiff of Ipswich), &c., on a Flemish Brass, are also among its striking embellishments.

Part III. has a St. Agnes of about the date of 1520, a whole-length of extraordinary interest; the face very handsome, and the whole minutely and exquisitely finished. The original is by Lucas Van Leyden. Four figures from the “Romance of the Rose” in the British Museum, and whole-lengths of King John, in long-toed shoes, and Henry I. in robes, from the same quarter, also adorn this Part, which closes with the effigy of an archbishop, respecting which we have the following description:—

“After the entry of the Normans, some modifications are visible in the costume of the clergy; but, in general, they are by no means so great as in the other classes of the community; the religious and ecclesiastical forms retaining a certain permanence which was not shared by those of the temporal power. The pontifical dress of an archbishop is exhibited in the accompanying plate, taken from a MS. of the latter end of the twelfth century (MS. Reg. 2. A. XXII.) Above his ankles we see the lower part of the long garment which was called the *albe* (*alba*). Over this is the tunic (*tunica*), fringed at the extremity. Then the dalmatic, richly ornamented, descending to the knees. Above all is the *chasuble* (*casula*), thrown over the body and raised on the arms like a mantle, with a standing collar. Hanging on the left arm is the maniple, fringed at the end. The stole (*stola*), which hung from the shoulders, and descended nearly to the feet over the albe, is not seen in this effigy. On the hand are the episcopal gloves; but the ring, which was properly placed on the middle, appears here on the second finger. He wears boots (*caligæ*), highly embroidered, which reached to the knees. Behind the mitre we perceive distinctly the two *villas* or *infule*, hanging down one on each side. The two marks which generally distinguish the archbishop from the bishop are the *pall* (*pallium*), or narrow label, running round the shoulders,

and hanging down before and behind, made of white wool, spotted with purple crosses; and the *crozier*, or staff headed with a cross, which he held instead of the hooked pastoral staff of the inferior prelate.”

The last Part we have to notice is equally rich with the foregoing. Poor Henry VI. with his court at prayers, from the Coventry tapestry; heralds in full costume, victorious or mournful; the death of St. Edmund; head-dresses of the beginning of the sixteenth century (which might be revived with effect by our living fair ones); daggers, swords, sheaths, cups, chalices, &c. &c. displaying all the delicate and grotesque workmanship bestowed upon these *articles of luxury*, in the way of profuse ornament, by the warriors, the priests, and all the powerful and wealthy classes, fill up the measure of grace and variety, for which we bestow our most cordial praise upon Mr. Shaw's production.

*Canadian Scenery.* Illustrated Drawings by W. H. Bartlett; Literary Department by N. P. Willis. Part XXXVIII., America; Part VIII., Canada.

OGDENSBURG Harbour, the Owl's Head (Lake Memphremagog), an Indian village on the St. Lawrence, and a timber dépôt near Quebec, are the picturesque and characteristic subjects of this fasciculus. They are chosen with great taste and judgment, and charmingly engraved.

#### MUSIC.

CHAPELL'S COLLECTION OF NATIONAL ENGLISH AIRS.  
[Concluding notice.]

WE now pass to—

“No. CCXXXVIII. *Trenchmore*.—From the seventh and other editions of ‘The Dancing Master.’ The following description of an old minstrel, is from a morality entitled, ‘A Dialogue bothe pleasaunte and pitiefull, wherein is a goodly regimēte against the fever pestilence, with a consolation and comfort against death. Newly corrected by William Bulleyn, the author thereof. Imprinted at London by John Kingston, Mareil Anno Salutis, 1564.’ ‘Sir, there is one lately come into this hall, in a grene Kendale cote, with yellow hose, a bearde of the same colour, onely upon the upper lippe: a russette hatte, with a great plume of straunge feathers, and a brave scarf about his necke, in cut buskins. He is playng at the trea trippe with our host sonne: he plaieth trickes upon the gitterne, and daunce ‘Trenchmore’ and ‘Heie de Gio’ and telleth newes from Tera Florida.’ *Trenchmore* is also mentioned in Stephen Gosson's ‘Schoole of Abuse,’ 1579; and in Heywood's ‘A Woman kill'd with Kindness,’ 1600. In ‘The Island Princess,’ by Beaumont and Fletcher, act v. one of the townsmen says:—‘All the windows i' th' town dance a new *Trenchmore*’; and in the comedy of ‘The Rehearsal,’ the earth, sun, and moon, are made to dance the Hey to the tune of *Trenchmore*. In Part II. of Deloney's ‘History of the Gentle Craft,’ 1598, he says:—‘And in this case, like one dauncing the *Trenchmore*, he stamp't up and down the yard, holding his hips in his handes.’ In ‘A Merry Wherry-ferry Voyage,’ by Taylor, the water-poet, he says:—

‘Methinks Moriscoes are within my brains,  
And Heyes' and Antiques run through all my veins;  
Heigh, to the tune of *Trenchmore* I could write  
The valiant men of Cromer's sad affright.’

“The Hey was a figure of the country dance; Moriscoes were dances with castanets.”

Burton, in his 'Anatomy of Melancholy' (1621), says that mankind are at no period of their lives insensible to dancing. 'Who can withstand it? be we young or old, though our teeth shake in our heads like Virginal Jacks, or stand parallel asunder like the arches of a bridge,—there is no remedy; we must dance Treuchmore over tables, chairs, and stools.' The following amusing description is from Selden's 'Table Talk':—'The court of England is much alter'd. At a solemn dancing, first you had the grave measures, then the corantos and the galliards, and this kept up with ceremony; and at length to Treuchmore and the Cushion Dance: then all the company dances, lord and groom, lady and kitchen-maid, no distinction. So in our court, in Queen Elizabeth's time, gravity and state were kept up. In King James's time things were pretty well; but in King Charles's time, there has been nothing but Treuchmore and the Cushion Dance, omnium gatherum, tolly polly, hoite come toite.' Several political songs were sung to the tune of Treuchmore, one of which is in the collection of 'Poems on Affairs of State, from 1640 to 1704.'

"No. CCXXXIX. *The Cushion Dance.*—From the 'Dancing Master,' of 1686.—Its full title is 'Joan Sanderson, or The Cushion Dance, an old Round Dance.' In the Apophthegms of King James, the Earl of Worcester, &c. 1658, a wedding entertainment is spoken of; and, 'at last, when the masque was ended, and time had brought in the supper, the Cushion led the dance out of the parlour into the hall.' It is also mentioned by Taylor, the water-poet; and by Selden, with Treuchmore. (See the preceding.) In Heywood's 'A Woman kill'd with Kindness,' 1600, Nicholas says: 'I have ere now deserved a Cushion; call for the Cushion Dance.' The following is the description of the figure, from the 'Dancing Master':—'This dance is begun by a single person (either man or woman), who, taking a cushion in their hand, dances about the room, and at the end of the tune they stop and sing, 'This dance it will no further go.' The musicians answer, 'I pray you, good sir, why say you so?'—*Man.* 'Because Joan Sanderson will not come too.'—*Musicians.* 'She must come too, and she shall come too, and she must come whether she will or no.' Then he lays down the cushion before the woman, on which she kneels, and he kisses her, singing, 'Welcome, Joan Sanderson, welcome, welcome!' The she rises, takes up the cushion, and both dance, singing, 'Princem Prancum is a fine dance, and shall we go dance it once again, and once again, and shall we go dance it once again?' Then making a stop, the woman sings as before, 'This dance it will no further go.' *Musicians.* 'I pray you, good madam, why say you so?'—*Woman.* 'Because Joan Sanderson will not come too.'—*Musicians.* 'He must come too, and he shall come too, and he must come whether he will or no.' And so she lays down the cushion before a man, who, kneeling upon it, salutes her; she singing, 'Welcome, Joan Sanderson, welcome, welcome.' Then he takes up the cushion, they take hands, and dance round the room, singing as before. And thus they do, till the whole company are taken into the ring; and, if there is company enough, make a little ring in its middle, and within that ring set a chair, and lay the cushion in it, and the first man set in it. Then the cushion is laid before the first man, the woman singing,

'This dance it will no further go;' and, as before, only instead of 'Come too,' they sing, 'Go fro;' and instead of 'Welcome, Joan Sanderson,' they sing, 'Farewell, John Sanderson, farewell, farewell;' and so they go out one by one as they came in. Note.—The women are kissed by all the men in the ring at their coming and going out, and likewise the men by all the women.' A political parody of this is to be found in 'Poems on Affairs of State, from 1640 to 1704.' It is called *The Cushion Dance at Whitehall, by way of Masquerade.* To the tune of Joan Sanderson:—

*Enter Godfrey Aldworth, followed by the King and Duke.*  
King. 'The trick of trimming is a fine trick,  
And shall we go try it once again?  
Duke. 'The plot it will no further go.  
King. 'I pray thee, wise brother, why say you so,' &c.

"No. CCXLI. *O Mistress Mine.*—This is one of the songs sung by the clown in 'Twelfth Night.' The first edition of 'Twelfth Night' was printed in 1623, and the tune of this song is to be found in Morley's 'Consort Lessons,' printed in 1611 (eleven years earlier); also in Queen Elizabeth's 'Virginal Book,' arranged by Byrde, whose harmonies we have taken, in preference to a new arrangement:—

'O, mistress mine, where are you roaming?  
O stay and hear, your true love's coming,  
That can sing both high and low.  
Trip no farther, pretty sweeting,  
Journeys end in lovers' meeting.  
Every wise man's sonne doth know.

What is love, 'tis not hereafter,  
Present mirth hath present laughter;  
What's to come is still unsure.  
In delay there lies no plenty,  
Then come kiss me sweet and twentie;  
Youth's a stuff that will not endure."

Lamenting again that we can give no specimens of the music, we conclude with Mr. Chapel:—

"The present publication has been limited to three parts, according to the original proposal; and although each part has exceeded the preceding in size, a large number of interesting airs ('Come o'er the bourne, Bessy, to me,' 'Farewell, dear love,' &c. &c.) still remain unpublished. From these it is contemplated, at a future time, to make another selection, should the present meet with adequate encouragement. The editor trusts, however, that he has already satisfactorily demonstrated the proposition which he at first stated, viz. that England has not only abundance of national music, but that its antiquity is at least as well authenticated as that of any other nation. England was formerly called 'Merry England.' That was when every gentleman could sing at sight;—when musical degrees were taken at the universities, to add lustre to degrees in arts;—when college fellowships were only given to those who could sing;—when Winchester boys were not suffered to evade the testator's will, as they do now, but were obliged to learn to sing before they could enter the school;—when music was taught in all public schools, and thought as necessary a branch of the education of 'small children' as reading or writing;—when barbers, cobblers, and ploughmen, were proverbially musical;—and when 'Smithfield with her ballads made all England roar.' Willingly would we exchange her present venerable title of 'Old England,' to find her 'Merry England' once again."

Most glad shall we be to see any sequel to these valuable and delightful volumes; which not only every musical library, but every music-stool in the empire, ought to make their constant companions.

## ORIGINAL POETRY.

### SONNET.

Suggested by Haydon's Picture of the Duke of Wellington and his Horse, Copenhagen, on the Field of Waterloo, Twenty Years after the Battle. Painted for St. George's Hall, Liverpool; and now Engraving by Lupton.

THROUGH ART's bold picturing Warrior and War-Horse stand  
On ground still strewn with the last battle's wreck.  
Let the steel glory, for his master's hand,  
Lies fixed for ages on his conscious neck.  
But by the Chief's look, though by his side  
Hangs that day's treasured sword, how firm a check  
Is given to triumph, and all human pride!  
Yon trophied mound shrinks to a shadowy speck  
In his calm presence. Him, the mighty deed  
Elates not: brought far nearer the grave's rest,  
As shows that face, time-worn. But he such seed  
Hath sown, as yields, we trust, the fruit of fame  
In Heaven: hence no one blushes for thy name,  
Conqueror! mid some sad thoughts divinely blest.

Composed while ascending Helvellyn.

Monday, August 31st, 1840.

WM. WORDSWORTH.

### WEEP NOT.

The maise was lonely; and no sound was heard  
From out those walls which once were Joy's domain.  
All was neglected,—e'en the much-prized bird  
Pined unregarded, utter'd no sweet strain.  
Death, Death! had late been there!

Within, a childless widow held commune  
With her dear thoughts:—no hope, no fear was left.  
Her life was blank, except the one short moon,  
In which of all she loved she was bereft.  
Life, Life, thou'rt hard to bear!

Nay, weep not, widow'd heart! nor yet repine;  
Thy lost ones are in Heaven, and throned in love:  
And, lo! that peace may once again be thine,  
Thy former foe thy dearest friend shall prove.  
Death, Death, will take thee there!

G. G. JUN.

### THE DRAMA.

LITTLE of any consequence requires chronicling this week. *Covent Garden*, with its stock-pieces, is playing to good houses; so is the *Hay-market*; and a most agreeable addition has been made here in the revival of *The Road to Ruin*, most delightfully played by Mr. Wallack as *Harry Dornton*; Mr. Phelps, as *Old Dornton*; Mrs. Glover, as *Widow Warren*; and Mrs. Stirling, as *Sophia*. These principals are ably supported by Messrs. Wrench, Strickland, Howe, &c. &c., and the comedy is as successful as a good comedy with so good a cast deserves to be.

The *English Opera* republic brought forth its *Ancestress* in the last week of its existence, which speaks well for the energy of its management: the piece itself requires no comment.

At the *Strand*, Mr. W. J. Hammond, as the *Bill-Sticker* and *Othello*, seems to have infused new life into the company; and, if we may judge from the appearance of the house, he has also brought profit to the treasury. He is much more at home in this little theatre, which he has made peculiarly his own, than he was in his unfortunate speculation at the larger house.

### VARIETIES.

*English Roads.*—There are 22,000 miles of turnpike-roads in England and Wales; upon which there are mortgages to the amount of 3,365,267*l.*, being an increase of 1,040,461*l.* in the last nine years. The annual receipts are under 1,500,000*l.*; the expense of repairs, 36*l.* per mile per annum; of improvements, 9*l.* per mile; and of surveyors' salaries, and other charges, 6*l.* per mile.

*Justices of the Peace.*—A Short Inquiry into what the writer considers to be the imperfections of the system of an unpaid magistracy, and a proposition for substituting legal tribunals, is before us; and of it we can only say that we differ almost entirely from the view it takes of the subject.

\* "In the eighteenth edition of the 'Dancing Master,' the second and third parts of the tune are in 6-4 time, and the first only in 3-4."

**Ancient Coins.**—A collection of interesting coins has lately been found near Armagh. They are chiefly from various mints of Edward I. and II.; but are mixed with some of the base coinage which at that period, and long after, inundated Ireland. One or two of these seem to be extremely rare, if not unique.

**The Nassau Balloon.**—We hear that an aerial voyage across England is only awaiting a favourable wind. The monster balloon is at Norwich; a party of gentlemen intending to take flight with Mr. Green from that town.

**Hypnology.**—In former days we mentioned the system of Mr. Gardner, for producing sound and refreshing sleep at will without the aid of medicine; and he has recently put into our hands a mass of testimonials from clerical, medical, and other intelligent persons, who have tried his method with success. Where there is a secret it is not easy for a journalist to give the public information he could wish; but we can truly state that, there is much of philosophical principle in Mr. Gardner's system. It so far embraces metaphysics as it is grounded on mental phenomena; but it is, after being demonstrated so simple and natural, that a child may practise it, and never dream that it rests on singularly abstract reasoning. We cannot say that we have ourselves made many experiments, but we are perfectly convinced that, in thousands of instances, individuals, when perturbed or restless, may, by attending to Mr. Gardner's rules, forget their wakeful propensities, and fall quietly into the arms of gentle Slumber.

**New Steam Force.**—The newspapers contain an account of a successful experiment made with improved steam-boat machinery, by Mr. George Bloxland, but do not explain the principle. A very small boat on the river was fitted up with the apparatus, and conveyed the lord mayor and a party up and down much to their satisfaction. The force is applied at the stern (as in the Archimedes), and it is stated to increase the speed one-third with the same power, to create no wave, and to have neither paddles nor paddle-boxes to disfigure the vessel.

St. Petersburg, September 1, 1840.

In the night of the 7th of February, a little before midnight, a volcanic eruption, accompanied by a subterranean noise, which was heard at the distance of twenty miles, took place at the village of Baklichli, about ten miles from the town of Baku, on the Caspian Sea. The flames were visible till the morning at the distance of above twenty-five miles. For two miles all round, clouds of earth were thrown up; a dense, black smoke, which rose like an immense column, was driven like a thunder cloud before the wind, and left behind it, for nearly thirty miles, a great number of small hollow globules, resembling shot, composed of the matter burnt, mixed with sulphur. On the following day the flames indeed ceased, but the ground was still violently agitated, and small eruptions occurred from time to time. Lava flowed from several places, but far less than in 1830. After the eruption the atmosphere, to a great distance all round, was impregnated with sulphur. In many places there are such broad clefts in the earth that the people do not venture to let the cattle feed there.

**Curious Relationship.**—In the "John Bull" of Sunday, there is a notice of Mad. Laffarge's trial, which says of one of the witnesses that he is "a Mr. Beaufort, the father-in-law of the deceased—that is the husband of his first wife;" *sed de hoc quare.*

**Pilgarlick's Memoirs, &c.**—"Thank Heaven," said Pilgarlick, in conversation with an extensive farmer,—"thank Heaven, for the good of the country, that we have excellent crops, and the poor will have bread at a reasonable price." "Heaven!" replied the farmer; "we have no business to thank Heaven for what Heaven has nothing to do with! If bread be cheap (which it won't be), you may thank the corn-dealers in Mark Lane."

Pilgarlick's friend, Twink, having published a work of some interest, procured, whilst in town this season, an invitation to dinner with the Most Noble, &c. &c. &c. "I wished particularly to go," said he, "to see what a marquisate was." "And what was it?" asked Pilgarlick. "A plate of soup, some fish, chicken, cotelettes, game-pie, fritters, jelly, and macaroni."

Pilgarlick has noticed a capital joke going the round of the newspapers, viz. that if you mix salt with the lime for mortar in chimney-building, the salt will always deliquesce with the temperature, and cause the soot to fall and keep the "chimney" clean without sweeping it! Better try sea-water, if you want mortar that will not cohere or bind. Mortar could not be made with such a mixture of either salt, even were it to salt the soup and porridge without trouble every time the pot was put on!

### LITERARY NOVELTIES.

#### LIST OF NEW BOOKS.

Travelling Sketches in various Countries, by H. Fulton, M.D. 2 vols. 12mo. 10s. 6d.—Course of Mathematics, by the Rev. J. Cape, Vol. II. Part I. 8vo. 10s. 6d.—The Gem of the Peak; or, Matlock and its Vicinity, by W. Guide, by G. C. Bainbridge, fourth edition, with coloured plates, 8vo. 10s. 6d.—Domestic Affections and other Poems, by Mrs. Hemans, 24mo. 2s.—Dr. Macnish's Philosophy of Sleep, sixth edition, 18mo. 2s. 6d.—Jardine's Naturalist's Library, Vol. XXIX.: Duncan's Introduction to Entomology, f.cup. 6s.—Dr. Weatherhead on Headache, second edition, 12mo. 4s.—Memoir of John James Macgregor, 12mo. 6s.—Buckton's Western Australia and the Vicinity of Australind, 12mo. 2s.—Tytler's Elements of General History, new edition, 1 vol. 8vo. 14s.—Practical Treatise on the Law of Elections, by A. J. Stephens, 2 vols. 12mo. 38s.—Erro, a Romantic Poem, 8vo. 4s.—The Cashmere Shawl: an Eastern Fiction, by C. White, 3 vols. post 8vo. 11. 11s. 6d.—G. S. Faber on Transubstantiation, 8vo. 8s. 6d.—Rev. Dr. Shuttleworth's Three Sermons on Justification, &c. f.cup. 3s.—Dean Graves' Complete Works, with Life, 4 vols. 8vo. 21. 16s.—Dean Graves' Scriptural Proofs of the Trinity, 8vo. 6s.—Organic Chemistry, in its Applications to Agriculture and Physiology, by J. Liebig, M.D. 8vo. 12s.—G. Mair Bumeys's Life of Napoleon, with 500 cuts by Horace Vernet, 2 vols. imperial 8vo. 21. 2s.—Castle of Otranto, illustrated edition, 12mo. 5s. 6d.—Rural Scenes, a new edition, square, 2s. 6d.—Summer Rambles and Winter Amusements, f.cup. 3s. 6d.—The Equestrian, a Hand-book of Horsemanship, f.cup. 3s. 6d.—Notes on the Pentateuch, selected by T. Brightwell, 12mo. 7s. 6d.

### METEOROLOGICAL JOURNAL, 1840.

September.	Thermometer.	Barometer.
Thursday .. 10	From 50 to 65	29.89 to 29.94
Friday .. 11	48 .. 63	29.90 .. 29.94
Saturday .. 12	40 .. 63	29.92 .. 29.90
Sunday .. 13	35 .. 61	29.81 .. 29.68
Monday .. 14	37 .. 55	29.47 .. 29.28

Wednesday 16	40 .. 53	29.02 .. 29.09

Prevailing wind, S. W.

On the 10th, morning cloudy, with rain, otherwise clear; the 11th, and two following days, generally clear; the 14th, a general overcast, small rain falling all the afternoon and evening; the 15th, generally clear, till about 10 P.M. when it began to rain, and continued till after midnight; the 16th, morning clear, otherwise cloudy, with rain; thunder about half-past one P.M.

Rain fallen, .406 of an inch.

Edmonton.

CHARLES HENRY ADAMS.

### TO CORRESPONDENTS.

"W. E."s lines on the death of the Earl of Durham are not adapted to our Journal.

"Spendthrift" need not waste any more of his paper on us.

Early communications are again requested at this time of the year, if early attention to them be desired.

### ADVERTISEMENTS.

Connected with Literature and the Arts.

**THAMES TUNNEL**, open to the Public every day (except Sundays), from Nine in the Morning until Dark. Admission, 1s. each. The Tunnel is Eleven Hundred and Thirty-five Feet in length, built with Gas, and the Entrance is on the Surrey Side of the River, close to Rotherhithe Church. The Shield is now advanced to within Twenty-five Feet from the Wharf Wall at Wapping.

By order,  
J. CHAMBLIER,  
Clerk to the Company.

Company's Office,  
Wallbrook Building, Wallbrook,  
September 1840.

**LEEDS SCHOOL OF MEDICINE.**—The Tenth Session will commence on Thursday, October 1, 1840.

#### PLAN OF LECTURES.

Anatomy, Physiology, and Pathology—by Mr. T. P. Teale, F.R.S. M. Garlick, and Mr. Nanneley. Five Days in the Week at Twelve o'clock.

The Introductory Lecture, Thursday, Oct. 1, at Twelve.

Anatomical Demonstrations—by Mr. Price and Mr. Nelson. Monday, Tuesday, Thursday, and Friday, at Ten A.M.

The First Demonstration, Friday, October 5, at Ten A.M.

Principles and Practice of Surgery—by Mr. William Hey. Tuesday, at Seven P.M. and Saturday, at Ten A.M.

The Introductory Lecture, Thursday, Oct. 1, at Seven P.M.

Materia Medica and Therapeutics—by Dr. Chadwick. Monday, Tuesday, Wednesday, and Thursday, at Four P.M.

The Introductory Lecture, Thursday, October 1, at Four P.M.

Chemistry—by Mr. Morley and Mr. West. Monday, Tuesday, Wednesday, and Thursday, at Eight P.M.

The Introductory Lecture, Thursday, October 1, at Eight P.M.

Principles and Practice of Physics—by Dr. Hunter. Monday, Tuesday, Wednesday, and Thursday, at Three P.M.

The Introductory Lecture, Thursday, October 1, at Three P.M.

Midwifery and the Diseases of Women and Children—by Mr. Smith. Daily, at Seven A.M.

The Introductory Lecture, Friday, October 5, at Seven A.M.

Forensic Medicine—by Dr. Pyemont Smith.

In the Summer Months.

Botany—by Mr. Donny. In the Summer Months.

Clinical Lectures will be given at the Infirmary:—

On Medical Cases, by Dr. Hunter.

On Surgical Cases, by Mr. Smith, Mr. William Hey, and

Mr. T. P. Teale.

Certificates of Attendance on the above Lectures will confer the same Qualification for Examination as Certificates from the Medical Schools of London.

A Museum of Pathology and Comparative Anatomy, also of Materia Medica, and a Medical Library, are attached to the School, for the Use of Students.

Application for Tickets may be made to Mr. Garlick,

21 Park Row.

#### MILMAN'S EDITION OF GIBBON.

**SUBSCRIBERS to Mr. Milman's Edition** of Gibbon's Roman Empire are recommended to complete their Copies of the Work, &c. after October, it can only be sold in Sets.

John Murray, Albemarle Street.

### BOOKS PUBLISHED THIS DAY.

2 vols. post 8vo. 91s. bound.  
**NARRATIVE OF THE LATE WAR IN AFGHANISTAN.**

By Captain HENRY HAYLOCK.

Aide-de-Camp to His General Sir Willoughby Cotton, G.C.B.

K.C.H. &c. commencing the Bengal Forces.

"This work furnishes by far the most comprehensive as well as the most interesting account the public has yet received of the late brilliant war in Afghanistan. Captain Haylock's position was peculiarly favourable for the production of a narrative of the events of the campaign, and his work is highly creditable to his spirit of observation, his impartiality, and his desire and determination to tell the exact truth on all points."—*New Monthly*.

Henry Colburn, Publisher, 13 Great Marlborough Street.

#### GUIDE TO EGYPT AND INDIA.

**A NEW GUIDE to the LEVANT**, for the Use of Travellers in Greece, Egypt, Syria, and Asia Minor; together with Tables of all the Mediterranean Steamers, and Descriptions of the Places at which they touch, including Lisbon, Cadiz, Gibraltar, Malaga, Malta, the Ionian Islands, Cyprus, and Constantinople; also comprising full Particulars of the Overland Journey to India, the Voyage from Suez to Bombay, and the Systems of Dawk Travelling in the Three Presidencies.

By T. H. USBORNE, Esq.

London: Cradock and Co. (late Baldwin and Cradock),

46 Paternoster Row.

### PROFESSOR GRANT'S OUTLINES

of COMPARATIVE ANATOMY. 8vo. Part VI. price

3s. Parts I. to VI. 11. 6s.

Professor Thomas Graham's Elements of

Chemistry, including the Application of the Science in the Arts.

8vo. Parts V. 4s. Parts I. to V. 15s.

Dr. Robert Willis's Illustrations of Cerebral

Diseases. Part XX. containing Four coloured Plates, folio,

price 3s. Parts I. to XX. 4s.

H. B.'s New Catalogue of Foreign Books is just out, and will

be delivered gratis, on application.

London: H. Baillière, Publisher and Foreign Bookeller,

219 Regent Street.

In 8vo. price 18s. boards.  
**PROPÆDIA PROPHETICA; a View of the Use and Design of the Old Testament; followed by Two Dissertations—I. On the Causes of the Rapid Propagation of the Gospel among the Heathens. II. On the Credibility of the Facts related in the New Testament.**  
 By WILLIAM ROWE LVALL, M.A.  
 Archdeacon of Colchester; Co-Dean of Bocking; and Rector of Hadleigh, Suffolk.  
 Rivingtons, St. Paul's Churchyard, and Waterloo Place.

In small 8vo. price 7s. 6d. in boards, the 3d edition of  
**ECCLASIASTES ANGLICANUS; being a Treatise on Preaching, as adapted to a Church of England Congregation. Contained in a Series of Letters to a Young Clergyman.**  
 By the Rev. W. GRESLEY, M.A.  
 Late Student of Christ Church.  
 Rivingtons, St. Paul's Churchyard, and Waterloo Place.

In 12mo. price 4s. 6d. cloth and lettered, the 2d edition of  
**THE GOSPELS OF ST. MATTHEW and ST. MARK Paraphrased and put into Question and Answer, on a new Plan; intended for the Use of Parents and Teachers.**  
 Dedicated, by permission, to the late Lord Bishop of Cloyne.  
 By the Rev. JOHN ROGERSON COTTER, M.A.  
 Rector of Innishannon, and formerly Chaplain to the Female Orphan House, Dublin.  
 Rivingtons, St. Paul's Churchyard, and Waterloo Place.

In 4 vols. 8vo. (sold separately), price 10s. 6d. each: in boards,  
**PAROCHIAL SERMONS.**  
 By the Rev. JOHN HENRY NEWMAN, B.D.  
 Vicar of St. Mary the Virgin, Oxford; and Fellow of Oriel College.  
 J. G. F., and J. Rivington, St. Paul's Churchyard, and Waterloo Place, Pall Mall; and J. H. Parker, Oxford.  
 \*A Fifth Volume is in the press.

In 12mo. price 7s. 6d. bound, the 4th edition of  
**EXCERPTA ex VARIS ROMANIS POETIS, qui in Schollis variis leguntur:**  
 Lucretio Seneca Martiale  
 Catullo Lucano Juvenalis  
 Propertio V. Flaccus Anthonio  
 Tibullo S. Italico Claudiano  
 Persio Statius  
 Notulis illustrata, quas elegit  
 JOHANNES ROGERS PITMAN, A.M.  
 Rivingtons, St. Paul's Churchyard, and Waterloo Place.

**THE PENNY SUNDAY READER.**  
 The Eleventh Volume (for January to June 1840), price 2s. 9d. in cloth boards.  
 This Work is continued in Weekly Numbers, and forms a cheap Manual of Sunday Reading, adapted to the sacred character of the Lord's Day, especially connected with its devotional offices. It contains, also, Miscellaneous Papers, Sacred Poetry, original and selected; choice Extracts from eminent Divines, and Communications from Correspondents.  
 Rivingtons, St. Paul's Churchyard, and Waterloo Place.  
 \*The Volumes of this Work are included in the List of Books recommended by the Society for Promoting Christian Knowledge.

In 8vo. price 10s. 6d. boards, Volume the First of  
**THE CLOUD OF WITNESSES; a Series of Discourses on the Eleventh and Part of the Twelfth Chapters of the Epistle to the Hebrews.**  
 By the Rev. JAMES S. M. ANDERSON, M.A.  
 Chaplain in Ordinary to the Queen; and to the Queen Dowager; and Perpetual Curate of St. George's Chapel, Brighton.  
 J. G. F., and J. Rivington, St. Paul's Churchyard, and Waterloo Place, Pall Mall; J. H. Parker, Oxford; and the Booksellers in Brighton.

**HOMER'S ILIAD, WITH ENGLISH NOTES.**  
 2d edition, improved, 8vo. price 18s. boards, or 15s. bound.  
**OMHPOI IATAZ. The Iliad of Homer,** chiefly from the Text of Heyne, with copious English Notes, illustrating the Grammatical Construction; the Manners and Customs, the Mythology and Antiquities of the Heroic Age; and Preliminary Observations on Points of Classical Interest and Importance connected with Homer and his Writings.  
 By the Rev. WILLIAM TROLLOPE, M.A.  
 Formerly One of the Masters of Christ's Hospital.  
 Rivingtons, Longman and Co.; Hamilton and Co.; Duncan and Co.; Whitaker and Co.; Simpkin and Co.; B. Fellowes; and E. F. Williams.

**TO SPORTSMEN.**  
 Profusely illustrated on Wood and Steel, price 10s. 6d.  
**THE ROD and the GUN.**  
 By WILSON and OAKLEIGH.  
 Edinburgh: Adam and Charles Black.

Now ready at all the Libraries, in 8 vols. post 8vo.  
**THE CASHMERE SHAWL; an Eastern Fiction.**  
 By Captain WHITE,  
 Author of "The King's Page," "Almack's Revisted," &c.  
 3 vols.

**II.**  
**Oliver Cromwell; an Historical Romance.**  
 Edited by Horace Smith, Esq.  
 Author of "Brambletye House," &c.  
 3 vols.

"We may commend the battle scenes in this work as about the most spirited and thrilling since Scott described the gathering at London Hill and Bothwell Bridge."—*Athenaeum*.

Also, just ready,  
**The History of a Flirt.**  
 Related by Herself.  
 3 vols.  
 Henry Colburn, Publisher, 13 Great Marlborough Street.

On the 1st of October will be published, in 3 vols. embellished with Illustrations by Hervieu,  
**LADY BULWER'S NEW NOVEL,  
 THE BUDGET OF THE BUBBLE FAMILY.**

\* \* All Orders for this Work should be given at the Libraries and Booksellers throughout the United Kingdom immediately, to insure their being punctually supplied on the day of publication.

Edward Bull, Publisher and Librarian, 19 Holles Street, Cavendish Square.  
 Agents—Bell and Bradfute, Edinburgh; John Cumming, Dublin.

THE THIRD VOLUME OF  
**AGNES STRICKLAND'S LIVES of the QUEENS of ENGLAND**  
 IS NOW READY.  
 And may be had of all Booksellers, price 8s. 6d. bound, with Illustrations.  
 "These volumes have the fascination of a romance united to the integrity of history."—*Times*.  
 "A most valuable and entertaining work."—*Chronicle*.  
 "A charming work, full of interest, at once serious and pleasing."—*M. Gazette*.  
 Henry Colburn, Publisher, 13 Great Marlborough Street.

**BRITISH AND FOREIGN REVIEW,**  
 No. XXI.  
 1. Chartism and Church Extension.  
 2. Austria and her Resources—Milan Treaty.  
 3. Modern French Novelists—Le Nœud Gordien.  
 4. Montenegro.  
 5. British Administration of India.  
 6. Medical Reform.  
 7. History of Fiction—Eastern Story-tellers.  
 8. Hungary and the Hungarians.  
 London: R. and J. E. Taylor, Red Lion Court, Fleet Street.

Royal 8vo. 2d edition, enlarged, price 1s. 6d.  
**RELIGION and CRIME; or, the Distresses of the People and the Remedies.**  
 By JOHN MINTER MORGAN.  
 "There is valuable matter in this pamphlet."—*Athenaeum*.  
 "This is an excellent attempt to point out the probable remedies for the distresses of the people. We trust this pamphlet may meet attention."—*Sunday Times*.

Also,  
**A Lithographic Print of a Self-supporting Institution in connexion with the Church of England, for Three Hundred Destitute Families.** Price 5s.  
 Longman and Co.; Hatchard and Son; H. Hooper.

12mo. pp. 476, price 6s. cloth boards,  
**SHAKSPERIAN READINGS, illustrative of English and Roman History, selected and adapted, by connecting Memoranda, for Young Persons and others.**  
 By B. H. SMART.  
 J. G. F., and J. Rivington, St. Paul's Churchyard, and Waterloo Place, Pall Mall; and Thomas (Jestell) and Co. 63 Lendenhall Street (Successors of John Richardson).  
 Of whom may be had, Mr. Smart's other Publications.

Preparing for the press,  
 1. Accidence, 2. Principles, and 3. Practice, of English Grammar, founded on the Views of Language developed in the Author's "Beginnings of a New School of Metaphysics."

**COMPLETION OF THOMAS'S LIFE OF NAPOLEON.**  
 Dedicated, by express permission, to the Right Hon. Lord Holland.

In 2 vols. price 8s. 2s. cloth,  
**THE LIFE OF NAPOLEON.**  
 By GEORGE MOIR BUSSEY.  
 Illustrated with 500 superb Engravings, from Designs by the celebrated Horace Vernet.  
 London: Joseph Thomas, 1 Finch Lane. Sold by Simpkin and Co.

18mo. price 2s. sewed,  
**AN EASY GUIDE to the GAME of CHESS,** in which the Manner of Playing it is laid down, so as to enable any Person to acquire it without the aid of a Teacher.  
 By CHARLES CHECK.  
 London: Simpkin, Marshall, and Co.

**MURCHISON'S GEOLOGY.**  
 3 vols. royal 4to. with large Geological Map, Views, coloured Sections, and numerous Plates of Organic Remains.  
**THE GEOLOGY of the SILURIAN REGION, or Border Counties of England and Wales.**  
 By RODERICK IMPEY MURCHISON, Esq. F.R.S.  
 Vice-President of the Geological Society.  
 John Murray, Albemarle Street.

REV. HENRY MELVILL'S SERMONS.  
**SERMONS.** 4th edition,  
 8vo. 10s. 6d.  
 2. Sermons, Volume the Second. 2d edition,  
 8vo. 10s. 6d.

3. Sermons preached at Cambridge, in 1836. 4th edition, 8vo. 5s.  
 4. Sermons preached at Cambridge, in 1837. 3d edition, 8vo. 5s.  
 5. Sermons preached at Cambridge, in 1839. 3d edition, 8vo. 5s.

By HENRY MELVILL, B.D.  
 Minister of Camden Chapel, Camberwell; and late Fellow and Tutor of St. Peter's College, Cambridge.  
 Rivingtons, St. Paul's Churchyard, and Waterloo Place.

In small 8vo. price 2s. in boards,  
**JUSTIFICATION through FAITH—The Merciful Character of the Gospel Covenant—The Sufficiency of Scripture as a Rule of Faith: Three Sermons, preached before the University of Oxford, in the Course of the Past and Present Year.**  
 By PHILIP N. SHUTTLEWORTH, D.D.  
 Warden of New College, Oxford; and Rector of Foxley, Wilts.  
 Rivingtons, St. Paul's Churchyard, and Waterloo Place.

**BOOKS IN THE PRESS.**  
**THE QUARTERLY REVIEW,**  
 No. CXXXII. will be published next week.  
 John Murray, Albemarle Street.

On Monday next, price 4s.  
**JOHN di PROCIDA; a Play, in Five Acts.**  
 By JAMES SHERRIDAN KNOWLES.  
 Edward Moxon, Dover Street.

8 New Burlington Street, Sept. 19, 1840.  
**MR. BENTLEY has just ready for publication the following NEW WORKS:—**

I.  
**The Clandestine Marriage; A Story of the Present Day.**  
 By Miss Ellen Wallace.  
 3 vols. (On Monday next.)

II.  
**Memoirs of the Colman Family.**  
 By R. B. Peake, Esq.  
 Including their Correspondence with the most distinguished Persons of their Time.  
 2 vols. 8vo. with Portraits.

III.  
**The Dowager; Or, the Modern School for Scandal.**  
 By Mrs. Gore.  
 Author of "Mothers and Daughters," &c.  
 3 vols.

Also, now ready,  
 I.  
**The Thames and its Tributaries.**  
 By Charles Mackay, Esq.  
 3 vols. 8vo. with numerous Illustrations.

"The subject is most felicitous; such a book has long been wanted. The author has made a valuable and graceful addition to the literature of the day."—*Morning Herald*.

II.  
**A Summer amongst the Bocages and the Vines.**  
 By Miss Louisa Stuart Costello,  
 Author of "Specimens of the Early Poetry of France."  
 2 vols. 8vo. bound, with numerous Illustrations.  
 "One of the most fascinating books of travel that has for many years issued from the press."—*Atlas*.

III.  
**The Man at Arms; Or, Henri de Cernon. A Romance.**  
 By G. P. R. James, Esq.  
 Author of "Darsney," "Charles Tyrrell," &c.  
 Post 8vo.  
 "The work abounds with soul-stirring descriptions of battles, sieges, and all the pride, pomp, and circumstance of glorious war; and the varied adventures incident are delineated with great animation, and in the happiest manner of the author."—*Courier*.

IV.  
**Narrative of the Campaign of the Army of the Indus in Sind and Kaubool, in 1838, 1839.**  
 By Richard Hartley Kennedy, M.D.  
 2 vols. post 8vo. with numerous Illustrations.  
 "Crowded with anecdotes and descriptions, the work is extremely entertaining, and written in a spirit of vivacity unusual in narratives of this class."—*Atlas*.  
 Richard Bentley, New Burlington Street, Publisher in Ordinary to Her Majesty.

Printed by HANNAH PAGE MOYES, of Brook Green, Hammersmith, and GEORGE BARCLAY, of Number 2 Pallin's Place, Islington, both in the County of Middlesex, Printers, at their Printing Office, Number 66 Castle Street, Leicester Square, in the said County; and published by WILLIAM ARMIGER SCRIPPS, of Number 13 South Molton Street, in the Parish of Saint George, Hanover Square, in the County aforesaid, at the LITERARY GAZETTE OFFICE, Number 7 Wellington Street, Waterloo Bridge, Strand, in the said County, on Saturday, September 19th, 1840.

THE BRITISH ASSOCIATION.

TENTH MEETING: GLASGOW.

[Second notice.]

OWING to the excellent arrangements made in every department connected with this year's assemblage, the business of reception and location of strangers was conducted with more apparent ease and regularity than we have ever seen it at any very numerous meeting. The same facility and precision marked the opening of the Sections on Thursday at eleven o'clock, their several Committees having met an hour earlier to settle the order of proceedings, agreeably to the suggestions and instructions after the General Committee on the preceding afternoon. Every thing went smoothly and without confusion; and in all the Sections except B (Chemistry), where there were but few communications, a good deal of useful and interesting matter was brought forward, under the following intimation:—

"Members who desire to read memoirs to any Section of this Meeting are requested immediately to confer with the Secretaries of that Section, as to the time and manner of reading them.

"Letters and other communications to the Secretaries of Sections, and other Officers of the Association, are to be left in the care of the College Clerk, Faculty Hall, before 3 P.M. and afterwards at the Reception Room.

"Authors are requested to prepare immediately short and careful abstracts of their papers, and to leave the same in the hands of the College Clerk, for the Secretaries of the Sections, before the close of the Meeting, otherwise no notice of their communications can be printed in the Transactions of the Association."

A correct list of the Sectional business of the first day was judiciously printed and circulated about ten o'clock,—a great improvement upon the proceedings of former meetings, and a valuable guide to those who desired to know what was about to be done, and attend where their inclinations led them.

We subjoin a more accurate list of the Officers of the Sections than we obtained by hearing the names read at the General Committee:—

**SECT. A. President.**—Professor Forbes. **Vice-Presidents.**—G. B. Airy, Esq., Professor Whewell, Professor James Thomson. **Secretaries.**—Rev. Dr. Forbes, Professor Stevely, Archibald Smith, Esq.

**B. President.**—Dr. T. Thomson. **Vice-Presidents.**—Professor T. Graham, Professor Johnston. **Secretaries.**—Dr. R. D. Thomson, Dr. Clarke, Lyon Playfair, Esq.

**C. President.**—Charles Lyell, Esq. **Vice-Presidents.**—Rev. W. Buckland, H. T. Delabache, Esq., James Smith, F.R.S.—**Secretaries.**—David Milne, Esq., Hugh E. Strickland, Esq., Professor Scouler. **Geography** (attached to this Section); **President.**—G. B. Greenough, Esq. **Vice-President.**—Captain Washington. **Secretary.**—Hugh Murray, Esq.

**D. President.**—Sir W. J. Hooker. **Vice-Presidents.**—Sir W. Jardine, Bart., Professor R. Graham, Rev. J. Fleming, P. J. Selby, F.L.S. **Secretaries.**—Professor W. Couper, Robert Patterson, Esq., Edward Forbes, Esq.

**E. President.**—James Watson, M.D. **Vice-Presidents.**—J. Hodgkin, M.D., Dr. Abercrombie, Dr. Andrew Buchanan, Dr. John Macfarlane. **Secretaries.**—Professor John Cooper, Dr. James Brown, Dr. Rees.

**F. President.**—Lord Sandon, M.P. **Vice-Presidents.**—Mr. Sheriff Allison, Rev. T. Chalmers, Lieut.-Col. Sykes. **Secretaries.**—Professor Ramsay, R. Rawson, Esq., R. C. Baird, Esq.

**G. President.**—Sir John Robison. **Vice-Presidents.**—His Grace the Duke of Argyll, Rev. T. Robinson, John Taylor, Esq., James Walker, F.R.S. **Secretaries.**—J. Scott Russell, Charles Vignoles, James Thomson, James Tod, Esqrs.

One of the points which contributed greatly to the convenience of the meeting was the proximity of the various halls and rooms assigned for holding the Sections; being all within the gates of the College, except B, which is close to

the entrance. We now proceed to a report of the first day's proceedings as far as we could collect them; and if there are *lacunæ* involving any matters of importance, we shall endeavour to fill them up in future numbers;—this year, as heretofore, thinking it necessary to pay attention only to what may be new in the advance of Science, and not to go over grounds which, though popular enough at a meeting of this description, have become familiar to the Scientific Societies of London, and to the public through Reports and the publication of Transactions.

THURSDAY.

SECTION A.—*Mathematics and Physics.*

1. Sir J. F. W. Herschel's 'Report on Magnetism.'
2. Major Sabine's 'Report on Translation of Foreign Memoirs.'
3. Professor Powell's 'Report on Radiant Heat.'
4. Professor Forbes's 'Supplementary Report on Meteorology.'
5. Professor Whewell's 'Report on Tide Discussions.'
6. Professor Powell, 'On a Limit to the Refrangibility of Heat and Light.'
7. Mr. Graham, 'On the Solution of Numerical Equations.'

Professor Forbes opened the business of the Section by calling on the General Secretary present for Sir J. Herschel's report. Major Sabine replied that it had not yet been received, but that he expected it to-morrow.

Major Sabine proceeded to submit the Report of the Committee, consisting of Dr. R. Brown, Dr. Robinson, Sir J. Herschel, Professor Wheatstone, and himself, for the translation of foreign scientific memoirs. The Committee was appointed at Newcastle in 1838, and the sum of 100*l.* granted. At Birmingham a similar money-vote was passed. By some accidental circumstance the report of the appropriation, &c. for the first year was not presented in 1839, and, consequently, the present report embraced a period of two years. A convenient and appropriate channel for publication occupied the early attention of the Committee. They discovered that the valuable work, Taylor's "Scientific Memoirs," was about to be discontinued, and they resolved to give that publication a trial for the first year. The result is, that those Memoirs contain five eminent papers chiefly on magnetism, for the translation and publication of which the first grant had been paid to Mr. Taylor. Out of the second grant, 63*l.* had been expended for engraving seven plates for illustration. Seven gratuitous translations of memoirs, by names of Continental notoriety, had been received by the Committee, and forwarded to Mr. Taylor to be printed.

Professor Whewell then submitted the additional report, 'On Radiant Heat,' which Professor Powell had been requested to furnish. The report was voluminous, and such parts only were selected as the reader considered most interesting and calculated to explain its general character. In 1831–2, Professor Powell drew up, at the request of the Association, a report, which was printed in the "Transactions" of that period, 'On the Present State of our Knowledge of the Science of Radiant Heat;' the supplementary one now submitted (the introduction to which was expressive of the peculiar satisfaction the learned Professor felt at the high honour conferred upon him) was

considered necessary in consequence of the additions to and discoveries in this branch of science since that time. The more recently ascertained facts, and especially the very newly supplied and important one, namely, polarisation, rendered it expedient not to adhere to the divisions of the subject as treated in the report of 1831–2, but to treat it as done in this report, under two heads—unpolarised and polarised heat. Under the first, Professor Whewell pointed out one or two conclusions arrived at by M. Melloni and Professor Forbes—resistance to heat, not on the surface of a substance, but in the mass; diathermanency, varying in different crystallised bodies; rock-salt, very permeable to heat, even to non-luminous heat; diathermanency, not proportional to transparency. Reflexion, refraction, and transmission, were severally treated in the report, the heads of which only, in many cases, were stated. Professor Forbes had conceived the probability of heat in the lunar rays; he has, however, most carefully experimented, and he says if there be any, it must be less than the 13,000th part of a degree of a centigrade thermometer. All Melloni's experiments on heat, as tested by Professor Forbes—in short, all that have been conducted and published on the subject of heat for several years past—were, in this report, under the judgment and pruning-knife of Professor Powell, collected and collated; and, therefore, it is a valuable statement, shewing the actual present condition of facts in support of the undulatory theory of heat. The principal point, however, dwelt upon by the reader was the polarisation of heat realised by Professor Forbes, with tourmaline, by reflection of glass, mica plates, &c. Out of 157 experiments, one only was neutral and one negative. Ninety-two were made with heat below luminosity; and by those and others subsequently, all the phenomena of polarisation of heat, ordinary, elliptical, and circular, were proved. In Nov. 1836, Professor Forbes established by experiment, that the waves of heat were the same in kind as those of light, but that the wave of heat was three times the length of the wave of red light. There seemed also to be analogy in temperature to heat as colour to light. It appears that there exists a difference of opinion between Melloni and Forbes as to the equal or unequal polarisation of heat from different sources; and Professor Powell thus sums up his report. Upon a review of the different points of the inquiry, and upon reducing them to chronological order, there appears to be no real ground of rivalry. There had been ambiguous expressions of claim, which he thought a simple and careful statement of facts would remove. Diathermanency, refraction from dark sources, the peculiar properties of rock-salt in relation to heat, &c., were associated with the name of Melloni; whilst with that of Forbes were, transmission of heat, refraction and diffraction, the grand facts of polarisation; also circular and elliptical depolarisation, and length of wave. The facts and arguments of the point in dispute were contained in the report.

Professor Forbes took this opportunity of mentioning, that the question of equal or un-

equal polarisation will be soon settled. It appeared Melloni and Forbes were both right and both wrong; and that the former had lately published facts which will bear an interpretation to reconcile their differences.

Professor Stevelly asked how, consistently with the wave theory, can heat be considered the quantitative substance that chemistry shews? There was no analogy to this in light.

Professor Whewell said that he would answer or suggest to Professor Stevelly, that, when we said we have quantitative heat, the terms were indefinite. There is a question which must receive an answer, What is temperature? What quantities do temperatures mark? They give no indications of substance. Light may be similarly accumulated and marked by the photometer. It was his opinion that the attempt to combine caloric with the elements must be dropped. There was one circumstance, however, which led him to object to the wave theory—the small difference of the refracting index; that difference between the ray of heat and light was very small, whereas the difference between the lengths of the waves was threefold.

Professor Forbes observed that the explanation of this was not his, but that as a paper on the subject was set down for to-day, he would proceed to read Professor Powell's explanation of the phenomenon of dispersion (No. 6), which had long also been considered an objection to the undulatory theory of light, the removal of which depends upon the distance between the molecules, whose undulation causes heat and light. If the molecular distance be considered not very small, the term is lost, and a limit to refrangibility is obtained; and the limit being obtained, explanation is easy: for, however much the length of the wave increases, refrangibility is stopped. The length of the wave is in a certain ratio to the distance of the particles, and that of heat is, as before stated, three times the length of that of light; but the refrangibility is limited, and little more than the refrangibility of light.

Sir David Brewster suggested the test of the opalescence of bodies. From fluor spar, for instance, a beam of light was not only reflected from the surface but transmitted from the mass, or reflected from the particles. He should like to have ascertained what influence this substance would have on the rays of heat. He instanced, also, an alcoholic solution of the colouring matter in plants, and other substances. To Professor Forbes the suggestions of Sir D. Brewster were extremely interesting, inasmuch as he himself had considered such experiments of great importance, and had employed during his investigation substances of similar structure, namely, incoherent substances dusted on transparent bodies; these had strict analogy to opalescence: also powders in fluids: and the result was, that the rays of heat in these cases are most refrangible.

Professor Whewell took the chair while Professor Forbes read his Supplementary Report (No. 4). He observed, however, that the subject was so extensive that it would be in vain to attempt to occupy the time of the Section by reading the whole, and that, therefore, he would make as trivial a statement as the multiplicity of subjects would allow. After a few introductory remarks, he proceeded to select such topics as bear on the general principles, viz. temperature, pressure, humidity, winds, clouds and rain, electricity, meteors, and suggestions for definite pursuit. He merely referred to the foregoing, with the exception of the division of the temperature of the globe

itself; from that he selected copious extracts; but as the whole will be published in the "Transactions," in accordance to the new regulations, in four months after the meeting, we shall follow the author's example, but still further abbreviate, premising with an opinion that the report contains extensive and most valuable facts, data, suggestions, &c., on temperature, construction of thermometer, diurnal and annual curves of temperature, distribution of temperature over the world; additions to isothermal lines of the globe, different places exhibiting a remarkable difference of climate where the mean temperature is nearly alike. Another point was the decrease of temperature in ascent, important as to the limit of the atmosphere; speculations as to temperature of space, not cold as supposed; then solar radiation and force of solar rays; temperature of globe itself, and of the part of space in which it was now moving. This was the division upon which the author dilated. Internal heat; solar heat; quantity lost in atmosphere; to what extent does direct solar heat influence the temperature of the atmosphere? what would be the difference without the sun? Poisson's theory of atmospheric heat; De la Rive's criticism thereon, with which Professor Forbes agreed. Much variance of opinion exists on the subject of the temperature of space; similarly to that of temperature the several divisions of the report were enlarged. In concluding, the author remarked on the value of public observatories, or rather, observations on meteorology made on authority; he commented largely on those of Paris, Brussels, St. Petersburg, &c. He lauded, also, the observatories erected and being erected abroad under the auspices of the British government and the East India Company, but he regretted there were none established at home. The desiderata for individual inquirers are to establish curves of phenomena and fix secular data. He concluded by recommending that the observations making at Plymouth and in Scotland, at the expense of the British Association, should be by no means discontinued.

Professor Whewell next read Report No. 5. The object was to ascertain the moon's mean declination; but as it varied every year, a number of years' observations would be required. From a series of observations made at Leith, a number of calculations had been made; and from observations also made at Liverpool, Bristol, and Plymouth, tables had been made out to shew the height of the tide at any hour of the day, according to the moon's age. Observations had also been made to determine the curve of the rise and fall of the tides. Diagrams of the curves were exhibited and explained to the Section.

Professor Thomson stated the purport of the paper (No. 7) given in by Mr. Graham. The Professor stated that the principle was correct, but he considered that of Mr. Horner to be superior.—The Section then adjourned.

#### SECTION B.—Chemistry.

1. M. Schönbein's 'Report on Electricity.'
2. Mr. Solly, 'On Bleaching Vegetable Wax.'
3. Dr. Gregory, 'On the Pre-existence of Urea in Uric Acid.'
4. Dr. Gregory, 'On Liebig's Process for Preparing Muri-oxide.'
5. Dr. Schafheutl, 'On the Relation of Form to Chemical Compounds.'

#### (Brief Summary.)

Dr. Thomas Thomson, the President, having taken the chair and opened the meeting, Mr. E. Solly, jun. proceeded to read an abstract of the Report of Professor Schönbein, of Basle, 'On the Peculiar Odour evolved in certain Electro-chemical Decompositions.' It may be recollected that among the grants of last year,

40*l.* were voted to Professor Schönbein towards defraying the expenses of his research into the connexion between chemical and electrical phenomena. In the present abstract, the learned Professor described a number of experiments, with their results, which he had made in order to ascertain the circumstances under which this odour was evolved, the causes of its production, and the original principle whence its presence was to be attributed. The odour is evolved by the decomposition of water, by numerous electrolytes, and in great quantities by dilute sulphuric acid. The Professor is of opinion, that the odour which is perceptible when bodies are struck by lightning may be due to the disengagement of a portion of *Ozone*; and supports this argument from having witnessed a church recently struck, when all the surrounding objects were wrapped in a bluish vapour, and a peculiarly pungent smell affected the sense. Should the existence of this new substance, ozone, be demonstrated, it is evident that a very considerable change, as regards the science of chemico-electricity, must be produced.

The President observed that nothing was stated respecting its actual or supposed properties.

Professor T. Graham, of London, replied, that M. Schönbein thought he had established by analysis an analogy between ozone and chlorine; and explained the analytical process by which this opinion had been arrived at.

The next paper, read by Mr. E. Solly, was, 'On the best Method of Bleaching Vegetable Wax.' Mr. Solly, after referring to a number of experiments which he had made during the course of the summer, to discolorise vegetable wax, stated he found the following to answer the purpose most completely, by which the wax was bleached in a few minutes, and a greater effect of discoloration was produced than by the mere passage of chlorine for half an hour. This method consisted of bleaching by pure nitric acid, by melting the wax, pouring in a small quantity of sulphuric acid, composed of one part of oil of vitriol to two of water, and then stirring in a few crystals of nitrate of soda, the whole to be agitated with a wooden stirrer and kept heated. Nitric acid is then evolved in considerable quantity and purity from a large surface, and in such a manner that all the acid evolved must necessarily pass through the melted wax. This method answers the purpose very completely, the process is cheap and rapid, and the residuum being merely a little solution of sulphate of soda, is very easily removed.

The Chairman remarked that this was a very simple mode of bleaching wax, and a general knowledge of it might be extremely useful.

Professor Gregory read a communication 'On the Pre-existence of Urea in Uric Acid;' and exhibited a new process, communicated by Professor Liebig, for preparing the new, singular, and beautiful compound, termed Muri-oxide by Liebig and Wöhler, and Purpurate of Ammonia by Prout. This process is quite certain, and very productive. It consists of adding a boiling solution of seven grains of alloxan, and four grains of alloxantine, in 240 grains of water, to eighty of a cold and strong solution of carbonate of ammonia. The mixture instantly acquires a deep purple colour, and on cooling deposits the golden green crystals of muri-oxide.

Professor Graham asked if Dr. Gregory thought this a good process for procuring muri-oxide, as it could be purchased in London from 4*s.* to 5*s.* per lb.?

Dr. Schafheutl, of Munich, read a very valuable paper 'On the Relation of Forms to Chemical Composition,' in which he shewed that the varieties of graphite which are frequently met with depend on difference of chemical composition. He also described his method of analysing graphite or plumbago by means of sulphuric and nitric acids.

The last paper read was by the same gentleman, 'On a New Compound of Arsenious Acid and Sulphuric Acid,' which appears to be the destructive agent to vegetable and animal life, in the vapour emitted from the copper works at Swansea in South Wales. This discussion is likely to throw much light on some peculiarities observed in poisoning by arsenic, of which the trial of Madame Laffarge at this moment affords so romantic and tragical a mystery.

#### SECTION C.—Geology.

1. Dr. James Robb, 'On the Geological Features of the River St. John, in New Brunswick.'
2. Mr. Stevenson, 'On Changes of Level Land and Sea.'
3. Capt. Baddley, 'On the Geology of Canada.'
4. Mr. Bowman, 'On the Silurian Rocks of Llangollen.'

Mr. Lyell, President, took the chair, supported by the Marquess of Northampton, Mr. Greenough, Mr. Murchison, Mr. DeLaBeche, and other distinguished geologists. Previous to commencing the sectional business, Mr. James Smith (of Jordanhill) took occasion to correct a mistake which had occurred in the notices on the cards delivered to members, where, among the places opened for their inspection, the Hunterian and Andersonian Museums were marked as being accessible only by a fee of 1s. On the contrary, he wished it to be generally known, that they were freely and gratuitously thrown open to whoever would do them the honour of a visit.

Dr. James Robb then proceeded, *viva voce*, to explain the geological features of the River St. John, in New Brunswick, of the course of which a diagram was hung up in the Hall, as also several diagrams of the valley and bed of the stream.

[It appeared at first that this Hall was ill adapted for hearing; but when better filled with auditors, the interfering echo was not so bad.]

Dr. Robb began by noticing the extent and importance of the St. John, which drained two-thirds of the whole province of New Brunswick, through which it pursued a course of between five and six hundred miles. A considerable way up above the town of St. John and the Bay of Fundy, it was above ten miles in width; but, as it approached the sea, a closure of the banks formed an aperture of only 310 feet, through which the mass of water had to pour its wave. On the making of the tide, "a fall upwards" of thirty-five feet was created by this formation, and an immense cataract all across the river was the consequence. Tracing the banks on both sides, a complete series of terraces were seen, sometimes two and sometimes three deep. They consisted of detrital matter, and seemed as if the water had originally filled the whole of the valley, but descended to lower levels in the process of time. He described the various soils of which these terraces were composed, and mentioned the trees which grew upon, and the other vegetation which clothed, them. At all points the terraces were distinctly marked, although the country was flat above, and you descended as if by these steps to the river below. Such terraces were common more or less to all large rivers. They abounded in England and Scotland, on the Niagara, the St. Lawrence, and on the rivers of the south and north in the United States. In fact, the phenomena were

general; and they were only more distinctly marked in New Brunswick in consequence of less having been done to efface them by the hand of man. The occurrence of these terraces, covered with detrital matter, on the St. John and all the rivers of North America, might be explained by some geologists by supposing that lakes on the course of the rivers had burst their banks; that their barriers had given way; and that the rivers had fallen to their present level. Now, if the rivers in question had ever had lakes in their course, there might have been some reason for this hypothesis; but this was not the case. He inferred, therefore, that the general cause, or causes, of these terraces were operating throughout a vast extent of country, and that these were the uprisings of land, occasioning a corresponding depression in the levels of the river. Thus, wherever they found terraces, and they found them in all the rivers of America and Scotland, there were indications of the upheavings of land, and that at a comparatively recent period of the world's history. His object in being here to-day was to have the opportunity of hearing geologists expressing their views in solution of the phenomena he had described.

The President observed that the bore such as Dr. Robb described was well known on rivers where wide estuaries caused an accumulation of the ascending tide, and inquired if any, and what, organic remains were found in the gravel and sand of the terraces.

Dr. Robb, in answer, said, there were very few fossils of any kind; and though he had found unios, and another fresh-water shell, he inferred that the detritus was ill adapted for their preservation, and therefore their number was so extremely limited. On the shores of the Bay of Fundy only marine shells were found. In answer to another question, Dr. Robb stated that the slopes at the bottom of the terraces were from and lower down than the river, and not towards it.

Mr. Greenough raised a good-humoured laugh by animadverting on the maintainers of the Elevation system, and their fondness for the words upheaving and elevating. They have now even heard of a fall upwards; by and by, he supposed, they would hear of some rocks having *risen downwards*. The term subsidence afforded, in his judgment, quite as perfect an explanation of these phenomena as the favourite elevation: in fact they both meant the same thing—displacement. A series of lakes where there was now a river would account for the terraces and levels in a satisfactory manner. First they burst one boundary, and then they burst another, till at last the waters reached the channel by which it emptied itself into the sea. This was not peculiar to the St. John, but to other rivers in all parts of the world.

In reply to a question from the Marquess of Northampton, Dr. Robb more fully described the nature of the soil on the upper and lower terraces, and stated that some bones, said to have been found on the banks somewhere up the river, had been shewn at St. John's as mammoth remains: he had examined them, and believed them to belong to the spermaceti whale.

The next matter brought before the Section was Mr. Stevenson's paper 'On Changes of Level Land and Sea,' the details of which were stated to be of very great importance. From their length, however, Mr. Smith, through whom the essay was submitted to the Association, restricted himself to only a few prominent points by way of reference; and enlarged on them to explain his own views on the subject,

to which he has devoted some years of careful research. The gist of Mr. Stevenson's argument was, that a universal waste of coast had taken place, with few exceptions, caused by local circumstances. Mr. Smith commenced his own remarks by saying, he would confine them to the locality on which they were assembled, the great basin of the Clyde. It consisted of three beds. The lowest, i. e. below the tertiary formations, was that of diluvium, which other geologists had called till, and which, in other parts of the island, was marked by the occurrence of those erratic blocks on which so much observation had been expended. The second, which was one of the tertiary series, might be described as the clay of which bricks and tiles were made. In it marine remains were found in abundance. The third he might denominate as belonging to the historical period, as ancient boats, and wood for various uses, had been discovered in the sands of which it was composed. These sands were evidently fluvial, and contained no marine shells. The lower parts of Glasgow stood on this bed. Such was the general formation of the valley, though, at a greater distance, there were other distributions of strata, which probably shewed that a considerable change of climate had taken place. Before going farther, Mr. Smith desired to define what he meant by "tertiary." He understood by the term, strata in which the proportion of shells of extinct species was found, as in the present case, to the extent of fifteen per cent. He also noticed, that the upper sands to which he had referred were, in one instance, traversed by a trap-dyke, as if an igneous origin might be ascribed to this part of the formation. The bed exhibited a fall of forty feet to the level of the water, and in his opinion the historical period embraced only a small part of the present physical structure. With regard to the strata he had particularised as the brick clay, it was 100 feet above the level; and seemed as if it had been formed at the tranquil bottom of the sea, at a period far remote. It extended throughout the entire valley of the Clyde; and he believed a corresponding feature was found in the Cast clay which occupied the valleys of the Tay and Forth. In the diluvium below the tertiary, there had been discovered the remains of the mammoth, the deer, and other races, which were not distinctly ascertained. Below this, in some places, but rarely, were stratified beds, the till resting generally on old sandstone, where violence in the position was very obvious. One thing had struck him forcibly whilst making these observations, that the shells found were of the same kind as those now obtained from the Arctic regions, Behring's Straits, and more northern shores. From this he deduced the fact, that our climate of old had been much colder than now, and these deposits were made in the strata he had thus briefly described.

Mr. Lyell concurred in the opinion, that the latter remarkable fact demonstrated a change of climate from a colder to a warmer condition, and fancied this change might be connected with the phenomena of the erratic block, and the period of deposition.

Dr. Scouler, being called upon, gave some further particulars of Mr. Stevenson's paper, in which the writer expressed his surprise that little or no progress had been made in the investigation of this important subject.

Mr. Greenough remarked, that such an allegation was ill-founded, for the subject had attracted the utmost attention. The Geological Section had soon come to the conclusion that they could not grasp it in all its bearings; and

had consequently referred it to the Physical Section, by whom it was entertained, and a series of experiments undertaken to arrive at data for its explanation. By establishing observations at various places—London, the Bristol Channel, &c. &c.—some interesting points had been made out and reported for the "Transactions" of the Association. How, then, could it be asserted that the subject had been neglected? and how could Mr. Stevenson claim the merit of having taken the mean level of the sea as the basis of these observations? At the same time that he condemned these matters, he was ready to acknowledge that the details of this paper were no doubt highly valuable.

[As these details were not gone into, we can only deal in the dark allusions to them; and we may as well observe here, that such was the case with many of the reports and papers which were subjects of discussion in the Sections, their contents being only known to the officers of these Sections.]

Mr. Greenough inquired if the Crag shells had been compared with those which were said to be identical with the existing species in the Arctic regions?

Mr. Delabèche also expressed his surprise at the statement that little had been done in attempting to ascertain the sea level; though he must remind the Section that all that could be done could only reach to approximation and not to a certain conclusion. The phenomena noticed by Mr. Smith, of a fall of forty feet in the sand strata, appeared to him very remarkable; for engaged as he had lately been in government works in Wales, and in making accurate measurements, he had ascertained that forty feet was the maximum height of the same strata in that country and in Devonshire and Cornwall; which shewed that this change of level between land and sea had taken place over a great area, embracing probably the whole, or nearly the whole, of our island.

Mr. Milne, whose opinion had been asked in the course of the discussion, stated, from recent observation, that on the east coast of Scotland a cliff, of exactly forty feet in height above high-water mark, could be distinctly traced. He meant that forty feet was the maximum, for as you descended the Forth, though it reached that height about Stirling, it was only thirteen feet at Dunbar. This he accounted for by the different action at narrow and wider channels; but was a complete proof of a subsidence to that extent. Mr. Milne also stated, that farther inland he had clearly made out another and a higher cliff, of from 90 to 100 feet above the level of the sea. He had clearly followed it for three miles to the north of Stirling, though not exactly parallel, and it was indicated by rocky cliffs and pudding-stone that skirted the Ochil Hills, shewing plainly that the sea must have been there.

Dr. Buckland made a few observations on the extraordinary fact of shells (if in the till, where elephant remains were found) being similar to the Arctic species. He also remarked on the lapse of time being no certain measure for the absence of shells in any deposit; and on the occurrence of basalt dykes in such sands as Mr. Smith had referred to, which remained for ages, whilst the more perishable matter by their sides was removed. A single storm which might occur in a hundred or five hundred years did more to change the nature of a shore than the common action of the waves for centuries. Happening at high tides, such storms would completely alter the face of the land; and therefore it was an error to argue from such

premises on the lapse of years as the cause of the observed phenomena. He compared the sedimentary deposits in valleys to the contents of slop basins, where one substance was thrown after another, and sank in layers to the bottom; and mentioned some curious tracks of deer and large oxen on clay, subjacent to a bed of peat, recently discovered in excavating for a dock at Pembray, in Pembrokeshire. The lower peat was moulded into the footsteps of these animals; and similar impressions were found on the upper surface of the peat under a bed of salt, whilst the bones of both the deer and oxen were lying in the peat itself. Similar tracks were also noticed in the excavations for another harbour on the coast of Neath.

Mr. Smith answered, that he had found shells in the till, but only of two species; and that they were very rarely to be met with.

The remaining proceedings of the Section, which do not require a detailed report, consisted of Capt. Baddeley's paper 'On the Geology of Canada,' and Mr. Bowman's 'On the Silurian Rocks of Llangollen.' Upon the first, a conversation ensued touching the importance of government obtaining correct surveys of our North American colonies; and Dr. Buckland declared it to be the more essential, since there was a chance in the settlement of our differences with the United States, that tracts of country might be exchanged, and we might be giving away a coal-field worth 10,000l. or 20,000l. an acre for fields of granite not worth five shillings. Such a proceeding would be like the conduct of the foolish fellow at the siege of Troy, who exchanged gold for brass. The rich mineral resources of Nova Scotia and New Brunswick were spoken of in strong terms.

Mr. Bowman's paper was illustrated by sections of the upper Silurian rocks between the valley of the Dee, from Mool Ferna to the Egenyseg, and of the Silurian and associated igneous rocks between the river Tanat and the Denbighshire coal-field. Nothing new was adduced and the Section adjourned.

#### SECTION D.—Zoology and Natural History.

1. Professor Henslow's 'Report on the Preservation of Animal and Vegetable Substances.'
2. Mr. E. Forbes and Mr. Goodair, 'On the Structure of the Ciliograda.'
3. Dr. Hodgkin's 'Queries respecting the Human Race.'
4. Dr. E. Lankester's 'Notice of Plants and Animals occurring in the Sulphureous Waters of Yorkshire.'
5. Dr. William Macdonald, 'On the Structure of Fishes.'

The Rev. J. Fleming, one of the Vice-Presidents, took the chair, in the anticipated absence of Sir W. Hooker.

Last year, 6l. were voted to Professor Henslow, Mr. Jenyns, Dr. Clark, and Professor Cumming, for experiments 'On the Preservation of Animal and Vegetable Substances'; and Professor Henslow's report thereon was the first paper, read by Mr. Babington, who apologised for the unavoidable absence of the writer. Professor Henslow divided his report into two parts; in the first he stated the results obtained with vegetables. The effects of a number of preservations, chiefly mineral, were experimentally investigated; but with vegetables the success obtained was very slight, none of the salts being likely to turn out favourably. In naphtha and acetic acid the specimens were preserved, but in the latter they lost their colour, and assumed a reddish tinge.

The next communication was by Mr. E. Forbes and Mr. Goodair 'On the Structure of the Ciliograda.' In this paper the authors gave an account of the researches they had made on this subject since the last meeting, chiefly bearing on the internal structure of the animal. They stated that they had confirmed Mr. Garner's discovery of the existence of cilia

in the stomach and vessels. The mouth was found to be surrounded by a rim of cilia. The authors announced their discovery, that ciliary motion depends, in these animals, on the presence of a granular tissue having undulating movements, on which the cilia are placed. They stated that the description hitherto given as characterised by having two openings to the digestive canal is not true, and that there is but one opening as in other medusae. Lastly, they gave an account of a remarkable worm which lives in the stomach and vessels of the Cydippa, and which presents the first instance of an entozoon, or intestinal worm, inhabiting the interior of any of the scalegrha, or jelly fishes.

The third communication resulted from the grant of five pounds to Dr. Prichard, Dr. Hodgkin, Mr. J. Yates, Mr. Gray, Mr. Darwin, Mr. R. Taylor, Dr. Wiseman, and Mr. Yarrell, for printing and circulating a series of questions and suggestions, for the use of travellers and others, with a view to procure information respecting the different races of men, and especially those which are in an uncivilised state.

'Queries respecting the Human Race.'—Mr. R. Patterson (one of the Secretaries), in the unavoidable absence of Dr. Hodgkin, brought forward this paper, which had been printed at the suggestion of the Natural Historical Section. The object of the queries was to supply a desideratum complained of by Dr. Prichard at the last meeting of the British Association at Birmingham, in a paper which he read 'On the Extinction of some Varieties of the Human Race,' wherein he pointed out the irretrievable loss which science had sustained by a large portion of the human race, counting by tribes instead of individuals, having been suffered to perish before many interesting questions of a psychological, physiological, and philosophical character, as well as many historical facts in relation to them, had been investigated. To supply this deficiency, a series of queries had been prepared by the Committee, and were read in detail by Mr. Patterson. The Report states that Britain, in her extensive colonial possessions and commerce, possesses unrivalled facilities for the elucidation of the whole subject, and the very numerous queries refer generally to the stature of the people—the disproportion between the different parts of the body—the complexion—the colour and character of the hair and eyes—the formation of the head and face—the skull—and other physical peculiarities.

After some conversation from Mr. Brodie and Dr. Macdonald, in reference to the theory that the accentuation of most languages was preserved even when the words were changed, Dr. Fleming said that the subject suggested many important considerations, which he trusted would be brought before the Association on a future occasion.

Dr. Edwin Lankester gave a notice of plants and animals found in the sulphureous waters of Yorkshire; and Dr. Macdonald, a detailed dissertation 'On the Structure of Fishes.'

#### SECTION E.—Medical.

1. 'Report on the Motions and Sounds of the Heart,' by the London Committee of the British Association for 1839-40.
2. Dr. Jeffray, 'On the Use of Conglobate Glands.'
3. Dr. Perry, 'On the Diffusion of Contagion.'

The first paper was the 'Report on the Motions and Sounds of the Heart,' by the London Committee of the British Association, for which experiments 25l. were voted at Birmingham to Dr. Clendinning. It was read by the Secretary, Professor Wm. Couper. A short discussion ensued, in which Sir Charles Bell and others

took part. But neither the Report nor the debate require our report.

Dr. Jeffray, of Glasgow, read a paper 'On the Functions of Conglobate Glands,' in which he denied the muscular contractility of the absorbent vessels; and attempted to shew that the glands act the part of little hearts in propelling the chyle along these tubes.

Professor Allen Thompson, of Aberdeen, thought the latter opinion ingenious, and perhaps correct; but he was quite satisfied of the contractile power of the absorbents. In these sentiments Dr. John Reid, of Edinburgh, generally concurred.

Sir Charles Bell stated that the elevation of the shoulder in inspiration assisted the flow of the fluids through the vessels at the root of the neck; and referred to Dr. Reid's experiments on this subject; and Dr. Abercrombie warmly complimented the venerable professor, and expressed the lively pleasure he had in seeing him present on this occasion.

Dr. Perry then read a paper containing remarks 'On the Diffusion of Contagious Fevers, the Laws which govern them, and the Mode by which they are Communicated from one Individual to another.' On no subject, he said, did there exist a greater degree of obscurity, and, consequently, greater difference of opinion, than this; while there was none connected with prophylactic medicine of greater importance. From the extensive prevalence of fever in Glasgow, it had been thought that causes of unhealthiness existed here, which were not to be met with in any other part of Great Britain. This he believed to be a mistake. A correct history of fever, and of the circumstances which favour its diffusion, would, he thought, go far to shew that there was nothing in the situation, the air, or the want of cleanliness in Glasgow, which gave rise to fever, or tended to make that city more unhealthy than any other large city in the kingdom, where the same number of people of the working classes were brought together from different quarters of the country. It was from the constant influx of strangers and poor from distant parts, where contagious fevers seldom prevailed, and who were therefore unprotected, by not having previously undergone the disease, that the epidemics which prevailed in Glasgow were constantly fed with victims. It was true that typhus fever was not so general in England as in Scotland or Ireland. In the former, from the existence of poor-laws and a body of organised overseers, the poor were not permitted so freely to wander about or settle in their cities or towns. When they were seized with fever, and unable to work, they were sent at once to the parish hospital, generally attached to the workhouse, where they remained till they were able to work, or be sent to their own parish, the power of infection being lost in most cases before they were dismissed. The greater poverty and the mendicacy permitted in Ireland and Scotland was unquestionably a principal means of spreading contagious fever; but poverty and destitution would never originate this disease of themselves. The length of the period between the extensive prevalence of epidemic fever, and the time it took to exhaust its virulence, was a point of no small importance. It had been ascertained, from a sketch of the periods of the prevalence of epidemic fever, that from ten to fifteen years was about the average length of time during which it existed in a sporadic form, and about two years in its epidemic form. Were they to ascribe this (as had been done) to a difference in the constitution of the air, which appeared to be a mere fancy, without facts to support it? The same

epidemic period took place in small-pox before the introduction of inoculation; and the same thing takes place also with respect to measles and scarlatina; but their continuance in sporadic form is much shorter, because they are the diseases of children, who catch them from each other in their intercourse in the school-house, in a way which he would afterwards point out. We had at this moment proof that destitution alone will not produce contagious fever. In a memorial to the Lords of the Treasury, signed by the chairman, secretary, and treasurer of the Highland Relief Fund, it was stated that in the Highlands of Scotland there are at the present moment 150,000 persons of all ages requiring support; that on these poor people famine and starvation have laid their ruthless hands, who must either die of actual want or stretch out their hands and steal; and this not merely for the present, but that it has existed, and is gradually increasing, since the alteration of the salt laws and the cessation of the kelp manufacture; that this portion of the empire is becoming, or has already done so, the scene of unmitigated wretchedness; yet contagious typhus is rare among them, while they remain in their own damp and every way wretched dwellings. He had the authority of more than one resident medical practitioner, that when typhus fever appears among them, it can always be traced to their intercourse with our large towns. In coming into large cities in search of food and employment, their poverty and clannishness led them among those of their own class, or into low, miserable lodging-houses, where contagious epidemics almost constantly prevail. They were soon seized, and became inmates of hospitals; and being sent out before they were fully purified from the contagion, they spread the disease among others of their class. What was true of small-pox was true of typhus fever. It was well known that those contagious fevers with which we were best acquainted, as variola, rubeola, and scarlatina, were governed by certain general laws, to which there were few exceptions. These laws were stated in a professional manner; and the author went on to the influence of age in the result of the disease, shewing that the deaths amongst males under the age of twenty were small compared with the deaths of females. The paper concluded with suggestions for checking the progress of such contagious diseases as typhus fever, or eradicating them altogether. The means for accomplishing the first were within our own power; the second could only be done by a general measure, which embraced the whole united empire. The first point of importance was as far as possible to have sufficient hospital accommodation, where the patient should be kept until all danger of infection was past. Cleansing and ventilating houses, the separation of patients, the proper use of the bath, &c., were recommended. To accomplish the total eradication of contagious diseases would require the interference of government in the establishment of a medical police, with responsible inspectors, to be paid by rates levied on the county or city in which they were located.

Dr. Black, of Manchester, gave it as his opinion that this was a most important and valuable paper to the profession, and also to the public, who must feel interested in whatever might tend to prevent the spread of fever in large towns—a calamity which this place had grievously felt of late. The Doctor attributed the prevalence of fever to contagion, and suggested means by which that might be prevented, or at least checked; but it must be evident that

there were many other causes in Glasgow generative of fever. Among these the nature of the dwellings and the mode of living might be mentioned, and a good deal of the evil arose from immigrations from Ireland. He might allude to the town of Manchester, which was increasing in population as rapidly as Glasgow, to shew that in consequence of a greater dispersion of the houses, wider streets, absence of filthiness, people living on animal food and drinking less spirits, fever was less prevalent than it was in Glasgow.

Professor Hannay expressed his concurrence in the views of Dr. Black. But he had other, and, it was known, rather peculiar views, respecting the spread of contagion. He held that due prominence had not been given in the Report of the Poor-Law Commissioners to the fact that fever was greatly increased in consequence of the poor being ill fed and ill clothed. The time when febrile diseases prevailed, in February and March, was the very period when we could least expect them, because at that period, from the want of heat, as is the case in marshes and other sources of miasma, fewer noxious principles are ever to be found. The comfort of the poor should be better attended to, as where there was poverty in food and clothing an accumulation of disease was certain to be found.

Dr. J. R. Cormack differed from the author that typhus fever could not be taken more than once by the same individual. He knew that some of the nurses in the Edinburgh Hospital had had the disease twice; and an eminent clinical professor (Christison) no less than five times. Dr. C. himself had twice had typhus. He also stated that much depended upon the degree of exposure. In Edinburgh, the nurses were the most common victims, then the resident clerks, then the non-resident clerks; and among the medical students who merely visited, the cases of fever were of comparatively rare occurrence. He would make another remark. It was not always the ill-fed who suffered. In the Edinburgh epidemic of 1827, the disease chiefly raged in the New Town.

Dr. Perry remarked, that he did not consider the cases referred to of the disease occurring more than once, as genuine typhus.

After a few remarks from Dr. Seargent, the Section adjourned.

#### SECTION F.—Statistics.

1. Capt. Miller, 'On the State of Crime within the Royalty of Glasgow.'
2. Dr. Cleland's 'General View of the Population, Trade, and Commerce of Glasgow.'
3. Mr. Alston, 'On the Progress of the Blind Asylum in Glasgow.'

Colonel Sykes in the chair.—Captain Miller proceeded to read the following paper 'On the State of Crime, &c. within the Royalty of Glasgow, and City Police Jurisdiction, with Observations of a Remedial Nature,' prepared by the Superintendent of Police.

Population of Glasgow, within the Police Jurisdiction, supposed .....	175,000
Population beyond Police Jurisdiction, and within the Parliamentary Bounds, supposed .....	97,000

Total..... 272,000

#### I. STATE OF CRIME, &c.

1. *Extent of Crime.*—During the year ending 31st December, 1839, the number of persons brought before the magistrates of the city, including parties charged with contravening minor police regulations, as well as parties charged with crimes and offences, was 7687—the males being in the proportion of three to one of the females. Of the total number, 468 were discharged, 5410 were summarily convicted, 661 were sentenced to Bridewell, 46 were sentenced to gaol, 179 were acquitted, 1178 were

admonished, 72 were ordered to find bail, 306 were transferred to the Burgh Criminal Court, 72 were transferred to the Sheriff Court, 55 were transferred to the Justice-of-Peace Court, and 20 were sent to other counties. On examination, it will be seen that the greater part of the offences charged were of a very light description. Robbery, thefts by house-breaking, and other offences of a grave nature, are now of rare occurrence in the city. The estimated value of property stolen within the police bounds, and reported at the office during the year 1839, including watches, and money taken from the persons of individuals in a state of intoxication, was 7653*l.* 10*s.*; the estimated value of property recovered, 1260*l.* 10*s.*; the number of attempts at housebreaking discovered by the police, 84; the average number of disorderly women found in the streets at night, and brought to the office, 50; the number of criminal informations lodged in the course of the year, 3725; and the number of cases actually brought into court, 5047. As may be presumed, the aggregated number of offenders includes many parties who reappeared. The preceding statement applies solely to the city of Glasgow, exclusive of the suburban districts; but it is right to state that a very large number of offenders within the city truly belonged to the suburbs. Nearly all the thefts of watches and money taken from the person, and those by domestic and other servants, were committed in circumstances beyond the control of the police, and where they could not act in a preventive capacity. It is proper to observe that many of the persons convicted of theft were not habitual thieves—some were wives deserted by their husbands—some were children deserted by their parents—and many of the persons belonging to this class of offenders, as well as to other classes, were led to the commission of offences by intemperance. The Glasgow Police Office is not a prison, except for the detention of parties to be brought before the magistrates, and remanded for further examination. Many of the offences being such as not to merit the severe punishment of confinement in gaol or Bridewell, the temporary detention in the office till the case had undergone investigation was deemed by the magistrates a sufficient correction of the parties; and many of the offenders, being very young persons, were ordered to be given over to their parents or relations for correction. Notwithstanding the increase in the population of the city and suburbs, the amount of crime has of late years diminished within the Royalty. This is satisfactorily shewn by the Table, No. II. subjoined, in which the number of police cases of every description, with the amount of fines levied for petty assaults, disorderly conduct, &c., are given for each year from 1826 to 1839, both inclusive:—

TABLE, NO. II.

Table showing the Number of Cases brought before the Police Court, Glasgow, and the Amount of Fines recovered each year, from 1826 to 1839, both inclusive:—

Year.	Number of cases.	Amount of Fines.
1826 .. .. .	6071	£. s. d.
1827 .. .. .	6485	828 4 9
1828 .. .. .	7123	1417 5 1
1829 .. .. .	7587	1544 13 0
1830 .. .. .	7376	1606 2 9
1831 .. .. .	7591	1376 1 8
1832 .. .. .	7631	1108 10 4
1833 .. .. .	6118	1037 4 11
1834 .. .. .	6126	813 12 8
1835 .. .. .	6126	851 14 4
1836 .. .. .	4927	804 0 11
1837 .. .. .	4347	576 4 10
1838 .. .. .	3659	367 18 7
1839 .. .. .	5010	550 19 10
1826 .. .. .	5047	768 0 3

The number of persons sent to the Glasgow Bridewell from the Justice-of-Peace Court, for offences of every kind, in the year 1836, was 224; in 1837, 412; in 1838, 401; in 1839, 498; and for the period ending on 18th August, 1840, 535. Of these offenders, during the two years ending 18th August, 1840, 137 were sent to Bridewell for periods of from five to sixty days, for the non-payment of fines varying from 5*s.* to 5*l.* The number of persons sentenced to be executed in Glasgow from the year 1820 to 1840, both inclusive, was sixty-six; of whom, forty-five were hanged, and twenty-one had their sentences commuted to transportation for life. Of the persons executed three were females. There have been only four executions in Glasgow since 1833: three for murder, and one for throwing vitriol with intent to murder.

2. *Houses of Bad Fame.*—Under this head Mr. Miller gives some particulars of the unfortunate creatures who frequent these houses of a very melancholy description. He says:—The average period during which girls are known to continue on the streets, before they disappear by death and otherwise, is about five years. For the most part, these unfortunate girls live in great wretchedness—their personal habits are filthy—they have miserable homes—they are seldom in bed till far in the morning—they are without wholesome diet—they are constantly drinking the worst description of spirituous liquors—and they are exposed to disease in its worst forms.

3. *Fires.*—The number of fires in the city and suburbs, from 1st January, 1836, to 31st January, 1839, being three years, was 208. Of these, in 19 instances, the premises were totally destroyed; in 64, considerably damaged; and in 185, slightly damaged. In 232 instances the causes were ascertained, and were very varied; in 31, the causes were not ascertained; and in 5, the fires were considered wilful, the parties having been taken into custody, and the cases reported to crown counsel. The most frequent cause was found to be from flues and stoves taking fire through carelessness.

#### II. OBSERVATIONS OF A REMEDIAL NATURE ON THE STATE OF CRIME IN GLASGOW.

1. *Publicans.*—In the year 1839, there were within the Royalty of Glasgow 1220, and within the suburbs 1080, licensed public-houses, and other places for the sale of excisable liquors; in all, 2300. These houses, particularly the low-rented class, are productive of evil to a fearful extent, as it may be safely affirmed that three-fourths of the crime in the city originate in habits of drunkenness. This fact, it is believed, will be fully borne out by the respectable assessor of the Burgh Criminal and Police Courts. The lower class of public-houses are frequented by persons of the most worthless description, and there scenes of brutal dissipation are constantly going on; schemes are matured for committing thefts and other depredations; and a connexion formed between thieves and re-setters, or purchasers of stolen goods. This great evil ought to be repressed in every possible way; and the most effectual mode, in the first instance, of doing so, seems to be to diminish materially the number of public-houses, and to place those actually licensed under the strictest police regulations. The city should be divided into districts, and a prescribed number of such houses, and no more, allotted to each. The houses licensed should be of a respectable description, and the keepers of them persons possessed of some capital, and of unblemished character. It should be a condition, also, that the police should at all hours,

when demanded, have access to the houses. At present the keepers of public-houses refuse admittance to the police, except in peculiar circumstances; and hence offenders may assemble in their haunts unmolested, to devise schemes of villany, and how the vigilance of the police may be best overcome. The magistrates ought also to possess the power, without appeal, of granting or withholding a license within the city, as they are the constituted guardians of the community, and must be considered the best judges in all matters relating to the city police. It has frequently happened that worthless people, who have been refused a license by the magistrates, have succeeded in obtaining one by an appeal to the justices of peace at quarter sessions, though, on such occasions, the superintendent of police and his officers were in attendance to support the decision of the magistrates.

2. *Pawnbrokers.*—There are thirty-three licensed pawnbrokers, and about 400 small unlicensed brokers, within the Royalty. The small brokers carry on business to a great extent upon a system of the most vicious and ruinous nature, and for which no remedy has been provided. They exact an exorbitant interest from the unfortunate or improvident persons who resort to them, and in very many instances they become the owners of the goods impledged, if the trifle advanced upon them is not punctually repaid. These small brokers, too, present great facilities for the disposal of stolen property; and it is a well-known fact, that the facilities thus offered form the strongest encouragement to the greater part of the thieves and vagrants who infest the city to steal and commit depredations. The pawnbrokers of the city ought to be licensed exclusively by the magistrates; the same careful selection of individuals should be made as has been recommended in the case of publicans; and they should also be placed under special regulations. The police should at all times have the privilege of access for inquiry or inspection, and the law should be rigidly enforced against all who have not a license. Every means should be taken to root out the hordes of petty brokers, who demoralise and rob the poor; or at least to confine them, as far as possible, under severe penalties, to a lawful course of dealing.

3. *Unfortunate Females.*—Under this head Mr. Miller enters at some length into the causes which swell the ranks of female wretchedness, attributing it principally to worthless parents, consequent vagrant habits, &c. He says:—Many of these young creatures might be saved from destruction, and induced to lead an honest life, if they could find shelter and protection from the evil that surrounds them; and this great good may to a certain extent be accomplished by houses of refuge similar to that now in progress for females in the city.

4. *House of Industry.*—It is in vain to endeavour to repress crime merely by punishing the offenders. Mere punishment has never yet, it is believed, effected any lasting good upon the community. It forms, indeed, but a feeble defence against the efforts of persons prompted by hunger and necessity. When crime has been committed, and especially after conviction and punishment, the character of the delinquent is almost always irretrievably lost. Though he were so disposed, he has no way of obtaining honest employment, for no one will take him without a character, and he is shunned by all. Necessity therefore compels him, though it may be against his own inclination, to continue the guilty career he has commenced. He proceeds from bad to worse, until finally arrested by the

hand of justice, and made to expiate his crimes in exile or on the scaffold. Thousands of unhappy individuals who have once swerved from the path of rectitude would gladly return to a virtuous course of life, if they had the power; and it is certainly deeply to be deplored that no adequate means have hitherto been provided for remedying so great an evil. The most effectual mode appears to be, the formation of a Work-house, or House of Industry, set apart for the accommodation of the criminal part of the population of the city; where, by a confinement of some duration, and by regular tuition and industrial occupation, habits of industry and morality may be formed, and the inmates fitted for again mingling with the respectable portion of the community: and it should be a part of the plan of such an establishment that, after an inmate has approved himself satisfactorily to the directors, means should be taken of finding him honest employment on again entering the world. The present mode of punishment for crime is not merely useless—it is absolutely prejudicial to a very great extent, and tends materially to increase the evil it is intended to alleviate. The great mass of offenders, when convicted, are sent to gaol or to Bridewell, for periods varying from five to sixty days; and hence, from the shortness of the period, they are no sooner placed within the walls than their minds are occupied with the prospect of a speedy deliverance. Attempts are, no doubt, made to instruct them, and they are put to some description of work; but, for the most part, such endeavours are completely in vain, as virtuous principles and industrious habits cannot be formed in a day. They come out of prison really in a more hardened state than before, and with a deeper sense of their destitute condition; and, at all events, if any good impressions have been made, they are soon obliterated: for, at the very threshold of the prison, they are met by bands of their old associates ready to welcome them; and as they have no calling to which to turn, nor any honest mode of obtaining shelter and subsistence, they are forced once more to mingle with the guilty crowd, and do as they do. It is a matter, therefore, of the deepest consequence that a House of Industry (in addition to houses of refuge for juvenile delinquents) should be provided, where there may be an intermediate state between a prison and the world, and where the destitute criminal population may have an opportunity of retracing their steps, and once more gaining the bread of honesty. But a House of Industry of the nature suggested should also afford accommodation, or there should be a separate establishment, for the reception of idle and dissolute persons who follow a vagrant life and refuse to work, and for the accommodation of individuals who, from want of employment or otherwise, are reduced to destitution,—care of course being taken that individuals belonging to other parts of the country should be sent to their own proper place of settlement. In this way vagrancy would be extensively checked, and all excuse for begging or the commission of crime would, in a great measure, be removed. It may be here noticed that individuals are frequently committed by the justices of the peace to Bridewell for failure to pay small fines of five shillings or upwards. In very many other instances individuals who have committed petty thefts, but who are not abandoned characters, are sent to Bridewell for periods varying from seven to sixty days. In all such cases it is humbly thought that there should not be a commitment to Bridewell. If the offence is not of a nature to warrant a confinement of con-

siderable duration in Bridewell, the offender should be sent merely to gaol, or to a police lock-up house; and thus he would, in a great measure, escape the brand of degradation which uniformly adheres to him after a commitment to Bridewell.

5. *Health.*—Under this head, Mr. Miller gives a painful detail of the accumulated mass of wretchedness, filth, and loathsomeness, which exists in the wynds of the city, and in the closes and lanes leading from High Street. As a remedy to this fearful state of things, he says:—Much might be done to relieve the misery, and to repress the crime, of this destitute population,—by compelling attention to personal cleanliness, so as to remove and prevent disease; by placing the lodging-houses for the destitute under proper regulations; by preventing the assemblage of a large number of persons in one apartment, by opening up and widening the thoroughfares, and forming new streets wherever practicable; by causing the houses to be properly ventilated, and all external nuisance removed; and by an improved plan of sewerage for carrying away all impurities. Were it possible to adopt measures something similar to these, the health of the community would be greatly improved, and by the breaking up of the haunts of vagrancy, a happy check would be given to the spread of profligacy and crime. In order more fully to shew the extent of the wretchedness which abounds in certain parts of the city, reference is made in Table, No. VII., containing the results of an inspection of fifteen houses in Old Wynd, New Wynd, and the Vennals, early on the mornings of 4th and 5th September current. In single apartments, or hovels of small dimensions, there were found congregated from four to fourteen individuals, all in the most filthy and wretched condition.

6. *Extension of the City Police Jurisdiction.*—At present there is a police establishment for the city of Glasgow proper, another for the suburb of Anderston, another for the suburb of Gorbals, another for the suburb of Calton, besides the police for the Harbour. These five establishments are constituted by separate acts of parliament, and are perfectly independent of each other, the city being placed in the centre. Under such a system it is extremely difficult for the city police to carry out any general plan, either for the prevention or the detection of crime. It frequently happens that crimes committed in the city require to be investigated in the suburbs, or city offenders betake themselves to the suburbs for shelter. The number of small unlicensed brokers in the suburbs is nearly 300, and who are wholly beyond the control of the city police. Many of these brokers are resellers, or purchasers of stolen goods; and hence the city thieves, when they have obtained plunder, often find themselves more safe to deal with the suburban brokers, where they can more effectually escape detection. Instances are of constant occurrence, both in the city and suburbs, where offenders altogether escape, in consequence of the difficulty of following them through the several conflicting police jurisdictions. It would tend greatly to the prevention of crime, as well as to the apprehension and punishment of offenders, were the city and suburbs placed under one undivided police jurisdiction, with one set of officers, responsible to one superior; and until this is accomplished it will be in vain to hope that the community can receive, for their persons and property, that thoroughly efficient protection which they have a right to obtain. As matters

stand at present, all the efforts that may be made to improve the efficiency of the city police will be rendered comparatively fruitless by the counteracting tendencies of the suburbs; for it is not to be expected that crime in the city can be either adequately met, or sensibly diminished, so long as offenders of every description find a ready shelter in the suburbs. Many of the suggestions which have been humbly offered in the preceding paper probably cannot be carried into effect without legislative authority; but, surely, if it is deemed of consequence to diminish the amount of crime in the city, to endeavour to reform the criminal population, to improve the health, and ameliorate the condition of the poor and destitute, the aid of the legislature need not be long wanting; and especially at the present time, when the attention of government has been urgently called to the condition of the labouring classes in the large towns of the kingdom. On concluding, Mr. Miller handed in seven carefully prepared tables, explanatory of, and having reference to, the document which he had read. Upon the conclusion of the paper the thanks of the Section were voted to Mr. Miller, and a long discussion followed, in which many opinions were put forth as to the causes in which crime originated, and the remedies necessary for its prevention or suppression. Drunkenness, on the part of the lower orders, was universally regarded as one of the greatest, indeed the principal, incentive to vice, in conjunction with the facilities afforded by pawnbroking establishments, &c.

#### SECTION G.—*Mechanics.*

Sir John Robison in the Chair.

1. Mr. Galline, 'On Safety-Valves.'
2. Mr. Wallace, 'On Extinguishing Fire in Steam Vessels.'
3. Mr. Grime, 'On Wheels of Locomotive Engines.'
4. Mr. J. Scott Russell, 'On the Temperature of most effective Condensation in Steam Vessels.'
5. Mr. Ritchie, 'On the Warming and Ventilation of Buildings.'
6. Mr. Vignoles, 'On Large Timber Bridges, with special reference to Railways.'

(*Outlines.*)

The Chairman said, they were now about to proceed to the business of the Section. The Association, under no ordinary circumstances, had met in this city, remarkable for the discovery and application of improvements in the arts and sciences. They were met in the University where Black promulgated those doctrines in light and heat which led to so many posterior discoveries of an important character. They were met in the very spot where the illustrious Watt put forth those gigantic powers which conferred advantages greater, except those conferred by the invention of printing, than any exertion of genius which the world had ever known—greater than the conquests of the most renowned heroes. He then called upon the Secretary to bring under the notice of the meeting the several communications.

Mr. J. Scott Russell said, the first paper was that of Mr. Galline 'On Safety-Valves.' He did not intend to follow Mr. Galline through the whole of his description, but would read that part which tended to illustrate his plan. Mr. Galline went on the general principle that the safety-valves at present in use were not large enough, and his object was to allow a large surface, like the lid of a chest, to rise at once when the pressure below becomes great enough to force it up; so that upon a great accumulation of steam, it will escape before any accident could take place. He meant, in fact, that a large valve should open instead of a small one. As Mr. Galline had not submitted machinery for it, and the subject could not be

adequately explained without a diagram, the Section would be content by its attention being called to a matter so important. The paper was deposited.

Mr. Russell then took up the next paper, that of Mr. Wallace, 'On extinguishing Fire in Steam-Vessels.' Mr. Wallace's principle, he said, might be explained by the following mode of applying it on board of the Leven steam-boat. On the cabin-floor of the steam-boat, a space of ten feet by fourteen feet was covered with wet sand, on which was laid iron plates, and on which a fire was kindled of very combustible matter, consisting of old tar-barrels, &c. The quantity of this material was about four and a-half cwt. A hose thirty-four feet long, and two and a-half inches diameter, extended from the boiler of the engine to the cabin, and when the fire had been sufficiently kindled, so that the panes of glass in the windows of the cabin began to break by the heat of the flames, the steam was let in, and the doors of the cabin were shut. The fire was extinguished in about four minutes. Several trials were made; all of them terminated in extinguishing the fire with the same success. Mr. R. then gave an interesting detail of his experiments on the temperature of condensation in steam-vessels. His principle was 'that there was a temperature of the greatest effect, which might be readily attained by ordinary calculation, and which, if acted upon, would result in a material saving of power. The subject gave rise to considerable discussion, in which Mr. Taylor, Mr. Fairbairn, and other members of the Section took part.

A paper was then read from Mr. Ritchie 'On the Warming and Ventilation of Buildings,' supplementary to a document on the same subject in "Loudon's Encyclopedia." A long conversation ensued, in which Mr. Hopkins, Mr. Jeffries, Sir John Robison, and other members participated.

Mr. Vignoles then called the attention of the Section to the construction of large timber bridges, with special reference to railways, and illustrated his proposition by numerous drawings of diagrams upon the board.

At the adjourned meeting of the General Committee on Monday, at three o'clock, the President in the chair, Mr. Phillips read the minutes of the last meeting, which were confirmed.

Mr. Murchison then rose to state the suggestions of the Council as to the place and time for the next Meeting of the Association, and the appointments of President, Vice-Presidents, and other local officers, for the occasion. He mentioned that the Association were invited by four great towns—Manchester, Plymouth, Hull, and York. That from conversation with gentlemen connected with the first-mentioned place, it appeared that the meeting would be more convenient and agreeable to Manchester if it took place in 1842 rather than in 1841. For this reason, the Council had come to the conclusion that it would be most expedient to fix the meeting for Plymouth, Devonport, and Stonehouse—representing the interesting counties of the far West of England, Cornwall and Devon. Looking for a President, and desiring, as had been the case before, to alternate between high rank and great eminence in science, they recommended Professor Whewell to the choice of the Meeting for that important office. For Vice-Presidents, the Earl of Morley, Lord Eliot, Sir Charles Lemon, and Sir T. D. Acland. For local Secretaries, Mr. Snow Harris, Mr. R.

Vere Fox, and Colonel Hamilton Smith; and for local Treasurer, Mr. Henry Woolcombe. All these names were received with applause, and the Meeting proceeded to the formal choice and election.

Lord Greenock proposed that Plymouth, &c., should be the place of meeting; which being seconded by Principal Macfarlan, was carried.

With regard to fixing the time, Mr. Murchison suggested that, as had been usual, it should be left to the Council in consultation with the local authorities, who were best acquainted with the circumstances that would render the visit most acceptable.

Mr. Bryce made some remarks, in the hope of inducing an earlier meeting. The stormy weather had prevented many Dublin gentlemen from attending the present meeting; and the same cause, the equinoctial gales, would operate against the journey to the seaport of Plymouth. He also adverted to the absence of other parties when the meeting took place late in the season. Some conversation ensued on the topic, and the arrangement was finally left to be settled as proposed by Mr. Murchison.

The Marquess of Northampton moved that Mr. Whewell be elected President; and in doing so, warmly complimented the learned Professor as every way admirably fitted for the office. Some men might be deeply conversant with particular sciences, but, perhaps, Mr. Whewell was unequalled throughout the world for his general knowledge of every branch into which it could be divided. And besides, the British Association owed him a debt of gratitude for his services during all the years it had existed; and he was a man of business too, a quality as essential as rank or science to the due administration of the Chairman's duties. Another point especially connected him with the office at a large sea-port town, namely, his interesting researches on the tidal wave, and other inquiries, which were calculated to be fully appreciated at such a place. Lord Sandon seconded the motion, which was carried by acclamation.

Colonel Sykes, with a prefatory eulogy, proposed Lord Morley, Lord Eliot, Sir C. Lemon, and Sir T. D. Acland, as Vice-Presidents. Mr. John Taylor, in seconding the motion, as a Cornishman, bore testimony to the scientific pursuits and public spirit of the three latter; and mentioned, that he had not the honour of a personal acquaintance with Lord Morley. Mr. Jordan said, that few noblemen took a greater interest in the pursuit of useful knowledge, as might be testified by Dr. T. Thomson opposite, who had, on a former occasion, accompanied his lordship in a studious examination of the manufactures and mechanical arts which flourished in Glasgow. Mr. Murchison also spoke of his lordship's attachment to geology.

This vote was also carried by acclamation.

Mr. Murchison spoke highly and deservedly in praise of the distinguished talents of Mr. Snow Harris; and like measure was dealt to Mr. Vere Fox and Colonel H. Smith, who were elected to the offices of Local Secretaries; and Mr. H. Woolcombe, whose intelligence was also complimented, was chosen Local Treasurer.

On the motion of Mr. Lyell, supported by Dr. Arnott, Colonel Sykes, Professor Johnston, &c., Mr. Murchison and Major Sabine were re-appointed General Secretaries; Mr. Phillips, Assistant Secretary; Mr. John Taylor, Treasurer; and Mr. Yates, Secretary to the Council; justly merited eulogiums being bestowed on the services of these individuals, who have, indeed,

done much to promote the prosperity of the Association.

Sir John Robison, after noticing the heavy local expense to which places which entertained the Association had been, thought it would be well if the Council were instructed to take some measures for diminishing such cost in future. Upon this point a long conversation ensued, in which many members participated, and it was finally shaped into the form of a resolution, "that the Council should be requested to advise with the localities, as to what steps could be taken to limit the expenditure within as moderate bounds as possible."

Mr. Taylor, in conclusion, thought it would be acceptable to the members to learn the success that had attended the Meeting at Glasgow, at which the receipts had been inferior to those of only one former (the Liverpool) Meeting. Last night the amount of tickets sold gave the number of 1290. Money received, 2490*l*. [The additional fee of 1*l*. for every new member entering the Association accounts, in some degree, for the sum being so much larger at so early a period of the week than on former occasions.] The highest amount ever collected had, as he had observed, been at Liverpool, when it was .....

At Cambridge .....	£2960
Edinburgh .....	1060
Dublin .....	1400
Bristol .....	2100
Newcastle .....	2050
Birmingham .....	2400
	1500

[At York the Association was in its infancy, and Oxford was not stated.]

Professor Airy, as an Englishman, paid a compliment to the intelligence of the Scotch nobility, and moved a vote of thanks to the Chairman, which was carried unanimously, and the Meeting adjourned to Wednesday, at one o'clock.

#### EVENING MEETING.

For the Evening Meeting the Theatre was very handsomely fitted up, and filled with a brilliant audience to listen to the performances on the elevated stage. Many distinguished noblemen, and men eminent in the various sciences, here presented a group of no common interest to the spectators; and it is but truth to say, that on no former occasion has there been seen a more noble and illustrious assemblage to grace the induction of the President to the chair.

Mr. Murchison, the senior General Secretary, stated that the Marquess of Northampton, who, in consequence of the indisposition of Mr. Vernon Harcourt, acted as president at the close of the meeting last year, would now address them on transferring that office to the Noble Marquess of Breadalbane, the President elect.

The Marquess of Northampton spoke nearly as follows:—"Ladies and Gentlemen, I am extremely sorry to have to address you this night, because the reason why I was appointed to this duty is the absence of one of the most valuable and important members of the British Association—the Rev. Mr. Harcourt. Gentlemen, he was the most active friend of the Association from the moment of its commencement. He it was who drew up the regulations, and was in office for some time, during the early part of the proceedings, as one of the principal secretaries. Last year he was appointed our chairman, but unfortunately he took ill, and was unable to continue in the discharge of his duties; and the same cause has prevented him from coming forward this evening. Gentlemen, on coming before you

on the present occasion, I cannot but greatly rejoice that the British Association have come to Glasgow; because, whatever were the claims of other towns upon them, Glasgow combined the claims of all. Certainly the learned University of this city had those claims which Oxford and Cambridge urged upon them at the commencement. Glasgow was the site of a similarly ancient and learned body. Glasgow, too, contained a large and intelligent population,—one of the largest in the kingdom. Besides, it was the seat, not only of commerce, but of extensive and flourishing manufactures. Here the steam-engine had its cradle; here one of the greatest improvements of the age—the application of steam to vessels—had also its commencement. It was, therefore, the peculiar privilege of the British Association to come here, not so much for teaching as for learning—for seeing what science had done, and for applauding the works of men of genius and enterprise. Gentlemen, it is not my intention to trespass long on your attention, because I shall soon have an opportunity of seeing placed in the chair which I now occupy a noble peer, who has long been a friend to science. Gentlemen, that noble marquess is, in addition to his high rank, possessions, and long-distinguished family, fully aware of the importance of science—of this great truth, that the mind is, after all, the noblest part of man, and that the cultivation of science promotes the welfare of the nation. I am sure you feel yourselves under deep obligation to him for consenting to take the chair on this occasion. Gentlemen, perhaps you will allow me to make a few remarks on the advantages of the Association. The first, as it is one of the greatest fruits of the Association, was the important and ever-memorable expedition to the Antarctic Seas, commanded by a sailor who is an honour to Scotland—Captain James Ross. In that expedition, also, was one who, as a naturalist, will do honour to the town and the name which he bears, I mean Mr. Hooker. Gentlemen, at the meeting in Newcastle, those who were present would recollect that there was a proposal made in the General Committee, that there should be formed an additional section for promoting agricultural science. No man can doubt the importance of that art, which ministers to the first necessities of man. No man can for a moment doubt the propriety of acquiescing in the proposal, had there not been difficulties of a practical nature in the way. These difficulties have been done away with by the agriculturists forming an association of their own—an association which, I am happy to say, is a child of the British Association. I had the pleasure of attending a meeting of the Agricultural Association at Cambridge, and of meeting my friend, Professor Buckland, and several other friends now present; and nothing could give me higher delight than listening to their proceedings. They are following our example in pursuing their peripatetic course throughout the kingdom; and from what we know of them it is impossible not to be convinced, as I am, that if the British Association had not set the example, it might not have occurred to themselves. I believe it is extremely probable that the British Association will lead to the formation of other useful societies. Long may the Agricultural Association continue to emulate us in behalf of agriculture! I am sure we shall never envy them, but consider it of great advantage to have their countenance and co-operation in the advancement of science and art. I have now to move, that the noble marquess occupy the throne lately filled by my

friend, Mr. Harcourt, and I hope you will obey his commands while he wields the sceptre of science."

The Marquess of Breadalbane, on taking the chair, was loudly cheered. He then said,—“In the first place, I must sincerely thank my noble friend for the very kind and very flattering manner in which he was pleased to introduce me to your notice; and in taking upon myself the very important duties which devolve upon me in this situation. I do so under a deep sense of the high honour which has been conferred upon me—an honour which was unthought of and unlooked for on my part: and I am afraid I must say that I have no claim to such an honour as has been bestowed on me, save that of one who has a firm conviction of the vast importance and value of science, and an earnest wish to support its best interests by every means in my power. And why is it that I entertain such feelings? It is because I consider the great objects of science to be the investigation of truth—the interpretation of the laws of nature—and the improvement and advancement of human knowledge, and consequently of the happiness, the peace, and the best interests of mankind. It is unnecessary in a meeting of this distinguished Association, composed as it is of some of the greatest ornaments of our own country, as attached to science, and many of the highest character in science in foreign countries, to dilate on that firm bond of union which is here presented, to promote the great and glorious object of the investigation of truth. The British Association, as a means of attaining that most important and desirable end, have united themselves together, and their doing so will confer great and valuable benefits upon the nation, and even upon the world at large. Here we have philosophers, men who deal in speculations and in theories, and men who are more particularly engaged in the prosecution of practical pursuits, meeting together and holding communication with each other on subjects mutually interesting. And their doing so, I am perfectly confident, will be productive of great and important results, not only to science, but to the useful arts, and secure the greatest advantages to humanity in general. I may be allowed to congratulate this great city, that the British Association has held a meeting here; that the members have been received with such cordiality and hospitality; and that such a deep interest in the prosperity of the British Association has been created by its meeting here, among the liberal and enlightened inhabitants of this city, does them the greatest honour; it confers a great benefit on the British Association itself, and adds greatly to its efforts in the promotion of science. This great city combines in itself, as my noble friend has already so properly stated, more than any provincial city in the empire, the great elements of national wealth—commerce and manufactures; and it has besides in its bosom the seat of science in its venerable and long-celebrated University. Where could we find a locality more likely to conduce to the promotion of scientific objects than that where the inhabitants, liberalised by the science and intelligence acquired in their University, thereafter applying what they have acquired to the promotion of the best interests of the arts, of commerce, and of manufactures? I feel deeply the importance of the highly responsible duties I have to perform in the office I have now undertaken to fill; I am afraid I shall be able to perform them very imperfectly; but I trust to your support and aid to enable me to dis-

charge them, and with these, I hope the best interests of the British Association, and the interests of science in general, will not suffer during the time I have the high honour of filling the chair. I shall not attempt to occupy your time farther, but call upon Mr. Murchison, one of our General Secretaries, to read to you a paper detailing the progress of the Association."

Mr. Murchison then rose and read the following 'Address of the General Secretaries of the British Association, Roderick Impey Murchison, F.R.S. F.G.S., and Major Edward Sabine, V.P.R.S.'

"In entering upon the duty assigned to us, we heartily congratulate our associates on this our second assembly in Scotland. As, on our first visit, we were sustained by the intellectual force of the metropolis of this kingdom, so now, by visiting the chief mart of Scottish commerce, and an ancient seat of learning, we hope to double the numbers of our northern auxiliaries. Supported by a fresh accession of the property and intelligence of this land, we are now led on by a noble marquess, who, disdaining not the fields we try to win, may be cited as the first Highland chieftain who, proclaiming that knowledge is power, is proud to place himself at the head of the clans of science. If such be our chief, what is our chosen ground;—raised through the industry and genius of her sons to a pinnacle of commercial grandeur, well can this city estimate her obligations to science! Happily as she is placed, and surrounded as she is by earth's fairest gifts, she feels how much her progress depends upon an acquaintance with the true structure of the rich deposits which form her subsoil; and, great as they are, she clearly sees that her manufactures may at a moment take a new flight by new mechanical discoveries. For she it is, you all know, who nurtured the man whose genius has changed the tide of human interests, by calling into active energy a power which (as wielded by him), in abridging time and space, has doubled the value of human life, and has established for his memory a lasting claim on the gratitude of the civilised world. The names of Watt and Glasgow are united in imperishable records! In such a city, then, surrounded by such recollections, encouraged by an illustrious and time-honoured University, and fostered by the ancient leaders of the people, may we not augur that this meeting of the British Association shall rival the most useful of our previous assemblies, and exhibit undoubted proofs of the increasing prosperity of the British Association? Not attempting an analysis of the general advance of science in the year that has passed since our meeting at Birmingham, we shall restrict ourselves, on the present occasion, to a brief review of what the British Association has directly effected in that interval of time, as recorded in the last published volume of our 'Transactions.' From this straight path of our duty we shall only deviate in offering a few general remarks on subjects intimately connected with the well-being and dignity of our Institution. One of the most important—perhaps the most important—service to science, which it is the peculiar duty of the Association to confer, is that which arises from its relation to the government,—the right which it claims to make known the wants of science, and to demand for them that aid which it is beyond the power of any scientific body to bestow. In the fulfilment of this important and responsible duty, the Association has continued to act upon the principle already laid down in the address of the General Secretaries at the meeting at New-

castle in 1838; namely, to seek the aid of government in no case of doubtful or minor importance; and to seek it only when the resources of individuals, or of individual bodies, shall have proved unequal to the demand. The caution which it has observed in this respect has been eminently displayed in the part which it has taken with reference to the Antarctic Expedition, and to the fixed magnetical observatories. It abstained from recommending the former to the government until it had called for, and obtained from, Major Sabine, by whom the importance of such an expedition was first urged, a report in which that importance was placed beyond all doubt; and it withheld from urging the latter, although its necessity was fully felt by some of its own members, until the letter of Baron Humboldt to the Duke of Sussex gave authority and force to its recommendation. The delay which has in consequence occurred has been productive of signal benefit to each branch of this great twofold undertaking. Since the time alluded to, our views of the objects of investigation in terrestrial magnetism have been greatly enlarged, at the same time that they have become more distinct. Major Sabine's memoir 'On the Intensity of Terrestrial Magnetism' has served to point out the most interesting portion of the surface of the globe, as respects the distribution of the magnetic force, and has indicated, in the clearest manner, what still remained for observation to perform; and the beautiful theory of Mr. Gauss, which has been partly built upon the data afforded by the same memoir, while it has assigned the most probable configuration of the magnetic lines of declination, inclination, and intensity, has done the same service with respect to all the three elements. In another point of view, also, delay has proved of great value to both branches of the undertaking, but more especially to the fixed observatories. Our means of instrumental research have, since the time of their first projection, received great improvements, as well in their adequacy to the objects of inquiry, as in their precision; and, finally, the two great lines of inquiry—the research of the distribution of terrestrial magnetism on the earth's surface, and the investigation of its variations, secular, periodic, and irregular—have been permitted to proceed *pari passu*. Last of all, the prudent caution and vigilant care which the two great scientific bodies have exhibited, both in the origin and progress of the undertaking, have naturally inspired the government with confidence; and while, on the one hand, science has not hesitated to demand of the country all that was requisite to give completeness to a great design, so, on the other, the government of the country has not hesitated to yield, with a liberal and unsparring hand, every request the importance of which was so well guaranteed. But while we thus enumerate the benefits which have resulted to magnetical science from the delay, it must be also acknowledged that something has been lost also, not to science, but to British glory. Although terrestrial magnetism stood forward as the prominent object of the Antarctic Expedition, yet it was also destined to advance our knowledge of the 'physique du globe' in all its branches, and especially in that of geography. Had the project of an Antarctic Expedition been acceded to when it was first proposed, viz. at the meeting of the British Association in Dublin, in 1835, there can be no reasonable doubt that a discovery, which by its extent may almost be designated a southern continent, situated in the very region to which its efforts were to have

been chiefly directed, must have fallen to its lot; and the flag of England been once more the first to wave over an unknown land. But while, as Britons, we mourn over the loss of a prize which it well became Britain and British seamen to have made their own, it is our part too as Britons, as well as men of science, to hail the great discovery—one of the very few great geographical discoveries which remain unmade, and to congratulate those by whom it has been achieved,—those whom we are proud to acknowledge as fellow-labourers, and who have proved themselves, in this instance, our successful rivals in an honourable and generous emulation. The caution which has characterised the British Association in the origination of this great undertaking, has been followed up by the Royal Society in the manner in which it has planned the details, and in the vigilant care with which it has watched over the execution. Of the success which has attended this portion of the work, the strongest proof has been already given in the unhesitating adoption of the same scheme of observation by many of the Continental observers, and in the wide extension which it has already received in other quarters of the globe. All that yet remains is to provide for the speedy publication of the results. The enormous mass of observations which will be gathered in, in the course of three years, by the observatories established under British auspices, and by the Antarctic Expedition, will render this part of the task one of great expense and labour. To meet the former, we must again look to the government, and to the East India Company, who will certainly not fail to present the result of their munificence to the world in an accessible form. The latter can only be overcome by a well-organised system. The planning of this system will, of course, be one of the first duties of the Royal Society; and it is important that it should be so arranged, that while every facility in the way of reduction may be given to those who shall hereafter engage in the theoretical discussion of the observations, care is taken at the same time that the data are presented entire, without mutilation or abridgement. The Council of the Royal Society will, doubtless, be greatly assisted in this duty by the eminent individual who has had in every way so large a share in the formation of these widely scattered magnetic establishments, and whose own observatory, founded by the munificence of the Dublin University, has nearly completed twelve months' magnetic observations on that enlarged and complete system of which it set the first example. In referring, as we have done, to those most valuable services which the Royal Society have rendered, and are continuing to render, in directing and superintending the details of this great undertaking, in both its branches, it is right that, on the part of the British Association, we should express the cordial satisfaction and delight with which we witness their exertions, united with our own, in this common cause; nor should we omit to recognise how much this desirable concurrence has been promoted by the influence of the noble President of the Royal Society, the Marquess of Northampton, whom, as on so many former occasions, we have the pleasure of seeing amongst us, as one of our warmest supporters and most active members. In the volume of our 'Transactions,' now under notice, is contained the memorial presented to Lord Melbourne by the Committee of the British Association, appointed to represent to her majesty's government the recommendations of the Association on the subject of terrestrial magnetism. This

memorial is one of many services which have been rendered to our cause by Sir John Herschel, whose name, whose influence, and whose exertions, since our meeting two years since at Newcastle, have largely contributed to place the subject where it now stands. The devoted labour of other of our members has long been given to an object which they have had deeply at heart, viz. the advancement of the science of terrestrial magnetism; but the sacrifice which Sir John Herschel has made of time, diverted from the great work in which his ardent love of astronomy, his own personal fame, and his father's memory, are all deeply concerned, the more urgently demands from our justice a grateful mention,—because the science of magnetism had no claim on him beyond the interest felt in every branch of science by one to whom no part of its wide field is strange, and the regard which a national undertaking such as this deserved from the person who occupies his distinguished station amongst the leaders of British science. The advancement of human knowledge, which may be reckoned upon as the certain consequence of the Antarctic Expedition (should Providence crown it with success), and of the arrangement connected with it, is of so extensive a nature, and such incalculable importance, that no juster title to real and lasting glory than it may be expected to confer has been earned by any country, at any period of time; nothing has ever been attempted by England more worthy of the place which she occupies in the scale of nations. When much which now appears of magnitude in the eyes of politicians has passed into insignificance, the fruits of this undertaking will distinguish the eye which gave it birth, and, engraved on the durable records of science, will for ever reflect honour on the scientific bodies which planned and promoted it, and on the government which, with so much liberality, has carried it into effect. Were the value of this Association, gentlemen, to be measured only by the part which it has taken in suggesting and urging this one object, there might here be enough to satisfy the doubts of those who question its utility: to overlook such acts as these, and the power of public usefulness which they indicate, to scrutinise with microscopic view the minute defects incidental to every numerous assemblage of men, to watch with critical fastidiousness the taste of every word which might be uttered by individuals amongst us, instead of casting a master's eye over the work which has been done and is doing at our meetings, is no mark of superior discernment and comprehensive wisdom, but is evidence rather of confinement to narrow views, and an indulgence of vain and ignoble passions. But to proceed with our useful efforts:—One of the principal objects of our annual volumes is the publication in the most authentic form of the results of special researches, undertaken by the request, and prosecuted in many instances at the cost, of the Association. It is a trite remark, that if a man of talent has but fair play, he will soon secure to himself his due place in public estimation. We fully admit the truth of this in many instances, and above all where the points of research are connected with commerce and the useful arts; but many also are the subtle threads of knowledge, which, destined at some future day to be woven into the great web in which all the sciences are knit together, are yet not appreciable to the vulgar eye, and if simply submitted to public judgment, would too often meet with silent neglect. Numberless, we say,

are the subjects (and if your Association exceeds a centenary, still more numerous will they be) with which the retired and skilful man may wish to grapple, and still be deterred by his want of opportunity or of means. Then is it that adopting the well-balanced recommendations of the men in whose capacity and rectitude you confide, you step forward with your aid, and bring about these reconducive researches, the result of which in the volume under our notice we now proceed to consider. The first of these inquiries to which we advert you called for at the hands of Professor Owen, upon 'British Fossil Reptiles,' one of the branches of natural history on a correct knowledge of which the development of geology is intimately dependent. The merits of the author selected for this inquiry are now widely recognised, and he has, with justice, been approved as the worthy successor of John Hunter—that illustrious Scotchman who laid the foundation of comparative anatomy in the British Isles. That this science is now taking a fresh spring would, we are persuaded, be the opinion of Cuvier himself, could that eminent man view the progress which our young countryman is making towards the completion of the temple of which the French naturalist was the great architect. It is, therefore, a pleasing reflection, that when we solicited Professor Owen to work out this subject, we did not follow in the wake of Europe's praise, but led the way (as this Association ought always to do), in drawing forth the man of genius and of worth; and the value of our choice has been since stamped by the approval of the French Institute. If Englishmen first perceived something of the natural affinities of Palaeosaurians, it was reserved for Cuvier to complete all such preliminary labour. The publication of his splendid chapters on the osteology of the crocodile and other reptiles, drew new attention and more intelligent scrutiny to these remains; and it ought to be a subject of honest pride to us to reflect, that the most interesting fruits of the researches of that great anatomist were early gathered by the English palaeontologists, Clift and Hume. One of our leaders, whose report on geology ornaments the volumes of this Association, formed the genus *Plesiosaurus* on an enlarged view of the relation subsisting between the ancient and modern forms of reptile life; while, shortly after, Buckland established the genus *Megalosaurus*, and Maudet, the *Iguanodon* and *Hylaeosaurus*—worthy rivals of the *Geo Sauri* and *Moso Sauri* of Cuvier! The other Englishmen who have best toiled in this field are Delabèche, Hawkins, and Sir Philip Egerton. Yet, although this report is on British reptiles, we are fully alive to the great progress which this department has made, and is making, on the Continent, through the labours of Count Münster, Jäger, and Hermann Von Meyer. The last-mentioned naturalist has been for some time preparing a series of exquisite drawings of very many forms unknown to us in England, most of which have been detected in the Muschelkalk, a formation not hitherto discovered in the British Isles. Yet, despite of all that had been accomplished in our own country or elsewhere, Professor Owen has thrown a new light of classification on this subject, founded on many newly discovered peculiarities of osseous structure, and has vastly augmented our acquaintance with new forms by describing sixteen species of *Plesiosauri*, three of which only had been recognisably described by other writers; and ten species of *Iohithosauri*, five of which

\* Stukely.

are new to science. Such results were not to be obtained without much labour; and, previous to drawing up his report, Professor Owen had visited the principal depositories of *Enaliosauri* described by foreign writers, as well as most of the public and private collections of Britain. This, the first part of Mr. Owen's report, concludes with a general review of the geological relations and extent of the strata through which he has traced the remains of British *Enaliosauri*. The materials which he has collected for the second and concluding portion of his report, 'On the Terrestrial and Crocodilian Sauria, the Chelonian, Ophidian, and Batrachian Reptiles,' are equally numerous; and the results of these researches will be laid before the Association at our next meeting. Deeply impressed as we are with the value of this report, we cannot conclude a notice of it without again alluding to its origin, in the words of Professor Owen himself:—'I could not,' says he, 'have ventured to have proposed to myself the British fossil reptiles as a subject of continuous and systematic research, without the aid and encouragement which the British Association has liberally granted to me for that purpose.' Mr. Edward Forbes, whose labours in detecting the difference of species and varieties among the existing marine testacea of our shores have been most praiseworthy, has, on this occasion, given us a report 'On the Pulminiferous Mollusca of the British Isles.' The variations in the distribution of the species in this class of animals are shewn by him to depend both upon climate and upon soil, the structure of the country (or geological conditions) having quite as much share in such varied distribution as the greatest diversity of temperature. The Association has to thank the author for valuable tables, which shew both the distribution of the pulminiferous mollusca in our islands, and their relations to those of Europe generally. From zoological researches let us now turn to physical geology. One of the most interesting fruits of modern experimental research is the knowledge of the fact, that electrical currents are in continual circulation below the surface of the earth. Whether these currents, so powerful in developing magnetical and chemical phenomena, are confined to mineral veins and particular arrangements of metal and rock, or generally capable of detection by refined apparatus well applied, appeared a question of sufficient importance to deserve at least a trial on the part of the Association. Our present volume records the result of such a trial on the ancient and very regularly stratified rocks of Cumberland, consisting of limestone, sandstone, shale, and coal, so superimposed in many repetitions as to resemble not a little the common arrangement of a voltaic pile. Varied experiments, with a galvanometer of considerable delicacy, failed to detect, in these seemingly favourable circumstances, any electrical current. The extensive and rapidly increasing applications of iron to public and private structures of all kinds in which durability of material is a first requisite, have made it highly desirable to possess accurate information respecting the nature of the chemical forces which effect the destruction of this hard and apparently intractable metal. The preservation of iron from oxidation and corrosion is, indeed, an object of paramount importance in civil engineering. The Association was, therefore, anxious to direct inquiry to this subject, and gladly availed itself of the assistance of Mr. Mallet, a gentleman peculiarly qualified for such investigations, both from his knowledge as a chemist, and from his opportu-

nities of observation as a practical engineer. An extensive series of experiments has accordingly been instituted by him, with the support of the Association, on the action of sea and river water, in different circumstances as to purity and temperature, upon a large number of specimens of both cast and wrought-iron of different kinds. These experiments are still in progress, and the effects are observed from time to time. They will afford valuable data for the engineer, and form the principal object of the inquiry; but a period of a few years will be required for its completion. In the meantime, Mr. Mallet has furnished a report on the present state of our knowledge of the subject, drawn from various published sources, and from his own extensive observations. In this report he examines very fully the general conditions of the oxidation of iron, and how this operation is greatly promoted, although modified in its results, by sea-water; also, in what manner the tendency to corrosion is affected by the composition, the grain, porosity, and other mechanical properties of the different commercial varieties of iron. The influence of minute quantities of other metals, in imparting durability to iron, is also considered. Mr. Mallet devotes much attention to the consequences of the galvanic association of different metals with iron,—a subject of recent interest, from the applications of zinc and other metals to protect iron, which are at present agitated. He concludes this, his first report, by recommending a series of inquiries, ten in number, which will supply the desiderata immediately required by the engineer and by the chemist. We have next to notice a report by Professor Powell, 'On the Present State of our Knowledge of Refractive Indices for the Standard Rays of the Solar Spectrum in different Media.' The difficulty which the fact of the dispersion of light has offered to the universal application of the undulatory theory, has been in a great measure removed by the analysis of Cauchy and others, who have considered the distances of the undulatory particles as quantities comparable to the length of a wave. Velocities of propagation of the different rays of the spectrum are made to depend upon the length of wave which constitutes a ray of a given colour, and upon certain constants proper to the medium. These constants being obtained from observations on refractive indices for certain definite rays (or dark lines) of the spectrum, the refrangibility of any other definite ray (whose wave-length has been ascertained by examining an interference-spectrum) becomes known, and may be compared with observation as a test of theory. Such experiments have been made by Fraunhofer, Rudberg, and Professor Powell, who has given a tabular view of the various results, without, however, instituting the comparison between theory and observation which it would be desirable to extend farther than has yet been done. It would be important, also, to elucidate the disturbing effect of temperature, which prevents even existing observations from being rigorously comparable. The calculations respecting the tides, which have been prosecuted by the aid of the Association ever since its institution, have been continued this year by Mr. Bunt, under the directions of Mr. Whewell. These calculations have now reached such a point, that the mathematician, instead of being, as at the beginning of this period, content with the first rude approximations, is now struggling to obtain the last degree of accuracy. The country in which we are now assembled has always been conspicuous for attention to meteorology,—a branch

of physical science in which the British Association, with its power of combining the efforts of many observers in distant quarters of the globe, may hope to be especially useful. In Scotland, Leslie opened a new train of inquiry, by examining the earth's temperature at different depths; and his successor in the University of Edinburgh is now directing, at the request of the Association, a large and complete course of experiments on that interesting subject. Framed in conformity with the plans adopted for similar objects by Arago and Quelet, these researches of Professor Forbes contain also the means of determining the power of conducting heat, which different sorts of rock possess; and may thus throw light on some of those peculiarities in the distribution of temperature at greater depths below the surface, which have become known by experience, but are not explained by theory. In Scotland, Sir D. Brewster was the first to obtain an hourly meteorological journal for a series of years, and to draw from that fertile source new and important deductions, which have had a powerful influence on the progress of scientific meteorology. How gratifying to receive, through the same hands, after the lapse of nearly fifteen years, an additional contribution of the same kind, and from the same country; but embracing new conditions, on a new line of operations, in order to obtain new results! By the observations now in progress at Inverness and at Kingussie, the influence of elevation in modifying the laws which have been found to govern the hourly distribution of heat near the level of the sea may be discovered, and thus a great addition be made to the experimental results, for which science has long been grateful to the distinguished philosopher we have named, and which have been described as 'of the highest value to meteorology, and as the only channel through which any specific practical information can be obtained in this most interesting department of physics.' This is no ordinary praise. It is the just tribute of one who is worthy to offer it; one who, at the call of the British Association, has conducted at Plymouth a still more extensive series of similar observations, and has added to them hourly comparisons of the temperature and moisture of the air, and an hourly record of barometric oscillations. Mr. Snow Harris has presented in a few pages of our last Report the precious results of 70,000 observations, and thus rendered them immediately available in the foundations of accurate meteorology. The documents thus patiently collected are, however, not yet exhausted in value; they may be again and again called into the court of science, and made to yield testimony to other, and as yet, unsuspected truths. They must not be lost. Shall we lay them by in manuscript among other unconsulted records of the past labours of men, or, by undertaking their publication, do justice to our workmen, and establish a new claim on the imitation of the present, and the gratitude of future, days? This question is of serious import. Already, stimulated by success in thermometric registration, we have set to work on a more perplexing problem; we have resolved to bind even the wandering winds in the magic of numbers. While we speak, the beautiful engines of our Whewells and Osiers are tracing at every instant of time the displacements of the atmosphere at Cambridge, at Plymouth, at Birmingham, at Edinburgh, in Canada, at St. Helena, and at the Cape of Good Hope: and ere long we may hope to view associated in one diagram the simultaneous movements of the air over Europe, America, Africa, India, and Australia,

recorded with instruments which we have chosen, by men whom we have set to work. Amongst the causes which tend to retard the progress of science, few, perhaps, operate more widely than the impediment to a free and rapid communication of thought and of experiments occasioned by difference of language. It appeared to the British Association that this impediment might in some degree be removed, as far as regards our own country, by procuring, and causing to be published, translations of foreign scientific memoirs judiciously selected. Accordingly at each of the meetings at Newcastle and Birmingham, a grant of 100*l.* was placed at the disposal of a committee appointed to carry this purpose into effect. Aided by the contributions of several translations which have been gratuitously presented to them, the Committee have been enabled, in the two last years, to publish fourteen memoirs on subjects of prominent interest and importance in the mathematical and physical sciences, bearing the names of some of the most eminent of the Continental philosophers. Such, gentlemen, is an imperfect review of our recent proceedings. In two essential respects the British Association differs from all the annual scientific meetings of the Continent, no one of which has printed transactions or employed money in aiding special researches. We also differ from them in the communications which, in the name of the representatives of science assembled from all parts of the United Kingdom, we feel ourselves authorised to make from time to time to the government, on subjects connected with the scientific character of the nation. On our first visit to Scotland, for example, we felt it to be an opprobrium that this enlightened kingdom should, in one essential feature of civilisation, be still behind many of the Continental states, and we prepared an address to his late majesty's government, urging strongly the necessity of the construction, without delay, of a map of Scotland, founded on the trigonometrical survey. Representations to the same effect have since been made by the Royal Society of Scotland and by the Highland Society; and the subject has now engaged that attention which will, we trust, soon procure for this country the first sheets of a large and complete map. If, then, it be asked, Why are the men of highest station happy to associate and mingle with us in official duties? Why have the heads of the noble houses of Fitzwilliam, Lansdowne,\* Northampton, Burlington, Northumberland, and Breadalbane, alternated in presiding over us, with our Bucklands, our Sedgwicks, our Brisbanes, our Lloyds, and our Harcourts? Why, indeed, on this very occasion has Argyll himself, overlooking the claims due to his high position and his ancient lineage, come forward to act with us, and even to serve in a subordinate office? May we not reply that it is, we believe, a consequence of the just appreciation, on the part of these patriotic and enlightened noblemen, of the beneficial influences which this Association exercises in so many ways on the sources of the nation's power and honour? If we have hitherto dwelt almost exclusively on the value of our transactions, researches, recommendations, and the good application of our finances, let it not, however, be supposed that we are not also fully alive to the advantages which flow from the social intercourse of these meetings, by bringing together, into friendly communion, from distant parts, those who are struggling on (often remote and unas-

sisted) in advancing experimental science. If, indeed, this principle of union (which we are proud to have borrowed from our German brethren) has been hitherto found to work so well amongst our own countrymen, we cannot but doubly recognise its value when we see assembled so many distinguished persons from foreign countries. In the presence of these eminent men we forbear to allude to individual distinctions, conscious that any brief attempt of our own would fall far short of a true estimate of merits, the high order of which is indeed known to every cultivator of science in Britain. Well, however, may we rejoice in having drawn such spirits to our isle: valuable, we trust, will be the comparisons we shall be enabled to make between the steps which the different sciences are making in their countries and in our own. That advantages, indeed, of no mean order arise from such social intercourse, is a feeling now so prevalent, that foreign national associations for the promotion of natural knowledge have rapidly increased. Germany, France, and Italy, have their annual assemblies; and our allies of the northern states hold their sittings beyond the Baltic. In all this there is doubtless much good; but an occasional more extensive intercourse of a similar nature, to be repeated at certain intervals, is greatly to be desired. It has therefore appeared to us (and we say it after consultation with many of our Continental friends, who equally feel the disadvantage), that the formation of a General Congress of Science might be promoted at this meeting, which, not interfering with any assemblies yet fixed upon, or even contemplated, may be so arranged as to permit the attendance of the officers and active members of each national scientific institution. If the British Association should take the first step in proposing a measure of this kind, and should solicit the illustrious Humboldt to act as president, we are sure that scientific men of all nations would gladly unite in offering this homage to a man whose life and fortune have been spent in their cause, whose voice has been so instrumental in awakening Europe to the inquiry into the laws of terrestrial magnetism, and whose ardent search after nature's truths has triumphed over the Andes and the Altai. If such be your suggestion, then will a fresh laurel be added to the wreath of this city. She who, through the power bequeathed to her by her illustrious offspring, conveys with rapid transit her inventions and her produce to the remotest lands, well can she estimate the value of an union of men whose labours can but tend to cement the bonds of general peace. In such a body the British representatives would, we trust, form no inconspicuous band; and, with minds strengthened by the infusion of fresh knowledge, they would, on reassembling for our own national ends, the better sustain the permanent and successful career of the British Association."

#### REVIEWS OF NEW BOOKS.

*Correspondence relating to the Boundary between the British Possessions in North America, and the United States of America, under the Treaty of 1783.* Presented to both Houses of Parliament by Command of Her Majesty, July, 1840. [See *Literary Gazette*, No. 1228.]

THESE papers were delivered to the Members of the House of Commons only on Wednesday, the 29th of July; and on Saturday, the 1st of August, we published a notice of them, because we thought it desirable that, before the excitement,

\* The Marquess of Lansdowne, who had accepted the office, was prevented from attending by deep domestic affliction; and the Marquess of Northampton cheerfully supplied his place.

which the unpalatable conclusion of the Commissioners was likely to produce in America, could be very widely diffused, the historical and literary facts which they had adduced in support of their opinions should be presented in a popular form, as a sort of condiment which, to a certain extent, might diversify the flavour of the principal ingredient. We have been gratified by finding that, for the most part, the views of those facts taken by the Commissioners will bear a leisurely and critical examination: and we offer, as an instance, the correction they have made of the translation previously given, from the Latin, of a portion of the grant of Nova Scotia by the British King James I., in 1621. That grant, after describing the boundary from Cape Sable to the source of the lowest western branch of the St. Croix, proceeds thus:—*“Unde per imaginariam directam lineam quæ pergere per terram sed currere cœteris septentrionem concipietur ad proximam navium stationem, fluvium, vel scaturiginem, in magno fluvio de Canada sese exonerantem.”* In one of the documents laid before Congress by the government of the United States, in the course of the discussions on this question, the following translation has been given of these words:—*“Thence by an imaginary direct line, to be drawn or run through the country, or over the land, to the north, to the first bay, river, or spring, emptying itself into the great river of Canada.”* To this it is very properly objected by the Commissioners, that the accurate translation of *“versus”* is not *“to”* but *“towards,”* and that *“nearest”* is a better translation of *“proximam”* than *“first”*; and, consequently, that the Latin words do not mean a direct line to the north, or a due north line, which, for any thing the parties to the grant could have known, might have run to the North Pole without touching any naval station, or bay, or river, or spring emptying itself into the river of Canada; but the words mean a straight line to be drawn northward to the nearest naval station, or place for ships, river, or source emptying itself into the river of Canada. These remarks of the Commissioners appear to us to be unanswerable. If any question can be raised upon them, we think it might be left to the decision of an American statesman,—to Dr. Wheaton, Mr. Webster, Mr. Buchanan, or Mr. Clay. Yet if this be so, inasmuch as the sources of the Chaudière river are springs emptying themselves into the St. Lawrence, and all of them lie many miles north of the source of the St. Croix designated in the grant, and the nearest of them is very much nearer to it than any other spring or river which empties itself into the St. Lawrence, or than any place upon that river or point in it, it follows, that the only line which could correspond with the words of James's grant, when rightly translated, would be a straight line from the source of the St. Croix to the nearest source of the Chaudière. Now the difference which results from adhering to the one or the other of the two translations is a difference of not much less than two hundred miles in the northern boundary line of the grant.

As a testimony to the general accuracy of the Commissioners, and for the purpose of suggesting at the same time how much inaccuracy there has been in the previous stages of this awkward discussion, we have selected this fact; because we believe that there is no other which at first sight would have been more vehemently denied by the assertors of the American claims. We hope, also, that it may have the further good effect of inducing all parties to examine whether there are

not some readier, more palpable, more indisputable, and more decisive criterions, by which the main question may be at once concluded; something present and visible, and comparatively simple, to which an effective appeal may be made without wandering into the debatable and provocative details of all that has been done or said in regard to the boundaries of Nova Scotia, Canada, and Massachusetts, in the last two centuries and a half. This brings us to a consideration of that which at once was the most appropriate, and is by far the most important part of the labours of the Commissioners—their observations of the face and configuration of the country; and to the connexion of that, which they have observed, with those words of the treaty of peace of 1783, the right construction and application of which ought to be the whole subject-matter of the dispute.

The words of the treaty are:—

“That all disputes which might arise in future on the subject of the boundaries of the United States may be prevented, it is hereby agreed and declared that the following are and shall be their boundaries; viz. from the north-west angle of Nova Scotia; viz. *that angle which is formed by a line drawn due north from the source of the St. Croix river to the Highlands*, along the said highlands, which divide those rivers that empty themselves into the river St. Lawrence from those which fall into the Atlantic Ocean, to the north-westernmost head of Connecticut River.”

Now we claim on the part of England a right to have the whole question determined by these words, and by no other words than these; we affirm that they are sufficient for that purpose, and we protest against the introduction of evidence or extraneous matter for any other object whatever than that of shewing either that there are no highlands which answer the description of highlands given in the treaty, or of shewing where it is that the due north line of the treaty first comes to the highlands; and we consider it to be the peculiar and all-sufficient merit of the Report of these Commissioners, that they have shewn fully and distinctly, that before a due north line from that source of the St. Croix which the Americans claim to have been intended by the treaty, reaches any portion of the disputed territory, it comes to highlands, which do fulfil the description given of highlands in the treaty.

Inasmuch as there is no dispute that the parties to the treaty were competent to declare and to establish whatever boundaries of these territories they could agree upon, nor any that Nova Scotia was contiguous to the river St. Croix on its eastern bank, the issue which will be found to be really decisive of the whole case is, whether those words of the treaty which we have printed in Italics do, or do not, of themselves, when applied to the configuration of the country, describe any angle, the lines of which are north and west of territories which, at the time of the treaty, bore the appellation of Nova Scotia.

It will be conceded, we hope, even by Governor Fairfield himself, that all “highlands” have both length and breadth, and consequently that every straight line, drawn to any highlands whatever, may be properly described as forming, at least, one angle with them; the other straight line of the angle being understood to lie in that face of the highlands to which the first line is drawn. Now the line directed by the treaty to be drawn due north from the St. Croix, being acknowledged by all parties to be a part of the western boundary of what was Nova Scotia at the time of the treaty, to fulfil the

description of a north-west angle of Nova Scotia, it was necessary only that this line should touch some highlands extending eastwards: and the Commissioners shew that before the due north line reaches the Roostuc or Aroostook river, which has latterly made so great a figure in these disputes, it has reached highlands of the most unquestionable form, which extend in a north-easterly range and direction to the head of the Bay of Chaleurs, leaving to the south of them more than nine-tenths of all the territories to which at the time of the treaty of 1783, or for many years before, or at any time since, the name of Nova Scotia ever was applied. The same highlands are shewn to extend south-westerly to the head of the Connecticut river, mentioned in the treaty, and in that direction to throw off to the southward all the rivers flowing into the Atlantic Ocean between the Connecticut and the St. Croix; whilst the sources of the rivers flowing into the St. Lawrence are all to the north; and the whole intermediate and continuous space is highland: as much so as the highlands of Scotland, or the country “above the Ghauts,” between the Coromandel and the Malabar coasts of Southern India.

Here, we say, the case is complete; and here we ought to make a stand, and to refuse to step out of these limits of the argument. The lines are ascertained which correspond with the words of the treaty, and which strictly answer the description given. If the United States can controvert the facts which we have here asserted on the authority of the Commissioners, let the controversy proceed; but if these facts be as the Commissioners have stated them, they are conclusive; and we must not be tempted to leave the grounds on which we actually hold the verdict, by our adversaries offering fresh debate from positions in which we are not called upon to attack them, even though it should be possible or easy to do so with success. That which is our own, and to which we have made out our title, might, in this way, be subjected to the repetition of a wrangling scramble which has been going on too long, and the renewal and further development of which may be conceived from the notice we subjoin of two only of the principal arguments into which even these Commissioners have been compelled to deviate by the course of previous dispute. We refer to the arguments, not with the intention of pronouncing any decision who is right or who is wrong, but for the purpose of reiterating that the arguments are inadmissible, and, consequently, that there is no occasion to refute those portions of them which are sustained by our opponents.

The United States assert that, prior to the treaty of 1783, the British government had described a north-west angle of Nova Scotia somewhere farther to the north than the point at which we now wish to fix it. The Commissioners deny this; and the difference of the two opinions could only be settled by a decision upon all the evidence that has been, and that might be, adduced on either side as to the boundaries of Canada, Massachusetts, Sagadahoc, Maine, and Nova Scotia, and Acadie, since the first discoveries of those countries; but we affirm that, inasmuch as the treaty of 1783 has sufficiently described where the angle was to be thereafter, the United States have no right to make it a part of this question where it was before. The British crown had a full right, by its declaration in that treaty, to constitute the angle for the first time, if it had never been constituted before, or to fix it with precision, if it had only been vaguely laid down before, or

to alter it; and by that treaty the north-west angle was declared to be that which is formed by a line drawn due north from the St. Croix to the highlands. The first highlands which the line meets, and which will form that angle, are the only highlands to which any one has a right to look for the purpose of construing the treaty.

Again, the United States have led all who have been engaged in this dispute into a vast field of evidence and of controversy, by asserting that there is in the treaty what lawyers call a latent ambiguity, to which the parties did not at the time advert, by reason of there being two ranges of highlands, or two points of the same highlands, which would equally answer the description in the treaty. The Commissioners deny that the second range of highlands, or second point of the highlands, marked out by the United States, does answer the description in the treaty; and after going through some long and curious details of evidence, and after having with great labour made fresh barometrical measurements of numerous mountain-heights in these wild and wooded territories, the Commissioners denounce some most extraordinary deviations from fact in the previous reports of certain agents of the United States, and even of one agent of the British government. These disclosures, we are afraid, will not improve the humour in which this contest has been carried on, but the Commissioners could not avoid stating them when they had come to their knowledge; and there cannot be any malice in the statement, inasmuch as they are physical facts, the truth of which may be placed beyond all dispute by further examination. We, however, protest against its being now necessary for the right and full decision of the question, that we should argue any further upon them. There is no such ambiguity in the words of the treaty; for even if there were two ranges of highlands, or two points in the highlands, which in other respects would answer the description in the treaty, it would be impossible to deny that a line which is described to be drawn due north to the highlands, and not into or through them, must have been intended to stop at the first highlands which would form the required angle.

These are the grounds on which it seems to us that, so long as the question is argued rigidly as a matter of right, our country is entitled to take and to keep its stand: but we are not political enough to pronounce any opinion whether, viewed in conjunction with the whole of our relations with the United States, this right is one on which we ought to listen to no terms of compromise. In Utopian and cosmopolitical dreams, in which literary men have a privilege to indulge, it has sometimes seemed to us that a neutral character might be given to a portion of this territory for the benefit of the Indian tribes, some individuals of whom still linger in these deserts; and to whom, as late as in the treaty of 1763, there are still traces of the intention of the British government to reserve the highlands and the upper waters of the great rivers throughout the North American continent; or we have sometimes thought that if America and England would set the example to the world of erecting an independent tribunal for the determination of international disputes, it might be found, a hundred years hence, holding its sittings in these cool and elevated regions, and beneath the solemn umbrage of some remnant of its dark primeval forests.

We should wish, also, to suggest to our geologists, that by traversing the disputed territory a few scientific men might, perhaps, have in

their power to prevent a war; and we can assure them, from our own observation, that the valley of the St. Lawrence and the great lakes presents one of the richest treats for a geologist which this globe can afford; and especially that there is a glorious opportunity there and to the northward, of studying the traces of those actions of masses of ice in motion which Agassiz, more than any one else, has brought into notice: nay, if we are not too late to address a word to the Scientific Association now assembled at Glasgow, we would beg of them to inquire whether there is any city in which, with more of interest and *éclat*—with more of benefit to America and to England—or with more zeal and delight to themselves, their next September meeting could be held than in Montreal, the capital of the new province of the United Canada?

#### MISCELLANEOUS.

*A Treatise on Agriculture and Dairy Husbandry.* By James Jackson. 8vo. pp. 116. Edinburgh, 1840. Chambers.

THE fund of useful agricultural information collected during many years of both theoretical and practical inquiry and experiment, and lucidly as well as comprehensively set out in this cheap volume, will recommend it very generally to the farmer, and all those connected with farming interests. In the division of it applicable to dairy husbandry there is much valuable advice; and, altogether, it does great credit to Mr. Jackson, whose skill and ability are so well known in the northern parts of our island, where these occupations are pursued with so much earnestness and success.

*Mrs. Loudon's Ladies' Flower-Garden: Bulbous Plants.* No. VI. London, 1840. Smith.

*Ixia* and *tritonis* are the exquisite embellishments to this number, which well deserves its place among the sweetest illustrators of our gay garden borders.

*Tyde's Legal Hand-Book of Landlord and Tenant.* Pp. 120.

FULL of useful information to help us where we cannot help ourselves.

#### THE DRAMA.

*Covent Garden.*—The first event of the season at this theatre has been the production of another successful play by Sheridan Knowles, founded on the "Sicilian Vespers," and entitled *The Bride of Messina*. Beautiful scenery, appropriate costume, and great attention to every minor detail, tended greatly to promote this desirable effect, for the tragedy itself is certainly much inferior to Mr. Knowles's former dramatic efforts. But censure to a man who has done so much for the drama and its literature as Knowles is rather ungrateful, after all; so we will content ourselves with giving a summary of the acting, and then extract a few of the many poetic beauties with which the play abounds; for our censure of the tragedy is only applicable to it as an acting play. The hero, *John of Procida*, was intrusted to Mr. Moore, who went through the part with great credit to himself; for he is but young on the London boards, and, on this account, does not always succeed in carrying his audience with him: in older hands, the part of *Procida* would have been rendered much more effective. The other male characters were fairly sustained by Messrs. Anderson, Cooper, Payne, Hemmings, Diddear, Brindal, J. Vining, &c. &c.; and the heroine could not have been intrusted to any one more worthily than Miss Ellen

Tree, who did all for a part which is not sufficiently definite to be very taking on the stage. Enough of this; let us now turn to the play in a literary point of view, where its errors of construction are not so apparent. Our daily contemporaries have all extracted one of the best "bits" in the play, but we are still tempted to transfer it to our pages:—

*Fernando* (in answer to the question, "Hast thou a father?") :—

"No,—no! thou churlish, harsh, remorseless man—  
That bait'st me with thy coarse and biting words,  
As boors abroad let loose unmuzzled dogs  
Upon a tether'd beast!—my arm withheld  
By thy defencelessness, that hast defence  
At hand, but will not use it—who art thou  
To use me thus? to do me shameful wrong.  
And then deny me means to right myself?  
What have I done to thee to use my heart  
As if its strings were thine to strain or rend?  
Thou mak'st my veins hot with my boiling blood,  
And not content, thou followest it up,  
Mine eyes inflaming with my scalding tears,  
Thou kindest, ruthless man! Hast thou a father?  
I never knew one!"

*Procida* (aside). I thank God!

*Fernando*. Thou hadst.  
A father—hadst a father's training—O,  
How blest the son that hath. O Providence,  
What is there like a father to a son?  
A father, quick in love, wakeful in care,  
Tenacious of his trust, proof in experience,  
Severe in honour, perfect in example,  
Stamp'd with authority! Hadst such a father?  
I knew no training, save what fostering  
Did give me, in the mood; and was bestow'd  
Like bounty to a poor dependant; which  
He might take or leave. Those who protected me  
Were masters of my native land, not sons.  
How could I learn the patriot's lofty lesson?  
They told me Sicily had given me birth,  
But then they taught me, also, I was son  
To a contentless and ungracious mother.  
And they were kind to me. What would'st thou have  
Of a young heart, but what you'd ask of wax—  
To take the first impression given to it?  
Except that, unlike wax, it is not quick  
What once it takes to render up again.

*Procida* (aside). O, my poor boy!

*Fernando*. If thou hadst a father,  
'Twas cruel, knowing that thou wast so rich,  
To taunt me, where, knew'st not that I was poor.  
Though mightiest at least suspect my poverty.  
How had I loved my father! He had had  
The whole of my heart. I would have given it him  
As a book, to write in it what'er he would.  
I never had gain'd him—never run  
Counter to him. I had copied him, as one  
A statue doth of the rare olden virtue,  
In jealous, humble imitation.  
I had lived to pleasure him. Before I had  
Disgraced him, I had died."

Another fine passage illustrative of woman's passionate love :—

*"Iolene. Fernando!*

When I consented to become thy wife,  
I gave myself to thee. A thousand rites  
Not more had made me thine. I was thy wife  
That very hour—that very minute! All  
Ties of reserves, heeds, other interests,  
That held my heart from thee I snapp'd at once;  
And, like a woman, gave it thee entire!  
Whole and for ever!—ay, so gave it thee,  
Were I and all my race in slavery,  
And it the ransom, which, on paying down,  
The shackles would fall off—gall as they might,  
They must remain. I could not take it back,  
Not even if I would."

*A Massacre:*—

"Then came the massacre,  
'Mid yells for quarter, answer'd by despair.  
The strugglings then—the blows—the kinds of death!  
Some falling by a single stroke, and some  
By none at all but grasp of strangling horror.  
By pieces some despatch'd—gash upon gash—  
Their bodies hack'd, yet life without a wound.  
How variously they met their fate—some mad,  
Some as all sense were lapsed, some seeking it—  
Some flying from it; and with all the signs  
As the blood works in such extremity!  
Some, pale as ashes; some, with face on fire;  
Some, black as though with premature congealing!  
Here tears; there scowls; there laughter,—yea, I saw  
Some that did die with laughter! Some did groan,  
And some did shriek; most died with curses; few  
With prayers, and they were mix'd with imprecations:  
Not one encounter'd death with constancy.  
But all as to its pangs were superadd'd  
The sharper stings of conscience."

*The Dance* (and this is a very pretty and natural scene) :—

On the 1st of October, uniform with "The History of British Birds and British Fishes," by Mr. Yarrell, and "The British Quadrupeds and Reptiles," by Mr. Bell, Part 1. price 2s. 6d.

**HISTORY OF BRITISH STAR-FISHES,**  
and other Animals of the Class Echinodermata.  
By EDWARD FORBES, M.W.I. Per. Sec. B.S. &c.  
This Volume will be completed in Four Parts, and will contain, besides the History, a Figure of each Species, and numerous Pictorial or Anatomical Tailpieces. A few Copies will also be printed on royal 8vo. price 5s. each Part.  
John Van Voorst, 1 Paternoster Row.

#### NEW MEDICAL JOURNAL.

The Members of the Medical Profession, particularly those who reside in the provinces, are respectfully informed, that on the 3d of October next will be published the first Number of a Weekly Medical Journal, to be entitled the

#### PROVINCIAL MEDICAL and SURGICAL JOURNAL.

This Journal will appear under the Patronage of many influential Members of the "Provincial Medical and Surgical Association," a body which comprises more than twelve hundred amongst the most respectable members of the Medical Profession in all parts of England. The main objects for which the "Provincial Medical and Surgical Journal" is established, are, 1st. To represent, in a more adequate manner than has hitherto been done, Medical Science throughout the Provinces; and, 2d. To serve as an organ of communication between the members of the various Medical Associations which have been recently formed in the United Kingdom. The new Journal will be of a convenient size and form, and, being stamped, can be forwarded, postage free, to any part of the Empire. Communications to the Editors, Orders, and Advertisements, &c., will be received by the Publishers, Messrs. Ball, Arnold, and Co. Paternoster Row, London.

Terms of Subscription (payable in advance).  
Twelve Months ..... £1 10 0  
Six Months ..... 0 15 0  
Single Number ..... 0 7

To Advertisers.—Twelve hundred copies of the first Number will be forwarded to the members of the "Provincial Medical and Surgical Association." This Number, therefore, will present a favourable opportunity for Advertisements, &c.

Intended for the use of the Heads of Families, the Clergy, Commanders of the Army, and the Benevolent who frequent the Sick Chamber.

To be published in Six Monthly Parts, with Practical Illustrations, at 2s. 6d.

#### THE CYCLOPEDIA of DOMESTIC MEDICINE.

Intended for Popular Use.

By RICHARD MURRAY, M.D.

Fellow of the College of Physicians at Edinburgh, and Licentiate of the Royal College of Surgeons in Edinburgh.  
Part I. will be published on the 1st of October.  
London: Ball, Arnold, and Co.

#### BOOKS PUBLISHED THIS DAY.

##### MURCHISON'S GEOLOGY.

2 vols. royal 4to. with large Geological Map, Views, coloured Sections, and numerous Plates of Organic Remains.  
**THE GEOLOGY OF THE SILURIAN REGION, or Border Counties of England and Wales.**  
By ROBERT MURCHISON, Esq. F.R.S.  
Vice-President of the Geological Society.  
John Murray, Albemarle Street.

#### BRITISH and FOREIGN REVIEW,

- No. XXI.  
1. Christianity and Church Extension.  
2. Austria and her Resources.—Milan Treaty.  
3. Modern French Novelists.—Le Neud Gordien.  
4. Montenegro.

Containing Thirteen Plates, bound in cloth, price 3s. Division I. (also in Parts, price 2s. each), Fisher's

**HISTORIC ILLUSTRATIONS of the BIBLE,** principally after the celebrated originals of the Old Masters. The Subjects already engraved comprise Designs by Rubens, Houbraken, Copley, Poussin, Overbeck, Mola, Rembrandt, Spada, Guercino, Wheatley, Franklin, and Melville.  
N.B. By particular request, a limited number of Proof Copies, imperial 4to., forming a most splendid work, are issued, price 4s. per Part; in Division, price 7s. each.

18th edition, price 3s. 6d. silk, 11s. 6d.

#### THE WOMEN of ENGLAND: their Social Duties and Domestic Habits.

By Mrs. Ellis.  
"If we could have our own way, every family should order a copy of 'The Women of England.' Husbands, especially young husbands, should buy it for their wives; fathers, for their daughters; brothers, for their sisters."—*Methodist Mag.*  
Fisher, Son, and Co. London: Chatham Street, Manchester; and Hunter Street, Liverpool.

#### THE LANGUAGE of FLOWERS.

The beautiful little work that has recently appeared, entitled "The Language of Flowers," is a practical guide to the knowledge of floral emblems; and will be found most useful to those who are desirous of adopting the beautiful Eastern custom of corresponding by means of flowers. Lady Wortley Montague, in her charming letters, alludes to this practice when she speaks of communicating thoughts and opinions "without even linking your fingers, no fruit or flower being without its signification."

Saunders and Otley, Publishers, Conduit Street.

#### On the 1st of October will be published, in 3 vols. embellished with Illustrations by Hervieu, LADY BULWER'S NEW NOVEL, THE BUDGET of THE BUBBLE FAMILY.

\* \* All Orders for this Work should be given at the Libraries and Booksellers throughout the United Kingdom immediately, to insure their being punctually supplied on the day of publication.

Edward Bull, Publisher and Librarian, 19 Holles Street, Cavendish Square.  
Agents—Bell and Bradfute, Edinburgh; John Cumming, Dublin.

THE BRITISH ASSOCIATION.

TENTH MEETING: GLASGOW.  
[Third notice.]

BEFORE continuing our Sectional Report, we may observe that, as the week advanced, the warmth of welcome seemed to increase as the natives and strangers got a little better acquainted with each other, and that the meeting concluded in a manner altogether as productive, as harmonious, as auspicious for the future, and as likely to leave a lasting impression and stimulus favourable to the cultivation of science, as any previous assemblage of the British Association.

At first there appeared to be no general feeling among the inhabitants of even curiosity respecting their visitors. The multitude immersed in business, and "minding their ain concerns," cared little or nothing about the influx of mathematicians, chemists, geologists, naturalists, doctors, economists, and meobanicians, who soon began to attract only a trifling notice as they perambulated the unknown streets with books, maps, cards, and papers in their hands, trying to make themselves understood by, and to understand, the persons to whom they happened to apply for some desired information. The difference of dialect, however, imposed almost an impassable bar to this sort of "march of knowledge." Meanwhile the local Secretaries and other gentlemen of Glasgow, who had from the beginning taken an interest in its coming hither, exerted themselves most assiduously, and, upon the whole, most successfully, in carrying into ready effect the complicated arrangements which such a congregation demands. Still several important points were neglected or overlooked. The non-publication of a list of resident members was one of these which caused some inconveniences; and still more loss and trouble were occasioned by the very crude and imperfect manner in which the list of non-resident members was issued. We speak of this feelingly, for none attending the meeting suffered so much from it as those connected with a journal which required extended intercourse with very many of the parties who took an active part in the proceedings; though every stranger must have been more or less affected by it.\* The local authorities did not seem to be aware of the extreme value of having this list published daily with correct addresses. We could not obtain the insertion of our own though repeatedly pressed, and the result was extreme disappointment and trouble in collecting the materials for our report. In the list of about 650 names, above 150 were in the same predicament. We trust that such a hindrance to business and intercommunication will never be suffered to occur again.

To compensate it in some measure, an idea which we suggested in the *Literary Gazette*, two or three years ago, was this year carried into execution, and contributed much to the

benefit of the meeting. We allude to the printing and circulating every morning a list of the papers read on the preceding day, and of those to be read on the same day. By this species of information every body was led to the Section and subject which it was their wish to attend.

In general, we would say that the matters transacted by the various Sections at this meeting were quite equal to the average. The Geologists, as usual, had a brilliant session; and the Statistics excited a strong degree of popular interest, though some of the questions discussed could hardly be asserted to come within the range of science. The grand difference of opinion, however, upon the treatment of the poor (which, like the Intrusion question, divides the country), and the acknowledged talents of the champions on either side, as well as the expectation of vehement debate, crowded this Section till it overflowed into the church with an ample audience. The presidency of Lord Sandon was of peculiar service here. Had there not been a chairman of consummate prudence and intelligence it might have been very difficult to keep the discussion within due bounds. The Section of Physics was also occupied with many great and important investigations,—some of them, indeed, sublime, and almost all of scientific value. Upon the whole, though many curious things are brought forward and lost sight of from year to year as the excitement of the hour passes away, and, from the hurry of time and an attempt, perhaps, to grasp too many objects, a number are very imperfectly developed,—whilst old familiar or unimportant trifles occupy the space, still, with all this evanescency and waste, there is so much of the permanent, solid, and memorable remaining, that nothing short of the most perverse blindness and malice can deny to the British Association the merit of being truly an inestimable friend and ally to Science, not only of Britain but of the civilised world. The idea thrown out at Glasgow of forming a congress of nations on the same principle, with the great Humboldt at its head, and every country sending its representatives to the meeting, will, if it can be realised, be another mighty measure for the diffusion of knowledge, and of peace and goodwill amongst the whole family of mankind. Many difficulties certainly stand in the way; but zeal and perseverance may overcome them all. With these remarks, and reserving others on different matters collateral with the Glasgow wise-week, we conclude for the present; and proceed to our journey-work.

FRIDAY.

SECTION A.—Mathematics and Physics.  
Papers and Communications.

1. Sir David Brewster's 'Report on Meteorological Observations at Kinsale and Inverness.'
2. Mr. Osler's 'Comparative Force of Wind during the 24 hours.'
3. Mr. Caldicott's 'Hourly Meteorological Observations at Trevandrum.'
4. Sir David Brewster, 'On a Blue Sun at Bermuda.'
5. Mr. John S. Russell's 'Report on Waves.'
6. Professor Kelland, 'On Mathematical Theory of Waves.'
7. Mr. Peebles, 'On Expressibility of Roots of Equations.'
8. Sir David Brewster, 'On Professor Powell's Measure of the Refrangibility of the lines G and H in the Spectrum.'
9. Professor Powell, 'On a Case of Interference.'

Whilst the diagrams, &c. were being prepared for the Meteorological Report, Sir D. Brewster read a communication from Colonel Reid, 'On the Appearance of a Blue Sun at Bermuda,' where the gallant Colonel now is, administering the government, prosecuting his scientific inquiries, and adding to his already high acquirements. The communication bearing date 17th August, 1839, described, and requested, an explanation of the singular phenomenon familiar to all at Bermuda; white objects appearing blue, and all others taking a similar hue. After stating the fact, which he had had, since at Bermuda, a good opportunity of observing, viz. that the revolutions of a water-spout near the surface were like the hands of a watch, Colonel Reid observed that Dr. Hardy, the present Collector of Customs, when recently at sea fifteen miles east of Bermuda, a hurricane raging over St. Vincent, saw all objects of a greenish colour. But the most remarkable blue sun occurred in 1831, which Dr. Hardy described. The night previous to the 3d of August, 1831, huge masses of clouds had collected, threatening a prodigious fall of rain, but no indications of wind or of a storm. During the night the thunder and lightning was severe; in early morning, some time after he had risen, the light became so dim, and every object in the room looked so blue, that he apprehended a sudden failure of sight. He communicated this to his family, but they also saw every thing of the same blue colour. Dr. Hardy then looked out;—the day was tranquil, the purely white sails of a vessel near were, to the sight, a deep blue; and the sea, to the coast of America, looked yellow.

Sir David Brewster was not aware that the fact, although frequently observed, had ever been accounted for. The phenomenon occurs when halos are formed, and is produced in a way analogous to the colours of mixed plates, which are caused by fringes of rays of light, portions of different degrees of refrangibility. These colours, so brilliant, might be produced by a lather of white soap between two plates of glass; the bubbles will be small vesicles, or cavities of air, through which the light will pass, and which afford different media of different degrees of refrangibility, therefore interference and therefore colour. It is easy to conceive that vesicular globules exist in the atmosphere, and consequently, that light, passing through different media, will, and does, produce the phenomena of mixed plates.

Professor Forbes noticed that the communication did not state whether the disc of the sun was visible, and of a blue colour. This fact, however, is well known; and was last observed, he believed, by M. Arago, at Algiers. The explanation given by Sir D. Brewster had been already suggested by M. Babinet, and when two such authorities agreed he thought there was no doubt but that the cause was clearly established.

Professor Stevelly asked whether it was essential that the particles should be of the vesicular form, as a difference of opinion existed as to the construction of atmospherical vapours?

\* At the end of the list the following appeared:—"It is requested that members whose addresses in Glasgow are omitted, or incorrectly reported, will give immediate intimation of the same at the appointed place, in the Reception Rooms; to which, as far as our experience goes, it might have been added, "of which no use whatever will be made!"

Sir D. Brewster said that what he had stated involved no theory. It was well known, however, that a high storm on the sea-coast drives vesicles up into the atmosphere. At St. Andrew's he had observed the sea raised in this manner, and the vesicles falling, burst, and left marks of salt water. The blue may be seen with a distinct blue image in the centre through films of sulphate of lime, in which are cavities either hollow or containing water: he believed water.—Here the conversation dropped.

An abstract of the Report No. 1, to shew its nature, and the results obtained, was then read by Sir D. Brewster, who selected two stations as best suited for the above purpose, Inverness and Edinburgh, where the observations had been conducted under the superintendence of Mr. Rutherford and Mr. McKenzie since November 1838. The results of the observations during the winter months were submitted to the Association at Birmingham; but now the observations themselves were brought up in two quarto volumes—a work of stupendous labour. The variations of the thermometer; the height and mean of the barometer; the character and direction of the wind; the number and nature of the auroræ boreales observed at these two stations, when compared with results obtained at Leith, Plymouth, Padua, and Philadelphia, exhibit traces of meteorological laws which Sir D. Brewster said will lead us to detect the phenomena of planetary action. The table of mean temperatures (the annual mean at Inverness is  $45\frac{1}{2}^{\circ}$ ) shews remarkable results. The temperature for one day presents capricious and irregular variations,—curves so irregular that there is no trace whatever of a curve. When, however, 76,000 observations are combined, these irregularities assume a regular curve. Thirty-six thousand hourly observations give an extraordinary identity of critical interval. Beginning from the north, in the order of latitude, the critical interval at Inverness was  $11^{\text{h}} 13^{\text{m}}$ ; at Keordin,  $10^{\text{h}} 44^{\text{m}}$ —this is a considerable difference; but it may be in consequence of its altitude (750 feet) above the sea; at Leith,  $11^{\text{h}} 15^{\text{m}}$ , or  $11^{\text{h}} 20^{\text{m}}$ ; at Plymouth, seventy-five feet above the sea (here only even hours are given),  $11^{\text{h}}$ ; at Padua,  $11^{\text{h}} 14^{\text{m}}$ ; at Philadelphia,  $11^{\text{h}} 20^{\text{m}}$ ; in Ceylon, at Trincomalee,  $11^{\text{h}} 5^{\text{m}}$ ; at Colombo, from observations made by Major Ord every two hours, differing therefore from the others,  $10^{\text{h}} 55^{\text{m}}$ ; at Kandy, 1600 feet above the level of the sea,  $11^{\text{h}}$ —but these have not been carried through accurately; at Trevandrum, 170 feet above the sea, at an observatory erected and furnished by a native prince, in consequence of the reports of the British Association, as explained to the Prince of Travancore by Mr. Caldicott, the critical interval was  $10^{\text{h}} 56^{\text{m}}$ , agreeing with Colombo. It does not appear that the difference of level above the sea is sufficient to account for the differences; and some are hostile to the idea that altitude affects the critical interval. But it is a remarkable circumstance that the curve at Kandy agrees with the curve at Plymouth, as if elevation above the sea produced such an effect as so many degrees of south latitude. Thus to temperature Sir D. Brewster confined his remarks. The observations, he stated, made at Trevandrum were only reduced this morning, and they exhibited a remarkable annual curve.

Professor Forbes, who had been examining the projected curves and tabulated details, said there was one point clear from the results; viz. that they exhibited a probability of fixed laws, as fixed even as astronomical laws. The first

impulse to these inquiries was given in this country by Sir David Brewster; and he (Professor Forbes) would inform him that the coincidence he had just described extended to two cases which had not come under his notice—at Nova Zembla and North America, both near the poles of maximum. No constant quantity is as yet known; but, if once established, it must be general.

Sir D. Brewster rose to supply an omission. Mr. Rutherford, the first so to do, had projected the curve of calm, together with those of wind and temperature, and they exhibited a remarkable relation.

Mr. Osler then stated that his anemometer at Birmingham had been in full operation nearly four years, and he thought his observations were sufficient for reduction to shew if there be laws for the wind. He described his mode of tabulating. His diagrams were beautiful, and shewed the comparative force of the wind for the day, month, seasons, and year. The results given were that an increase of temperature precedes an increase of wind; and it is probable that certain winds blow at certain hours; but sufficient observations to establish this probability have not yet been made.

Mr. Scott Russell suggested (and described the arrangement as used by himself) the substitution of fluid pressure for the spiral spring of Mr. Osler's anemometer.

'Abstract of Mr. Caldicott's Communication of Hourly Meteorological Observations at Trevandrum.' The author observed, that having had an opportunity in India of forwarding an inquiry which the British Association has considered to possess great interest, viz. that into the thermometrical, barometrical, and hygrometrical condition of the atmosphere within the tropics; it was with feelings of great pride and pleasure that he was enabled by his present visit to this country to offer to the present meeting of that eminent Association a series of hourly observations of the thermometer, barometer, and wet-bulb thermometer, carried on under his direction and superintendence, at a situation only  $8\frac{1}{2}^{\circ}$  north of the equator. The author then proceeded to describe the circumstances under which the observations have been made, in the following terms:—

"In the beginning of the year 1837 it devolved on me to undertake the direction of an observatory then recently established at Trevandrum, in the south of India, by his highness the Rajah of Travancore (a young native prince of that country, of whom, for his liberal patronage of science, his munificent encouragement of education among his subjects, and for his beneficent rule, it is impossible to speak too highly), and noticing among the recommendations promulgated by the British Association, that a set of hourly meteorological observations within the tropics was considered highly desirable, I thought the opportunity a grand one for supplying this desideratum. I accordingly explained the matter to his highness, and with the liberal confidence which I have ever experienced from him, was immediately provided with the necessary means for accomplishing my purpose. I have, therefore, no other merit to claim (with respect of these observations) than that of a diligent perseverance in the task I had imposed on myself."

Mr. Caldicott then described minutely the building in which the observations were made, the instruments used, and the registers which accompany his communication; informing the meeting that the observations have been made

every hour since the commencement of June 1837; and that they are intended by him to be continued for the period of five years from their commencement. The situation is described to be in the latitude  $8^{\circ} 30' 35''$  north, longitude  $5^{\text{h}} 8^{\text{m}}$  east of Greenwich, 170 feet above the mean level of the sea, and distant from it in a direct line about two miles. Every precaution appears to have been taken for the protection of the instruments from all interfering influences; and of the observers (all natives of India), Mr. Caldicott remarks, that "after the first difficulty of instructing them is surmounted, their patient, temperate, and diligent habits peculiarly fit them for the office here required of them, and I have always found those who have been selected for the duty fully as trustworthy as, I imagine, is any class of persons to whom such observations are usually intrusted."

The registers are arranged in monthly tables, and contain, among other interesting determinations, the following particulars, clearly shewn, and prepared for any investigation to which they may be considered applicable, viz. :—

- In Temperature.*
1. The mean of each hour for the month.
  2. The mean of each day of the month.
  3. The above two determinations for each period of ten days.
  4. The mean range for the month for each ten days.

- In Pressure.*
1. The mean pressure of each hour for the month.
  2. The mean pressure of each day of the month.
  3. The same quantities for each period of ten days.
  4. The maximum and minimum pressure for each day, with the extreme variation for each day.
  5. The four semi-oscillations for each twenty-four hours, with the mean values of these for the month.

- In Humidity.*
1. The temperature of the air each hour (repeated from the register of "Temperature").
  2. The depression of the wet-bulb thermometer for ditto.
  3. The dew point for ditto, calculated from Professor Apjohn's formula, disregarding his correction for pressure.
  4. The mean of all these for each day.
  5. The quantity of rain for every twelve hours.

Besides these registers, the author presented two tables, drawn up in the form first adopted by Sir David Brewster, shewing for the complete year of the observations, viz. from June 1837 to June 1838,

1. The daily and monthly mean temperature, from 8760 observations.
2. The mean temperature of each hour for each month, and for the whole twelve months, from ditto.

Also two others, shewing for the same period,

1. The daily and monthly dew points, also from 8760 observations.
2. The mean dew point of each hour for each month, and for the whole twelve months, from ditto.

The first two tables give for the mean temperature of the station  $78^{\circ} 89'$ , and the other two give for the mean dew point  $71^{\circ} 78'$ .

The barometric registers give, by a mean of all the diurnal semi-oscillations for the same period, the following results:—

Fall between 10 A.M. and 4 P.M.	0.106
Rise .... 4 P.M. ... 10 A.M.	0.108
Fall .... 10 P.M. ... 4 A.M.	0.071
Rise .... 4 A.M. ... 10 A.M.	0.073

Times of maxima between the hours of nine and ten, morning and evening.  
Times of minima between the hours of three and four, afternoon and morning.

Mr. Caldicott concluded his communication with a notice to the meeting that he was about to return to his post in India, amply furnished with meteorological, magnetical, and astronomical instruments; and added that, should the Committee of the Physical Section of the British Association see fit to honour him with any suggestions as to points in meteorology, or any other branch of the physical sciences, which his local situation and means might enable him

to elucidate, or be of use in, he would feel proud to receive its instructions, and would do all in his power to forward its objects.

Professor Forbes said that the observations exhibited admirable care, and that the results were distinguished in a peculiar manner. Some remarks with regard to the dew-point and Apjohn's formula provoked a discussion, in which Sir D. Brewster, Mr. Espy, Major Sabine, &c., took part; but as the subject will come before our readers in a more regular form, we pass on to

Mr. Russell's report 'On Waves.' The chief business of the Committee during the past year had been to carry the level line from Stirling to Leith, compare observations, and reduce the results. Mr. Russell described and illustrated the peculiarities of the tidal waves in the Frith of Forth, the extraordinary form they assume, and the phenomenon of two high waters of one tide; and attributed them to the slope of the bed, the level line, and to two tidal waves. This latter circumstance was in relation to the tidal discussions of Whewell and Lubbock. From their chart of cotidal lines it appeared that there were two great tidal waves in the Forth; the one passing through the British Channel to the east coast and German Ocean, and the other round the Orkneys. The two meet in the Thames, coincide, go up together, and cause one high water; but the channel tide-wave arrives at the Forth about three hours before the northern one, but is overtaken by the latter at Stirling, where the two coincide, and a single high water results; although all up the Forth two high waters occur, and sometimes three, which, however, has not been accounted for. The first arrives to a shallow channel, and is therefore greatly retarded, and the hump on the crest is observed; whereas the northern one comes to deeper channel, and its velocity increased, moves much more rapidly than the former, overtakes, and becomes incorporated with it. It has been proved beyond doubt that a large wave can overtake a small one, pass through it, and leave it behind; that is, that first one wave shall be seen, then two, then one again. In conclusion, the Report briefly alluded to the mechanism of the wave, of translation, and the mathematical results worked out by Professor Kelland; also to the beneficial results arrived at with regard to the forms of vessels: but both these will be noticed hereafter in their regular order.—The Committee considered this their final Report.

Professor Whewell acknowledged the high interest of these curious facts, and the great probability of their close relation to two tidal waves; but also, he observed, it is probable that other circumstances coincide and give depth to the water, &c. &c. It was difficult to improvise a discussion on such a subject, although tempting; the first thing that presented itself, as possibly an influence, was the age of the moon. Looking at each projected curve in the diagrams before him, certain waves always preserve the same forms; and, probably, throughout the whole lunation others change their character. For instance, in April, from the 5th to the 8th, the wave previously double was single; on the 10th, apparently, and on the 11th, clearly and decidedly double again. He then suggested a comparison to be instituted for every day of the semi-lunation, to shew what relation each day of the moon had to the facts; and for this further tidal observations would be required.

Mr. Russell, in explanation of one or two points, referred to Whewell's map of cotidal lines; and observed that the tides in the Ger-

man Ocean appear capricious, running in various directions. In one place they were marked as travelling in a circle, making for the coast of Norfolk and Suffolk, and thence sweeping round to the coast of Holland. As Mr. Whewell observed, great proof of the correctness of these tidal lines has lately been afforded; it was conceived that if the tides made as projected, in the central point of this sweep there would be no tide, as in the centre of a wheel there is no motion. A letter from the Admiralty had announced the discovery of this point where there was no rise.\* He had hoped to lay the particulars before the Section, but the first letter, containing full details, had not been received. This is, indeed, a striking proof of the truth of the theoretical views on waves.

Professor Kelland next submitted his 'Mathematical Investigations of the Theory of Waves.' His memoir has already been published. For this reason, therefore, and also because, as Professor Kelland observed, "the formulas were too abstruse to put altogether into oral relation," it will be sufficient to observe that all the problems solved gave facts precisely those resolved by experiment. This was confirmed by Mr. Scott Russell.

The three last papers were then read, but were of a character too abstruse for popular illustration.

#### SECTION B.—Chemistry. Papers and Communications.

1. Prof. Thomson 'On the Chemical Manufactures of Glasgow.'
2. Mr. Connell's Additional 'Observations on the Voltaic Decomposition of Alcohol.'
3. Prof. Graham's 'Notice of the New Chemical Views of Prof. Liebig, on Agriculture and Physiology.'
4. Dr. R. W. Glover, 'On a New Process for obtaining Hydrobromic Acid, and Hydriodic Acid.'
5. Prof. Bunsen, 'On the Compounds of a New Radical called Kakodyl.'
6. Dr. Mohr, 'On a New Mode of preparing Morphia.'
7. Mr. Sturgeon, 'On a Peculiar Class of Voltaic Phenomena.'

A specimen of Dr. Gregory's muri-oxide (respecting which a communication was made yesterday) was handed round for the inspection of the Section.

Dr. T. Thomson was then moved from the chair to read his paper 'On the Chemical Manufactures of Glasgow,' and it was provisionally taken by Professor Graham. The paper itself was long and interesting, detailing the methods by which these important manufactories are carried on, without, of course, divulging any of the peculiar processes which are kept secret by their proprietors. It will be seen, therefore, that an account of those which are generally known, even with the luminous explanations of this able chemist, could convey no new intelligence to parties concerned in similar undertakings, and would be of less value to the public at large than to such an assembly as attended this lecture. We need not then enter upon the details, but merely state that the exposition fully illustrated the great manufactories of iron, sulphuric acid, bleaching powder or chloride of lime, alum made at Hurler and Campsie, precipitate of potash, achromate of potash, tartaric acid, acetic acid, pyroxylic spirit, iodine, soap, bleaching of cotton cloth, Turkey-red dyeing, glass-making, cudbear and gas, and all the other leading products for which this enterprising and wealthy community is celebrated.

Professor Graham expressed the thanks of

\* This remarkable fact is communicated by a captain of the British navy now employed in these seas: the precise point, giving the longitude and latitude of the central calm, did not transpire.—Ed. J. G.

the Section to Dr. Thomson for collecting such a mass of valuable information on the manufactures of Glasgow and neighbourhood.

Mr. Connell, 'On the Voltaic Decomposition of Alcohol,' endeavoured to shew that by dissolving a small quantity of potassium in pure alcohol, and then subjecting the compound to voltaic action, water was obtained.

Dr. L. Playfair read the next paper, which was by Dr. R. W. Glover, 'On a New Process for obtaining Hydrobromic Acid, and Hydriodic Acid,' and proposed the employment of bromite and iodine of bromine in atomic proportions, as a convenient method.

Professor Bunsen, 'On the Compounds of a new Radical Compound, called Kakodyl.' The process by which this compound is obtained is exceedingly dangerous, and the author, in his experiments, has been several times severely injured. Arsenic is a principal ingredient.

The next paper read was by Dr. Mohr, 'On a new Mode of preparing Morphia.' The principle of the new method of preparing morphia consists in dissolving the morphiium in caustic lime by means of heat, and precipitating the filtered liquor by muriate of ammonia. The lime is neutralised by the muriatic acid of the salt, ammonia set free, and the morphia precipitated. In this process the morphia is obtained in a crystalline and very pure state, without the alcohol. This mode of operating is as follows:—The opium is dissolved in boiling water and strained, this operation repeated twice, the liquors concentrated by evaporation, boiled with caustic lime, strained again, and mixed while hot with powder of sal ammoniac.

Dr. Gregory said he had had a great deal of experience in preparing morphia, and he was quite satisfied that Dr. Mohr's was the best, both for preparing small quantities and for class experiments. He was sure it would be universally adopted as soon as known.

Dr. R. D. Thomson read a paper by Mr. Sturgeon, 'On a peculiar Class of Voltaic Phenomena.'—The Section then adjourned.

#### SECTION C.—Geology. Papers and Communications.

1. Professor Johnston, 'On Chemical Geology.'
2. C. Lyell, Esq. 'On Ancient Sea Cliffs and Needles of Chalk in the Valley of the Seine in Normandy.'
3. A. Ramsay, Esq. 'On the Geology of Arran.'
4. W. Keir, Esq. 'On the Geology of Castle Hill, Ardrossan.'
5. W. Sanders, Esq. 'On a Raised Beach at Woodspring Hill.'

Professor Johnston's paper 'On Chemical Geology' affords one of those instances of the conjunction of sciences which is so truly valuable in all useful pursuits, that we beg to direct particular attention to it, as one of the principal features of the meeting. The very able and distinguished Chemist of the University of Durham, indeed, discussed a subject of such general interest, and produced so much information respecting the compehony of various coals, that we are sorry to have been obliged to postpone it from even our earliest Number which reports these transactions. In this report the author considered, 1. The characters, classification, and constitution of the different kinds of coal which occur in various parts of the globe. 2. The origin of coal, which he considered to be unquestionably derived from the decay of vegetable matter. 3. He then explained the general law, according to which vegetable substances undergo decay in connexion with air and water. 4. The next point adverted to was the relative constitution of the different kinds of coal, as expressed by chemical formulae. This relative constitution was represented in the following table:—

Table, exhibiting the approximate Constitution of several Varieties of Coal, and their Relation to Lignin, and to each other, to illustrate Mr. Johnston's Report on Chemical Geology. Part I.

Name.	Formula.	Loss compared with Lignin.		Loss compared with preceding variety.
		C	H	
Lignin.....	$\frac{1}{100} \frac{128}{128}$			
Fossil wood (Usnach).....	$\frac{1}{100} \frac{107}{107}$			31 HO + 18 O
Dr. (Fossil) at (Gulf).....	$\frac{1}{100} \frac{79}{79}$			9 HO + 28 O
Imperfect lignite (Greece).....	$\frac{1}{100} \frac{78}{78}$			8 HO + 2 O
Lignite (Lower Alps).....	$\frac{1}{100} \frac{70}{70}$			2 HO + 8 O
Jet.....	$\frac{1}{100} \frac{63}{63}$			2 HO + 2 O
A steam-coal	Dry blazing coal (Blanczy).....	160	65	26
	Imperfect cannel (Clifton).....	100	64	16
	Cannel (Wigan).....	100	64	13
A steam-coal	Splint (Willington).....	160	60	11
	Caking coal (Newcastle).....	100	56	8
	Hard bituminous (Hive).....	160	52	6
	de Gier.....	100	42	4
Anthracite	A (Mayenne).....	160	33	3
	B (Welsh).....	100	33	3
	C.....	160	24	3

In this table, the two remarkable points particularly dwelt upon by the author were,—1. That from the formulæ it appears that the several species of coal form a series, indicating a succession of steps from the unchanged woody fibre (Lignin) to the anthracite coal, in which all traces of organisation have entirely disappeared. 2. That in the progress of the decomposition a point is at length reached (see *splint coal*, *Willington*, in table), when, instead of water and oxygen, water and hydrogen are evolved. Up to this point the vegetable matter gives off, by its decomposition, water and carbonic acid only; hence, in mines of brown and cannel coals, carbonic acid is the principal gaseous substance given off by the coal. Beyond this point, however, water and light carbonated hydrogen (*marsh gas* or *fire damp*) are given off; and hence the evolution of inflammable gas in the mines of certain bituminous coals (*splint*, *caking coal*, &c. of the table), and in them only. These observations serve to illustrate very beautifully the production of the several kinds of coal, and of the gaseous and other substances obtained in connexion with it in the various coal mines. The last division of the report was devoted to the consideration of the question as to the mode by which the vegetable matter from which the coal is formed had been derived? whether, for example, it had been brought from a distance as *drift*, or had grown on the spot? On this point the Professor considered the *balance* of evidence, of *all kind*, to be in favour of the opinion that the vegetable matter grew on the localities in which the coal is now found. This report was followed by an interesting discussion, in which Mr. Delabèche, Dr. Buckland, the Marquess of Northampton, and various other members, took part.

The President said, that this was the first chemical and geological paper that had been read before any geological society. The writer was well known by his great chemical and geological knowledge, and they had just had an

opportunity of witnessing the extreme value of having the two displayed in combination.

Dr. Buckland held the views propounded by Professor Johnston to amount almost to a demonstration, and regarded them as an epoch in the investigation of the origin of coal. With respect to the opinions of practical men as to the formation of the Newcastle coal-field, the only criticism he was disposed to make was this—it was urged that, because there were seams of coal only one inch thick, they could not have been produced from drifted trees. But *non sequitur*; the vegetable matter might not have been trees, but a smaller vegetable—the leaves of ferns, or aquatic plants—floated from a distant lake or forest. The argument against drifted trees might be true as far as it went; but it was not true altogether. He believed that other beds of coal were the result of vegetable matter drifted from great distances. Instances of this kind were clearly proved by the pine found in Craighleith quarry, and other fossil trees embedded in sand, and completely cut off from the ground below. The truth probably lay between extreme views on both sides.

Professor Phillips instanced a few cases he had known of trunks of trees denuded of their leaves and branches and surrounded by coal, and of the stem of a plant that was found in conjunction with the root of another. He stated these things to show that different facts required to be kept in view in concluding upon this matter. He congratulated the Section on the interest and importance of the paper they had heard; it proved that geologists were willing to call in the aid of all the correct sciences to test and corroborate the principles of their own.

The Marquess of Northampton offered a few remarks on the different qualities of wood, as promoting or retarding the process of decomposition. He recommended the subject to the consideration of botanists.

Dr. Buckland reminded the noble Marquess of the interesting experiments of Dr. Lindley on the vitality of plants. Dr. B. also referred to the fact that none of the grasses had been ever yet found in any kind of coal. Mr. Featherstonhaugh described the anthracite coal of the State of Pennsylvania, and mentioned that he had observed it in a filamentary form like thousands of small coral branches. He did not comprehend how such a formation could be included in the category of coals of vegetable origin.

After some farther discussion of this point, the conversation on the paper terminated.

Mr. Lyell gave an interesting essay on the sea-cliffs and needles of chalk in the valley of the river Seine; but we did not observe that it led to the statements of any new geological facts or results. The formations examined by Mr. Lyell did not differ from the sea-marks and deposits of similar in other parts of the globe; but confirm all the data which the science has deduced from their position and appearance.

Mr. Ramsay, to whom the meeting are much indebted for an admirable model of the Isle of Arran, and a collection of its minerals and fossils arranged around the room where it was exhibited, explained a fine map and sections of the island; but as we shall have the satisfaction in our account of to-morrow's proceedings to enter into a more stirring eye-witness description of similar remarks, we shall simply say that Mr. Ramsay demonstrated the geological structure of his subject with uncommon perspicuity and accuracy.

Mr. W. Keir read the paper announced 'On the Geology of the Castle Hill at Ardrossan, on the opposite coast of the Clyde.'

#### SECTION D.—Zoology and Natural History.

##### Papers and Communications.

1. Sir John Dalzell, 'On the Loss and Regeneration of Organs discharging the Functions of the Head and Viscera, in the Holothuria and Amphitrite, with Drawings.'
2. Mr. James Wilson, 'On Insects from Persia.'
3. Dr. Aldridge, 'On the Pollen of Plants.'
4. Mr. Babington's 'Notice of *Cuscuta Ejulnium*.'
5. 'Report of the Committee on Radiate Animals.'
6. 'Report of the Dredging Committee.'

P. J. Selby, Esq. in the chair.—The business of the Section opened with a paper by Sir John Graham Dalzell, 'On the Regeneration of Lost Organs by two Marine Animals, the Holothuria and Amphitrite.' He described the holothuria as resembling a sausage or cucumber in shape, with ten beautiful red branches surrounding the mouth, and above 2000 suckers covering the body. The head of this animal, including the branches, mouth, throat, and intestines, were sometimes separated from the body; but the animal did not die—it lay at rest for several months, when the whole lost parts were found to have grown again. This loss might happen more than once—yet the animal would become again entire, and the new organs were seen discharging the same functions as the old. Further, there was a certain species of holothuria which divided spontaneously through the middle. Each half then became perfect and entire. A single specimen produced above five thousand eggs. Sir John next described the amphitrite as of a serpentine form, a foot in length—the head consisting of eighty fleshy feathers, disposed as a funnel or shuttlecock, three inches deep. This creature dwells in a black tube, manufactured by itself, of a kind of composition which it knows how to make. He shewed how the observer could induce it to work—that every fleshy feather consisted of 500 hairs, bordering the shaft; that these collected invisible materials suspended in the water, united them with glue from its mouth, and plastering them on its tube, smoothed them down with two trowels provided by Nature on its body. That 40,000 instruments were thus all employed in the work at once. If this industrious creature lost its head, a new head would grow. Nay, if a fragment sundered from the extremity of its serpentine body, the same singular feathered apparatus would be generated to perfect the fragment. Sir John shewed, also, that the elements of a new head resided in different parts of the body; of two sections from the lower extremity, each generated a head, so that besides the original plume or head of the entire animal, two new plumes on the separated parts existed—all three at once. Sir John interspersed his narrative with various remarks on the works of creation, and concluded by an appropriate apostrophe, demonstrating the protective cares of Providence over the humblest beings.

Dr. Fleming expressed a hope that Sir J. G. Dalzell would be induced to publish the great mass of interesting matter he had collected on this subject, which would be a valuable addition to the animal biography of Europe. After some observations from Mr. Forbes and the Chairman to the same effect, Sir John expressed his acquiescence in the unanimous wish of the Section.

Mr. James Wilson exhibited a number of rare and splendid specimens of insects from Persia, from Java, and Serampore in the Bengal district. They were extremely interesting, as exhibiting their geographical distribution,

and those from Persia particularly, as shewing how far south the European insects are found.

Mr. Forbes read a paper from Dr. Aldridge, illustrated by diagrams, 'On the Pollen of Plants.'

Mr. Babington stated, that he had found the *Cascular epilinum*, or flax dodder, at Barishoolie, in the county of Mayo, Ireland; and, also, in a field near the Crinan Canal in Scotland. He also stated, that it had been introduced into this country with the seed of the flax from the north of Europe, and that there was no doubt of its being distinct from the *C. Europæa* of Linneus.

**Radiate Animals.**—Mr. Patterson read the 'Report of the Committee on Radiate Animals,' for which 50l. was granted at the Birmingham meeting. The Report stated that one portion of the Committee's labours was superseded by the investigations, either published, or in course of publication, of individuals connected with the British Association; and that part which remained to be treated, namely, the Acalipha, required the assistance of an individual uniting in his own person the qualities of an artist as well as those of a naturalist. The Committee, therefore, having made their drawings, begged to discontinue the further prosecution of the subject. The drawings were exhibited.

Mr. Forbes brought up the Report of the Committee for investigating the marine fauna of Britain, especially the fossils of the pleiocene period, by means of the dredge, for which a grant of 60l. was made at Birmingham. In consequence of the badness of the weather, and other causes, they had been enabled to expend but a portion of the grant, with, however, most interesting results. A series of dredgings had been conducted on the west coast of Ireland, by Mr. Thompson, Mr. Bull, and Mr. Forbes; in the neighbourhood of Belfast, by Mr. Patterson; and on the coasts of the Isle of Man, by Mr. Forbes. The results had been carefully noted down in papers prepared by the direction of the Committee, the number of species and their associations, the comparative numbers of living and dead specimens, the ground depth, locality, and region, all being recorded. On the west coast of Ireland, the testacea, regarded as characteristic of the southern districts in Britain, and on the east coast, are found extending their range far to the north. One district, that of Conneemara, presented an exception, agreeing in the character of its fauna with the loughs of the Highlands of Scotland. The species of testacea observed were very generally distributed; those in the region of laminariæ were generally the same region on the east coast, but such as inhabited the region of corallines were more southern in character. The sandy tracts examined were very scant in specimens; muddy bottoms abounded in bivalve mollusca, and the gravelly in univalves. Scallop and oyster banks were not met with; indeed, no instance of a true shell-bank was observed. Dead shells were generally more abundant than living. On the Manx coast, a great bank or bed of scallop and other shells ran from opposite Peel to the point of Ayr, a distance of seventeen miles or more. The proportions of dead and living shells on it are about equal. It varied in distance from the shore from half a mile to five miles. Between it and the shore was a great tract of sand, with accumulations of boulders, giving attachment to fusi towards low-water mark. Animals were rare on this sandy track, but abundant on the shell bank. The coast with which this bed ran parallel was of pleiocene

marl and sand, in places exhibiting traces of a similar shell-bank to that at present existing in the sea. The characteristic shells of the fossil beds are, however, altogether wanting in the recent. The east coast of the Isle of Man presented a different character. The dredging on the east coast of Ireland was entirely in the neighbourhood of Belfast. Dead shells were found much more numerous than living, except in the case of *Nucula margarita*, which was the only species found very abundant.

[This paper did great honour to the diligence and acuteness of the reporters; and may, perhaps, appear more at large in our columns.]

In our notice of this Section for Thursday we were compelled entirely to abridge Mr. Lankester's paper 'On Plants and Animals found in the Sulphureous Springs in Yorkshire,' of which we now copy a more detailed, though still a very brief, notice.

The inorganic ingredients of mineral waters have been closely investigated, but so much attention has not been given to the organic matters they frequently contain. Continental chemists have described various organic substances, under the names of *Glairine*, *Baregine*, *Zoogene*, animal and vegeto-animal matters, &c. In the sulphureous waters of Harrowgate and Askrum, a plant described by Dillwyn as *Conserva nivea* is frequently found; and the author has recognised in the organic filaments described by Dalby and others, the early state of growth of the *Conserva nivea*. In Harrowgate a *Conserva* abounds, having a peculiar structure similar to that of *Oscillatoria*. These *Conserve* quickly decompose, giving rise to a variety of singular secondary compounds, which have led to the supposed existence of the various substances before alluded to. Vegetable matters existing in these situations have been before recorded, but no distinct notice of animalcules occurs. The author described two new animalcules which he had discovered, forming a beautiful rose-coloured deposit, in the sulphur wells of Harrowgate and Askrum. So constantly do these animalcules occur in sulphureous waters, or districts where sulphuretted hydrogen exists, that the latter may be always inferred from the presence of the former. The animalcules appear to be at present undescribed, but one of them resembles the *Astasia hamatodes* of Ehrenberg, which he found producing a rose-coloured deposit in Siberia.—Specimens and drawings of the animalcules and plants were exhibited to the Section. After pointing out the advantage derived of late years by tracing the analogies of the different numbers of the zoological scale, and the adoption of the circular arrangements of Systematic Zoology, he proceeded rapidly to shew that in the particular class of fishes very erroneous views had been promulgated under the authority of names the most distinguished in science, and more particularly by the illustrious Cuvier. Restricting his observations to the skeletons of fishes, and principally to the analogies of the similes of higher vertebrals, he shewed that the pectoral fin had been mistaken for the anterior or respiratory limb, and that more correct induction and observation would easily shew that there was a much stronger analogy between it and the pelvis arch and posterior extremity. According to Cuvier (whose opinion he respectfully dreaded to dissent from), the pectoral fin was supported, 1. By a clavicle composed of two pieces, with a coracoid process, frequently also found double. A single bone represented the humerus, the radius and ulna, and carpus and phalanges; also two bones, four smaller specula, to which

were attached the rays of the fins. Viewing this fin as the analogies of the leg or posterior extremity, the upper portion of the scapula represents the pelvis bone, or *os innominatum*, connected with the femur by means of a beautiful acetabular joint. The tibia is the largest bone of the circle, its very largely developed internal malleolus meeting with that of the opposite side under the head, forms a complete circle. The bone mistaken for the coracoid process of the scapula is truly the tibia (the leg being turned has thrown it internal); and the foot with its sole anterior. The tarsus is then traceable with the usual character of the higher vertebrals, where it is always easy to trace a strong analogy, both in form and function, with the forearm and carpus, and it is this which has tended to mislead naturalists. He then pointed out that the opercular bones were the analogies of the anterior extremity; and that in the osseous fishes the branchial respiration was always connected with this form; and that in the poeteus, where both pulmonic and branchial circulation existed, both the specular circle and the scapular clavicular arch and arm existed; and that in the cartilaginous fishes, where the respiration was different from both, the scapular clavicle and anterior extremity were largely developed with the pelvis and leg, also found in connexion with the lower part of the spine. Thus, in this class of fishes itself, it is easy to prove that the pectoral fin of ichthyologists is really the leg, and that the opercular bones represent scapula, clavicular arch and arm, or respiratory limb.

#### SECTION E.—Medical. Papers and Communications.

1. Dr. Allison, 'On Certain Inferences which may be drawn from the Study of the Nerves of the Eye-ball.'
2. Dr. Newbigging, 'On the Therapeutic Effects of Croton Oil in certain Nervous Diseases.'
3. Dr. Lawrie, 'On the Results of Amputation.'
4. Dr. Reid, 'On Blood-vessels of Mother and Fœtus (human).'
5. Dr. Glover, 'On Effects of Bromine, and its Compounds.'
6. Dr. Thomson, 'On Opacity of Cornea produced by Sulphuric Acid.'
7. Dr. Reid, 'On Medulla Oblongata.'

Dr. Watson in the chair.—The first paper was postponed in consequence of Dr. Alison's engagement in the Statistical Section.

Dr. Eric Mackay, of Birmingham, then read a paper highly commendatory of the medical properties of the Matias bark of Columbia, South America; and Dr. P. Newbigging, of Edinburgh, and others, stated that they had successfully used this new bark. In answer to a question by Dr. Seargent of Dublin, Dr. J. H. Balfour stated that, from the appearance of the bark, he was of opinion that it belonged to the natural family *Winteracea*, though its botanical relations were not yet ascertained.

Dr. Mackay then shewed two drawings of a monocephalic monster, and gave a minute account of its anatomical peculiarities. Sir Charles Bell thought that this was a case on which nothing new could be said. The records of medicine abounded with accounts of monsters. The President, Dr. Cooper, Professor Jeffrey, and others, made a few remarks; after which Dr. Mackay stated that this is the first case of the kind in which an anatomical account has been given; and G. St. Hilaire mentions that only two similar instances are on record.

[It may be observed that many papers, &c., of this Section are unfit for publication in a popular journal, however interesting to the Faculty and valuable to Science.]

Dr. P. Newbigging then read a paper 'On the Internal Use of Croton Oil in Nervous Diseases.' He stated his belief that it had a specific influence in such cases. The usual dose

administered was a drop. Dr. Abercrombie was inclined to agree with Dr. Newbigging in believing that it had a specific, independent of its purgative, effect in many nervous diseases. In convulsive affections Dr. A. had tried croton oil with eminent success. In the crowing disease of children to which Dr. N. had alluded, he would rather recommend a trial of a combination of carbonate of iron, rhubarb, and musk. Sir Charles Bell thought that in neuralgic cases mere purging would not do. We ought to look out for remedies which affect particular parts of the intestinal canal. The croton oil was very excellent in those neuralgic cases where the head was affected. Dr. Fowler of Salisbury also thought that it was in this class of cases that the croton oil was useful; and in this opinion Drs. Bacon and Lawrie of Glasgow concurred. Dr. E. Mackay stated, that when under Dr. Nicol of Inverness, as house-surgeon of the infirmary of that place, he had frequently used the croton oil as a counter-irritant in neuralgic cases with great advantage. Erythema followed the application in four hours. The strength of the ointment employed was a drachm to one ounce of lard. Dr. Buchanan of Glasgow remarked that, when applied externally, it often produced the same effect as when taken internally. Dr. Nicol of Inverness agreed in this opinion, and said that, as an external application, he was in the habit of advantageously combining it with tartar emetic ointment. Dr. Seargent had given carbonate of iron and rhubarb as a substitute for calomel to children, in the class of cases alluded to by Dr. Abercrombie. Dr. Perry also highly approved of tonic treatment and change of air in these cases. He reprobated the purging system.

Dr. Lawrie of Glasgow then read a memoir 'On the Results of Amputation.' Sir Charles Bell said that this paper *must* be printed; it was of immense value. Dr. Abercrombie stated that it was another admirable instance of the application of statistics to medical subjects. After some remarks from Drs. Perry and Bacon, Sir Charles Bell said, "If you talk of amputations after diseases of the joints, you get favourable results—after tumours of the bones, &c., most unfavourable. It seems to me that the immediate dressing the stump prevents many fatal consequences. The deaths after amputation are so much influenced by the state of the kidneys, &c., that this point might have been perhaps more attended to by the author." Dr. Lawrie remarked that he had attempted to give due prominence to these considerations, and in proof of this referred to his memoir.

Dr. John Reid then read a very important paper 'On the Communication between the Mother and Fœtus (human),' altogether unsubmitted to our columns. The President said that this communication was of extreme value. It was quite new to the profession, and placed us in advance in one of the darkest subjects of physiology and anatomy. Dr. Martin Barry congratulated Dr. Reid on filling up a desideratum in medical science; and an examination of the preparations shewn by Dr. R. convinced Dr. B. of the correctness of Dr. R.'s statements. Professor Allen Thompson concurred with Dr. Barry, that in this matter the merit of originality must be given to Dr. Reid. It is most satisfactory to find different opinions coalescing. The beautiful arrangement of the placental vessels, and the similarity with the branchial vessels of fishes and other similar structures, was highly interesting; and those familiar with the researches on unity of organ-

isation would from this draw additional evidence of their correctness. Dr. Seargent asked if Dr. Reid ever discovered any difference in the blood in the umbilical vein and umbilical artery? Dr. Reid could not speak on this point from personal observation. He had never had an opportunity of examining it.—It fell more under the notice of accoucheurs. It was then resolved to print Dr. Reid's paper.

Dr. Reid then read a communication received from his friend, Dr. Robert M. Glover, of Newcastle, 'On the Therapeutic and Physiological Effects of Bromine and its Compounds;' when the Section adjourned.

#### SECTION F.—Statistics.

1. Dr. Chalmers, 'On the Application of Statistics to Moral and Economical Questions.'
2. Dr. Cowan, 'On the Vital Statistics of Glasgow, illustrating the Sanitary Condition of the Population, with Suggestions for its Improvement.'
3. Dr. Allison, 'Illustrations of the Practical Operation of the Scottish System of the Management of the Poor.'

Dr. Chalmers's paper 'On the Application of Statistics to Moral and Economical Questions,' was one which created the greatest interest, both for strangers and inhabitants. The room assigned for this Section was accordingly crowded long before eleven o'clock, and multitudes besieged the entrance in vain. Here the patient curiosity of the successful Intrusionists was sorely tried; for, after much deliberation in the Committee, it was agreed to transfer the business to the College Church. This being announced about a quarter to twelve o'clock, the outsiders had far the best of the start, and the company from the interior had to follow as fast as they could. The church was well filled in a few minutes; Lord Sandon took the chair in the precentor's seat below the pulpit; and the Rev. Doctor proceeded to read his paper, which certainly rewarded the feeling its promise had excited, by its strong sense, bursts of eloquence, and the importance of the question it involved. The great principle enforced was that of locomotion in the administrators of succour to the poor, and the dispensers to all of rational education and religious instruction. Those who wished to enlist others must move to them, and not, on mere invitation, expect that the latter would come to them. As an illustration, he would suppose they wanted a petition numerously signed to be presented to parliament. How could they best effect this?—By going with it from door to door, and house to house, and seeking the persons to affix their signatures. The example of their neighbours, and the consequence of taking home and explaining the business to them, would procure a vast number of names; whereas, if they simply left their petition at stated places, and told the people to go there and sign it, they would find that thousands would not be at the trouble of crossing the street to do so. This was an example of what might be called the impulsion of individuals on the masses, the only true way of stimulating the action required; it was fruitless to leave these masses to their own *vis inertia*. The Doctor then went on to illustrate his proposition by particular cases. He instanced a community in Edinburgh, consisting of 1350 persons, about the Water of Leith,—carters, quarrymen, pig-feeders, and other of similarly low class, the majority plunged in vice and immorality, habitual Sabbath-breakers—the surest source of all profligacy; for if they traced the latter to its origin, they would invariably discover that the Sabbath-breaker was also the worst-conducted during every other day of the week. Well, looking at human nature with the view he, and those who were with him, entertained of it, they founded their

hopes of success not upon mere preaching on the Sunday, but on the minister's going among the people, taking an anxious concern in their well-doing, and enforcing the precepts of morality and religion upon their minds: in short, in not leaving them to act of their own accord, but to shew them what was for their benefit in persevering visits, and court them to adopt that course for their own and their families' sakes. They anticipated that even among the rudest of Nature's children they would, by such means, find access to their hearts and homes; and they had not been disappointed. Vain were the speculations of romantic enthusiasts, built upon poetical fancies of innocent rural life, and the demoralised habits of the dwellers in populous cities and towns. The same susceptibilities of nature existed in the town and in the country; the human being in either was alike sensible of kindnesses, of attention shewn to their offspring, of consolations administered to them on their death-beds, in the hour of trial, when all other considerations were as nothing; and then were they, indeed, impressed with that reverential regard for the Man of God shedding the halo of religious truth and hope round their sore distress and sufferings. Thus the instructor and benefactor acquired the influence he sought. Kindness and assiduity finally triumphed. They would attend their humble funerals as sympathising with them; they would offer remedies for their ignorance; they would impart letters to the young, and religion to the old. These obvious Christian duties, reiterated and concentrated, could not fail of victory, no matter where they were exercised. The urban and the rural were the same races. The former were not the simple patriarchs of the retired and quiet world, or the happy swains of Arcadia, any more than the latter were destitute of every sense and virtue. No; human nature was the same in hovels and bustle as in the most beautiful scenery; and to work out good for either they must appeal to the same emotions and the same sympathies of humanity.

[These sentiments were expressed in a manner of which we regret our inability to convey an adequate idea to our readers. The best short-hand might preserve the words, but the discourse must have been heard to form a notion of the rich Doric accent and Attic eloquence with which its leading points were enforced on the audience, so as to extort plaudits even in the sanctity of the church.—*Ed. L. G.*]

Dr. Chalmers continued to describe the measures adopted by the little association, of whom he formed one, and another of whom was a zealous missionary, upon whose personal exertions he bestowed great praise, and the gradual success that attended their labours. They turned an old malt-barn into a chapel, and they hung up an old manufactory bell to summon the people to worship: it was not remarkable for musical sound to be sure, but it could be heard; and it was no matter how common were the instruments through which such endeavours were carried into effect. They, more than on aught else, depended upon their domiciliary visits; and through them became perfectly convinced of the truth of the saying, "A house-going minister makes a church-going people." Within two months, in the year 1836, the malt-barn was attended by 364 regular hearers; the chapel, previously, in the district, by not more than five; the proportion was as seventy-three to one: and this was the advantage of the Aggressive over the Attractive system. It shewed that by this means alone could they expect to recover a generation from the vice

and heathenism to which they had been born and bred, till custom rendered every other method useless. The learned Doctor energetically contended for the marked value of the statistics of a small subdivision of territory over those of more comprehensive range. The investigation of large fields were of necessity superficial, and brought no certain information upon which the inquirer could rely. Men might make wide surveys of the world, of a whole country, or of a densely populated town; but they would acquire ten times the insight into the conditions they wished to examine for the sake of founding a beneficial practice upon them, by confining themselves to parish, household, or even family observation; thereupon to improve the whole economics of society. Only by drudgery and minute details could they accomplish this, and lay down the basis and a sure substratum of any certain science. But this was not the way of the hard and heartless Utilitarians, who had no thought of acting on the emotions and sympathies of their fellow-creatures. They seemed to fancy that the moment a man began to feel he ceased to discern. They were Osteologists in morals, and wanted only the skeleton and dry bones for their studies. They were experimenters on the dried specimens of nature; and hated the freshness of the living subject. They reminded him of what he had heard of Burke, who, when he began to speak had the effect of emptying the House of Commons. The members could not believe that his brilliancy of style could be combined with the most philosophical and recondite of logical reasoning and powers of generalisation. Not so with the Greeks of old, who had but the same word to express truth and beauty. The *καλόν* was the expression of those who gloriously held that nothing could be true which was not beautiful, nothing beautiful which was not true. Dr. Chalmers next proceeded to give another illustration of the subdivision of territory by a reference to Glasgow, where, so far back as 1816, he had divided a single parish, with 11,000 inhabitants, into forty distinct and independent operations. This parish was broken up into a congeries of Sabbath schools on the aggressive principle, the effects of which all turned upon the difference of seeking and being sought after. When the children were left to themselves, not more than 100 attended the Sabbath schools; but on the aggressive principle being instituted, the yield amounted to 1200 of the juvenile population. As another illustration of the same principle, the Doctor stated that he had met with equal success in the institution of little home-sewing schools for girls, in the parish of St. John's, Glasgow. This species of education, he observed, was peculiarly required here, and all similar towns, where many girls were called to work in public works, just at the time they would be sent to learn to sew, and this branch of domestic duty was afterwards neglected. In the district to which he alluded the girls were, from habits or from other causes, negligent of learning to sew; but a number of ladies, always the best friends of the poor, exerted themselves to find out those who were in that situation. The application of statistics here was in ascertaining that six female schools, with 300 scholars each, would meet the demands of 9000 of a population; and having completed arrangements, they succeeded, through these means, in restoring character and comfort to a hitherto neglected class of individuals. The Rev. Doctor then entered into the subject of "localisation" in the government of large towns. Here he

adverted to the views brought out in the paper read yesterday, in which a general police over the city and suburbs was recommended by one who was better qualified than he was to deal with such matters. He alluded to this for the purpose merely of shewing the value of "localisation." He was confident that it was beneficial to the population to have local magistrates, such as those of Calton, Gorbals, and Anderston. He believed there was an attempt made to sink the local magistracy in England. He would not, however, enter into that subject, but would refer them to a pamphlet by Sir F. Palgrave, who had done him the honour to quote his views. In regard to the experiment at the Water of Leith, as a means of producing a diminution of crime, he referred to the evidence of a Commissioner of Police in Edinburgh, in which the latter accounted for a marked improvement in the condition of the people, by referring to the exertions of a faithful minister being settled amongst them. There was one advantage of statistics, that through that science you more readily arrive at the real principles of the subject you are investigating. Suppose you wish to ascertain the character and condition of a district, you come more readily at the end in view by carefully investigating a part of it, instead of adopting more general and extended views. Unless justice was done by this mode of strict and successive experiment in regard to crime, the means of improvement to a great extent must be overlooked. By statistics applied in this way you are enabled to form a correct idea of the general mass, and to arrive much sooner at the discovery of causes. He then came to the establishment of extensive Boards for the management of the funds for the support of the poor. In them he felt other feelings obtained than those of humanity on the one hand, and those of respectful solicitation on the other, and thus the institutions became to a certain extent ineffectual. If the maxim "*Divide et impera*" in any case held good, it might be applied to the subdivision of pauperism. It might be applied to the study of any of the sciences—as, for example, the establishment of a single experimental farm might lead to a universal result in the science of agriculture.

We believe we have omitted in its proper place to allude to an interview which Dr. C. had with Lord Landsdowne in 1837, in which he had told his lordship of the success of his Water of Leith experiment; and he mentioned now, that the state of the case was infinitely more favourable. There were fifteen similar plans in operation in Glasgow, and 130 in all Scotland; and all of them productive of the best results. He hoped statistical accounts of these, and others, would hereafter be transmitted to the British Association, for the statistics of morals were far more important to mankind, for their reform and amelioration, than were those of pauperism, or crime, or deaths. General statistics could never enable us to ascertain the real causes of crime so as to lay down a system for its diminution. Yesterday, they had been told of the corrective means; to-day he had endeavoured to impress upon them the more effectual character of the preventive. By it, within the limited sphere

in pronouncing these words, the Doctor made a false quantity, which raised a laugh among the Southern classic listeners; but he recovered himself with much good humour by observing, that the English were apt to consider the Scotch, and other people, as provincials in this respect; though, in point of fact, the Scotch pronounced the Latin in the same broad manner as Continental nations. They were, therefore, the court; and the English, who stood alone in clipping the language, were the country cousins.

of the Calton, crime, from 573, had been reduced to 394;—such were the consequences of aggression, and this course he most earnestly recommended. He was opposed, in the treatment of pauperism, to all national and extensive management; and, on the contrary, held that separate, independent, and limited interference could alone be effectual. It must be carried on without complication, or co-operation, with other parishes or bodies. Great Unions and Boards could not properly perform the duties required. Their doings were too noticeable; and a great expense was accompanied by a great public blaze inconsistent with the work to be done. Public views and public institutions could not take cognisance of individuals and particulars. They created a greater distance between the distributors of charity and its recipients, so that their necessities were unknown of, and unknown to, each other. Thus the Commissioners were led to become either too easy to the claims of the undeserving and clamorous, or too resistant to the claims of the really unfortunate and distressed. They had no means of distinguishing the one from the other, which could be acquired only by localising. The philosopher, emulous of fame, looked over a wide field in which he could see only the objects which are palpable; but the careful inquirer took a microscopic view of minute objects, confident that in the end he would come to a more satisfactory result. Let those who would ameliorate the condition of their fellow-men recollect that the burden of philanthropy did not rest on the shoulders of one man. He would find it enough to accomplish the contribution of a part for the good of society, others would follow in another, or perhaps the same field. Let us be contented, then, to do our own duty in our narrow sphere and little day, and leave it to Him whose agents we were to accomplish the generalisation as a blessing to the human race.

Lord Sandon observed that he had, perhaps, as chairman, allowed the argument to wander almost into a forbidden track; but after the delight they had experienced from this noble address (in many of the sentiments in which he cordially agreed), he hoped he need offer no apology to the Section (applause).

Lord Montague, on the same grounds, moved a vote of thanks to Dr. Chalmers, which was carried by a unanimous show of hands.

Dr. Alison's 'Illustrations on the Management of the Poor' in our next.

#### SECTION G.—Mechanics, Papers and Communications.

1. Wallace's 'Smoke Protector.'
2. Hawkins's (Model) 'Bakewell's Anglo-Meter.'
3. Rayner's (Model) 'Machine Regulator.'
4. Smith's (Model) 'Canal Lockage.'
5. Fairbairn's 'Iron as a Material for Ship-building.'
6. Hodgkinson's 'Strength of Pillars.'
7. Fairbairn's 'Raising Water from Low Lands.'
8. Hodgkinson's 'Clegg's Safety-Lamp.'
9. Rev. J. Brodie's 'Uniform Propelling Wheel.'
10. Dunn's (Model) 'Improved Working Barrel.'
11. Dr. Farquharson's 'Sea-borne Vessels.'
12. Evans's 'Anthracite Pig-Iron.'

Sir J. Robinson in the chair. — The proceedings in this Section on Friday were more numerous than important, though several of the subjects were of practical utility.

Mr. Wallace exhibited and explained his apparatus for enabling persons to enter places on fire without danger from smoke, by means of breathing through water. A box of tin, containing the water, is placed on the man's back with tubes connected, forming a ring round the body and straps for the shoulders. A hood of Macintosh cloth, glazed in front, is put on the head, and being attached to the side tubes, four

gallons of water will enable a person to bear the densest smoke for twenty minutes. Several members expressed their high opinion of the Protector, and explained its analogy to some other plans in present use in London and elsewhere. It resembled the diving apparatus in appearance.

Mr. Hawkins exhibited a small instrument, made by Mr. Bakewell, for taking the angle of the dip of strata, whether the surface seen is above or below the strata. This is accomplished by a spirit-level, which can be placed above either the higher or lower limb of the 'Anglo-meter,' which has a scale of degrees at its apex. A small compass is attached to the spirit-level to shew the direction of the dip. The instrument was much approved of.

Mr. Rayner exhibited a wheel for regulating the speed of machines, such as cotton-mill spindles. It was described by some members as being merely a modification of the expanding pulley, and as liable to several objections. It was asserted that the best instrument of this kind was that by Mr. Houldsworth, jun., of Manchester.

Mr. Smith, of Deanston, exhibited a model of a new plan of canal lockage; the advantages of which he stated to be that the descent in each lock would not be more than twelve to eighteen inches, that the locks were opened by the passage of the vessels, that they shut of themselves, that the vessels did not require to stop, and that little or no water was lost. The lock-gate is hinged at the bottom; the upper portion, which is round, floats at the level of the higher part of the water, and is pressed down by the bow of the vessel in passing, and when it has passed rises to its former position. A long conversation took place on the subject, during which the highest opinion was given of the value of the invention to canal navigation. Mr. Smith mentioned that a trial was to be made on the Great Canal.

Mr. Fairbairn read a paper on 'Iron as a Material for Ship-building.' He went into the subject of the extent to which the strength of iron plates was affected by the rivet-holes, and the general deduction made from his experiment was that there was a loss equal to about thirty-two per cent. A conversation followed as to the comparative strength and safety of iron boats, in which it seemed to be a general opinion that they were preferable to wood in these respects. Mr. F. was urged by several members to give his paper to the public, from the valuable matter it contained on this question, and seemed himself to be so fully confirmed in the superiority of iron, that he predicted it would entirely supersede wood in the course of four or five years.

Mr. Hodgkinson then read a paper relative to a series of similar experiments made by him on the strength of iron pillars. It appeared from these that a pillar, square at top and bottom, was about three times as strong as one rounded at the ends—that if the pillars were not placed perfectly perpendicular, at least two-thirds of their strength was lost—and that they were one-seventh stronger when swelled in the middle, like the frustrum of a cone with the base in the centre. A short conversation ensued, in the course of which Professor Wallace suggested that Mr. H. should try the experiment with various curves, which that gentleman readily promised to do.

Mr. Fairbairn next exhibited a model of an engine for raising water, which he had suggested for the purpose of draining the lake of Haarlem, in Holland, which covered upwards of 50,000 acres. It was his opinion that this

could be accomplished by the application of a Cornish engine of from 200 to 300 horse power, attached to a scoop 30 feet square, the one end of which was made to move on a centre. In the bottom of this scoop, which was curved, were several valves, opening upwards, on the side nearest the engine. By the descending stroke of the engine, this side was immersed in the water, and filled by the valves. The returning stroke, or rather the weights attached to the other end of the beam, raised the scoop, and threw the water into a canal at a higher level than the lake. Such an engine as he proposed would lift seventeen tons of water at each stroke, and make seven or eight strokes a minute. The average depth of the lake was ten feet. The engine was so constructed as to give the dipping of the scoop a longer or shorter stroke as required.

A Member gave a short account of the mode adopted in draining some of the fens in England, which was done by an engine, on Watts' principle, turning a kind of bucket-wheel, and raising the water into the adjoining river. This gave rise to a long but inconclusive conversation on the comparative merits of these modes of draining.

Mr. Hodgkinson produced a miner's lamp, invented by a Mr. Clegg, near Oldham. It was in principle the same as that of Davy's, but was inclosed in a triangular lantern, with three bull's-eye glasses. The object was to get rid of the danger arising from the use of Davy's, which, should it fall or upset, let the flame through the wires, and caused an explosion. In this lamp that danger was obviated, as there was gauze on the air-holes of the lanterns; and it had this excellent property, that whenever there was danger the light went out. The model was much commended.

The Ordinary on Friday was fully attended; and in the evening the promised Promenade, in the handsome room appointed for it in the Exchange, was crowded. The local newspapers state that, among the company a few of the swell mob (from the South, or London, as they say) found their way among the honest bodies of the West, or Glasgow, and ingeniously possessed themselves of certain monies in their pockets, or the pockets of their visitors, and of sundry watches and trinkets of use to their owners. Some amusement was produced by a new feature in these assemblies, viz. an opposition wine-shop against the apartment where tea, coffee, and cakes, were dispensed gratuitously. Strangers, not being aware that the former refreshments were, like the "pyes and porter," or "whisky," so frequently and conspicuously announced in the illuminated street lanterns, "sold here," rashly adventured upon the champagne, (fancying, poor ignorants! that it would cost them nothing), when, to their astonishment and dismay, they had no sooner discussed a bottle, or swallowed a glass, than they were pulled with "Nine shillings to pay for that, sir," or "that's a shilling, mem." The scene was indescribably droll; and the apprehensive looks with which some of the parties afterwards applied to the tee-totaller's table, dreading another charge, added much to the fun of the entertainment.

#### TERRESTRIAL MAGNETISM.

The following paper, referring to a matter which now occupies the attention of the whole civilised world, and which stood first on the list of Section A, but was delayed till Tuesday 22, when read by Major Sabine, seems to

us to be so important as to claim a place in this week's *Literary Gazette*.

'Report of the Committee consisting of Sir John Herschel, Mr. Whewell, Mr. Peacock, Professor Lloyd, and Major Sabine, appointed to draw up Plans of Scientific Co-operation relating to the subject of Terrestrial Magnetism, and to report to the Association. Grant of 400*l.* at Birmingham.—"In consequence of the measures adopted as detailed in the last Report of this Committee, a very extensive system of magnetical corresponding observations has been organised, embracing between thirty and forty stations in various and remote parts of the globe, provided with magnetometers and every requisite instrument, and with observers carefully selected and competent to carry out at most, if not all, the stations, a complete series of two-hourly observations, day and night, during the whole period of their remaining in activity; together with monthly term observations, at intervals of two minutes and a half. Of these observations, that at Dublin, placed under the immediate superintendence of Professor Lloyd, has been equipped and provided for by the praiseworthy liberality and public spirit of that metropolis. Those at Toronto, the Cape, St. Helena, and Van Dieman's Land, as also the two itinerant observatories of the Antarctic Expedition, by the British Government. Those of Madras, Simla, Singapore, and Aden, by the East India Company. To which are to be added ten stations in European and Asiatic Russia; two by Austria, at Prague and Milan; two by the Universities of Philadelphia and Cambridge, in the United States; one by the French Government, at Algiers; one by the Prussian, at Breslau; one by the Bavarian, at Munich; one by the Spanish, at Cadiz; one by the Belgian, at Brussels; one by the Pacha of Egypt, at Cairo; and one by the Rajah of Travancore, at Trevandrum, in India. In addition to this list, it has recently also been determined, at the instance of the Royal Society, by the British Government, to provide for the performance of a series of corresponding observations, both magnetic and meteorological, in the Royal Observatory at Greenwich, under the able superintendence of the Astronomer Royal. At Hammerfest, in Norway, negotiations have been for some time carrying on for establishing an observatory of a similar description, in which M. Hanstein has taken an especial interest. A great number of magnetic and other instruments, available for this service, it appears, have been left at Kaasford, by M. Gaymard, acting for the 'Commission Scientifique du Nord,' under the direction of the French Ministry of the Marine—all which instruments, through the efficient intervention of M. Arago, it is understood, will be placed at the disposal of the observer or observers who may be appointed to conduct the observations. To complete the establishment, however, certain instruments, as well as registry-books, &c., are still requisite. The Council of the Royal Society have undertaken to supply these from the 'Wollaston Donation Fund.' As regards the magnetic observatory at Breslau, under the direction of M. Baguslawski, your Committee have to report, that in order to secure the establishment of that station, and to place it on an equal footing with the rest, certain instruments, &c. required to be provided, for which no funds existed or could be made available on the spot: viz. a biilar and a vertical force magnetometer, with the requisite reading telescope, and a set of registry-books. As owing to the actual circumstances of that observatory there appeared no prospect of these requisites being

otherwise supplied, as the station appeared to your Committee a desirable one, and as M. Baguslawski was willing and desirous to lend his aid to this great combined operation, by taking on himself the laborious duty of conducting the observations, your Committee conceived that, although possibly transgressing in some degree the strict wording of their powers, they were only acting up to their spirit in devoting a portion (185*l.*) of the funds placed at their disposal, to supplying them at the expense of the Association. Unwilling to claim any privilege, or establish any precedent of the smallest deviation from the strict liberal interpretation of a money grant, your Committee suggest to the meeting the propriety of ratifying, by an express act of recognition, this application of the above-mentioned sum. A letter from M. Baguslawski, dated 22d July, 1840, announces the safe arrival of the instruments and books in question, and the consequent complete state of instrumental equipment of the Breslau Observatory; expressing, at the same time, his sincere thanks for the assistance accorded to him. By returns for several stations authorized by the British Government, so far as yet received, it appears that the observations at the Cape and St. Helena might be expected to be complete and ready for the reception of the instruments in May. From Van Dieman's Land no accounts have yet been received. At Toronto, where the greatest delays and difficulties were to be expected, and have been experienced, the observatory was so far advanced, at the date of Mr. Riddell's last communication, as to leave no doubt of its completion in time for the regular observation of the August term. Meanwhile in this, as in all the other stations, all observations practicable under the actual circumstances of each are made and regularly forwarded; and here the Committee would especially call attention to the extremely remarkable phenomena exhibited at Toronto on the 29th and 30th of May, when, by great good fortune, a most superb aurora appeared at the very time of the term. Observations (see table of the terms, 'Report of Council of Royal Society,' p. 38,) on the phenomena of this aurora (which was remarkable for the extent and frequency of the *pulsating waves* alluded to in that part of the report above cited (p. 47), relating to this subject), are very minutely and scientifically described by Mr. Riddell. But what renders the occurrence presently interesting is the fact, that during the whole time of the visible appearance of this aurora on the night from the 29th to the 30th, as well as for some hours previous, when it might be presumed to be in progress, though effaced by daylight, all the three magnetical instruments were thrown into a state of continual and very extraordinary disturbance. In fact, at 6<sup>h</sup> 25<sup>m</sup> on the morning of the 29th, the disturbance in the magnetic declination during a single minute of time carried the needle over 10' of arc; and during the most brilliant part of the evening's display (from 3<sup>h</sup> 25<sup>m</sup> Gött. M. T. ditto 4<sup>h</sup> 35<sup>m</sup>), the disturbances were such as to throw the scales of both the vertical and horizontal force magnetometers out of the field of view, and to produce a total change of declination, amounting to 1° 59'. It should also be remarked, that the greatest and most sudden disturbances were coincident with great bursts of the auroral streamers. The correspondence, or want of correspondence, of these deviations with the perturbations of the magnetic elements observed in Europe and elsewhere on the same day, cannot fail to prove of great interest. Should it fortunately have happened that Captain Ross has

been able to observe that term at Kerguelen's Land, which is not very far from the antipodes of Toronto, an indication will be afforded whether or not the electric streams producing the aurora are to be regarded as diverging from one magnetic pole or region and converging to another. Your Committee cannot conclude this Report without congratulating the Association, and the scientific world in general, on the vast range of observation consequently embraced by this operation; which, so far as any accounts have hitherto reached them, appears to be so far going on prosperously in all its parts, and to promise results fully answerable to every expectation of its promoters. Neither would they feel justified in their own eyes, were they to omit expressing their deep and grateful sense of the indefatigable personal exertions of Major Sabine throughout the whole of the progress, both in carrying on a most voluminous correspondence—in ordering, arranging, and despatching instruments—and facilitating, by constant attention and activity, those innumerable details which are involved in a combination so extensive—a combination which, but for those exertions, your Committee are fully of opinion must have been greatly wanting in the unity of design and co-operation which now so eminently characterise it."

The following report of the proceedings of the concluding General Committee Meeting on Wednesday, was unavoidably omitted in our last: we did not think it advisable to break in upon the Sectional business of the first day, nor to curtail the address of the General Secretaries:—

Glasgow, Wednesday, Sept. 23d.

The Session has closed. At half-past five the Marquess of Breadalbane terminated this busy week by returning thanks for, at the General Meeting in the Theatre, a vote of thanks proposed by Principal Macfarlane, and seconded by Mr. James Stuart Menteith (of Closeburn), and carried by loud acclamation. There is now but the Lord Provost and Magistrates' Dinner in the Town Hall to attend, and all will be over—"the pomp and circumstance of glorious" science.

Previous to this, however, the General Committee met at two o'clock, when the minutes of the meeting of Monday were read and confirmed. The London Council for the ensuing year were nominated and approved of.

The Auditors were also appointed, and Mr. Taylor stated that the amount of money received at this meeting was 2610*l.*

The number of tickets issued .....	1353
Namely, to new Members .....	965
Old Life Subscribers .....	211
Old Annual Subscribers .....	107
Foreigners .....	40
.....	1353

Major Sabine explained that the Committee of Recommendations had been constituted on a new principle, by which every Section was represented by members belonging to it. He then proceeded to read the recommendation of grants, divided, as heretofore, into three classes.

#### 1. Money grants;

2. Appointment of Committee for Reports which did not involve any expenditure; and

#### 3. Representations to government.

The grants proposed for Section A, and subsequently for the other Sections, were then read, and afterwards agreed to.

#### First Class.

A. Hourly Meteorological Observations in Scotland: Sir D. Brewster and Prof. Forbes ..	£85 0 0
For Tide Discussions: Professor Whewell ..	50 0 0
For Tide Observations, Bristol: Professor Whewell ..	50 0 0

For Barometric and Thermometric Instruments .....	£20 0 0
For the Reduction of Meteorological Observations, under the superintendence of Sir J. Herschel .....	100 0 0
Nomenclature of Stars .....	30 0 0
For the Reduction of Lacaille's Stars, under the superintendence of Sir J. Herschel, Professor Airy, and Mr. Henderson ..	184 5 0
For the Reduction of Stars in the <i>Histoire Céleste</i> : Mr. Baily, Professor Airy, and Dr. Robinson .....	150 0 0
To Extend the Royal Astronomical Society's Catalogue, on condition that it should be called 'The British Association Catalogue': Mr. Baily, Professor Airy, and Dr. Robinson .....	150 0 0
For Tabulating Observations of Anemometer: Mr. Osler .....	40 0 0
For Osler's Anemometer at Inverness .....	60 0 0
For Two Actinometers, to enable Professor Agassiz to make Observations in the High Passes of the Alps: Major Sabine .....	10 0 0
To Ascertain the Action of Gases on the Light of the Solar Spectrum .....	75 0 0
For Tabulating Annual Observations at Plymouth: Mr. Snow Harris .....	20 0 0
For Tabulating Barometric and Thermometric Observations: Mr. Snow Harris ..	35 0 0
For the Reduction and Tabulation of Observations on Subterranean Temperature: Professor Forbes .....	20 0 0
For Magnetical Observations, Instruments, &c.: Sir J. Herschel, Professor Whewell, and others .....	50 0 0
.....	£1149 5 0
B. For the Translation of Foreign Scientific Memoirs: Major Sabine, Dr. R. Brown, Dr. Robinson, Sir J. Herschel, and Professor Wheatstone .....	100 0 0
For Experiments on the Action of Sea Water on Cast and Wrought Iron: Mr. Mallet .....	50 0 0
On the Functions of Digestion: Mr. Prout and Dr. Thomson .....	200 0 0
.....	£350 0 0
C. Researches on the Mud of Rivers .....	30 0 0
President of Royal Society, President of Geological Society: for Maps and Coloured Drawings of Railway Sections, before they are covered in .....	200 0 0
To enable M. Agassiz to report on the Fossil Fish of Scotland, especially those in the old red sandstone .....	100 0 0
Temperature of Mines in Ireland: Mr. Portlock .....	10 0 0
To Register Shocks of Earthquakes in Scotland and Ireland: Lord Greenock and others .....	30 0 0
Solution of Silica in water of high temperature .....	25 0 0
.....	£375 0 0
D. For Experiments on the Preservation of Animal and Vegetable Substances: Professor Henslow, Mr. Jenyns, Dr. Clark, and Professor Cumming .....	6 0 0
For Engraving Skeleton Maps for recording the Distribution of Plants and Animals: Professor Graham and others ..	25 0 0
For Researches with the Dredge, with a view to the Investigation of the Marine Zoology of Great Britain .....	50 0 0
Britannica: Sir W. Jardine and Mr. Selby: Lists of Plants and Animals in Waters: Mr. Lankester .....	50 0 0
Experiments to prove the longest period the Seeds of Plants retain Vegetation: Professor Lindley .....	10 0 0
Questions on the Human Race: Mr. Pritchard .....	15 0 0
.....	£163 0 0
E. For Experiments on Acrid Poisons: Dr. Roupell .....	25 0 0
For Experiments on Medico-Acoustic Instruments .....	25 0 0
For Investigations on the Veins and Absorbents: Dr. Roget .....	25 0 0
.....	£75 0 0
F. To Give Encouragement to obtain Numerical Analysis of Education in Great Britain: Mr. Porter and others .....	100 0 0
Vital Statistics: Colonel Sykes .....	100 0 0
Statistics of Mining Coal Districts of Great Britain: Professors Johnston and Heywood ..	25 0 0
.....	£225 0 0
G. Experiments on Steam-Engine Condensers: Mr. Taylor and Mr. Fairbairn .....	25 0 0
For the Purchase of Roberts' Instruments for Measuring short Intervals of Time: Sir J. Robinson, &c. ....	30 0 0
Dynamics of Steam-Engine Duty: Mr. Mosely .....	100 0 0
For Experiments on the Forms of Vessels: Sir J. Robinson, Mr. J. S. Russell, &c. ....	100 0 0
.....	£255 0 0

Section A .....	£1149	5	0
B .....	350	0	0
C .....	375	0	0
D .....	162	0	0
E .....	75	0	0
F .....	225	0	0
G .....	255	0	0

Total .....£2091 5 0

#### Second Class.

Professor Airy, 'Second Report on the Progress of Astronomy in Present Century.'

Professor Airy and Major Sabine, 'On the best Method of Publishing the Hourly Meteorological Observations now in Possession of the British Association.'

Rev. Mr. Willis, 'On the Phenomena of Sound.'

Dr. Peacock, 'On the Differential and Integral Calculus.'

Sir W. Hamilton, 'On the Application of a General Principle in Dynamics to the Theory of the Moon.'

Professor Kelland, 'On the Undulations of Fluid and Elastic Media.'

Professor Kelland, 'On the Conduction of Heat.'

Professor Bache, 'On the Meteorology of the United States.'

Mr. Lubbock, Sir J. Herschel, &c. 'Whether it is of Advantage to ascertain State of Higher Atmosphere by Balloon Ascent?'

Mr. Smith, 'On Turbine Water-Wheels.'

Professor Wheatstone, 'On Vision.'

Dr. Daubeny, 'On the Connexion between Agriculture and Chemistry.'

#### Third Class.

'Representation to Government on the Reduction of the Greenwich Observations.'

At the conclusion of the reading of the several classes of Reports, on the motion of Mr. Strickland, after some discussion, it was resolved, that a recommendation should be submitted to the General Council to alter the time of sectional meetings at future annual meetings, for the following reasons:—

*"Proposed new Arrangement of the Times of the Sectional Meetings."*

"There can hardly be a member of this Association who has not experienced the great inconvenience, and frequent disappointment, which arises from the circumstance of all the Sections being held simultaneously. So intimately are the different branches of science connected together, that no person can be attached to any one science without taking a certain amount of interest in others; and yet, from the peculiar constitution of this Association, the members are in general debarred from attending any other Section than that with which they are more peculiarly connected. This evil is particularly felt by the officers of the Sections, who are generally tied down during the whole of the week to their own department, and remain in unwilling ignorance of all that takes place in the other Sections. How different is the rotation of the meetings of scientific societies in London, which are so arranged that cognate subjects are never discussed simultaneously. I am indeed well aware, that if all the Sections met in succession, and none of them simultaneously, these meetings, instead of lasting a week, would be protracted to a month; but I wish to inquire whether the evil in question might not be, in some measure, though not wholly, obviated by an arrangement differing but slightly from the present one. Under the present arrangement, the Sections meet daily from 11 to 3 during five days; making a total of twenty hours of business. In lieu of this plan, I would propose that the Sectional Meetings should be divided into two classes, viz. *Morning Meetings*, from 10 to 1, and *Afternoon Meetings*, from 1 to 4; and that they should be so arranged, as that the allied sub-

jects discussed at the meetings should interfere with each other as little as possible. Thus I would propose that Section A, of Mathematics and Physics; Section C, Geology; Section E, Medical Science; and Section F, Statistics, should all meet simultaneously at 10 A.M.; and that Section B, Chemistry and Mineralogy; D, Zoology and Botany; and G, Mechanical Science, should all meet at 1 P.M., immediately on the termination of the previous series of Sectional Meetings. By this arrangement, the mathematician, on the breaking up of his Section, might follow the bent of his tastes, into the rooms of Chemistry or of Mechanical Science; the Plutonic geologist would proceed to the Section of Mineralogy, and the studier of organic remains would leave his fossiliferous rocks for the existing fauna displayed in the Zoological Section. The medical man might then proceed from his own peculiar department to the Section of Chemistry or of Botany, in which subjects he is equally proficient; and the studier of Statistics might attend any Sections which may be connected with his favourite pursuit. It is evident that, if such a plan were adopted, the Sectional Meetings would be far better attended than they are at present, and this arrangement would suit the convenience of a much greater number of persons than is now the case. In places where a sufficient number of suitable meeting-rooms are not to be had, one Section might follow another in the same room; so that, in cases of necessity, four spacious apartments would suffice for the meetings of all the seven Sections. To counteract the deficiency caused by each Section meeting daily for three hours only instead of four, I would propose that the meeting should break up in future on the Thursday instead of the Wednesday. The Sections would then meet on six days instead of five, producing a total of eighty-eight hours of business for each Section; and I feel satisfied that the mutual accommodation caused by this arrangement would more than recompense the majority of the members for the additional day to which the meeting would thus be extended. Should it be objected that the above arrangement would not leave sufficient time for the meetings of the Recommendation Committee, I would propose, that the additional evening gained by the extension of the meeting to Thursday instead of Wednesday should be devoted to a meeting of that Committee. Should one evening not suffice, the Recommendation Committee might meet again on one of the promenade evenings.

"HUGH E. STRICKLAND,

Member of the General Committee."

The General Meeting at the Theatre was well attended. Particulars in a future Number.

#### ORIGINAL CORRESPONDENCE.

##### ERUPTION OF MOUNT ARARAT.

St. Petersburg, Sept. 11, 1840.

THE "Northern Bee" of yesterday publishes the following letter, dated Tiflis, August 1:—"You have doubtless heard of the terrible earthquake of Mount Ararat, which has entirely destroyed the town of Nakhitchevan, damaged all the buildings at Erivan, and devastated the districts of Scharour and Sourmala in Armenia: all the villages in these two districts are destroyed. The ground is cleft in such a manner, that all the plantations of rice and coffee have perished for want of water. But the most awful event has taken place in the vicinity of Ararat. Only conceive that a vast mass was loosened from the mountain, and destroyed every thing in its course for seven wersts (nearly five miles); among others, the

great village of Akhouli has experienced the fate of Herculaneum and Pompeii; more than a thousand inhabitants were buried under heaps of rocks. A thick fluid, which afterwards became a river, rushed from the interior of the mountain, and taking the same direction, swept away the mass which had fallen, carrying along with it the corpses of the unfortunate inhabitants of Akhouli, the dead animals, &c. &c. The shocks continued to be felt every day in the two above-mentioned districts, and completely laid them waste; they afterwards became less frequent, and Mount Ararat is not yet quiet. I was awakened the day before yesterday by two distinct subterranean shocks."

St. Petersburg, Sept. 15.

The earthquake of Mount Ararat has likewise done much damage at Erivan. The walls of the fortress are injured, and many houses thrown down. But that town is not the only one that has suffered, nor was it the force of the phenomenon. Other towns, some of them at a great distance, many convents and villages in the plain of the Araxes, are said to have suffered severely. We hear that the earthquake proved most destructive to the village of Arauri, situated amidst vineyards and plantations of apricot and mulberry trees. It is said to be totally destroyed; perhaps by the mass that was precipitated from Mount Ararat; for Arauri was at the mouth of the deep cleft which begins several thousand feet higher up, and the sides of which are nearly perpendicular. The beautiful village of Arauri had 175 families, that is about 1000 inhabitants, of whom not a trace remains. It would be remarkable if this great volcano, which has been perfectly quiet as far as history goes back, should now become an active volcano.

This phenomenon is probably connected with that at Baku, of which we lately gave some account; but we have not the precise dates of the two events.

#### ARTS AND SCIENCES.

##### ON ORGANIC MALFORMATIONS.

[Full as we are, at this period, of scientific matter, the following communication contains so much that is new and interesting that we cannot refrain from inserting it, even amid the masses of the British Association. We are sorry that we had not the MS. at Glasgow, where it would have formed a very valuable paper for the Section (D) of Natural History. However, we are not only desirous to present it among our notes of their proceedings, but also on account of the announced close of this Exhibition in a week or two, and put all our readers on their guard not to omit visiting a place so replete with curious and important instruction.—Ed. L.G.]

*On Organic Malformations, and the Production of Monsters and Twin-Birds within the same Shell, in the Eggs of the Common Fowl.*

By William Bucknell, F.Z.S. &c.

MY observations having now extended over upwards of 20,000\* birds, hatched artificially under every variety of condition, and nearly a like number also in every stage of development, some data are afforded whereby to judge of the influence which extraneous circumstances, affecting the outward conditions to which the egg must necessarily be subjected in order to develop life, have in producing structural malformation, and other defects usually considered as consequences of improper treatment during the process of hatching. The results of my experience go to prove, that no alterations or variations of the conditions essential to the development of life, viz. heat, moisture, and air, induce malformation within the

\* The number at this present date, September 22d, exceeds 30,000.

shell. The only effects (with slight exceptions hereafter named) produced by improper treatment being either increased excitement, or languid action of the vital principle, both alike destructive, sooner or later, of life itself. This may appear somewhat surprising from the fact, that a large proportion of the birds hatched artificially in Egypt are wanting a leg, a wing, or a claw, or are otherwise malformed; which defects have always been attributed to improper hatching: further, it has also frequently been affirmed that any particular malformation, or deformity, can be produced in any egg by covering certain portions of the shell with varnish, thereby preventing the ingress of air through its pores at those particular places, and by such means impeding the development of the nascent bird. From above 20,000 birds, hatched under every variety of circumstance, not more than one per cent has been found in any way defective; and it is also true that such defects were the result of improper hatching, and could be satisfactorily assigned to their determining causes: such as a contraction of the claws of the feet, which generally followed an administration of too much heat, or deformity of the whole limb—a not unfrequent occurrence if the liberation of the bird was impeded, so that it remained too long a time in the singular position it assumes within the shell: but these are exceptions, and not the rule. We must look, then, to other causes than the presumed one of improper hatching to account for the almost universally defective state of the Egyptian birds, which I consider to arise solely from the degeneracy of the breed; and no efforts having been made to improve it, these peculiar defects are propagated from parent to offspring. Although it be true that a lame mother will not necessarily produce a lame progeny, yet where deformity is almost universal, and has continued through generations for many centuries, it is not improbable to suppose that such deformity may have become at length hereditary. With regard to a coating of varnish placed over certain parts of the shell, producing a peculiar malformation of organic structure, it is only necessary to observe that such coating could not affect any organ in particular, from the fact of the chicken within constantly changing its position as the egg is moved: these presumed discoveries, therefore, may be safely pronounced as belonging to the region of fable. Of the 200 birds, being a proportion of one per cent of the 20,000, which I have found deformed, it should be observed that it was *deformity merely*; not a single instance of the absence of an entire limb, or even of a single claw, has ever occurred: this per-centage also includes the results of my experimental attempts at hatching. The average of defective birds by the most approved mode of eliciting life does not amount to one half the above estimate,—a proportion certainly not above what occurs in the natural way. It thus appears that no outward circumstances or conditions influence the development of organisation, otherwise than if such circumstances or conditions are favourable thereto, the development of the bird proceeds unto its perfect state. If unfavourable, such development is impeded, not in any particular limb or organ, but uniformly throughout the whole organising structure, and life either immediately or eventually destroyed. How admirable is this arrangement! Were it otherwise, from the diversity of circumstances to which the eggs of birds are exposed, how infinite would be the number of deformities throughout these various tribes of the animal creation! As it is, the effect of this

simple law gives to outward circumstances no other control over their formation than either to develop or to destroy. With respect to the production of monsters, or twin-birds, either united or separated within the same shell, my observations are of very limited extent: they go, however, very far to shew the fallacy of several commonly received opinions upon the subject. I have experimented at different times upon a large number of what are called double-yolked eggs, considered to be such from their remarkable elongation and large size, and, like most other eggs of unusual size, they invariably proved abortive. After ascertaining this fact I have broken them to examine their contents, and have never, in a single instance, found a double yolk in any of them (of course, at that period I could not ascertain whether the cicatrula had been impregnated or not); and in no respect did they present any difference of appearance from other abortive eggs. 40,000 individuals had now passed under my observation, and I almost began to despair of ever obtaining this long-sought phenomenon, when, to my inexpressible gratification, on Monday morning last (April 20th, 1840), when breaking an egg to procure a specimen at six days of incubation, out tumbled a double fœtus in the highest state of perfection. The following are the phenomena attending them:—The egg was of the middle size, of good form, and presented outwardly no unusual appearance. There was no double yolk, or double quantity of albumen: both fluids bore the usual relative proportions to each other. The chalazas were the same as in other eggs. The two bodies appeared to be disunited; if joined, the connexion was at the head, with the bodies separating in a lateral direction from each other, the two extremities forming the base of a triangle. Each fœtus had advanced perfectly as far as six days of incubation. The two hearts were at a distance of about half-an-inch from each other, four salient points were in action in each; the pulsations (in consequence of excitement) at first were 160 per minute, gradually they reduced in number, and ceased entirely at the expiration of half-an-hour. It presented altogether one of the most splendid sights for a physiologist ever witnessed. The vascular area in which the blood is illuminated was common to both, and not larger than is usual to a single fœtus at that period of its incubation. Not the slightest appearance of a junction of two membranes was visible. These two latter facts are particularly remarkable. The size of each was rather smaller than is usually presented by a common fœtus in an egg of similar size. The amnios, if one and entire, was exceedingly bilobed, as may be inferred from the lateral position of the bodies to each other. This, also, is an exceedingly singular fact, supposing the amnios to have been single. Such were the appearances which presented themselves at a first view, without dissection or disturbance, which I was unwilling to do until after a drawing had been taken, and further investigations made by some eminent physiologist. This design, however, was frustrated, to my great regret, by my servant, in his over-carefulness to preserve the specimen, upsetting the saucer in which it was placed, and thereby destroying it. It thus appears that the production of monsters, or twin-birds, in the same egg, are of exceedingly rare occurrence—only one in 40,000 in my experience. Nor are they produced in the larger eggs, nor in eggs possessing double yolks, but depend upon the presence of two impregnated cicatrulæ upon the surface of the same yolk. It is worthy, also,

of observation, to note that I have, in several instances before, discovered what I have conceived to be two cicatrulæ upon the same yolk, one impregnated, and the other not, but never both having the appearance of impregnation. They were always apart from each other; and the most remarkable phenomenon attending those just described is, that with an apparent separation of the two bodies there was but one vascular membrane. From this circumstance, I should conclude, that an union of both birds at the abdomen would have taken place at the completion of incubation. Had the vascular area common to both been of unusual size, instead of being about that of a single fœtus, it is evident there would not have been a sufficiency of fluids in the egg to have brought them to maturity. The same result must also have ensued had each fœtus had a vascular membrane peculiar to itself; but in this instance, a single membrane supplied nourishment to both bodies in common; and its extent of surface not being greater than is usual to a single fœtus, the development of the organs as regards size was proportionate only to the supply of nutrient matter; and, although perfect in every respect, so far as that stage of advancement (the sixth day), were therefore smaller than usual. It is, however, very doubtful if two birds could occupy the same shell without its producing deformity, from the unnatural position they must necessarily sustain within it.

*The Eccelesion, April 24th, 1840.*

#### PARIS LETTER.

Academy of Sciences, Sept. 22, 1840.

SITTING of September 14.—M. Cauchy read a memoir 'On a Method of Determining the Coefficients of the Series in Formule for Calculating the Perturbations of Planetary Movements.' In a previous paper, read in 1831, the author had disclosed a method of calculating each coefficient separately: he now announced new methods and formulæ leading to the same result, but more simple, and tending to abridge labour. M. Liouville had shewn that the coefficients in the development of the function R, expressing the perturbations, might be represented by certain definite double integrals, and in certain cases he had shewn methods of reducing their approximate values to those of simple integrals. M. Cauchy now shewed that this reduction was possible in all cases, and without neglecting any values: his formulæ also led to some important theorems in the theory of planetary movements.—M. Mathieu read a memoir 'On a Method of M. Luechesini for resolving various Arithmetical Problems by means of a Formula of Proportion.'

*Fossil Elephant Bones.*—Messrs. Rivière and Briggs presented to the Academy several fragments of fossil elephant bones, found in a sand-pit between Champigny and Joinville le Pont. They were in the midst of a stratum of fine quartzose sand, which was full of fragments of shells, and covered by a layer of gravel and large boulders, coming from the silicious mill-grit or from the chalk-flint formations. The section of the sand-pit was as follows:—Vegetable earth and alluvium, thirty to forty centimetres; stony diluvial deposit, one metre; diluvial sand, representing the gypseous marls of Montmartre, four metres. The average level of the sand-pit, which is very rich in fossil bones, is higher than that of the Marne or the Seine.—M. Walferdein communicated the exact note of the temperature at the bottom of the Artesian well at Grenelle, as recently determined: it was 26.43 degrees of the centigrade

scale, at a depth of 505 metres. Hence, since the mean temperature at the surface is 10·6 degrees, it may be inferred that the temperature increases one degree for every 31·9 metres of depth. Similar experiments in the well of the Observatory had given one degree of increased temperature for every 32·3 metres of increased depth: at the Military School it was one degree for every 30·85 metres; and at St. André, in the Eure, one degree for every thirty-one metres.

An absorbing well has just been formed in the fossé of the Château de Vincennes to carry off the stagnant water: the bore has been made 300 feet deep; and in the plastic clays lying over the chalk there has been found a stratum of sand which, in a few days, absorbed three-quarters of the water of the fossé. M. De-goussé, who was intrusted with this operation, has been ordered by the Minister of War to make an Artesian well at Lille for the Military hospital.

The Scientific Congress of France closed its eighth annual sitting at Besançon, on the 15th inst. Its next meeting is to take place on the 1st of September, 1841, at Lyons.

**Italian Scientific Congress.**—The second annual meeting of the *Scienziati Italiani* commenced at Turin on the 15th inst., under the presidency of the Count Alexander di Saluzzo, President of the Academy of Sciences of Turin. A considerable number of Italian men of science had enrolled their names on the 12th, 13th, and 14th,—most of them from Tuscany, and the other northern states of the peninsula; a few from Naples; none, that we are aware of, from Rome. Very few foreign names of distinction appear on the list of members this year. Among those that do, we find Decandolle of Geneva, and Messrs. McCulloch and H. Lloyd of Dublin, as well as Professor Tiedemann, of Heidelberg.

The following is a list of the Sections, with their officers, places, and hours of meeting:—

1. **Medical Section.**—**President:** Professor Tommasini. **Vice-President:** Professor Griffa. **Secretary:** Professor Martini. Meets in the Theatre of the University, from two to four, P.M.

2. **Geological and Mineralogical Section.**—**President:** The Marchese Lorenzo Pareto. **Secretary:** M. Pasini. Meets in the Hall of the Royal Academy of Sciences, from nine to eleven, A.M.

3. **Physical, Chemical, and Mathematical Section.**—**President:** Il Commendatore G. Plana. **Vice-President:** Professor Configliachi. **Secretaries:** Professor Mossotti and Professor Belli. Meets in the Theatre of the University, from eleven to one.

4. **Agronomical and Technological Section.**—**President:** Dr. Gera. **Secretary:** Professor Milano. Meets in the Theatre of Chemistry of St. Francesco di Paola, from eight to ten, A.M.

5. **Botanical and Vegeto-physiological Section.**—**President:** Professor Moris. **Secretaries:** Professor Devisiani and Dr. Maxi. Meets in the Theatre of Chemistry of St. Francesco di Paola, from eleven to one.

6. **Zoological and Comparative-anatomical Section.**—**President:** The Prince di Canino e Musignano. **Vice-President:** Il Cavaliere G. Carena. **Secretary:** Dr. Filippo de Filippi. Meets in the Hall of the Royal Academy of Sciences, from one to three, P.M.

The general meetings are held in the Great Hall of the University.

On the 15th, all the members attended high

mass at the church of St. Filippo, and then divided themselves into their several Sections. The government and all the local authorities of Turin have, by his Sardinian majesty's express desire, shewn every possible attention to the members of the Congress: all the public establishments are thrown open to them, and every thing is done to promote the objects of the meeting. The following is a brief summary of the topics discussed on Thursday, the 17th inst.:—

1. **Medical Section.**—Introductory discourse of President. Dr. Thron read a memoir 'On the Cure of Cancer of the Heart,' according to a method of his own. Dr. Linoli read a paper, in which he denied the reproduction of organic tissue. This led to a long discussion, in which Professor Pasero, Dr. Bellingeri, and Professors Corneigliano, Riberi, Rossi of Parma, and Nardo of Venice, took part.

2. **Geological Section.**—Opening discourse of President. Letters, excusing absence, were read from M. Elie de Beaumont of Paris, and Professor Dommandos of Athens. A memoir was read, from M. Guidoni of Massa, 'On the Conversion of Dark-coloured Limestone into Dolomite, or Saccharoidal Marble.' A discussion ensued on the general theory of 'dolomitisation,' between the Signori Siamonda, Pasini, De Filippi, and the Marchese de Pareto. A letter from Professor Dommandos, of Athens, 'On the Remains of Fossil Mammifera in Oriental Attica,' was read.

3. **Physical, Chemical, and Mathematical Section.**—Opening discourse of the President. Professor Mossotti moved that, during the interval of each annual meeting of the Congress, one or more of the members should be instructed to draw up a synoptical account of the proceedings of the last meeting, to be presented to each member on the first day of the ensuing meeting. Professors Pasini and Configliachi seconded this motion, which was reserved for future discussion. A letter was read from the Rev. Canon Bellani, upon the question whether the formation of hail took place in the upper or the lower regions of the atmosphere, and on the necessity of having new observations carefully made relative to this phenomenon.

4. **Agronomical and Technological Section.**—Introductory discourse of President, including a brief notice of the agricultural meeting of Mileto. The Marchese Ridolfi invited all the members to visit another year his agricultural institution. Signor Rampinelli read a memoir 'On the Rearing of Silkworms,' and on the Suffocation of the Chrysalides.' Professor Ragazzoni, Dr. Gatta, the Cavaliere Santa Rosa, the Avvocato Dubois, and Signor Rampinelli, discussed this point. The Cavaliere Bonafous read a notice 'On the Method of Colouring the Cocoons, by mixing colouring matter in the Food of the Insects.'

5. **Botanical Section.**—Introductory discourse of President, including a notice on the services rendered to science by Italian botanists. The Avvocato Colla read a memoir 'On a Convolvulacea of the *Kalonyction* Species.' Professor Visiani read a paper 'On the *Gastonia palmata* of Roxburgh,' as being a type of a new genus (*Trevesia*) of the family of the *Araliaceae*. Professor Decandolle, Dr. Morris, and Professor Moretti, discussed this point. A letter was read from Professor Brignoli, of Modena, 'On certain Points connected with Botanical and Vegeto-physiological Nomenclature.' Professor Decandolle made some reflections on this subject.

6. **Zoological Section.**—The President thanked the members for the honour they had done

him by his election: he paid a tribute of gratitude to the founder of this general reunion of scientific men—Leopold II., grand duke of Tuscany, and introduced two new members to the Section—Professor Tiedemann and Signor De Selys Longchamps.—The Cavaliere Bellingeri read a memoir 'On the Anatomy of the Frog.'—A communication was read from Professor Dommandos 'On the *Catodon macrocephalus*.'—Signor Verany di Nizza gave a verbal notice of his genera *Carinaria cavallina*, *Eolidia*, *Tethys*, *Aplysia*, and *Bonellia*, and exhibited some beautifully coloured drawings illustrative of them. The President of the Section read a memoir 'On the Animals of the Rat and Mouse Genus indigenous in Italy,' with drawings and specimens of the species described.

*Sciarada.*

1. Fiume che bagna il Bavaro.
2. Fido animal domestico.
3. Droga, che vien dall' Asia.
4. Nota ben alta in musica.
5. Voce Lombarda e Veneta.

*Intero. Arte o virtù diabolica.*

Answer to the last:—Salva-guardia.

### THE DRAMA.

**Covent Garden.**—A novel, and we are glad to add a very successful, attempt was made on the stage of this theatre on Tuesday, in the production of a two-act musical drama, from the pen of Mr. Samuel Lover. We say novel, for *The Greek Boy* is written in a very fresh style; ballads, suited to stage or drawing-room, and calculated to be equally successful and popular in either place, being the most attractive feature. The plot is of the slightest description, but this deficiency is more than atoned for by the pleasant music, and still more pleasant words. The interest of the piece turns on the fidelity of a young Greek, who manifests his devotion to his master by plunging into the Adriatic and pretending to rescue from watery oblivion the ring with which the Dogs had wedded the sea, and with which alone he had vowed his daughter should be married. By this means, he brings about the union of his master and his lady love. The youthful Greek, having been a goldsmith's workman, is enabled to accomplish this apparent impossibility by forging a pretty correct resemblance of the lost treasure, of which he had been the original engraver. Upon these slight materials Mr. Lover has woven a neat little love-story, and introduced a good underplot, in which Mr. Keeley has a capital part, and plays it capitally. *The Greek Boy* is impersonated by Madame Vestris, who, by her looks, her acting, her dress, and her warbling, puts her audience into the best possible humour with her and with themselves. The *mise en scène* is as it used to be at the Olympic, only on a much larger scale. Every scene, every dress, is most gorgeous; and not only highly creditable to the establishment, but done in such a manner as it is not done elsewhere. The public have to congratulate themselves on the production of this pretty afterpiece as a source of amusement, and we hope Madame will have to congratulate herself on it as a source of profit; which, if the house be nightly filled as it was on Tuesday, must inevitably be the case.

We add a sample of the ballads, which are written and composed in Mr. Lover's pleasant style; our first is called:—

"Barcarole. Gondolier, row!  
Gondolier, row!  
How swift the flight  
Of time to-night,  
But the gondolier so slow!  
Gondolier, row!  
The night is dark,  
So speed thy bark  
To the balcony you know.

Gondolier, row!  
One star is bright  
With trembling light—  
And the light of love is so:  
Gondolier, row!  
The watery way  
Will not betray  
The path to where we go."

And if nightly *encores* be a criterion, Mr. Lover never made a more palpable hit than this. Another:—

"Mark! Lady, mark! or, the Wedding of the Adriatic.

Mark! lady, mark!  
You gilded bark  
Bearth a duke in pride;  
His costly ring  
Bravely to fling,  
And make the Sea his bride.  
Proud of her lord all Ocean smiles,  
And with soft waves kisses our isles,  
While her own mirror, gorgeously,  
Doubles the pomp she loves to see!  
Mark! lady, mark!  
You gilded bark  
Bearth a duke in pride.

Oh, why should pride  
Seek for a bride  
The cold, the faithless Sea?  
Vainly we throw  
Rich gems below—  
She will be false to thee!  
Dearest! hold plain rings of gold  
Binding two hearts ne'er growing cold.  
Proud lord, if thou hast rule o'er the Sea,  
Vast as the Ocean true love can be!  
Oh, why should pride  
Seek for a bride  
The cold and faithless Sea?  
Mine be the ring  
True love can bring,  
Such be the ring for thee!"

And yet one more:—

"Name not Danger, Love, to Me.  
Name not danger, love, to me,  
One who loves renown,  
There's more peril in love's smile  
Than in danger's frown;  
Danger we may meet and die,  
But the flash of Beauty's eye  
Kings cannot resist nor fly,  
No, not for their crown.  
Danger best becomes the knight;  
'Tis what soldiers prize:  
For it is the surest plight  
For love in woman's eyes.  
Welcome, danger, then to me,  
So it makes me dear to thee:  
Who would not in peril be  
For lovely woman's sighs?"

**Haymarket.**—Mr. Serle's new play of *Master Clarke* was produced on Saturday last with the most triumphant success, but certainly not greater than it deserved. Highly dramatic in its incidents and situations, full of fine and lofty sentiments, and admirably acted, it would, indeed, have been a pity for such offspring to have met with any other than a kindly fate. The play is founded on an anecdote as old as the hills, and hence the name; but as the drama explains that secret we shall not unfold the mystery. suffice it to say, that the period of the play is the time of the Restoration of the second Charles, and that the chief actor is Richard Cromwell. Of the acting we have but to repeat an oft-repeated tale: Mr. Macready, as *Cromwell*, was admirable, and made every line of the author tell; he was most heartily applauded in scene after scene, and at the fall of the curtain was uproariously compelled to make his bow to a delighted audience. As the great interest of the drama is in his hands, a slight notice will be sufficient for the remainder of the *dramatis personæ*. Messrs. Phelps, Lacy, G. Bennett (his first appearance here), Webster, J. Webster, &c. &c. have good subordinate parts, and play them well. Miss Helen Faucit, as *Lady Dorothy Cromwell*, has most arduous work; for it is entirely up-hill, and she has scarcely an opportunity of procuring a single cheer from her audience. She, however, did every thing that could be done with so difficult a character, and deserves especial praise for making so much of so slight

materials. The only fault (and what is perfect?) of *Master Clarke* is its want of lightness, though it is not without its comic characters, fairly sustained by Messrs. Strickland and Oxberry, and Mrs. W. Clifford.

On Tuesday, the most successful revival and reappearance we ever witnessed were made together; the revival was Macklin's glorious comedy, *The Man of the World*; and the reappearance, Mr. Maywood, after many years' sojourn on the other side of the Atlantic; and a most hearty welcome he met with on his return to the London boards. Few of the present generation of playgoers can remember Mr. Maywood's predecessors in the arduous part of *Sir Pertinax Mac Sycophant*, though of course there are many who must recollect the delineation of the character by Mr. Young, and even by Mr. Cooke: even with these Mr. Maywood will not hurt by the comparison, for his conception is as different from theirs as possible. Cooke was the slow, calculating, sleeky Scot; Young much in the same school: Mr. Maywood took a very original view of the part; and though he was at times boisterous, yet he had his audience so fairly with him, that with the same humour he must have carried them on, even had his acting been less forcible and effective. He was well played "up to," and consequently made some of the most cutting satires tell, though the age is past when their severity was felt. Mrs. Stirling was the *Lady Rodolpha*, and, with a fair Scottish dialect, acted most charmingly; and Mr. Phelps was an excellent *Egerton*. Mr. Webster has done the play-going world some service since he has been a caterer for their amusement; but nothing he has yet provided will be so agreeable to them as the capital variety he will now have an opportunity of offering them in the revival of the sterling old Scotch comedy. On Thursday a new farce, called *The Unfortunate Youth*, was produced, but without success.

**Strand.**—*The Perils of Pippins* was revived for Mr. Hammond's benefit on Monday, and has been attracting during the week. It is very amusing.

**The Princess's Theatre.**—This long-talked-of theatre was opened to the public on Wednesday; but, in consequence of the badness of the arrangements, we are able to say but little this week farther than that the interior of the house is most gorgeous, and that the building seems well adapted for promenade concerts and that species of entertainment. The music, on the first night, was continually interrupted by the pleasing accompaniment of a hammer and saw: but these are difficulties that may be overcome, and we hope we shall be able to report more favourably in our next.

**English Opera.**—The original promenade concerts have resumed business here, and as successfully as ever.

**Drury Lane** is making preparations for a winter campaign, under the title of the *Concerts d'Hiver*, with the celebrated Musard for leader; and the *Adelphi* is announced for Monday with a new piece founded on the French Revolution, in which Mrs. Yates is to make her first appearance since her long and serious illness: and if ever the *Adelphi* were full it ought to be on such an occasion, when hundreds of admirers will flock to greet and welcome so great a favourite. Wieland and Mrs. Keeley are of the company, and come out in farce.

#### VARIETIES.

**Geology in America.**—Mr. D. D. Owen, a gentleman of very high scientific attainments,

the son of the celebrated Robert, and now settled at New Harmony, has been engaged during all the last autumn by the Secretary of the Treasury in making a geological survey for the government of the United States, in order to enable the President to propose a plan to Congress for the sale of the public mineral lands. The district examined lay on both sides of the Upper Mississippi, chiefly in Iowa and Wisconsin, between the forty-first and forty-third degree of latitude, and comprehending an area of about 11,000 square miles, equal in extent to the state of Maryland. A hundred and forty persons were employed by Mr. Owen in this extensive expedition, so that he might be able to make his report in time to be acted upon as early as possible. It was finished in May, and will probably be published immediately at Washington. At present all we know of it is, that it is not only rich as a vast agricultural district, but contains the most important lead regions perhaps in the world. The territory was the seat of Black Hawk's war in 1832-3, and has, since the purchase of the land from the Indians, been the point in the far west to which the tide of emigration has been flowing.

**Berkshire Ashmolean Society.**—This Society, whose formation we noticed some time since, has attained a rapid increase in the number of its members, amounting nearly to 200. Their first publication is already in a state of forwardness, and will consist of the "Annals of the Abbey of Abingdon," from a manuscript in the Public Library of the University of Cambridge.

Vienna, 4th September, 1840.

Duke Paul William of Wurtemberg has arrived here from Constantinople, returning to Germany from his tour in Egypt. The duke went from Fozoglu to visit the rich gold mines of Bertat and Kamamik, and, in company of the expedition under Ferhad Bey, penetrated into the hitherto wholly unknown mountains of Fakarno and Sudé. He found the accounts of the richness of the Cascalhos of this country by no means exaggerated, and fully coincides with the opinion of Russigier and Boriani, as given in their reports to Mehemet Ali. The duke cannot find terms to express his admiration of the luxuriant vegetation of those countries of Central Africa which are covered with primæval forests, and of the variety and abundance of all classes of the animal kingdom; the collections of both which he has brought home are said far to exceed any that have hitherto been brought from those countries. The duke made the journey back chiefly by land, and describes the heat during the months of April and May as almost intolerable. He fell in with the expedition of Selim Capitana, with whose success in exploring the Bahr al Abiad we are already acquainted, and was so fortunate as to obtain the greater part of its collections of natural history, and others. The duke visited the ruins of Masuarat, discovered by Caillaud, and the Pyramids of Assur, the resemblance of which to the old Egyptian is evident.

#### Wedded Love.

Let wedded love be like the tire,  
The wheel of life to grasp,  
Gain more of force when less the fire,  
And, cooling, closer clasp.

I. O.

#### Sorrow.

Our joys are known from feeling wo:  
If life were always pleasure,  
'Twould be as some be-thins'd show  
That shone,—not real treasure.

But Sorrow is the truest friend,  
And tears bring joy the surer,  
As leaves that to the rain-drops bend,  
Rise the refresh'd and purer.

P. S.

Well.

*Epigramma Eleganticum.*  
Alderman Harmer he would be mayor,  
But "The Times" does so abuse him,  
Making "The Dispatch" their stalking-horse,  
That the Livery will refuse him.

## ORIGINAL POETRY.

## A FABLE.

THE Duck went a swimming; Good-lack!  
She came like a little boat back—  
And she said to the Sow, as she roll'd in her sty,  
"How is it you neither can swim nor fly?"  
"I shall fly next week," said the arrogant Sow;  
"But as to the swimming, I'll do it now."  
So she took to the water; Good-lack!  
The old lady never came back—  
For a sow is constructed, in carcase and limb,  
After a drowning not likely to swim—  
Still, drowning, she grunted, "I don't care a groat!  
I'll swim with the best, if I cut my own throat!"  
Now we come to the moral; Good-lack!  
That morals so oft should be slack!  
Like the Sow, there are people of boundless conceit—  
Small wits, who will never confess they are beat:  
They would fly without wings, taking infinite pains  
To prove to us all that they've heads without brains.  
R. J.

## LITERARY NOVELTIES.

*The Dugdale Society.*—Under this title another new society is projected for "the elucidation of British family antiquity," and a council and officers, of good name, have been chosen. The prospectus states the object of the Society to be "the elucidation of British family antiquity, by the publication of inedited documents relating thereto, and by systematic reference to those already extant; and the examination and arrangement of ancient documents relating to family antiquities. Notices of the Leiger books of monasteries, priories, and other foundations, and of the places where deposited, with extracts therefrom.—Transcripts of foundation charters—of heraldic visitations.—Historical particulars of parish registers.—Collections from ancient monumental brasses, epitaphs, and armorial engravings.—Excerpts from the Harleian, Cottonian, and other MSS. in the British Museum; as also from the Bodleian and various private libraries. The Society is to consist of 1500 ordinary, and thirty honorary, members, at a subscription of a guinea a-year, or single payment of 10*l*."

## LIST OF NEW BOOKS.

Lives of British Admirals, by R. Southey, LL.D., continued by R. Bell, Esq. Vol. V. fcap. 6*s*.—History of a Flirt, related by Herself, 3 vols. post 8*vo*. 1*l*. 1*s*. 6*d*.—The Canals and Railroads of the United States, by H. S. Tanner, royal 8*vo*. 1*s*. 5*d*.—abridged edition, 7*s*. 6*d*.—The American Traveller, by H. S. Tanner, 12*mo*. 7*s*. 6*d*.—Games and Sports, by D. Walker, new edition, fcap. 6*s*.—The Cherwell Water-Lily and other Poems, by the Rev. F. W. Faber, fcap. 7*s*. 6*d*.—Dr. James on the Collecta, ninth edition, 12*mo*. 5*s*.—Practice of Navigation and Nautical Astronomy, by Lieutenant H. Raper, 8*vo*. 1*s*.—Fuller's Backslider, with Preface by J. A. James, 18*mo*. 1*s*. 4*d*.—Rev. A. Roberts' Village Sermons, Vol. IV. 18*mo*. 4*s*. 6*d*.—Hulsean Lectures, 1839, by the Rev. T. T. Smith, 8*vo*. 7*s*. 6*d*.—Voice of the Church, Vol. II. Imperial 8*vo*. 9*s*. 6*d*.—Illustrated Commentary on the Bible, Vol. I. post 8*vo*. 7*s*. 6*d*.—The Budget of the Bubble Family, by Lady E. L. Bulwer, 3 vols. post 8*vo*. II. 1*l*. 1*s*. 6*d*.—Mrs. Trimmer's Sacred History, new edition, 6 vols. 12*mo*. 3*s*.—Dr. C. Waller on the Function and Diseases of the Womb, 8*vo*. 8*s*.—Dr. Prout on the Stomach and Urinary Diseases, third edition, 8*vo*. 2*s*.—Dr. M. Paine's Medical and Physiological Commentaries, 2 vols. royal 8*vo*. 3*s*.—Bodin's Summary of History of France, 18*mo*. 3*s*.—Theocratic Philosophy of Freemasonry, by the Rev. G. Oliver, D.D. 8*vo*. 10*s*. 6*d*.—The Protestant Keepsake for 1841, D.D. 8*vo*. 10*s*. 6*d*.

## TO CORRESPONDENTS.

By postponing part of our Paris correspondence and some reviews we are able to complete the report of the British Association up to Friday, and insert some miscellaneous papers. This will lighten our future numbers of scientific matter.

## ADVERTISEMENTS.

Connected with Literature and the Arts.

**KING'S COLLEGE, LONDON.**—Department of Civil Engineering and Architecture, and of Science applied to the Arts and Manufactures.—This Department, under the Superintendence of Professors Hall, Mosely, Daniell, Wheatstone, Hosking, and Ansted, and Mr. Bradley, Mr. E. Cowper, Mr. J. Tennant, and Mr. H. J. Castle, will be Reopened on Tuesday next, the 6th instant.  
A Junior Class, for Pupils of the age of fourteen years or upwards, will also be opened on the same day.  
Oct. 1, 1840. J. LONSDALE, Principal.

**ERECHEIUM CLUB.**—The Committee having taken the Mansion in St. James's Square, corner of York Street, lately in the occupation of the Earl of Romney, for the Club House of this Society, it is the object for the use of the Members as soon as the necessary alterations are completed, of which due notice will be given.  
(Signed) JOHN DEAN PAUL, Chairman.  
London, Sept. 18th, 1840.

**COMMERCIAL SCHOOL, Gothic Hall, Enfield, Middlesex.** By T. Wear. The intellectual improvement, moral character, and domestic comfort of the People, are the objects of unremitting attention. Terms, from 2*s* to 3*s* guineas per annum. Washing, two and a half guineas. References, Rev. J. J. Davies, Tottenham; D. McNeill, Esq. Stock Exchange; J. Ford, Esq. Clapham Road; and Mr. Davies, Surgeon, 150 Holborn Hill. Accommodation for parlour boarders.

## SALES BY AUCTION.

Sale of Valuable Stereotype Plates and Copyrights.

**MR. KEITH** begs to intimate to the Trade that he has been instructed to offer for Public Competition, in the Royal Exchange Sale Rooms, Glasgow, on Monday, the Fifth day of October, at Twelve o'clock, noon, the Stereotype Plates and Copyrights of the following valuable and highly popular Publications, viz.—The Scottish Pulpit, 5 vols. 8*vo*.—The Scottish Worthies, with McGavin's Notes, 5 vols. 8*vo*.—The Glasgow Mechanic's Magazine, 5 vols. 8*vo*.—Dr. Dewar and Mr. Leod's Gaelic Dictionary.—Johnson's Lives of the Poets, 8 vols. 12*mo*.—Macaulay's Anatomy of Drunkenness, 1*l*.—Ditto, Philosophy of Sleep.—Ditto, Book of Aphorisms.—Butler's Hand-Book for Australian Emigrants.—Bozwell's Poetical Yard.—Ditto, Treatise on Bees.—Ditto, Art of Taxidermy.—Blacklock's Treatise on Sheep.—The Practical Farmer's Manual.—Rivart's Advice to Purchasers of Horses.—Small's Veterinary Tablet.—Reid's Science of Botany.—The Science of Geology.—Mason on Self-Knowledge, 18*mo*.—Wilderforce's View of Christianity.—M'Gavin's Brief History of the Protestant Reformation.—My First Conclusions.—United States of America at one View.—Wilson's Wonderful Characters. From the high character and extensive sale which the above works have obtained, the sale of them presents an opportunity seldom to be met with, as they are parted with solely in consequence of the Proprietor turning his attention to another department of the trade. Orders from Gentlemen who cannot attend the sale, addressed to Mr. Keith, as Clerk of Sale, will meet with the strictest attention.

Also, just published,

I.

The 8th edition of The Man at Arms;

Or, Henri de Cerons. A Romance.

By G. P. R. James, Esq.

Author of "Darnley," "De l'Orme," "Charles Tyrrell," &c. "This work abounds with well-drawn descriptions of battles, sieges, and all the 'pride, pomp, and circumstance of glorious war'; and the varied adventures incident are delineated with great animation, and in the happiest manner of the author."—*Courier*.

II.

Memoirs of the Court of England during the Reign of the Stuarts.

By J. Henegau Jesse, Esq.

In 4 vols. 8*vo*. with Engravings from original Paintings. The First Two Volumes of the last Two, may be obtained separately, to complete Sets. "The great mass of interesting matter to be found in these volumes make them one of the leading publications of the season. Without this work, no library in the kingdom can be called complete."—*The Times*.

III.

The Clandestine Marriage;

A Story of the Present Day.

By Miss Ellen Wallace.

In 3 vols. post 8*vo*.

"The merits, literary and artistic, of this work, are of a very high order, and entitle it to rank with the very best productions of the day. The tone of sentiment is at once elevated and just, and it abounds in shrewd and caustic remarks on men and manners."—*Courier*. Richard Bentley, New Burlington Street, Publisher in Ordinary to Her Majesty.

On the 1st of October, will be published, 1 vol. 8*vo*. **PRACTICAL REMARKS ON THE DISCRIMINATION AND APPEARANCES OF SURGICAL DISEASE.** By JOHN HOWSHIP, Surgeon to Charing Cross Hospital. John Churchill, Princes Street, Soho.

\* \* \* Orders received by all Booksellers.

Cloth, lettered, 8vo. price 10s.

**FALLACIES of the FACULTY.**

By Dr. DICKSON.  
"We cannot too highly compliment the Author on his fearlessness and firmness of purpose; and if the eyes of the public are not opened to the nefarious practices of the apothecaries by his exposures, they will surely be opened by the treatment they receive at the hands of these cold-blooded impostors. Whoever reads this volume carefully will henceforth throw physic to the dogs. Dr. Dickson has placed it in the power of the invalid to take care of himself. Poor Lord Durham! had he read this volume he might have still been living." *Metropolitan Mag.*, 30 September.  
H. Baillière, 210 Regent Street, and all Booksellers.

Price 7s. 6d.  
**THE EDINBURGH NEW PHILOSOPHICAL JOURNAL.**

**THE BRITISH EMPIRE in INDIA.**  
By M. DE BJORNSTJERNA.  
Member of the Royal Swedish Academy of Sciences, and of the Academy of Military Science.  
"We know of no other work that contains so much in so few pages, no work that so ably offers a compendium, not alone of our empire, but of India generally; and we would recommend it to be read in preference to all others, by any individual desirous of obtaining a general idea of the past and present state, and even future prospects, of our vast possessions."—*United Service Journal*, No. 148, Sept. 1840.  
"This comprehensive volume will be read when bulkier tomes will be laid aside. The reading which was requisite for a foreigner to digest such a mass of information must have been very great; and the comprehensive mind of this Swedish nobleman is apparent in every page."—*Colonial Magazine*, No. VI. June, 1840.  
John Murray, Albemarle Street.

**LONDON MEDICAL GAZETTE.**—The

Third and Fourth Volumes of the New Series of this Weekly Journal of Medicine (for the Session 1839-40) may now be had, strongly bound in cloth, Vol. I. 11s.; Vol. II. 12s. The Volumes for 1840-41, the fifth and sixth of the New Series (the second Number of which is just published), will contain:—A Course of Lectures on the Practice of Physic, as delivered by Dr. Watson at King's College—Selections from Lectures on Physiology, delivered by Dr. Carpenter in the Medical School at Bristol—The Clinical Lectures of Dr. Corrigan, Physician to the Fever, Whitworth, and Jervis Street Hospitals, Dublin—A Series of Papers from the Lectures of M. Lugol, reported at his request, and with his co-operation, by Mr. Bennett, House Surgeon of the Hôpital St. Louis, Paris.

By Edward Leighton.  
Author of "Joseph a Model for the Young."  
London: Ball, Arnold, and Co.

## WIGHTWICK'S ARCHITECTURE.

In imperial 8vo. 2l. 12s. 6d. cloth, or India Proofs, 5l. 5s. elegantly bound, whole morocco, gilt leaves,

## THE PALACE OF ARCHITECTURE:

A ROMANCE OF ART AND HISTORY.

By GEORGE WIGHTWICK, Architect.

With a coloured Map, and Two Hundred and Eleven Plates and Woodcuts. The Plates by Le Keux, Brooke, Cates, Humphrys, Winkles, &amp;c.; the Woodcuts by Brooke.

"This very handsome, in these days we may say unique, volume, is truly a work *au genre*—original alike in conception and execution. Enamoured of the beauties of architecture, the author does not seem to feel, as in the case of beauties of another kind, that they are *passé* when aged, or liable to be disparaged when examined in detail, feature after feature. On the contrary, increase of appetite has grown upon him with the contemplation of his object; and he breaks out in glowing and enthusiastic terms the moment he approaches the general description, nor becoming cold and staid as he descends into the more minute parts. . . . This remarkable work will be one of the best ornaments we have seen of every good library, and particularly where a love of the arts and of architecture, embellished by genius, may be acceptable to the owner."—*Literary Gazette*.

"Most warmly do we cheer the motives that have prompted the author to his present undertaking, the principal object of his book being to effect what, although of paramount importance in itself, has scarcely ever before been attempted by any professional writer, namely, to popularise the study of the art; by showing it to be neither difficult nor tedious, but, on the contrary, a captivating pursuit, and affording an inexhaustible source of interest and delight. The object, in short, is to induce all who may be sufficiently favoured by education and leisure to become architectural amateurs, not even excluding those of the other sex. We cannot follow the author step by step as he conducts his readers through the fairy drama of his imaginary 'Palace,' which he supposes to be filled with groups of building in every style, to each of which is allotted its particular territory or garden."—*Polytechnic Journal*.

"Novel and attractive in itself, the title of this splendidly got up and copiously illustrated

volume, in some degree indicates its purpose and character. The object is a most laudable one, namely, to popularise the study."—*Surveyor, Engineer, and Architect's Monthly Journal*.

"We cordially wish the author and enterprising publisher success; this work is eminently calculated to command it. The volume has been got up in a style equal or superior to that of most of the Annuals, while upon a much larger scale. It contains 67 plates and 143 woodcuts, descriptive of various styles of architecture, including ancient Indian architecture, Chinese, Egyptian, Greek, Roman, Norman, Gothic, Christian pointed, Mohammedan pointed, Italian pointed, Greco-Roman, Anglo-Greek, and Anglo-Italian."—*Westminster Review*.

"One of the most splendid publications, either of ancient or modern date. It purports to be 'A Romance of Art and History,' and truly it may be said, the imaginative genius of the author has furnished such magic specimens of the art, in which he is evidently a great master, that we cannot, when examining the efforts of his pencil and his pen, resist a feeling almost of entrance—ment, mixed with a persuasion that his inventive capacity has indeed carried him far into the regions of romance; for Nature certainly has gifted him with most exalted faculties for whatever is sublime and beautiful in architectural design. . . . This elegant volume is illustrated with a coloured map and 211 plates and woodcuts; the plates engraved by Le Keux, Brooke, Cates, Humphrys, Winkles, &c.; the woodcuts by Brooke. It is published by Fraser, of Regent Street, in a style of surpassing elegance, at the very moderate price of 5l. 5s. 6d. Not a single admirer of architecture ought to be without it."—*Deconport Independent*.

## THOMAS CARLYLE'S WORKS.

FRENCH REVOLUTION. In 3 vols. 12mo. 1l. 5s.

WILHELM MEISTER. In 3 vols. 12mo. 1l. 5s.

MISCELLANIES. In 5 vols. 12mo. 2l. 5s.

CHARTISM. In 1 vol. small 8vo. 5s.

All Second Editions, and in cloth.

"Few writers of the present time have risen more rapidly into popularity than Mr. Carlyle, after labouring through so long a period of comparative neglect. Whatever judgment critics may be pleased to pass on him, it is certain that his works have attracted of late no common share of notice."—*Edinburgh Review*.

"There is so much truth in these remarkable volumes, and so many evidences not only of an inquiring and deep-thinking mind, but of a humble, trustful, and affectionate heart, that we have not the slightest inclination to speak of them otherwise than kindly."—*Quarterly Review*.

## LAWRENCE ON THE BRITISH GENTRY.

4th edition, in 1 vol. 12mo. 5s. cloth,

## ON THE NOBILITY OF THE BRITISH GENTRY;

Or, the Political Ranks and Dignities of the British Empire compared with those on the Continent. For the Use of Foreigners in Great Britain, and of Britons abroad, particularly of those who desire to be presented at Foreign Courts, to accept Foreign Military Service, to be invested with Foreign Titles, to be admitted into Foreign Orders, to purchase Foreign Property, or to intermarry with Foreigners.

By SIR JAMES LAWRENCE, Knight of Malta.

"All the political honours and distinctions recognised in the British empire are described in this volume, and compared with the titles, &c. used on the Continent. It is a curious little book, written in a genuine chivalric taste, and containing a mass of rare particulars."—*Atlas*.

## HANLEY'S CONCHOLOGY.

In 1 vol. small 8vo. 8s. cloth.

## THE YOUNG CONCHOLOGIST'S BOOK OF SPECIES: UNIVALVES.

Containing Descriptions of Six Hundred Species, and illustrated by numerous Figures, exquisitely engraved, some beautifully coloured.

By SYLVANUS HANLEY, of Wadham College.

## MITCHELL'S LIFE OF WALLENSTEIN.

2d edition, 1 vol. post 8vo. 10s. 6d. cloth,

## LIFE OF WALLENSTEIN, DUKE OF FRIEDLAND.

By Lieut.-Col. MITCHELL. With a Portrait after Vandyke.

"A work written with the feelings of a soldier, the principles of a patriot, and the penetration of a statesman."—*Alison's History of Europe*, vol. vii. p. 504.

"We welcome, as a gratifying confirmation of the high opinion we have expressed of its merits, the reappearance, in a new and more portable form, of this most interesting piece of biography. . . . Of its literary merits we have already spoken in terms of sincere praise. The style of the book, although free from the bombast in which military writers are but too prone to indulge, is vigorous and energetic. . . . Colonel Mitchell employs the simplest style throughout; and whilst he is always vigorous and eloquent in those parts of his narrative which are of stirring or peculiar interest, never attempts to give a fictitious sparkle to his style by the employment of the *dulcis vitia* of the language in which he writes. His 'Wallenstein,' as a piece of biography, is a perfect model for the type in this difficult class of literature, both in style and keeping. Every thing is in its proper place; and, to employ an artistical phrase, his perspective is always correct; for whilst he dwells with a light and apparently careless pen on the less important accessories of his narrative, he discusses with the most picturesque minuteness all those facts and features which are designed to form the foreground of his pictures. We look forward with great interest to his forthcoming 'Life of Napoleon,' which will, we are satisfied, disperse 'into thin air' much of the humbug which has been talked and written of this most splendid impostor of modern times. Recent events will, moreover, invest the subject with an interest which it cannot be said to have possessed for many years."—*United Service Gazette*.

In 1 vol. 8vo. with 4 Plates, and side-pocket for the coloured Map, 14s. cloth, the  
COLONY of WESTERN AUSTRALIA:

A Manual for Emigrants to that Settlement or its Dependencies.

Comprising its Discovery, Settlement, Aborigines, Land Regulations, Principles of Colonial Emigration; Statistical, Financial, and Agricultural Reports; also Instructions and Hints to Settlers, Directions for the Anchorage, &c.; and the latest Map extant. By NATHANIEL OGLE.

With an Appendix, containing Governor's Commission, Land Regulations, List of the Names of the Proprietors, their original Grants and Number of Acres, Tenures, Conditions, Transfers, &c.

1 vol. 12mo. 4s. cloth,  
ORIENTAL MUSINGS; and OTHER POEMS.

By P. SCOTT, Esq.

"We can very strongly recommend the whole of these poems."—*Bell's Messenger*.

In 2 vols. 1l. 1s. cloth, reprinted from "Fraser's Magazine,"  
THE RELIQUES OF FATHER PROUT.

With 18 Illustrations by D. Maclellan, Esq. R.A.

"For learning, talent, and originality, no one has surpassed Father Prout."—*Literary Gazette*.

## FRASER'S PANORAMIC PLAN of LONDON;

With all the Improvements to Michaelmas 1840.

For the Pocket.—In a French case and embossed cloth, with the various Boundaries carefully coloured in outline, &c.; beautifully embossed roan, the whole Map fully coloured in a superior manner, &c.

For the Library, Drawing-Room, &c.—On black roller, coloured and varnished, 7s. 6d.; on mahogany roller, French polished, 9s.

"This plan is about twenty-two inches in length, and a foot in breadth; but so clearly and accurately engraved as to be adequate for all beneficial reference. Tints of colour assist the eye, and almost render the sheet a picture."—*Literary Gazette*.

JAMES FRASER, Publisher, 215 Regent Street.

Printed by HANNAH PAGE MOYES, of Brook Green, Hammersmith, and GEORGE BARCLAY, of Number 2 Pullin's Place, Islington, both in the County of Middlesex, Printers, at their Printing Office, Number 29 Castle Street, Leicester Square, in the said County; and published by WILLIAM ARMIGER SCRIPPS, of Number 13 South Molton Street, in the Parish of Saint George, Hanover Square, in the County aforesaid, at the LITERARY GAZETTE OFFICE, Number 7 Wellington Street, Strand, in the said County, on Saturday, October 3d, 1840.

### THE BRITISH ASSOCIATION.

TENTH MEETING: GLASGOW.

[Fourth notice.]

SATURDAY.

SECTION A.—*Mathematics and Physics.*  
*Papers and Communications.*

1. Sir David Brewster, 'On the Decomposition of Glass.'
2. Sir David Brewster, 'On the Phenomena of Polarisation as exhibited in Decomposed Glass.'
3. Professor Phillips, 'On Rain Experiments.'
4. Professor Forbes, 'On Cases of Excessive Rain.'
5. Mr. Espy, 'On Storms.'

PROFESSOR FORBES in the chair.—Sir David Brewster read his interesting paper 'On the Decomposition of Glass.' He had formerly brought the subject before the Association; and since that time he had got two specimens of glass—one from Italy, and the other from St. Andrew's, of which the character had been entirely changed by decomposition. Sir David then described the mode of decomposition. It began at certain points, and extended over the surface, either in planes or in concentric films, affording colours of surpassing beauty. In one of the specimens, the silicious portions had separated from the metallic, and had arranged themselves in alternate circles around the first point of decomposition. This liability to decomposition Sir D. feared might produce serious results to science, as some of the finest glasses of scientific instruments were exhibiting symptoms of decay. Sir D. Brewster then described several curious effects produced by the polarisation of light by decomposed glass.

Professor Phillips gave an account of a number of experiments made by him on the subject of rain-gauges. To determine the difference between gauges at higher and lower altitudes, he placed one gauge on the ground, and completely exposed others at heights of three, six, and twelve feet; and after a trial of four months, he had found the results to be in the following proportions:—the highest, 8.206; the next, 8.249; the next, 8.314; and the lowest, 8.408; thus shewing the greatest quantity of rain to have fallen nearest the ground. In order to determine the effect of rain falling at an angle, he had constructed a gauge with a central, horizontal, and four vertical funnels, exposed to the cardinal points, which might lead to some practical result.

The Chairman considered the increase of rain near the ground to arise from the enlargement of the rain-drop by condensation from the heated air of the earth's surface.

After some observations by Mr. Thom, of Rothesay, the Chairman recommended all who had made observations on this subject to communicate them to Professor Phillips.

Professor Forbes made a few remarks on the subject of excessive rains, occasioned by his former statements on the subject having been questioned. He mentioned a number of instances, and referred to various authorities, among which he mentioned a fall of 30 inches of rain in 24 hours at Genoa; and falls at various other places of 25 inches in 24 hours; 14½ inches in 18 hours; 6 inches in 3 hours; four-fifths of an inch in half an hour; 24 feet in one year; 10 inches in 23 hours; 25 feet in one year, of which ten feet fell in June. Mr. Espy said, if they looked into Shliman's "Jour-

nal" they would find other cases equally astonishing, such as 10 inches in half an hour, and 15 inches in 3½ hours.

Mr. Espy then began his paper 'On the Theory of Storms,' which occupied nearly two hours. His theory was, that during storms the wind blew from all sides towards a centre, whether the centre of a circle or a square. He went into a great many instances of storms which had happened at particular seasons, and from facts ascertained as to the direction of the winds at various places around the space in which the storm prevailed, he shewed that the facts confirmed his theory. For instance, from the storm on the 6th January, 1839, he had prepared on the map an illustration of his theory. The storm began at Liverpool from ten to eleven o'clock P.M. on that evening, and he had written to various places to ascertain the direction of the wind between ten and twelve o'clock P.M. At the north-west of Scotland, near Cape Wrath, the wind was N.W. and it was the same all over the west of Scotland. In Ireland, at the same hours, it was W. and S.W. In the south-west of England it was S.W. On the south-east of England, at the same hours, S.S.E.; and in some places direct S.E.; at Birmingham, a little E. of S.; at Leeds and Manchester, S. of E.; at Liverpool at ten, S.S.E.; and before twelve, S.W. nearly. Thus were a line drawn from the north-east of Scotland to the south-west of Ireland, on one side of the line the wind would be found to have blown from the N.W. and on the other from the S.E. Mr. Espy then referred to other storms here, in the West Indies, and in America, which went to prove the same theory. The principles upon which it is founded are nearly the following:—The equilibrium of the air may become unstable by the heat or the moisture below. Ascending columns or currents of air are thus formed, which, as they ascend, are subject to less pressure and expand. This expansion produces 1½° of cold for every hundred yards of ascent, while the dew-point falls only ½° for the same space. Clouds will begin to be formed when the column of air rises, as many hundreds of yards as the dew-point is below the air in degrees. When the vapour condenses it will give out the latent caloric into the air, which will prevent the ascending air from cooling more than half as much as it would otherwise have done on its farther ascent. Thus, the higher the column of air rises, the warmer it will be when compared with the air on the outside of the cloud at the same height. For every degree that the cloud is warmer, it will be a certain amount lighter than air at zero, and thus under the cloud the barometer will fall, and the air will run in under the cloud and upwards, with a velocity of upwards of 240 feet per second. After a long account of his theory of the formation of clouds, Mr. Espy gave a description of the effects of the tornado, which he held to be additional evidence in favour of his theory.

Sir D. Brewster stated that he had received a letter from Colonel Reid, from which it appeared that five water-spouts had been examined carefully with the telescope, in all of

which it appeared that there was a revolution of the particles of water in the manner of the hands of a watch, from left to right, and that in the midst of such contradictory statements of facts it appeared difficult to settle the question without further examination.

Professor Phillips, in answer to Sir David Brewster, said, he did not conceive that any appearance exhibited by a water-spout could invalidate the conclusive evidence that was to be found of a direct inward motion to a centre, in the case of the tornado, on visiting the path it makes through a forest, and finding the trees thrown down as stated by Mr. Espy; and to him it appeared perfectly conclusive, that there must have been such a direct inward motion in the tornadoes described by the author of this paper.

Mr. Espy had disposed of this objection in his explanation of the tornado, where he shewed that all bodies taken up on the right-hand of the centre of the path of the tornado must, from the laws of dynamics, go up in a spiral from right to left; while those taken up on the left-hand of the path must move in a spiral upwards, from left to right; and that consequently one person might see the tornado whirl in one direction, and another in the other, according to the uniform testimony of the witnesses, along the whole tract of the tornado.

Professor Forbes presented three difficulties as objections, which he requested Mr. Espy to answer:—1st, How it was possible to conceive that such a mighty mass of air as he represented, pressing in towards a common centre for hundreds of miles around, could find vent up the very narrow vortex in the centre of the storm? It would require very strong proof to overcome the *a priori* improbability that such was the case. 2d, That as the tornado had an onward motion, it appeared to him difficult to find phenomena, on viewing the path of a tornado, which would prove without doubt that the motion of the air was inwards to a common centre; for the manner in which trees were thrown down would depend very much on the velocity of the onward motion, compared with the velocity of the wind in the tornado itself. 3d, He thought Mr. Espy would find that nearly all the vapour in the air would be condensed into water or cloud on going up the ascending column, before reaching any very great height in the atmosphere; and it seemed difficult for him to conceive how the principle of the evolution of latent caloric could produce so great an effect in the comparatively short column of the atmosphere, to cause the barometer to sink as much as it is known to do in great storms.

Mr. Espy took these objections in their inverse order. He stated, as to the last objection, that if all the vapour should be condensed into water, the effect would be found to be even greater than he had stated in depressing the barometer; for it was known that, for example, if the dew-point was 70° of Fahr., it contained latent caloric enough to heat the whole atmosphere about 70°, and, of course, half the atmosphere to double that amount; and the Professor would find on calculation that the barometer would fall under such a column of

70°, 4-48ths of 30 inches. His (Mr. Espy's) calculation had been made on the supposition that only about three-fourths of the vapour ever is condensed, however high the column may ascend. To the second objection Mr. Espy replied, that Mr. Redfield himself had proposed as a test of the truth of Mr. Espy's doctrine of inward motion, that the trees in the centre of the path should be found with their tops thrown either backwards or forwards, and he (Mr. Espy) introduced Professor Holmstead's testimony that such was the fact in the Newhaven tornado. And as to the great hurricanes in the West Indies, Mr. Redfield stated it would be a proof of Mr. Espy's doctrine, if it should be found that those storms began with the wind north-westerly, and ended south-easterly; and to prove that this was the fact, Mr. Espy quoted Edwards' "History of Jamaica," and also the fourth volume of the "Royal Philosophical Transactions," where it is stated that these storms begin with the wind north-west, and, when the wind gets round south-east, the foul weather breaks up. To the first objection Mr. Espy replied, that he did not mean to say that in the large storms of several hundred miles wide they pressed in to the centre to a very narrow vortex before it began to ascend; on the contrary, however wide the cloud extended, it must be going upward, there to form that cloud, frequently leaving a wide space in the centre, where there was a dead calm; and as to the tornadoes, where the vortex was very narrow, not more than two or three hundred yards wide in many cases, it was a perfectly well-established fact that all round the tornado, before and behind, and at the sides, it was a dead calm within a very few yards of the tornado itself: which fact was explained in that part of his paper which had not been read.

Mr. Osler stated that, from the investigations he had given the subject, he was convinced that the centripetal action described by Mr. Espy took place in most hurricanes: the particulars he (Mr. O.) had collected, together with the indications obtained from the anemometers at Birmingham and Plymouth, satisfied him that the action of the great storm of the 8th and 7th of January, 1839, was not rotatory at the surface of the earth when it passed over England. He differed, however, from both Mr. Espy and Mr. Redfield in one essential point, for he believed that it would be almost impossible for a violent hurricane to take place without at the same time having *both rotatory and centripetal* action. The storm might very probably be generated, in the first instance, in the manner accounted for by Mr. Espy, as well as occasionally by contrary currents; in the first case, the rush of air towards a spot of greater or less diameter would not be perfectly uniform, owing to the varying state of the surrounding atmosphere; this, together with the upward tendency of the current, would, in some cases, produce a violent eddy, or rotatory motion, and a whirlwind, of a diameter varying with the cause, would ensue. The centripetal action would thus be immensely increased, the whirlwind itself demanding a vast supply of air, which would be constantly thrown off spirally upwards, and diffused over the upper atmosphere: thus causing the high state of the barometer which surrounds a storm. When no rotatory action takes place, we merely experience the rush of air which necessarily precedes a fall of rain or a thunder-storm, in consequence of the condensation of moisture: but that nothing violent enough to be called a hurricane can take place unless a strong rotatory action, or in fact a whirlwind;

is produced; and that in most cases the rotating portion is not in contact with the earth, and consequently we only felt its secondary or centripetal action. He further stated that he had brought a short notice of his theory of the combined action of the rotatory and centripetal motion of storms before this Association, at their late meeting in Birmingham.

Professor Thomson said he could conceive a centripetal motion of the air causing a whirl, especially from the principle of the conservation of areas, as it appeared to him unphilosophical to assign a whirl as the cause of centripetal motion.

Professor Stevelly made some observations as to the probability of human feeling being a proper criterion of temperature in clouds.

Dr. Forbes said, if he understood Mr. Espy, he assigned the reason of the fall of the barometer to the vapour which the air contained.

Mr. Espy replied, that he did not wish to be so understood, but the sole cause was the solution of the latent caloric during the formation of cloud.

Mr. Miller thought, from the experiments of Dalton, that the more vapour the air contained, the greater its specific gravity.

Mr. Espy simply dissented; and Professor Forbes expressed his dissent also.

The Chairman complimented the author on the able manner in which he had treated the subject. It would be difficult to come to a conclusion on some of the points brought forward; but he was certain that such an interest had been awakened as to insure farther prosecution of the inquiry.

The Section then adjourned.

#### SECTION B.—Chemistry. Papers and Communications.

1. Dr. Schaffhaeuti, 'On a New Mode of Photogenic Drawing.'
2. Professor Graham's 'Notice of Professor Liebig's New Chemical Views relative to Agriculture and Physiology.'
3. Dr. Playfair, 'On a new Fat Acid called Sereic Acid.'
4. Dr. Etting, 'On Salicyl.'
5. Professor Liebig, 'On Poisons, Contagions, and Miasms.'

The author of paper No. 1. described two methods of producing photogenic drawings, one similar to Mr. Talbot's mode, which he termed the negative, and the other with the prepared paper or metallic plates, the positive method. Take, for the negative, Penny's improved metallic paper, and draw it over the surface of a concentrated solution of nitrate of silver, and then convert the nitrate adhering into a chloride by the vapour of boiling muriatic acid. This coating of chloride, when dry, should be again drawn over the solution of the nitrate and again dried; and thus may a paper of the greatest sensitiveness be produced. The manner of fixing the drawing is a more complicated affair, and requires great care; it should be immersed in alcohol for five or ten minutes, then dried, first by blotting paper and afterwards, slightly, before the fire, and then drawn through a dilute muriatic acid, into which a few drops of an acid nitrate of mercury had been put. The care required is principally for the exact quantity of the latter ingredient, to be known best by frequent testing. After being thus treated, washed in water, and dried at a temperature of about 158° Fahrenheit, a slight yellow tint appearing on the previously white portions of the paper shews that the fixing is effected. For the positive method the paper, prepared as above, is allowed to darken in the sun, and then to macerate for half an hour or more (not too long, or it will darken again) in the acid solution of the nitrate of mercury, mixed with nine or ten parts of alco-

hol. The paper thus macerated should then be drawn rapidly over dilute hydrochloric acid, washed in water, and dried at a temperature of about 212° Fahrenheit. It is now ready to take the drawing, to fix which a short immersion in alcohol, to dissolve the free bichloride of mercury, is alone necessary. If metallic plates are used for the positive process they should be coated with hydruret of carbon, the residuum of pitch dissolved in alcohol, be carbonized in cast-iron boxes, when cooled, be passed through polished steel rollers, be then plunged into a solution of nitrate of silver, and afterwards immediately submitted to the sun's rays in the camera obscura. An immediate reduction of the silver to the metallic state takes place, and the image is caught; no delay should occur in fixing, by dipping the plate in alcohol, into which a portion of hyposulphite of soda, or a small quantity of ammonia, had been put, because of the excessive sensibility of the plate in that state to light. The carbonized portions present the shade, and the varying thicknesses of the silver, in appearance frosted, give the lights of the picture.

An abstract only of Professor Liebig's Report, No. 2, was next read by Professor Graham. In opposition to the opinion hitherto held, that the fertility of soil was relative to the quantity of what has been termed humus contained therein, and from which it was supposed plants chiefly derived nourishment, Prof. Liebig contends that humus, as it exists in soil, cannot yield sustenance to plants. Humus, or the humic acid of chemists, is soluble when first precipitated, but insoluble when dried in air. To overcome this difficulty, the physiologists, or the holders of the opinion before stated, suppose that the alkalies from consumed vegetables solve the humic acid, and prepare it for assimilation. Granting, however, that the humate of lime thus produced is absorbed by plants, Professor Liebig argues that from the quantity of the alkaline bases of the ashes of plants in proportion to the carbon of fir wood, for instance, or of wheat straw, not one-thirtieth of that of the former, nor one-twentieth of that of the latter, could be derived from humate of lime. Moreover, 2500 parts of water are necessary for the solution of the humate; and if the whole of the rain falling on a given space becoming saturated with that salt, and being absorbed by the plants, were calculated (which is possible), the humate could not yield any thing like the quantity of carbon contained in the wheat there grown. For these and other reasons, the principal of which is, that decayed plants give origin to humus, and that none could have existed unless so produced, Professor Liebig concludes that the decomposition of carbonic acid, chiefly and almost entirely derived from the atmosphere, affords the carbon of plants. After remarking upon the effect of light on the vegetative process, and the chemical operation during the night, &c., the abstract dwelt upon the part the humus really plays in vegetation. That substance, which is nothing more than decayed woody fibre, converts oxygen into carbonic acid, and hence humus is a continued source of that necessary principle of plants; and, therefore, giving free access of the air to the humus by the loosening of the soil, by tilling, &c., increases the production of carbonic acid; and in that way cultivation is highly beneficial. Turning up the ground is not, however, so requisite when the leaves or lungs of the plant are fully developed, for then the carbonic acid of the soil is no longer wanted. The assimilation of hydrogen, also the assimilation of nitrogen and its origin, were fully treated.

Ammonia plays an important part in vegetation, and it is found in large quantities in the juices of some plants. It exists plentifully in different manures; and from its presence, especially in the animal, they principally derive their utility and value. Ammonia also forms the red and blue colouring matter of flowers. In short, the elements required for the support of vegetables and animals are contained in ammonia, carbonic acid, and water. The abstract then passed on to the inorganic substances, the alkalies or alkaline earths, wanting for the full development of plants, and to the application of the principles contained in the report to the art of culture; including the use of humus, nutrition and growth of plants, advantage of azotised matter, effect of food on the produce, the constitution of soils, their fertility, &c. &c. &c. The subjects were exceedingly numerous, and all of the highest interest and value; and well and truly did Dr. Gregory designate the report as most important. It was, he said, the first attempt to apply the recent science of organic chemistry to agriculture, and justly proud may the British Association be of, by their recommendation, originating such a work.

The radicals of seracic acid, Dr. Playfair (No. 3) considered similar to those of ananthic acid, with, however, one equivalent of oxygen substituted for one of hydrogen. The constituents of seracic acid are C 28, H 54, O 3.

No. 4. The oil distilled from *Spiraea ulmaria* separates by keeping into two oils, the one lighter, the other heavier, than water, and Dr. Etting shows that the latter is similar in composition to hydrated benzoic acid. Its compounds with ammonia were stated to be highly interesting. The final product belongs to the amides, and is called salicylamide. It combines with copper, lead, iron, &c. &c.

Dr. Playfair read paper No. 5.—Professor Liebig speaks of poisons as inorganic and organic. Several were called inorganic, such as sulphuric and muriatic acids, the action of which on the animal system may be likened to that of heated iron or a sharp knife. But the really inorganic poisons are those which, entering into combination with animal substances, become insoluble and incapable of change, and therefore destroy organic life. The organic poisons, especially putrid animal and contagious matter, seem to possess a peculiar property which is of very universal action, viz. the power to induce in any substance with which it may be in contact its own state of motion or decomposition. In Germany a disease is known which arises from the consumption of decayed sausages, and which produces, as it were, a mummification of the body ere death, for no corpse after this disease putrefies. The state of the motion or decomposition of the materials of the sausages induce the same condition in the constituents of the blood, too powerful for the vital principle, decomposition and wasting away go on, and death is the result. Contagious matter, in like manner, acts upon the blood, inducing in it its own state of change, and reproduces itself as yeast in fermentation. The action of yeast and contagion were shown to arise from the same cause. And the working of two kinds of yeast, the one violent, and the other tranquil, were assimilated to the action of the human small-pox and the virus of the cow in the human blood. After some remarks from Professor Hanney and Dr. Playfair in explanation principally to this, that the object of the paper being so purely chemical in the inquiry was to attract the attention of physiologists to the further development of the subject, the Section adjourned.

## SECTION C.—Geology.

1. Mr. Bald, to Exhibit a Model of a large Portion of Ireland.
2. Mr. Ravenstein, 'On Krummer's Relief Map' (to be read by Capt. Washington).
3. Dr. Robinson, 'On M. de Berton's Map of Palestine' (read by Capt. Washington).
4. Capt. Washington, 'On the New Maps in Progress in Germany.'
5. Mr. Ainsworth, 'On a Recent Visit to Al Hadr, in Mesopotamia.'
6. Mr. W. C. Trevelyan, 'On Changes of Level in the Faroe Islands.'
7. Mr. Mathie Hamilton, 'On Earthquakes of the West Coast of South America in 1833.'
8. Mr. B. Ibbetson, 'On a Method of Drawing Fossils by the Daguerreotype.'

Mr. Greenough, President, in the chair.—Mr. Bald read a paper 'On the Value of Topographical Maps and Models,' and exhibited his beautiful Map of the County of Mayo, in Ireland; which, if we remember rightly, we saw at Mr. Greenough's *conversations* in London. This map is on the scale of two inches to a mile, and represents admirably the remarkable physical features of that region; the levels of the mountains, hills, lakes, plains, &c. are all given, both barometrically and trigonometrically; and at the foot of the map is a vertical section of the country from east to west, describing its geological structure, besides various views, profiles, &c. Accompanying the map was a model, of seven feet six inches by five feet, on the scale of four inches to a mile. In the course of his paper Mr. Bald gave an account of the various methods of modelling, and strongly recommended their more general use, as giving a better idea of the country than any other mode can. This paper was listened to with much interest, and gave rise to a long conversation, in which Mr. Greenough, Mr. Ibbetson, Lord Northampton, Major Chartres, Mr. Featherstonehaugh, Captain Washington, and others, bore a part.

Mr. Ibbetson gave some account of the method he pursued in making his models of Neuchatel and of the Isle of Wight, and spoke generally of the relative value of barometric and trigonometric measurements.

Mr. Featherstonehaugh stated that, in the recent examination of the boundary-line of Maine and New Brunswick by himself and Col. Mudge, he had used twelve mountain-barometers by Bunten, of Paris, which he preferred to all others. Captain Washington contended that, for all practical purposes, the barometers of Newman, of London, were fully equal, if not superior, to the syphon-barometers of Bunten, in which it was difficult to read off the lower vernier with accuracy. Mr. Featherstonehaugh admitted that latterly, in completing the survey, four of Newman's barometers had been used, and had given every satisfaction.

'Some Observations on Relief Maps,' by Mr. A. Ravenstein of Frankfort. Communicated by Captain Washington, R.N.—"The obvious advantages of maps stamped in relief for representing the great physical features of a country, and the probability that such maps will soon be very extensively used, induces me to offer a few words in reply to a request I have received to state my opinion on the relief maps of M. Krummer of Berlin. With regard to their invention, I must claim to have been the first who introduced the method of raising the hills by means of the press, or stamping, as may be seen by my 'Plastic Atlas,' published in 1838. It would be unjust, therefore, to attribute to Berlin that which was first made at Frankfort. It must be observed that these are quite distinct from M. Krummer's 'Globe en Relief,' published some years since, as that was made of *papier mâché*. M. Bauerkeller, of Paris,

also made public, in 1839, his 'Environ de Paris,' in the stamped relief method; with the difference, however, that the colours are put in after the Congreve manner. In the preface to my 'Plastic Atlas' I anticipate that great improvements would be made; and it is due to M. Krummer to state that he has so far succeeded as to lead me to hope that these maps will shortly reach still greater perfection, and, when made on a large scale, will come into general use, and supersede all other maps,—and especially physico-geographical maps, without reference to political divisions; and I am satisfied that I do but express the feeling of all interested in the advancement of physical geography by saying, that I heartily hope that M. Krummer will persevere in his efforts." These brief observations were illustrated by M. Ravenstein's "Plastic Atlas," several stamped maps, by Krummer of Berlin, and a beautiful specimen of Bauerkeller's stamped and coloured plan of the city of Frankfort. In making some remarks on these maps, Captain Washington stated that, in the course of a recent visit to Germany to complete the collection belonging to the Geographical Society of London, he had been much gratified by the maps published at the topographical establishments at Vienna and Dresden; also, by the models in relief of the Taunus mountains and the Slesengebirge, as well as by a relief map of the Rhine, from Mainz to Bonn, by M. Ravenstein of Frankfort. In speaking of school maps, Captain Washington stated that he had been much gratified by the specimens of the "Church Assembly School Maps," then exhibited. These maps, published by Messrs. Fraser and Crawford of Edinburgh, he lauded for their peculiar excellence. The convenient mode by which they were exhibited on the stand, and the whole getting up, were highly creditable to the publishers. He considered, indeed, that they were equal, if not superior, to any he had ever seen.

'Additional Notes on the Wadi el 'Arabah in Syria,' by the Rev. Dr. E. Robinson, of New York. Communicated by Captain Washington, R.N.—"The interest attached to that very remarkable fact in physical geography which has not yet been cleared up,—namely, the depression of the surface of the Dead Sea (from 600 to 1400 feet, according to different measurements) below the level of the Mediterranean, and the drainage, probably dependent upon this depression, of a large tract of country including numerous lateral valleys, extending to the southward for upwards of 100 miles through the district termed Arabia Petraea, from the south point of the Dead Sea nearly to the Gulf of Akabah, induces me to offer a few words on the line of separation of waters between these two basins, which may be termed a postscript to some remarks I formerly had occasion to make on M. de Berton's account of his journey in 1838, through the Wadi el 'Arabah, from the Asphaltic Lake to the Euxine Gulf. At that time I took it for granted that the Wadi Talha of Berton (according to his own map) was identical with the great Wadi Jerafeh, with which we had become acquainted while travelling through the western desert to Hebron, and again as seen from the pass of Nemela, north of Mount Hor. But on a careful reconstruction of Berton's itinerary by M. Kiepert of Berlin, it appears that his Wadi Talha must be situated about two hours south of the Jerafeh, and has no connexion whatever with the latter. It would seem, therefore, to be the Wadi Abu Talha of Burckhardt. The effect of this is to move the

place of the watershed, as specified by Berton, to a point some six miles farther south than I had supposed him to mean; and if this cannot be well founded, it follows that the traveller passed before, and probably across, the mouth of the Jersafeh without noticing it; although this is the great drain of all the adjacent part of the western desert, and one of the most important and remarkable features of the whole region."

In connexion with Dr. Robinson's recent travels through Palestine, Captain Washington exhibited a newly constructed plan of the city of Jerusalem, correcting many former inaccuracies, pointing out several ancient sites, and shewing the shading of the hills within the city, — a feature not represented on any former plan.

Mr. W. C. Trevelyan communicated a letter from the Rev. Mr. Schroter, who had resided above fifty years in the Faroe Islands, expressing an opinion that the level of the coast had there undergone a depression. This was inferred from encroachments made by the sea at several points, and particularly from the fact that, on the 5th of January, 1828, fully two-thirds of the sun's orb had been visible above a hill near his house, from the same spot where, in 1801, he had only been able to see the upper disk.\* Captain Washington suggested that this effect might probably be accounted for by refraction; but Mr. Trevelyan conceived that the steady occurrence and similar observations in other quarters gave room to infer an actual change of level. Mr. Yates and Mr. Greenough observed that the fact, if it really existed, was very important; and that further and careful observations on the subject were desirable.

Mr. Mathie Hamilton read a paper 'On Earthquakes of the West Coast of South America, in 1833.' This paper described the destruction which these earthquakes caused in several towns, and assigned the following generalisation of the subject. When the atmosphere became clear, the Andes, as seen from Tacna, presented a novel spectacle; those mountains, in many parts, appeared with a new surface; large portions had been thrown off, and slid down into valleys or ravines below, leaving some of the more elevated peaks denuded of what had been their more prominent limbs; also large masses of snow were detached from some of the higher pinnacles. Within the last few years, an important subterranean change seemed to have happened below that portion of the earth's surface. From time immemorial, every shock of earthquake there was preceded by a subterranean noise; but since the great earthquake of the 8th of October, 1831, this warning had been seldom, if ever, heard; formerly the people had time to run from the houses to some open place, between the commencement of the noise and the shock. This subterranean noise was not unlike that of thunder, as it is heard when rolling among the valleys of the Andes far below places where the traveller has to traverse those sublime heights.

From what has been stated, Mr. Hamilton thought we might conclude that there was a vast cavity beneath the surface of that region, which cavity contained the chief agents of convulsion; also, at the moment of convulsion, that the earth's surface was strongly charged with positive electricity.

**Geology.**—This day might be considered the grand field-day of the Geologists; and it was, indeed, of almost unpreceded brilliancy and en-

joyment. The excursion to Arran, an island justly styled by Mr. Murchison "the Jewel of Geologists," was divided into two parties,\* the one proceeding and returning altogether by water in the Flambeau steamer, and the other taking a portion of the way by the railroad to and from Ardrossan, and thence, by steamboat, across to the island. It was our good fortune to belong to the latter expedition; though from the account given of the other it seems also to have had a full share of instructive pleasure. Both, indeed, participated in a genuine feast of reason, heightened by the addition of natural beauties, and glorious scenery not to be surpassed in any region of the globe. The following is the history of the Flambeau† trip, which left Glasgow at six o'clock of the morning, and consisted of about a hundred persons:—The arrangements were directed by Professor Nichol, Mr. Thomas Edington, jun., and Mr. William Murray. As they passed down the river, it was agreed that some of the gentlemen present should describe the geological features of this or any other district with which they were acquainted, and, accordingly, geological lectures and conversations occupied the party throughout the voyage. On passing the Kilpatrick Hills, where the peculiar beauties of the Vale of Clyde begin to appear, Mr. Craig gave a short detail of the nature of the formation that skirts that range, and which is to be considered as belonging to the regular carbonaceous series of the district. He alluded to certain beds of conglomerate, seen extending from Muirhouse, near Edinbarnet, to Craigmaddie and Strathblane. These he considered as underlying a bed of sandstone, which crops out below the Duntocher coal, and probably belonging to the old red sandstone. He then referred to the great limestone series, in which occurs the trap of the Kilpatrick and Campsie range, and described it as consisting of great layers of compact limestone, alternating with the shale, and as offering to the geologist a very interesting field of examination. Mr. Craig then adverted to the character of the red sandstone which occurs beyond the trap, and which skirts either bank of the Clyde. Portions of these were evidently newer than the older coals of the regular coal measures, and other portions older than them; and that the former were to be regarded as equivalents of the coal formation, rather than the new red sandstone.—Dr. Nichol next called attention to the peculiar characteristics of the Island of Arran.—Dr. Crooks explained the geological map of England.—Dr. McDonald described some of the features in the primary rocks of Argyllshire and the northern part of the Isle of Bute. The vessel steamed through the Kyles of Bute, and as the day was exceedingly fine, the party had an opportunity of viewing the splendid scenery there to the greatest advantage. The remains of the vitrified fort, on an islet in the upper district of the Kyles, attracted much of their attention. The whole of the surrounding country, both on account of its geological character and the variety and grandeur of its scenery, seemed to interest them highly. It may not be altogether uninteresting to diverge as far from the direct course to Arran as may enable us to catch a few hasty glimpses of the geology of the neighbouring islands of Bute and Cumbrae the Larger. The former island, which has acquired so high a reputation for the mildness of its climate, is about eighteen miles

in length, by about four in breadth. Its structure corresponds generally with that of the adjacent islands, which it unites geologically with the mainland in Argyllshire, from which it is separated by the romantic winding strait known by the name of the Kyles of Bute. Dr. McCulloch, whose useful and agreeable work on the Western Isles we shall partly take as our guide-book, found the geology of Bute peculiarly valuable, as elucidating some of the more obscure portions of the Island of Arran. On approaching Bute, it is seen to divide itself naturally into three parts, equally distinct in their general form and mineral structure. The northern division consists of primary rocks—micaceous schist, clay slate, chlorite schist, and greywacke, often traversed by trap and quartz veins. The central division is chiefly composed of sandstone, and the land is low and undulating. The southern district consists of a ridgy group of hills terminating in the promontory of the Ganoeh Head, and wholly of trap rocks. The intermediate valleys afford evidence in their coralline sand, clay and sand abraded from the rocks of the secondary strata, and vegetable matter, as well as in their remarkable flatness and lowness, that the sea has flowed through them at no remote geological period. Bute is, therefore, connected geologically with Argyllshire by the primary rocks on the north, and with Ayrshire by the secondary strata of the south. Supposing we start from Rothesay Bay on our course to Arran, as the steamboats are in the habit of doing, a number of the more interesting geological features of Bute may be observed from the deck of the vessel. Thus in skirting the shore as we leave the bay, the more prominent of the trap dykes which abound here may be seen traversing the sandstone and conglomerate on the beach. These are not laid down in McCulloch's maps, nor do we remember having seen them in any other; but they are very readily discoverable in walking or sailing along the shore. A quarry has been opened on the Chapel Hill at Rothesay, where the trap bursts out near the junction of the red sandstone and argillaceous schistose series. On the opposite shore of the bay, the point from which we are now starting, and in a direct line across from the quarry, the trap is observed cutting the sandstone along the shore eastward for a considerable distance, till it reaches Bognay Point, and, were it to continue in the same direction, would here run into the sea. But, singularly enough, when we round the Point, and proceed in a south-westerly direction, we find the trap vein has turned also, and that it treads along the shore to near Ascog, where it is lost in the sea. This strikingly beautiful vein, which on either side of Bognay Point maintains the accurate parallelism of a railroad, which it very much resembles, is repeatedly intersected at right angles by other veins, which run up from the sea through the conglomerate masses of the raised beach; and probably, as in one instance we have observed, crop out on the heights of the superincumbent sandstone. The interest of these phenomena will be understood by the ordinary reader to consist in the curious conjunction of the aqueous and igneous agencies, and in the obvious fact that these veins must have been discharged by volcanic influence, through the stratified rocks and raised beaches, at a period subsequent to their deposition. As we proceed southward, and near to Ascog, the grey or whitish appearance of the rocks on the shore indicates a small irregular bed of limestone, the boundaries of which graduate into the contiguous rocks; from which, indeed, it is

\* Query:—May not the spot from which the observation was made have risen, which would produce the same effect?

† There was also a third body in the William Wallace steamer.

‡ Handsomely placed at the disposal of the Section by the Proprietors.

scarcely distinguishable. Similar appearances are also common in Arran. A large overlying mass of trap occurs at Ascog, which is the more remarkable as being the repository of a bed of coal, corresponding exactly in its structure and quality to the Arran formation. Onward, the trap may be seen frequently alternating with the sandstone, till, arriving at Kilchattan Bay, we reach the southern portion of the island, and find the trap exclusively. Even the hasty view of these rocks caught from the deck of a steamboat, will convince the least practised observer that there is something interesting, if not peculiar, about their conformation and arrangement. They are disposed in ridges and prolonged valleys, the whole promontory consisting of a series of beds placed in a north-westerly direction, and dipping to the south-west in an angle of about fifteen degrees. "They present," says McCulloch, "a perfect appearance of parallel stratification; their abrupt edges declining from the perpendicular in an angle equal to that of their dip, and often forming high inland cliffs, of greater or less extent, prolonged on the line of their bearing. Among the numerous instances of apparent stratification in trap which have occurred in the course of this survey, the present is infinitely the most regular and perfect; since, as far as I could perceive, it does not in any instance betray indications of a disposition different from those of the sandstone in which it lies." These rocks sometimes present a rudely columnar appearance on its abrupt faces, but it is more frequently amorphous. We have here a tolerable view of the outline of the Large Cumbræ, an island four miles east of Bute. The two Cumbræ are a link in the geological chain which connects Bute with the adjoining mainland. The larger of the two is three and a half miles in length by two in breadth. It corresponds in geological structure with the middle (red sandstone) district of Bute, and is chiefly interesting, in a scientific point of view, from the enormous trap-dykes with which it is traversed. The "New Statistical Account" mentions that the more remarkable of these "are two on the east side of the island running nearly parallel, and from five to six hundred yards distant from each other. The one to the north-east measures upwards of forty feet in height, nearly 100 in length, and in mean thickness from ten to twelve feet. The one to the southward is upwards of 200 feet in length, from twelve to fifteen in thickness, and from seventy to eighty feet in height; and, when viewed in a certain direction, exhibits the distant resemblance of a lion crouching; hence it is sometimes called the Lion." These dykes reappear in Ayrshire, and traverse that and the whole of the neighbouring county of Galloway. The zoology and botany of this small island are abundant and interesting. Of Arran itself the narrative observes, not merely does it exhibit every variety of natural scenery, but it presents to geology an epitome of the structure of the whole globe. Arran is the world of geology in little. As we approach the beautiful bay of Brodick we are close upon the magnificent mountain group of the island. This is the granitic region; and there is a younger and an older granite in Arran, now only laid down in the map for the first time by Mr. Ramey, whose admirable model, sections, and sketches of the island, have brought him so advantageously before the public as a young and promising geologist. Arran should be approached by a summer sunset, and left at sunrise, when the summits of Goatfell ("the Hill of Winds") are tinted with living gold—were it only to

contrast the glistering light of its bold and serrated peaks with the lurid, superstitious twilight reposing upon its flanks, which is only to be witnessed in the alpine scenery of the Highlands, and adequately described by the pencil. The mountain-group, with Goatfell "towering above the rest," to borrow the characteristic simile of the writer of the "Statistical Account," "like a proud Highland chief surrounded by the cadets of his clan," present themselves to the beholder in their full dimensions from base to summit. They look from a distance as if in the act of springing from the depths of the sea—upheaving their giant bulks of rugged and spiry granite against the clouds, and thence descending in faces of bare rock, unrelieved by the slightest shade of vegetable green, sheer down into those yawning corries and glens, which, seen from afar, resemble the mysterious gorges and masses of impenetrable shade which the telescope describes on the surface of the moon. "It is in Glen Sannox, above all," says McCulloch, "that the effects arising from magnitude of dimension, combined with breadth of forms, and with simplicity of composition and of colouring, are most strongly felt." "The effect of silence," he adds in a note, "as a source of the sublime, is most strongly felt in these situations, as on the summit of the mountain. It is the silence of that which is seen, but is not heard, the fall of the foaming torrent, the business of the world below, too distant to reach the ear, that convey the impression. It is the silence of expectation amid the vastness of dimension, and the appearance of power. It is like that awful moment which precedes the thunder of the volcano." The shores exhibit an endless profusion of exquisite maritime views, now projecting in bold headlands and cliffs, now receding in wave-worn caverns and tranquil bays. The varied beaches are overhung with the wildest vegetation, and old ivy clings to the trees and cliffs, "all green and wildly fresh without, though worn and grey beneath." The bay of Brodick, with its animated hamlet, and retiring upon the romantic valleys of Glenrosa, Glensheraig, and Glencloy, presents a picture of delightful peace, simplicity, and loveliness; and the land-locked bay of Lamash, with the Holy Isle rising 900 feet at its mouth, and the pretty village curving along the beach, possesses capacity for the whole fleet of the empire riding in security. Every part of the island is characterised more or less by scenes of grandeur and sublimity, or of calm and romantic beauty. The first detailed description of the geology of Arran was given by Professor Jameson, who has been succeeded by Necker, Headrick, McCulloch, Sedgwick, Murchison, and Messrs. Oenhalisen and Dechen, two scientific Germans. It is, of course, impossible to give even an outline of the geological structure of an island such as Arran, representing, as may be truly said, all the mineralogical features of the globe. The Flambeau party approached the island near the detached sandstone block called the Cock, at the western extremity, and sailing southward along the shore had an opportunity of seeing the series of the coal measures. At Seriden they witnessed the great phenomenon of the "fallen rocks," the effect of an avalanche of a large portion of the mountain which has rolled down upon the shore. The rock is chiefly of red sandstone conglomerate, which here occupies an immense track upon the shore, and extends to a great height up the hill. They next observed the profuse variety of the secondary strata that succeed southward till they

reach Corry. Here they landed at a fine natural harbour; and armed, the geologists with hammers and bags, the botanists with vascu-lums, and a few of both arrayed in nondescript costume, sallied forth, to the no small astonishment of the natives, in quest of their respective objects of research. The first point of interest was the great lime-quarry of Corry, where all who chose collected specimens of the terebratulæ and productæ, which abound here in enormous quantities, resting in beds resembling those of oysters, in the position they must have occupied when upheaved from the sea, and of the madreporites which occur in smaller quantities. Here the party divided, about eighty commencing the ascent of the lofty Goatfell, the remainder penetrating Glen Sannox. The pull up the mountain from the point where they started was one of great labour, and the lighter men had for once the advantage of robust fellows, who, shouting in vain for mountain-dew, gave up the ascent in breathless despair. A haze rested upon the surrounding coast, which in a great measure obscured the commanding view from the summit, although the hill itself was without a cloud, and the prospect immediately around the island was extremely fine. For a general survey of the geological features of the island it was abundantly sufficient, and amply rewarded the toils of the party. Those who sailed by the Sir William Wallace made an easier ascent from a different point, and were met in their descent by those of the Flambeau. The surprise and delight of the strangers were boundless when they attained the summit, and found themselves as it were upon the edge of a crater of some Polynesian volcano; alike overwhelming by the vast dimensions of its circumference, its alpine altitude, and the yawning and seemingly fathomless profound in the gorges and valleys below. Here Dr. Nichol pointed out the geological characteristics of the island, so far as they could be discovered from such a position. His knowledge of the district being intimate and extensive, the absence of any of the great geologists was only regretted by himself; and three cheers, awakening echoes in the cliffs, testified to the pleasure the gentlemen derived from his peripatetic lectures. Numerous veins were observed of the finer-grained, and more recent granite, projected through the old and coarse-grained granite of which the group consists; and many specimens, with the two in conjunction, yielded to the hammers of the gentlemen of the "Chip-away tribe." The more recent granite bursts out in mass in another part of the group. The junction of the granite and schistose rocks, flanking the mountain, also presented an object of interest. Huge veins of trap, which traverse the strata in the lower part of the island, were here pointed out, projecting through the granite ridges of the adjacent mountains, and running from one hill to another. One of these veins, of immense size, was shewn to have suffered so much from denudation as to have left a deep cleft in the summit of the mountain. The divided parties were reunited at Brodick harbour, where they went on board pretty well appeased for dinner; and the botanists and geologists having, by common consent, agreed to merge themselves into one great Gastronomical Section, the vessel took the route to Glasgow while they discussed the substantial business of the meeting. The Flambeau reached the Broomielaw at eleven o'clock.

Having disposed of the preliminary and contemporary history of the memorable excursion

to Arran, we must, in justice and gratitude, devote a few lines of description to that division of it of which we may say *quorum pars sumus*. It was one of those golden days to be marked with a white stone. Nature was dressed in her brightest smiles; a lovely sky above, and a lovely landscape below,—of river, littoral, glen, and mountain, of almost every form in which these various beauties can present themselves to the eye and imagination. The pellucid water, fathoms deep, so pure, as it lay in still repose under the sunny ray, that the fringing sea-weeds,—green, purple, and brown,—the many-tinged rocks and shining stones at the bottom, as well as the fanciful medusæ as they swam around, expanding into full-blown tulips or closing into globular buds, with their tentacula now coiled up, and now navigating them like the oars of a Cleopatra's galley, seemed altogether a fairy vision. Never did we witness such submarine grottoes, nor could we have supposed aught so dazzling and yet so calm: a picture of common things, the humble creations of sea and shore, so blended together in indescribable brilliancy. But before we reached these charms we had to taste the effects of human art. At seven o'clock we started in a railway train, liberally assigned by the proprietors for the conveyance of the party, about sixty in number, to Ardrossan, on the banks of Clyde, opposite to Arran. Away went the iron horse puffing and snorting, as if proud of a freight of science from which he sprang. With excellent lungs, he hardly needed a second wind to accomplish the distance in good time; and the philosophers and their companions were speedily uncared on the strand; having, however, been subjected to the passing gaze of crowds assembled at every station,\* where they had taken in or discharged other passengers. We then found that our party was rich in men who could make it both profitable and pleasant; Mr. Murchison, Dr. Buckland, Mr. Delabèche, Professor Johnston, Mr. Milne, Mr. Strickland, and other able geologists, appearing in the front ranks. The Duke of St. Alban's, Lord Sandon, Mr. Wood, Professor Miller, &c., were among the less geological personages; and M. Agassiz joined us, and the distinguished foreigners who accompanied us, when we landed at Brodick.

At Ardrossan there was a glorious scramble for a breakfast, such as it was; for the innkeepers and their tails seemed to be sore afraid of the people with the hummers and bags, as if they had come to knock their brains out (?) and carry them away. By dint of clamour, however, hunger was appeased by such cold meats as could be hurried up; and we were soon on board of the steamer to cross the Clyde, in despite of the outcry of a waiter or two, who accused some of us of not having paid the *twa shillings for déjeûné*. Our consciences being clear, we record this fact against whom it may concern; for though we dare to say the payment generally was quite sufficient for the provision, it may be injurious to individual geologists hereafter to have it believed that they eat and run away. Mr. Murchison, too, mentioned the matter as we landed on our return; but it produced no shillings,—only a laugh.

From Ardrossan, with, we believe, maledictions on our heads which fell harmless and ineffectual, we ascended the river towards the more northern part of the island, to afford Mr. Murchison an opportunity of pointing out

\* This was very conspicuous at Dalry, where the crowd upon the bridge and parapets along the train-way, in Highland costumes and attitudes, had a striking and picturesque appearance. The ruins of Kilwinning also presented a fine object.

the position of the stratified rocks: we then coasted along by the vale of Sannox, where we passed the anticlinal axis, and immediately found them inclined in the opposite direction. Such a lesson in geology could, perhaps, be read nowhere else so visibly and clearly on the face of the globe. In the centre of the island rises the granite mountain, whose highest serrated top is called the Goatfell; and on either side the strata of the same rocks, which it has disturbed and upheaved as it burst in molten fires from the bowels of the earth, are thrown into almost vertical or highly angular forms, dipping on the one hand to the north, and on the other to the south. You distinctly see that these quondam plains of various deposits of the tertiary period must have been disrupted and thrown to the right and left in every direction by the more recent intrusion. And the newer granite, too, noticed by Mr. Ramsay, demonstrates that this grand and terrible phenomenon must have occurred at comparatively a very modern geological epoch. In short, the operation of the igneous upon the stratified rocks is admirably exemplified; and the theory, in this respect, confirmed beyond the possibility of question. Between Brodick Bay and the Holy Island, two or three adventurous puntfells landed, to examine another proof of this formation in a singular dyke of pitchstone (resembling obsidian), which has evidently forced its liquid and burning way through the red sandstone, and converted that material by induration, where it came into contact with its fiery mass, both above and below, into a compact material, quite different from the immediately adjacent portions of the same body.

About three o'clock we landed at Brodick Bay, and were received by the Marquess of Douglas with the grace and courtesy of a princely gentleman, and the hospitality of a Highland chief. With Lord Ossulston and Mr. Oswald to support him as croupiers, his lordship did the honours of the Castle in a manner at once so kindly and so refined, that it made a strong impression upon the least observant of his guests; and we have pleasure in recording a circumstance which added so gratifying a zest even to the high enjoyments of a day rarely to be equalled in the mixed pursuits of life. An hour fleetest like a minute in paying due attention to the results of the noble Marquess and his friends' natural history and ornithological pursuits, displayed in the forms of venison and grouse; to the renewed study of which, under their changed aspects, the geologists, with appetites improved by exercise and air after an Ardrossan breakfast, were well inclined to transfer their regards from shale, mica slate, old red sandstone, and trap or whinstone dykes. Nor ought the champagne and hock to be forgotten; nor the speeches, judiciously and gracefully acknowledged by our host; nor the piper, who, having played us up to the Castle, was in little more than an hour called upon to play us "back again."

Nor was the return impaired by the indulgence in this lively episode. On the contrary, it gave new spirit to the succeeding scene. The sun was descending in a blaze of crimson light upon the Goatfell, when Professor Johnston was pressed to give a lecture upon the travel of the day, and the connexion between chemistry and geology, which the glowing features around exhibited to our view. And we never listened to an explanation in which the great truths of science were more eloquently (in some parts sublimely) illustrated than by the learned Professor, who was inspired beyond

the retort and crucible by the resplendent character of all Nature around. After a good-humoured exordium on the slantitudinal inclination of the upheaved strata by the torsification of the central granite, the learned Professor stated that all these rocks, various and different as they were, consisted but of three simple substances,\* viz. *Silica, Alumina, and Lime*. As these entered into compounds in different proportions, they gave us every variety of matter upon which the geologist founded his observations; and as they were acted upon by heat or atmospheric influence their structure became changed, and we could readily trace that influence upon their constituent parts. What he could do in his laboratory, Nature only did on the largest scale. Thus, if he applied intense heat to sandstone its character was not destroyed, and it only became a little less stratified or laminated; but it never melted. Again, if he applied fervent heat to the clay rocks, the effect was still less apparent: they did not alter even in form. And, lastly, if he applied the heat to lime, it entirely changed; it was converted into quick-lime: and, if exposed to a yet fiercer degree of heat, in a gun barrel (for instance), or closed vessel, it was turned into marble. Such were the effects of heat, separately, upon sand, which was essentially silica; upon clay, which was essentially alumina; and upon lime. But if the three were exposed to heat and fused together, an entirely new substance was formed, and that substance was granite. And here was the grand work of Nature of which he had spoken. She applied her internal fires to the matters of which the stratified crust of the globe was composed, and out of the furnaces uprose the boiling and resistless floods of granite, which, when gradually cooled, presented the wildly dark-serrated cliffs which, if they turned their eyes to the Goatfell, they would now see beaming with the light of the sun before them. "Happy are we," exclaimed the learned Professor, in an animated strain,— "happy are we who live in days like this, when we can luxuriate in the contemplation of these splendid objects, and witness the peaceful descent of that glorious luminary upon the glowing hills and lovely glens of Arran! How different the time when that very Goatfell was bursting from its bounds in the burning caldron below, upheaving these ridges from their levels, and scattering destruction on every side! We are, indeed, given to inhabit the earth when terror and dismay have been expended, and intellect can be nobly employed in endeavouring to account for the ruins now converted into scenes of abundance and tranquillity. And again we see Nature at work in reconverting her materials. By the action of water and air upon that mass of granite, it is resolved into its original component parts; and being washed or crumbled down to the valleys or shores of the sea, once more takes up its position in strata of silica, alumina, or lime." Much more was delivered in this fine discourse, which truly made a Geological Section worth attending; but our memory, which has failed us much in endeavouring to recollect Mr. Johnston's admirable language and expressions, will not enable us to follow him farther.

We shall only add another geological description of Arran (amusing, if not sublime), which we heard from an inhabitant of the island, near whom we happened to be seated at the Brodick Castle entertainment:—

"Our island (said he), according to the best information which has been handed down to

\* He obtained from going into more detailed views.

us, was thus made:—The Almighty, having formed the yearth, just threw the riddlings into the sea, and so made Arran!!!"

#### SECTION D.—Zoology and Natural History.

##### Papers and Communications.

1. Sir T. Phillips, 'Notice of a Remarkable Root of a Beech-tree.'
2. Professor Robb, 'Remarks on an Anomalous Form of the Plum observed, in the Gardens of New Brunswick.'
3. Mr. Wilson, to exhibit a series of Specimens illustrative of Mr. Shaw's 'Observations on the Development of the Salmon.'
4. Mr. Adair, to exhibit a Specimen of the *Patella Anchyloides*.

Sir William Jardine in the chair.—The Chairman exhibited a specimen, which had been sent by Sir Thomas Phillips, of the root of a beech-tree, which had been reduced to a fibrous state by having grown for a long period in water. It was stated that during the period of its immersion it had absorbed a large tankful of water. Dr. Neill said that a similar specimen, varying slightly in appearance from that now produced, had been sent to him by Mr. Reddeek, of Falkirk, and that in both instances the spongioses were acicular.

Dr. Arnott observed, that roots in water were terminated by aciculae, and in the earth by knobs. On the motion of Dr. Arnott, it was agreed to send the specimen to the Botanical Museum.

The Secretary read the paper No. 2, 'On the Anomalous Form of the Plum, observed in the Gardens of New Brunswick,' by Professor Robb, of that University. Drawings of the fruit were exhibited. The peculiarity of form had been considered to have been produced by insects, but Professor Robb, from close observation, had every reason to believe that the cold winds and heavy rains during the flowering season had caused the anomalous form.

Dr. Arnott differed from the author, in considering that the effect had been produced by insects; he had seen the anomalous form so produced. The effect of excessive moisture, he observed, was a profuse development of leaves. Dr. Lankester mentioned several cases of abnormal development of leaves from the deposition, in the tissues, of the ova of insects.

Mr. James Wilson exhibited a series of specimens illustrative of Mr. Shaw's 'Observations on the Development of the Salmon' (No. 3.) Mr. Wilson stated, that having devoted his attention to the subject, he had now become satisfied of the accuracy of Mr. Shaw's views, already published in the fourteenth volume of the "Transactions" of the Royal Society of Edinburgh. He then proceeded to read the novel portion of Mr. Shaw's interesting paper, detailing the mode and results of his experiments, and illustrating them by the specimens, which were left in the Section for the inspection of members. The result obtained is, that the parr is one form of the fry of the salmon. The Chairman was quite satisfied with the experiments of Mr. Shaw, the *modus operandi* of which he had witnessed, and he considered the question of the relation of the parr settled. Dr. Lankester asked, whether any structural difference had been observed between different individuals of the salmon species, with a view of throwing light on a difficulty he had experienced in distinguishing two species of bream, *Abramis brama*, and *A. blicca*. If there had, the difference in the structure and relative size of the parts of these hitherto believed two species of bream, would lead him to think the *A. blicca* was only an early stage of growth of the *A. brama*. The difference of structure in the bream observed by Dr. Lankester related principally to the fins; and Mr. Forbes remarked

that the fins, the most to be depended upon, distinguished the species; and where they did not afford permanent characteristics, they must be the exception to the rule.

Mr. Adair exhibited a number of shells from Lough Strangford, in County Down, Ireland; also the *Patella Anchyloides*, found on the Isle of Arran, the only specimen known to exist in Scotland or England.

Mr. Forbes said it was not a patella, but a lottia; or rather, it was a shell of the former inhabited by a species of the latter.

#### SECTION E.—Medical. Papers and Communications.

1. Mr. James Douglas, 'On Dislocation of the Ankle.'
2. Mr. John Dunn, 'On the Vital Statistics of Scarborough.'
3. Dr. Henry Lonsdale, 'On Exostoses.'
4. Sir David Dickson. Several cases.

Dr. James Watson, President, in the chair.—The first paper read was 'On Blindness, produced by Sulphuric Acid,' by Robert Dundas Thomson, M.D., Physician to the Blenheim Street Dispensary and Infirmary for Diseases of the Skin, London. The author in this paper gave an account of a case which lately appeared at the Central Criminal Court. A woman, in a fit of passion, threw a quantity of sulphuric acid upon the face of a cabmaster, and when the author visited him professionally soon after, he found the vision of his right eye destroyed. On making accurate inquiry, it appeared that the acid remained in contact with the eye for two minutes before the unfortunate sufferer could obtain some water to wash off the deleterious agent. It occurred to the author, from this statement, that the agency of the acid could not have extended to any considerable depth. The structure of the cornea, the object injured, also strengthened this opinion. He therefore instituted a series of experiments, the result of which has proved of the most satisfactory character. He found that when the common oil of vitriol is brought in contact with the dead eye, it produces a milkiness, gradually an opalescence, and in the course of two minutes complete opalescence or destruction of vision. The cause of this is the formation of a false membrane, by the agency of the oil of vitriol, upon the organised albumen of the cornea. But the most interesting fact is, that the membrane can be readily separated from the entire portion of the cornea by means of a sharp-pointed knife. So that the author has introduced into practice a most important new operation, simple of execution, and one which cannot fail to restore the vision of those who have been so unfortunate as to be deprived of their eyesight by the agency of sulphuric acid. The author's experiments threw much light also on the formation of false membranes, as in croup, for which he suggested the simple remedy of neutralising, by means of ammonia, the acid secreted by the mucous membrane of the windpipe. The author also suggested that his results might lead the way to further inquiries into those forms of blindness which are produced by deposition of albumen, and on various opacities of the cornea: the capacity of cure depending on the relative position of the deposited matter to the external surface of the cornea.

Mr. James Douglas read a paper 'On Dislocations of the Ankle, forward and backward.' He shewed a preparation of the former dislocation, from which it appeared that it was accompanied with fracture, and that the displacement was not so far forward as stated by Sir A. Cooper; also a preparation of an injury which was supposed to have been a dislocation backward, but turned out, on dissection, to be

a fracture; and contended that there is no such thing as dislocation backwards. He also exhibited casts of two limbs taken before dissection.—Professor A. Buchanan concurred with Mr. Douglas, and stated that he had seen a similar case a few days ago.

Mr. Douglas also shewed a portion of a skull in which the hole made by the operation of trepanning had become closed with bone, which had hitherto been denied.

A paper by Mr. Dunn was read, 'On the Vital Statistics of Scarborough.'

Several cases were read, transmitted by Sir David Dickson, from the Naval Hospital.

#### SECTION F.—Statistics. Papers and Communications.

1. Mr. Alexander Watt, 'Comparative View of the Vital Statistics of Edinburgh and Glasgow during the year 1839; with Remarks on the Sanitary Condition of Large Towns, and on the Present State of the Registers of Births, Marriages, and Deaths in Scotland.'
2. Dr. Alcorn, 'On Excess of Population, and on Emigration as a Remedy, especially in Reference to the Highlands and Islands of Scotland.'
3. Mr. Leatham, 'Statement relative to the Bill Circulation of Great Britain and Ireland.'
4. Mr. Bentley, 'On the State of Education and the State of Crime in England and Scotland (Counties in England contrasted with each other).'

[The statistical papers run to such considerable length, that we are necessitated to select such as suit our space, not in the least attending to order or importance: those reserved will appear in future numbers.]

Professor Ramsay, in the absence of Dr. Alcorn, read a paper by that gentleman, 'On Excess of Population, and on Emigration as a Remedy, especially in reference to the Highlands of Scotland.'

Mr. Leatham, a banker from Yorkshire, delivered a most important 'Statement on the Amount of Bill Circulation in Great Britain and Ireland' (No. 3). The subject of the currency, he observed, was one of very great importance, and it was in a state of great darkness; this was not to be wondered at, when men had never taken into account an element greater by four times than all the rest which it involved—he meant the bill currency. Some years ago, a friend and himself were sorry to see disappear from circulation the small bills of exchange, because they considered that, next to gold, these bills were the soundest part of the currency, as they were drawn for a limited period, and upon bankers. They had since got a return, moved for in the House of Commons, of the number of stamps issued during a given number of years, with a view to shew the falling off in the revenue, in consequence of the duty which had been laid on stamps. The subject had been lost sight of; but the thought struck him that one good thing could be got out of it; they could ascertain the amount of the bill circulation of the country. For this purpose he took into consideration the sums which the stamps issued would bear, and, in doing so, fixed upon the medium; for, suppose a stamp allowed an advance of 50*l.* on a bill, he took it at half the amount. He happened, when in conversation with Lord Lansdowne on the subject, to mention the extent of our bill circulation, and he observed that he was perfectly ashamed of himself; for he had been talking of the currency all his life, and had always left out of view that most important item the bill currency. Mr. L. then proceeded to state, that he got Lord Morpeth to move for a return of the number of stamps for five years, from 1835 to 1839 inclusive. Having got this return, he took the medium amount which the stamps would carry; his next inquiry was, What was the mean average date of the bills? and he found them, by a

reference to his own book, to be three months. He went to London and made inquiry of some of the principal brokers, and found that three months with them also was the average date of the bills. He then took the whole stamps for a year, and divided them by four, which gave him the amount of the bill stamps circulated at one time. His next step was to get at the foreign bills circulated in this country, and he found that they amounted to one-fifth of our own; but, to be under the mark, he took it at one-sixth. Mr. Leatham then read from a Table an account of the sums created by bill stamps for Great Britain in the years 1815, 1824, 1825, and the last half-year of 1826, and first half-year of 1827; also the sums created by Irish and foreign bills; and the amount in circulation at one time during the same years. The following is the total amount of these bills in circulation during the years mentioned:—

1815 .....	£649,921,163
1824 .....	316,362,788
1825 .....	354,405,293
Last half of 1826, and first half of 1827 .....	282,222,305
<i>Average Amount out at one time.</i>	
1815 .....	£162,480,290
1824 .....	79,690,035
1825 .....	88,601,323
Last half of 1826, and first half of 1827 .....	70,555,576

*The following is the Total Amount in Circulation during the following Five Years.*

1835 .....	£405,403,051
1836 .....	485,943,473
1837 .....	455,084,445
1838 .....	465,514,041
1839 .....	528,493,842
<i>Average Amount out at one time.</i>	
1835 .....	£101,350,762
1836 .....	121,485,668
1837 .....	113,771,111
1838 .....	116,376,000
1839 .....	132,123,460

Mr. L. then proceeded to make a variety of remarks on the importance of a well-regulated currency, and observed that the great fault hitherto had been that the currency question was chiefly treated by theoretical and not by practical men.

The Chairman proposed thanks to Mr. Leatham for the invaluable statements he had made, and expressed his astonishment at the amount of bill circulation, which, upon evidence incontrovertible, he had shewn was in existence. It was a thing of which he had no conception. A valuable discussion followed, and the thanks of the Section were given to Mr. Leatham.

#### SECTION G.—Mechanics. Papers and Communications.

1. Mr. Dick, 'On an Improved Railway Wheel.'
2. Mr. Jeffrey, 'A New Hydraulic Apparatus.'
3. Mr. Smith, 'Drainage of Railway Embankments and Slopes.'
4. Mr. Russell, 'Additional Observations on Proportion of Power to Tonnage in Sea-going Steamers.'
5. Mr. Mallet, 'On the Action of Air and Water on Iron.'
6. Mr. Grimes, 'On Dunnet's Rockets for Preserving Lives in case of Shipwreck.'
7. Dr. Wallace, 'On Arches.'
8. Mr. Alexander, 'On an Electro-Magnetic Telegraph.'
9. Mr. Hawkins, 'On Rengeley's Safety Rotative Railway.'

Sir John Robison in the chair.—Mr. Dick read a paper 'On a New Railway Wheel,' which was illustrated by diagrams. It may be made of cast or wrought iron, and the channels are filled with wood; its advantages are, that it works much easier than those commonly in use, is less expensive, and can be easily repaired. It had been in operation for some time on the St. Helen's Railway, bearing daily five tons in weight, and was positively in better order than it was on the first day it was brought into operation. On the Kingston and Dublin Railway the sleepers were originally composed

of granite, but the tremulous motion was so great that they had to be changed to wood; now, had this wheel been in use, all this disagreeable motion complained of would have been obviated, and a large expenditure saved. It worked remarkably smooth, especially in wet weather, and the fastenings of the sleepers were not so much worn as by the present wheels.

Mr. Jeffrey called the attention of the Section to 'A New Hydraulic Apparatus.' Its principal properties were simplicity and cheapness; and each of the buckets employed would carry one hundred weight and a half of water. His attention had been called to the subject from observing the clumsy mode in which water was drawn, for the purpose of irrigation, in certain districts of India. Mr. Smith, of Deanston, observed that it was a decided improvement upon the old plan of the chain-bucket.

Mr. Smith, of Deanston, then submitted to the Section a new and improved mode of 'Draining Railway Slopes and Embankments.'

Mr. Scott Russell read an interesting paper, with explanatory deductions, being 'Observations on the Proportion of Steam-power Tonnage;' these were additional observations to those contained in a paper on the same subject, which had been submitted to last meeting of the Association. His object was to define the exact proportion of power to tonnage, which would be most economical in a sea-going steamer from the one end of the year to the other. The result was reached by taking the average, and allowing for the time consumed by favourable voyages in good weather, and bad voyages in rough weather.

He found that large vessels, reckoning for a whole year, consumed in proportion a less quantity of fuel than those which were smaller; this was an extraordinary result, considering the velocity of large steamers, and the disadvantages under which they laboured in bad weather. The rule to obtain the best proportion of power to tonnage in a given vessel was this:—Suppose they should know the distance between a port in this country and a certain port in America, and that a vessel took so much time, and consumed a certain quantity of fuel in making the voyage in good weather, and took another period of time and a different quantity of fuel in bad weather. Then, having ascertained these, from the square of the velocity of this vessel in good weather subtract the square of the velocity of the same vessel in the worst weather, divide the difference of these two by the square of the velocity in good weather, and the quotient, being multiplied into double the horses' power of the said vessel, will give the power requisite to propel her in the same circumstances with the smallest quantity of fuel. "Let us take," said he, "a transatlantic steamer, with 1 horse power to 4 tons—her bad voyage being 22 days, and her good 14 days; if we were about to build such a vessel, should we continue at the rate of 1 horse power to 4 tons, or should we alter it? Suppose her to be of 600 tons of actual horse power, then should we increase or diminish it? The rule I have laid down would say that her power ought to be increased in the proportion of 12 to 10, or 6 to 5: that is to say, the engines of 500 horse power ought to be made of 600. By adding the hundred the following results will follow:—The vessel of less power, by this formula, will burn 30 tons of coal per day, and in good weather do the distance in 14 days, burning in all 420 tons of coal. Her bad-weather voyage will be 22 days, burning 660 tons of coal—still at 30 tons a-day. The

vessel of greater power would burn 36 tons of coal per day, and make her voyage in 12½ days, burning in all 468 tons. This was a loss of 48 tons at first sight; but it was only an apparent loss. For let us come to the adverse weather, and instead of taking 22 days to complete her voyage, she will do it in 17½ days, burning 630 tons of coal; so that in this view of the case she gains 4½ days in point of speed, and burns 30 tons less of coal than the vessel of 100 tons less power. But then it may be said, that this is only one voyage, and this vessel will have more coal in the year than the other. They must, however, remember that no one knew when the bad weather would come, and she must always carry a quantity of coal prepared for it." Mr. R. then reasoned at some length in favour of his views from the deductions he had laid down. Mr. Fairbairn spoke briefly on the point. He had been in the Mediterranean last year, and was sorry to see the English vessels so much deficient in power. The French steamer passed them by two miles an hour. He was an advocate for increased power. After a few further remarks the subject dropped.

Mr. Mallet gave in some explanation 'On the Action of Air and Water on Iron.'

Mr. Vignoles read a paper by Mr. Grimes, 'On Dunnet's Rockets for Preserving Lives in Case of Shipwreck.'

Dr. Wallace read a paper 'On Arches,' with explanatory drawings.

Mr. Alexander explained to the Section his 'Electro-Magnetic Telegraph,' exhibited in the Model Room, and which we examined with much interest.

It is intended to illustrate, in the most simple and distinct manner, the plan published by Mr. Alexander in May 1837, for "An Instantaneous Telegraphic Communication betwixt Edinburgh and London, by means of Electric or Voltaic Currents transmitted through Metallic Conductors under ground." The plan is proposed to be carried into execution by the application of certain well-established scientific principles, viz. 1st. That the magnetic needle, when supported in such a manner as to allow it to have entire freedom of motion in a horizontal plane (as is the case in the common mariner's compass), tends to assume a position directed nearly north and south. 2d. That if a metallic wire, having one end attached to one of the poles of a voltaic battery, be placed in a certain position near the magnetic needle, the latter ceases to point north and south, and deflects or turns towards the east or west the instant that the other end of the wire is connected with the other pole of the battery. 3d. That although the wire uniting the two poles of the battery be many miles in length, the electric or voltaic current is transmitted instantaneously through the whole length of the wire. The model is contained in a mahogany case or frame, six feet long, two feet wide, and three and a half feet high. The end of the case, intended to face the north, is composed of a wooden board or tablet coloured black, with the twenty-six letters of the alphabet, a comma, a semicolon, a full point, and an asterisk, shewn on white enamel, at equal distances, in six rows or tiers. The tablet is protected by a sheet of plate-glass, and the top or lid of the case is also of glass, for more easy inspection of the interior. Behind the tablet are placed (also in six rows, or tiers) thirty steel magnets, about two inches long, poised on their centres, so as to admit of their assuming their natural position in the magnetic meridian, and thus having their north poles pointed to the back of the tablet. On the

north pole of each of the thirty magnets a small piece of brass wire is fixed, protruding through a slit or aperture in the tablet; and from the point of this brass wire a thin piece of brass, of about one half-inch square, coloured black outside, is suspended. Each of these thirty pieces of brass, when the needles are in their natural direction of north and south, conceal or veil one of the letters or points marked on the tablet; and, in this position, the observer of the tablet perceives nothing but one uniform black surface. Each of the magnets is poised within a coil of several convolutions of copper-wire, and a galvanometer is thus formed. At the other, or south end of the model, is a horizontal line of thirty wooden keys, resembling the keys of a pianoforte, and on these keys are marked the twenty-six letters of the alphabet, a comma, a semicolon, a full point, and asterisk, in the same manner as on the tablet. Thirty insulated copper wires traverse the model from the keys to the galvanometers, with both of which they are connected. Each galvanometer is also connected by an insulated wire, about three inches in length, with a transverse copper rod, extending from one side of the model to the other. There are six such transverse rods placed horizontally, and at right angles with the six rows, or tiers, of galvanometers. These copper rods are connected by wires with each other; and a thick copper wire traverses the model from the undermost rod to the south end of the model, and is there connected with the copper plate, or positive pole, of a small galvanic battery. In a small trough, or reservoir, extending under the whole length of the line of keys, a small quantity of mercury is deposited; and the zinc plate, or negative pole, of the galvanic battery is connected by a wire with the mercury in the trough. It must be here noticed that the two poles of the galvanic battery are thus connected together by the wires and metallic conductors above described, except in the space that intervenes between the keys and the trough of mercury placed beneath them. It has therefore, in the next place, to be remarked, that thirty pendant platinum wires are attached to the under part of the thirty keys of the model, and that when any key is pressed down with the finger, the pendant platinum wire is immersed in the mercury, and the galvanic circuit, by means of metallic conductors between the two poles (copper and zinc) of the battery completed. The instantaneous effect of the galvanic circuit being so completed, is to cause one of the magnets to deflect towards the west, carrying the small brass veil along with it, and thereby exhibiting on the tablet the same letter of the alphabet, or point, that is marked on the key pressed down. When the finger is taken off the key, it rises, by means of a spring underneath, to its former position on a level with the other keys; and the pendant platinum wire ceasing to be dipped in the mercury, the galvanic circuit is again broken, and the magnet returns to its natural position, and veils the letter that was shewn on the tablet. Hence it follows, that by simply pressing down with the finger any of the keys (precisely in the same manner as the keys of a pianoforte are touched), the same letter that is marked on the key is shewn on the tablet for a sufficient length of time to allow it to be observed by any person watching the motions of the veils on the tablet; and words are thus communicated in rapid succession from the one terminus of the telegraph to the other. When, in the course of a communication, it is wished to indicate a comma, semicolon, or full period, these will be disclosed on the tablet, on the

corresponding key being pressed down; and in order to indicate that the spelling of a word is finished, the key marked with the asterisk may be pressed down, and the asterisk being at the same instant exhibited on the tablet, will shew the observer that the word is completed, and that a new one is about to be spelled. In order either to send or receive a communication by a telegraph of the simple construction proposed, no greater learning would be required than is necessary in reading a common book; and the rapidity with which a communication could be made would be as great as that with which most persons are able to write, or as a compositor is able to set up types. In telegraphing between distant points, the connecting wires would be made to traverse the intermediate space through a tube of wood, or some other material that would protect the wires from external injury; and the wires would of course be separated from each other, by laying them in separate grooves in the tube, or by coating them with some non-conducting substance. The diameter of the tube might be very small; and in order to protect the wires from any atmospheric influence, and the tube itself from violence, it would be best placed under ground. Following out the scientific principles that have been explained, and taking advantage of the mechanical contrivances illustrated by the model, it appears perfectly practicable to the inventor to construct an electro-magnetic telegraph, surpassing all other kinds of telegraphs in respect to the rapidity, facility, and certainty with which every species of communication can be made between points however distant.\*

Mr. Hawkins detailed 'Mr. Rengeley's New Plan of the Safety Rotative Railway,' in which the wheels are proposed to be transferred from the carriage to the road, and the train to be moved by the revolution of the wheels, of which there will be 1760 upon the mile.

#### FRIDAY.—SECTION F.

Dr. Alison proceeded to his 'Illustrations of the Practical Operation of the Scottish System of the Management of the Poor;' but we found it impossible to hear and follow him distinctly, and are, therefore, obliged to the local press for this sketch, which seems to be correct. He was well aware of the restrictions which had been imposed on the discussion of the subject; but he would confine himself to the numerical part of it, which could be properly brought under the notice of the Section. He might remark that the Scottish law differed from the poor-laws not only of England, but, he might say, of almost every country in Europe, in so far as the former was rarely obeyed, while the latter were strictly enforced. By the letter of the Scottish law, the ministers, heritors, or magistrates of burghs, were required to make provision for the poor and to tax the inhabitants for the purpose; but he need not say that the spirit of the law was not carried into effect in any part of Scotland, nor was there any attempt to do so: on the contrary, the relief was small, and found to vary from one halfpenny to 3s. 6d. per week. The cause of this was the peculiarity in the Scotch law, by which the persons, or their representatives, who were called on to pay the tax, had at the same time the power of fixing the amount of funds to be raised, and from their resolutions it might be said that there was no appeal. It should be stated that the reason why the practice was so much at variance with

\* The model is substantially the same as was exhibited before the Society of Arts in Edinburgh three years ago, and gained the honorary medal of that Society.

the law was the belief, on the part of the heritors and others, of the great and formidably evils which would be connected with the proper execution of the law, and therefore the police of only resorting to it in cases of dire emergency. This opinion rested upon two grounds: first, upon its effect on the numbers of the poor; and, second, upon their character. First, it was presumed that if a fixed provision were made for the poor, it would have the effect of vastly increasing their numbers; and, secondly, it would destroy the feeling of independence of those who received it. But it was plain that the *onus probandi* rested with those who did not obey the law; for those arguments would apply equally well to private charity, which would have the same tendency as that attributed to the legal provision. Now, many facts might be quoted to prove that the Scotch system had not had any beneficial effect in decreasing the numbers of the poor; but that, on the contrary, they pressed upon the means of subsistence, and endured privations as painful to human life, as was the case in any country in Europe, where the relief of the poor had law in its favour. Even in country districts this was the case to a considerable degree; but that it was not the case more extensively might be attributed to the residence of landed proprietors who took an interest in the poor, and for the permanence of which there could be, of course, no security; and, second, to the proximity of large towns, where there was an extensive demand for labour, and more charitable assistance. It was only, therefore, by looking into the state of the large towns that the condition of the poor could be duly estimated. It was not the case, as had been more than once stated, that poor families in removing from the country at once became paupers; they came more generally in search of work; but they came in much greater numbers than were needed, and frequently they were partially disabled; and should they afterwards fail to procure employment, or lose it, or become unable to work, they did not return, but almost universally remained to swell the list of those who subsisted by charity. The learned doctor then produced a lengthened body of statistical facts in support of his position, and to prove the vast extent to which the charities of Edinburgh were burdened, not by the poor who claimed that locality as the place of their nativity, but by others who had taken up their residence there in after-life. This was the case, too, in Aberdeen, Dumfries, Dundee, Glasgow, &c.; and in reference to the latter place mentioned, Dr. Perry had stated that only fifteen per cent of those who were admitted to the fever hospital were natives of the city. On the subject of vagrancy, Dr. Alison remarked that it had been a pretty general statement, that the number of vagrants who issued from the towns in summer and spread themselves over the country might be held to compensate for the poor who left the country parishes and took refuge in the cities; but in reply to this, if it were inquired into, it would be found that a very small portion of these vagrants belonged to the towns in which they had taken up their residence. It was no argument to say that many of these persons were of bad character; that which concerned them was not the character of these persons, but that the evil of vagrancy and destitution existed to an excess. The learned gentleman then detailed to the meeting the result of a number of queries which he had addressed to twenty-eight gentlemen in Edinburgh, consisting of ministers, elders, lay visitors, &c.; in a town, he it understood, which was not the seat of a manu-

facturing population, and where, of course, there was little fluctuation. These queries had reference to the state of the poor in various districts of the city, and the replies in every case spoke to the appalling destitution which existed amongst them. In scarcely any case had they permanent employment, and even when employed, their earnings amounted to a perfect pittance; every thing they possessed, whether of clothing or furniture, went to the pawnbroker, until they had nothing left to pawn, and then they were left on the very brink of starvation. Intemperance was proved to have a very small share in causing this wretchedness; it rather arose from circumstances over which the poor had themselves no control, such as age, sickness, want of employment, and the like: and it was further proved, that those who suffered most severely were single females, or widows with orphans, who rarely earned more than from 6d. to 9d. per day in summer, and in winter could not find employment on any terms. The sufferings of this class were said to be such as almost to exceed belief; for months their food was scanty, and one of the ministers stated, that he had known instances of their attending sermon forenoon and afternoon without having broken their fast. Many of them consisted of labourers and decayed tradesmen, who had been unable, even when they could work, to save a shilling, however anxious and temperate they might be; indeed, such was their hard lot, that they had been known to work, when they could procure it, up till within a day or two of their death. Yet these were persons who rarely received any assistance whatever from the poor's funds, and it was a fact worth noting, that this wretched class were most frequently assisted by persons nearly as destitute as themselves. To take one instance, where fifty might be given: there was a close in the Cowgate of Edinburgh where forty-eight families resided, consisting of 168 persons. Of this forty-eight, there were ten widows who did not earn, even when employed, more upon an average than 2s. 6d. a-week; the larger portion of them had only occasional employment; few of them had permanent employment, and some of the men did not earn more than 3s. 6d. by their labours. Their furniture was scanty in the extreme, and sixteen of them had neither furniture nor bedding at all: out of the whole number not more than five could be stated to be of intemperate habits. Of the very small number who received aid from the parish, the allowance did not amount to more than 5d. per week. A widow with only one child did not receive any thing. Under these circumstances the poor were huddled together in great numbers in a single apartment; wretchedness banished every feeling of self-respect,—step by step they sunk into the depths of wretchedness and demoralization; their lean, ill-fed condition rendered them an easy prey to fever, which scarcely ever left them, and their condition altogether was such as to excite alarm in the minds of all. Dr. Alison, at considerable length, endeavoured to prove that fever and disease were, more than any thing else, the consequence of destitution; and that wholesome food, even with want of cleanliness, was much more likely to resist its aggressions than poverty with fresh air and cleanliness. Under these circumstances it was his conviction, that any inquiry into the sanitary condition of the people which did not also include an inquiry into the nature of the provision for the poor, would fail in its proper object. He would recommend an increased provision for the poor,

both to alleviate their sufferings, and for the sake of the other portions of the community. Were such provision given, many of the poor who now burrowed in the large towns would remove to their proper places of settlement. In the cases of destitution for want of employment the workhouse might keep them from starvation, and, should they take fever, they would be prevented from communicating it to others. Ireland had suffered bitterly; Scotland had also suffered much—both infinitely more than England; and he could not doubt that an increased provision for the poor was the only means, under Providence, for alleviating the evil. It had been said that, increase the provision and you increase the evil; but it had subsisted in England for 200 years, and fever amongst the poor there was comparatively rare and light as compared with its ravages in Ireland and Scotland.

A brief discussion followed, in which Mr. Wishaw, Dr. Hannah, and other gentlemen, took part. Dr. A. explained that the assessment was different in different towns. In Edinburgh it was six per cent upon the rental; but the members of the College of Justice were exempt. If the heritors should decline to impose an assessment, the sheriff had no power to interfere; the Court of Session alone could enforce it, and an appeal to this court involved a ruinous expense.

The Lord-Provost's and Magistrates' Dinner went off with great *éclat*. About 200 of the leading members of the Association dined in the Town Hall, the Lord-Provost in the chair.—On either side were the Duke of St. Alban's, the Marquess of Breadalbane, the Marquess of Northampton, Lord Montagu, Lord Greenock, Lord Belhaven, Lord Sandon, Sir J. Robtson, General Tscheffkine, Count de Lisle, Principal Macfarlane, Mr. Agassiz, and Mr. Murchison; whilst the Croupier (Baillie Small) was supported by Sir D. Brewster, Enke the famous astronomer, Sir T. M. Brisbane, Mr. Airy the Astronomer Royal, Dr. Buckland, and other distinguished men. But it is unnecessary to particularise the upper and lower tables; all the ranges between boasted a crowd of eminent individuals, both native and foreign. Mr. M. Lockhart, the county member, Mr. Dewar, one of the members for Glasgow, Sir J. Rennie, Mr. Vigora, M. Jacobi, M. Benckhausen, the consul-general of Russia, Professor Johnston, Mr. Wood, Mr. Colquhoun, and, in short, a roomful of the principal persons who have adorned this meeting. Turtle, venison, champagne, &c. &c., bore witness to the municipal hospitality of Glasgow; and twenty-two toasts called up some fifty speakers, who, in various ways and on various subjects, contributed much to the enjoyment of the day. The Lord-Provost performed the duties of the chair with great ability; and we may truly say that the British Association never concluded a meeting with a more harmonious, brilliant, and triumphant entertainment. Some of the facts and sentiments enounced on the occasion well deserve a record; and we shall endeavour to give it to them in a future number.

#### REVIEWS OF NEW BOOKS.

*The Clandestine Marriage, and The Sisters.*  
By Ellen Wallace. 3 vols. 12mo. London, 1840. Bentley.

We shall be particularly careful what we say of these tales, for we are placed by their fair authoress in "a peculiar position" as a critic of the male gender. After amusing ourselves

with two very readable volumes, containing lively sketches of female character, and, if deficient in what may strictly be called plot, certainly not failing in interest, we arrived at the end of the first tale; and, behold! we found ourselves like some trespasser in a fair domain, abounding with serpentine walks, flowery parterres, and umbrageous shrubberies, who suddenly comes on a notice couched in the plainest terms,—“No dogs or strangers admitted.” Well, we had had our walk, and we felt so little remorse at the trespass, that, taking *The Sisters* for our guide, we reached the end of the third volume. But we put it to any one whether we were not bold in the adventure after such a warning of the property as the following?—“I wrote this book for young women—it is not likely to interest men; I hope they will not read it, since it bears no reference to their feelings or pursuits.” But we have read your book, Miss Wallace, and though we agree with you that it is not a gentleman's book, we can assure gentlemen that they may safely place it in the hands of their female relatives, as containing several goodly warnings to the ladies of the creation. Here is a scene which a self-willed girl, the heroine of the first story, *The Clandestine Marriage*, enacts with a gentleman who has no small share in the narrative. Miss Fanny has made up her mind to take him to a little island on a lake, and, like most young ladies we know, she will have her own way:—

“‘I won't be scolded, sir!’ said Fanny. ‘I am going to row you to the island.’ ‘I shall not let you row,’ said Mr. Mapleton, taking up the oars; ‘you are a great deal too old. Besides I don't choose to let you spoil those pretty little hands with such hard work.’ ‘I will row!’ said Fanny, as they stepped into the boat; ‘so give me the oars.’ ‘No,’ said Mr. Mapleton, who delighted sometimes to tease her. ‘Give me one,’ said she, stretching out her hands. He pretended not to hear her, and began to fix them in the rowlocks. ‘Then look what I will do!’ cried Fanny; and springing up, she stood on the edge of the boat so as almost to upset it: ‘I'll swamp the boat if you don't give me an oar!’ ‘There, then! you little vixen!’ said he. Fanny evinced her gratitude by splashing her companion all over, as soon as she got the oar in her hand. They reached the island, and sat down in the thicket of shrubs. ‘Well, now,’ said Mr. Mapleton, ‘how have you spent your time while I have been away? How goes on Virgil?’ and what do you think of Niebuhr, whom I left you reading?’ ‘Why,’ said Fanny, ‘the very day you left, Mrs. Griffiths called—you know Mrs. Griffiths?—she lives in the white cottage just under the hill, on your road to Copsley.’ ‘And what may she have to do with Virgil?’ ‘Oh, I am coming to him by and by. She called to say that she had a peacock which did her a world of mischief: scratched up her flowers—you know how fond she is of flowers.’ ‘Well,’ ‘Well, but only think! she came to give her peacock to me; that is if I liked it. Oh, I did covet a peacock!’ So I ran out, and she had it packed in her carriage, in a basket with a lid; a great basket, but its tail was so squeezed! I promise you it screamed when we took it out; and now it knows me very well, and I feed it every day. I'll let you feed it to-morrow.’ ‘Thank you.’ ‘And you will be very much surprised to hear how easily I can read Virgil; but I very soon left off reading Niebuhr.’ ‘Why?’ ‘Because he contradicts all the nice old tales which I used to believe and delight in. He has made history so stupid.’ ‘But what if his account be the

true one?' 'Even then, I had rather not know it. There is no charm in ugly truth. Besides, he often contradicts the old story without putting another in its place. Now, something must have happened all that while; and I had rather accept the tradition, than believe the world went to sleep in the interim.' 'But for what purpose do you read history?' 'Oh, that is such a tiresome question; and I know you want me to say, 'To learn the true state of things in other times,' so I shall not say it; and, moreover, I will not read any more of Niebuhr.' Mr. Mapleton, laughed, and promised to send her 'The Seven Champions of Christendom,' since she was so partial to fictitious narrative. Upon this, Fanny very quietly inserted a bunch of tall grasses, that she had gathered, into Mr. Mapleton's crape hat-band; and as he had begun an eloquent panegyric of St. George and the Dragon, he remained unconscious of the honour conferred on him, till he caught a view of his nodding plumes in the water that wound close to the spot where they sat, so he strewed the grass upon Fanny's bright hair, and she threw it back again, laughing and scolding until she was out of breath. 'I don't know how it is,' said Fanny after a pause,—a grave pause, such as often succeeds to a fit of high spirits; 'but when I am with you, I never think about your being such a great barrister as people say you are, but I just say all the nonsense that comes into my head, and when you are gone I wonder at myself.' 'And when I am with you, little witch, I forget all about the courts and tedious cases, and only wish I could scramble about the hills all day long with you, and be a great many years younger, and then——' 'Oh! why younger?' said Fanny. He looked confused, actually. 'Oh! tell me, does nature become less beautiful, less dear to us, as we grow older?' said she, eagerly. 'To some it does,' he replied. 'Men become so engrossed with things of art, that there is no room in the mind for any thing else. The struggle for power or gain so utterly absorbs our faculties.' 'Oh, don't speak as if this was the case with you,' said Fanny. 'Not now,' said he; 'but it has been, for so many years, time wasted, as all time so spent must be.' He seemed deep in thought: Fanny sat silently by him for some time. 'I should so like to ask you one thing,' at last she said. He turned to her with his kind smile. 'Do you find much good in human nature; much in proportion to the ill? It seems to me, who know nothing of life, that there is so little good, even in those people I know, except you and papa, and aunt Parr.' 'You are very young to have come to that conclusion,' said he. 'Young people generally set out in life with an exaggerated idea of the excellence of those persons with whom they come in contact,—that is all the world to them. But many years do not elapse before they meet with some incident that seems to shake the ground under their feet, some utter breach of confidence where they most trusted, or some disclosure of unworthiness that for a time embitters their feelings towards their fellow-creatures. That has been my fate, and, I believe, is the lot of many others. But a further acquaintance with man teaches us that the human character is indeed a 'mingled yarn, of good and ill together,' and that few persons exist whose defects are not largely tempered with amiable or sterling qualities. And time teaches us to look with a lenient eye upon faults from which none are exempt, and to submit to the conditions of our humanity the more readily, as we find that our own deficiencies are

hard to overcome.' 'You must see the worst side of human nature?' said Fanny. 'Very often; the best side sometimes, though, as you shall acknowledge. I will tell you an anecdote I heard a little while ago from a solicitor with whom I am intimate. A young man lately came into the possession of a large estate and fortune—immense, I believe. He had one brother, two or three years younger than himself, who was deformed and sickly. I understand he had always been a neglected child; and as soon as he was old enough, he had been placed in a banker's house; for he had actually nothing, the estates being so rigidly entailed upon the elder son. Well, this deformed youth pined and fretted in the confinement of his new employment, and grew morose and bitter, in the feeling that no one loved or cared for him. His brother was on his travels, and they hardly knew each other by sight. The father dying, the brother was called home to take possession of his great property. As soon as the eldest son reached England, he went to his solicitor, and inquired about his brother, declaring that he was anxious to make over to him all the funded property that was at his own disposal; for that he should then be left rich beyond his desires, and he could not endure that his brother should be engaged in a profession directly opposed to his tastes and his state of health. It was so very large a sum, that the solicitor begged him to pause, to take time, before he decided; but he would not hear of a moment's delay; and as soon as the parchments could be written he set off with the solicitor to his brother's lodgings. They had not met for years.' 'Oh! tell me every word about this.' 'The deformed youth received his brother very coldly at first; but when he spoke to him with so much kindness, he seemed at first surprised, and then very much affected.' 'And when his brother told him of the fortune?' 'He fainted.' 'Oh! but you have not told me half. I want to hear all the particulars.' 'I was not present, and I only heard the outline I have given you.' 'And did you not ask your friend?' 'No. He would have thought me half mad to ask for particulars; or he would have fancied that I meant to write a romance about it.' 'And you know nothing more?' 'Only the name of the man who gave away his money.' 'And that is——' 'There is the dressing-bell,' said Mr. Mapleton, rising. 'I suppose you mean to make a very fine toilet to-day,' said Fanny, 'you seem in such a hurry. Now, do oblige me by not wearing a red velvet waistcoat; I do not care how gentlemen dress, so that they keep clear of red waistcoats. Now, I'll tell you what I mean to wear. A white muslin dress, worked all up the front and round the skirt as deep as that!' (measuring the distance on the border of her silk apron), 'and trimmed with pale blue riband. I wore it once before at a juvenile ball that Mrs. Griffiths gave. People said that I looked exceedingly well in it.' 'You conceited little creature!' said Mr. Mapleton. Fanny seemed to take no notice of this remark, and they went to the boat, which they had left moored in a little creek (if it deserved the name), and fastened to the root of an old oak with a bit of rope. Mr. Mapleton began to untie it. 'Come, make haste, oh! do,' cried Fanny,—'be quick, Mr. Mapleton; I mean to take at least an hour dressing. I do think you are going stone-blind! I'll get you a pair of spectacles when we go in. I know the housekeeper has two pair—she can spare you one. That's not the way! oh! do be quick!' 'Don't, child! you forget me,' said Mr. Mapleton. This

was exactly what Fanny wished to do. As soon as the knot was undone, she watched the right moment, and, with a sudden stroke of one of the oars, she pushed the boat fairly into the stream. It floated fast into the middle of the water—far—farther—quite out of their reach. Well, this is very diverting,' said Mr. Mapleton, watching their receding bark. 'Now, what could induce you, you provoking child! to play me such a trick?' 'Why, I'll tell you,' said Fanny, looking very important; 'people say that you are a very wonderful barrister, and that you can turn and twist a matter this way and that way, and any way but the right: so I wished to see what you would do on any great emergency; and now here is one to try your powers upon. See if you can conjure us two to the other side of the water!'

Referring the curious to the work, as to how they *did* get off the island, premising that it was not by conjuration however, we again commend these tales to all young lady readers.

## MISCELLANEOUS.

*Tyas's Legal Hand-Book: The Law of Bills of Exchange and Promissory Notes.* By a Barrister. Pp. 100. London, 1840. Tyas; Hastings.

VERY useful, we are bound to presume, and a good compendium of the laws as applicable to all incidents and cases connected with these securities. We would, however, venture a piece or two of advice (gratis, and not inferior in value to these 100 pages), viz. to have as little as possible to do with their subjects, and to avoid the "Law" of them altogether.

*The Afflicted Refuge.* Pp. 146. (Edinburgh, Johnstone.)—Prayers for periods of human distress, where only one Refuge can be satisfactorily appealed to.

1. *Optical Questions.* By A. M. Pp. 86.

2. *A New and Literal Translation of the First Book of Herodotus.* By Philomena. Pp. 216.

3. *An Elementary Treatise on Mechanics.* By J. Pendulum. Pp. 107.

4. *Luby's Elements of Geometry, &c.* A new edition. (Dublin, J. J. Ekins.)

These publications, principally intended for the undergraduates of Dublin University, are not undeserving of more extended use. As class-books, analytically arranged, they are well calculated to facilitate and improve the process of instruction. Mr. Luby's volume was originally noticed by us in those terms which made us look with confidence to its reaching new editions.

## ARTS AND SCIENCES.

## BOTANICAL SOCIETY.

FRIDAY, September 4. Mr. D. Cooper, Curator, in the chair.—Announced, a donation of a series of plants from Natal, Southern Africa, comprising upwards of 350 species, collected and presented by Dr. F. Krauss.—Exhibited, by the Chairman, specimens of *Aspidium cristatum*, collected by Mr. S. P. Woodward in July last, by the side of a drain at Fretton Broad, Suffolk; by Mr. T. Sanson, specimens of *Hypnum rugulosum* and *Bryum affine*, from Mr. F. K. Eagle, and first discovered by him at Mildenhall, Suffolk. Also, a specimen of *Schystega pennata*, found by the Rev. C. A. Johns, at Helston, Cornwall. Read, a paper by Mr. T. Sanson, 'On a Monstrosity of *Polypodium commune*,' which exhibited the union of two calyptræ.

Friday, 2d October. Mr. J. E. Gray, President, in the chair.—Specimens of *Aspidium cristatum*, collected on Edgelyd Heath, near Holt, Norfolk, were submitted for inspection.—A paper by Mr. Wallis, 'On the Flora of Essex,' was read. A former communication described the *Orchideæ* of Essex, the present embraces the *Ranunculaceæ*, &c.; and Mr. Wallis intends, by a series from time to time, to elu-

cidate the flora of the county. The descriptive remarks were clear and concise: the series will be an acquisition, and well worthy of imitation and extension to other counties and localities.

#### PARIS LETTER.

Academy of Sciences, Sept. 29, 1840.

SITTING of Sept. 21.—M. Breschet communicated to the Academy some interesting results of experiments 'On the Transmissibility of Hydrophobia and Canine Madness to the Human Species, and to all other Mammifera.' He considered it of importance to distinguish carefully between hydrophobia and canine madness, because the former was a symptom of various fevers, and was not necessarily attended by death; whereas the other was always fatal, but was not always accompanied by hydrophobic symptoms. He had inoculated a dog with the saliva of a patient who died of canine madness, and the animal went raving mad and died. Dogs had bitten, while in a state of madness, asses and horses; and these latter animals had shewn all the symptoms of the same disease, though the horse was not so much affected as the ass. It had been observed by him, that by successively inoculating dogs with the virulent saliva, one from the other, the disease gradually lost its intensity; as, also, that the blood of a rabid dog injected into the blood of one in a sound state of health, had even produced madness. Rabbits and other small animals, as well as birds of various kinds, had been inoculated by M. Magendie and himself with the saliva of a rabid dog, but they shewed no signs of madness though they all died soon after. The period for the rabid symptoms first manifesting themselves after inoculation was from twenty-five to forty days. He had given abundant liquors to a dog in a state of rabid madness, and had even poured them down his throat, the animal shewing no repugnance to it: on the contrary, the dog drank readily.—M. Christol addressed a memoir to the Academy 'On the *Metaxatherium*,' a fossil cetaceous animal of Angers, which, from a mutilated portion of its humerus, Cuvier had considered to be a species of large seal. The *metaxatherium* might be divided into two species, a smaller and a larger one: the former being found in the upper tertiary marine beds of Montpelier, and the latter in the lower tertiary strata of the Charente, and the Maine et Loire.—A second memoir 'On Planetary Movements' was sent in by M. Cauchy.

Academy of Fine Arts.—M. Caristie, the architect, has been elected a member in the room of the late M. Huyot.

Academy of Inscriptions and Belles Lettres.—This body held its annual public sitting on Friday for the solemn distribution of the prizes, the awarding of which we have already noticed. After the ceremony had been gone through, M. Berger de Xivrey read a memoir 'On the Intercourse between the Emperor Manuel Palæologus and France at the Commencement of the Fifteenth Century,' and M. Magnin communicated an interesting paper 'On the Theatre of the Greeks; on the Management, Scenery, Bills, &c. of their Places of Dramatic Representation.'

#### RIUNIONE DEGLI SCIENZIATI ITALIANI. (Italian Scientific Association.)

Turin Meeting, Sept. 18, 1840.

1. *Medical Section.*—Five papers were sent in, on the demand of the President, to compete for the prize offered by Professor Franck, for the best memoir upon the continuance or discontinuance of the doctrines of Hippocrates.—

The discussion on Dr. Linoli's position of the non-reproduction of organic tissue was continued. Professor Gallo produced two fine pathological preparations from the Museum of Turin to prove that the reproduction was possible. Professor Schinn also adduced facts on the same side. Dr. Ruatti, Professor Botto, and Professor Bianchetti, adopted the views of Dr. Linoli. The President declared himself opposed to the doctrine of the reproductive power, and was followed by Professor Pasero on the same side. Professor Schinn replied, and maintained his former opinion.—Dr. Parola read a paper 'On the Use of Bearded Rye in cases of Bronchitis and Phthisis.'—Dr. Nardo expressed a wish that a medico-statistical return should be made to accompany all statistical returns of population, &c.—Dr. Bertolini read a statistical report of the sanatory condition of the prisons of Turin during the last ten years.

2. *Geological Section.*—The discussion on the theory of dolomisation was resumed.—A letter from Professor Agassiz to the Prince de Cambrino e Musignano, 'On Fossil Fishes,' was read.—A memoir, contributed by the Cavaliere Graberg, of Hemsö, 'On the Recent Advance of Geographical Science,' was communicated to the Section. The Cavaliere Dispine read a memoir 'On the Mineral Deposits of the Sardinian States.'

3. *Physical, Chemical, and Mathematical Section.*—Professor Maiocchi communicated the plan of a scientific journal which he was about to establish.—Professors Configliachi, Magg, Porro, and Dr. Maestlin, sent in a notice upon the cases in which the formation of hail takes place in regions of the atmosphere inferior to that in which the temperature is at zero. Professor Belli made some observations on the importance, in all observations made upon hail-storms, of taking account of the time elapsing between the first formation of a cloud and the arrival of the hail-stones at the surface of the earth. Professors Configliachi, Baruffi, Pacinotti, Perego, and Dr. Arella, suggested various methods of examining into the nature of hail-stones, ascertaining their real weight, &c.—Professor Maiocchi sent in a paper 'On a New Electroscope.'—A letter was read from Captain Menabrea, 'On the Importance of Introducing the Theory of Virtual Velocities into all Elementary Works on Mechanics.'—Professor Visnara sent to the Section the result of his observations on a late remarkable thunder-storm at Cremona, and on the good effects of the lightning conductors erected there.

4. *Agronomical and Technological Section.*—A conversation took place on the best method of drying mulberry-leaves for silk-worms, and a commission was appointed to make experiments to that effect.—The Cavaliere Carena presented a packet of carbonised grain, known in Tuscany by the name of *Grano di Certaldo*; and a discussion on its nature ensued.—The Marchese Ridolfi produced a specimen of a poisonous spider, the *Aranea Savi*, found in Tuscany. A memoir 'On the Breeding of Silk-worms' was read by Dr. Ormea.

5. *Botanical and Vegeto-Physiological Section.*—Professor Decandolle read two memoirs: one 'On the Monstrosities resulting from Rupture of the Pericarp,' the other, 'On the Euphorbia with White-spotted Leaves.'—Dr. Giovanni Casaretto gave a highly interesting and animated relation of his scientific travels on the coast of Brazil.—Professor Moris communicated some remarks upon the point whether the *Samolus Valerandi*, L., had been introduced into Italy from Brazil, or whether it was indigenous.—

Professor Decandolle made some remarks upon the geographical botany of Brazil.

6. *Zoological Section.*—Professor Nardo read a paper 'On the Structure and the Integuments of Fish.'—The Marchese Durazzo communicated a notice supplementary to his catalogue of the birds of Liguria.—The Cavaliere Bellingeri offered to demonstrate some singular facts relative to the anatomy of the frog before a commission named by the President.—Dr. De Filippi presented some specimens of a species of rat common in Lombardy, but not generally known to naturalists. Professor Pictet presented another specimen from Switzerland, and M. Selys Longchamps one from France.—On the motion of Professor Gené, it was decided that a commission should be named to decide what species of *rodentia* existed in the Sardinian States.—Dr. De Filippi presented a specimen of a serpent, which he believed to be distinct from the *Rhinechys Agassizii*.—The President read a memoir 'On the *Falco Eleonora* of Gené.'

September 19th.

1. *Medical Section.*—Professor Tiedemann presented the Section with a copy of his work 'On Cowper's Glands.'—The President read a paper of his own, in continuation, of the controversy on the reproduction of animal tissue. He adduced many cases of his own observation, and others from the most celebrated medical authors: he also cited Hunter, Harvey, and other authorities, to prove that inflammation, at a certain point, did produce or reproduce animal tissue.—Professor Patellani produced the brain of an ox which had become petrified: he threw out the suggestion whether animal magnetism, or some powerful affection of the nerves, might not have caused this phenomenon.—Drs. Bianchetti and Pollo returned to the controversy on the reproduction of animal tissue, and adduced instances from the gestation of animals that induced them to differ from the President. Dr. De Michelis, on the contrary, sided with the President.—Dr. Angeline read a paper 'On Egyptian Ophthalmia,' which he considered not to differ in nature from the ophthalmia of other countries, and to be contagious.

2. *Geological Section.*—The Abbate Chamousset communicated some 'Observations on a new Method of treating the Minerals, and especially the Silver, found in Savoy.' He also read a memoir 'On the Formations of Anthracite found in the Micaceous Schists of the same Country.' M. Michelin read to the Section some observations which he had laid before the Geological Society of France relative to the anthracitic deposits of the Alps, and on the calcareous formations associated with them. Professors Sismonda, Balsamo, and Pasini, with the Marchese del Pareto, made observations on these communications.

3. *Physical, Chemical, and Mathematical Section.*—Professor de Cattenei di Momo read a memoir detailing various experiments to shew that calomel is not changed into corrosive sublimate by the action of the alkaline chlorures, which are found in the saliva, or other animal humours. A letter was communicated from Professor Perego, in which he gave an account of the high electric powers acquired by mercury when filtered through different substances.—A discussion on the power of lightning conductors, and the means of improving them, concluded the operations of the day.

4. *Agronomical and Technological Section.*—Professor Moretti gave an historical account of the introduction of the potato into Italy, and

of the actual state of its cultivation. He also read a paper 'On the Importance of a Scientific Agrarian Phraseology in Italy.'—The Conte Villa de Montpascal recommended that an inquiry should be made into the state of the cultivation of the *Murus Mulcaulis* in Italy, and particularly in the neighbourhood of Turin. The President approved of the motion, and two committees were named, one to inspect the neighbourhood of the capital, the other to examine the silk manufactories within the city. The President took the opportunity of mentioning, in terms of praise, the offering of a prize of 10,000 francs by the Society for the Promotion of Industry at Oneglia, for the best method of preserving olives from insects.—The Marchese Ridolfi presented to the Section two new species of grapes, of a strong flavour quite peculiar to themselves.

5. *Botanical Section*.—Dr. Trinetti read an elaborate memoir 'On the formation of Odours in Flowers.'—Professor Rizzo commenced the reading of a paper 'On the Natural History of the Wild Plants of Italy.'

6. *Zoological Section*.—A letter was read from the Marchese Ridolfi, together with a description by Dr. Marchetti, 'On a Species of Toad peculiar to Tuscany, and exceedingly venomous.'—Dr. Nardo communicated some important observations 'On the Cartilaginous Structure of Fishes.'—Professor Pictet, of Geneva, explained to the Section the basis and the plan of a monography, 'On Neuropterous Insects,' about to be published by him.—The Marchese Durazzo presented a fish from the Mediterranean, of a species not yet clearly determined.

September 21.

1. *Medical Section*.—Professor Landi disclosed his plan of an institution for the cure of pulmonary phthisis, and a commission was appointed to report upon it.—Professor Pallys, from Athens, described the maladies endemic in Greece, and gave an eloquent discourse on the benefits conferred on Italy in ancient times by great physicians, as well as the advantages derived by modern Greek practitioners from Italian science.—A discussion took place on the memoir of Dr. Parola, 'On the use of Bearded Rye in Cases of Consumption.' Dr. De Micheli thought that the action of the rye would augment the contractibility of the tissues.

2. *Geological Section*.—M. De Caumont presented a volume of the "Memoir of the Linnean Society of Normandy."—M. Boué presented his Map of the Geology of Europe, and observed that he intended to publish a new edition of it with all the latest additions and corrections. The Marchese Pareto observed that the new map ought to shew that the tertiary formations, traversed in the old map by the valley of the Po, traversed the Apennines near Savona, and joined the tertiary formations on the shore of the Ligurian Sea. He also read a memoir 'On the Alternation of Strata with Fluvial Shells, with the Strata containing Marine Shells of the Tortonese, and other points of Upper Italy,' and presented several specimens illustrative of his researches.—M. Barelli communicated to the Section the materials which he had collected for forming a geologico-mineralogical nomenclature for Italy.—The Intendant-General of the Interior communicated, by the medium of the Baron Hombrès Firmas, a description of the method of M. Pactot for treating argentiferous ores used in Sardinia.

3. *Physical, Chemical, and Mathematical Section*.—A commission was named to report

on the changes to which calomel was, or was not, liable from animal humours.—The hydraulic engineer, Signor Potenti, read a memoir 'On the Regulation of the Current of the Po,' and contended that scientific and practical knowledge was equally necessary in a work of that description.—A work on "The Hydraulic System of the Po," by the corps of Lombard Engineers, was presented to the Section by Signor Cadolini, one of that body.—Professor Avogadro read a memoir 'On the Laws of Specific Heat in various Substances.'

4. *Agronomical and Technological Section*.—The Marchese Ridolfi read a notice 'On the Compilation of a general Work upon Italian Agriculture.'—Dr. Rosnati read a memoir 'On the *Maculura Aurantiaca*,' and Professor Biasoletto one 'On the Drying of Mulberry Leaves for Silk-worms.'—The Cavaliere Bonafous gave an account of two machines for thrashing Turkey wheat, one of American, the other of Tuscany, invention. To this Professor Milano joined the description of a third, invented in Piedmont.

5. *Botanical Section*.—Professor Rizzo terminated the reading of his 'Account of the Natural History of the Wild Plants of Italy.'—Dr. Rerola and Professor Decandolle entered into a discussion on a monstrosity of the *Tragopogon pratensis*.—A letter was read from Signor Calamaci, of Florence, 'On the Fecundation of Plants.'—Dr. Biasoletto presented a fossil alga, which he thought to be a polysiphonia.

6. *Zoological Section*.—Dr. Garbiglietti read a memoir 'On a Skull found in an Etruscan Tomb.'—The Secretary read an extract of a work presented by Professor Fiedemann to the Section, 'On the Comparison of the Skull of a Negro with that of an European,' made by Professor Polli.—The Cavaliere Bellingeri presented some 'Comparative Tables of the Fecundity and the Manner of Living of Birds,' together with a memoir 'On the Proportion of the Sexes among Mammifera at Birth.' The Cavaliere shewed some rare varieties of the common snail, and mentioned the methods by which he had obtained a good number of the shells of this species, with a spiral turning to the left.—The Signor Verany described two new pteropodi of the Mediterranean Fauna.

September 22.

This day the members of the Geological Section made an excursion to the hills of Chieri and the Superga, to examine the nature and position of their strata. The members of the Zoological Section joined them in the excursion, in order to discuss any question of natural history which might arise from the fossil remains discovered. Neither of these Sections held sittings.

1. *Medical Section*.—The effects of the bearded rye were again discussed. Professor Del Chiappa maintained that this plant had a sedative effect; while Professor Alliprandi argued, on the contrary, that it was an active stimulant. Dr. De Micheli maintained his opinion that it exercised an active power on all fibro-membranous canals, and that it augmented the contractibility of their tissue.—Dr. Bellingeri read a memoir 'On *Encephalis*,' shewing that the inflammation exerted in the cortical substance caused a lesion of the sensorial functions, and that inflammation in the medullary substance caused injury to the moving functions.

2. *Physical, Chemical, and Mathematical Section*.—M. Potenti proposed that an address of thanks should be voted to the King, for the gift of the work describing the Royal Armory.—Professor Marianini explained a method, in-

vented by himself, of estimating the conductivity of liquids for the electric currents. Signori Botto, Configliachi, Pacinotti, Maiocchi, and M. De la Rive, entered into a discussion on this topic.—A memoir was read from Professor Paretti, 'On the Means of Obtaining from Vegetables the Bitter, but not Alkaloidal, Substances contained in them.'—Professor Mazzola read a short paper 'On the Application of Geometry to Architecture,' specially intended to give aid to antiquaries in obtaining architectural details with correctness.

3. *Agronomical and Technological Section*.—The Rev. Canon Stancovich read a paper 'On a New Method of Extracting Olive Oil,' and exhibited an instrument adapted to preparing the fruit.—The Signor Coppa read a memoir 'On Certain New Products made from Rice, and on the Use of *Dextrine*.'

4. *Botanical Section*.—Professor Decandolle read a memoir 'On the Myrtle Family,' illustrated with many drawings.—A paper was read from Dr. Meneghini, accompanied with plates, 'On certain Sea-Weeds.'

September 23.

1. *Medical Section*.—Dr. Derolandi read a memoir 'On the Means of Suppressing Mendi-cancy.'—Dr. Cervetto endeavoured to urge upon the Section the importance of drawing up a new medical history, in the form of a biography.—Dr. Despines explained his views of the manner of forming medico-statistical accounts.—The discussion on the effects of bearded rye upon the animal tissues was then continued, and Dr. De Micheli again explained and maintained his opinion that it increased the contractibility of the fibro-membranous vessels.

2. *Geological Section*.—The Cavaliere Rendu, of Chambéry, read a paper exposing a new theory of the origin of erratic blocks, and of the causes why glaciers in the Alps were formerly much more extensive than they now are, and descended much lower into the valleys. Professors Simonda and Pasini, with the Marchese Pareto, entered into a discussion on this subject.—The Rev. Canon Audisio, President of the Academy of the Superga, read a memoir, shewing that the Mosaic account of the creation might be reconciled with geological facts; and explaining, in eloquent terms, the advantage derived by true science from scientific meetings like the present.

3. *Physical, Chemical, and Mathematical Section*.—The engineer, Signor Bruschetti, laid before the Section a complete hydrographical account, with maps, &c., of the waters irrigating the Milanese.—Signor De la Rive explained the objects and results of his inquiries into the relation existing between electric and chemical forces, and exhibited a magneto-electrical apparatus by Bonjol. He also exhibited the method of gilding objects by the voltaic pile.

4. *Agronomical and Technological Section*.—Signor Ferrari read a memoir 'On the Destruction of Mulberry-Trees.'—The Cavaliere Bonafous exhibited an ingenious machine for cutting the leaves of the mulberry, made by a poor mechanic of Grenoble.

5. *Botanical Section*.—A memoir, by Professor De Visiani, 'On several New Plants from Greece and Asia Minor,' was read; as also was a paper, by Signor Colla, 'On the Classification of the Varieties of the *Camelia Japonica*.'—Professor Balsamo read some considerations 'On the Elementary Organs of Plants,' and exhibited a valuable series of microscopic preparations exemplifying his theory.

6. *Zoological Section*.—Professor Civinnini, of Pisa, read a memoir 'On the Spinal Nerves

of the Shoulder in the Human Body, and in Animals of the Higher Orders."—Dr. Rusconi communicated his method of operating upon very minute embryonic objects, such as the young of frogs and fishes, so as to obtain their skeletons.—Signor Michelin shewed the true distinctive characters of the *Turbidolia*, and described a new species of stony polypus, which he proposed to call after the name of the President of the Section (the Prince di Canino e Musignano).

September 24.

1. *Medical Section*.—Professor Lessona read a memoir 'On Glanders; on its Form, both in Man and the Horse;' he was of opinion that it was not contagious. M. Lecerf stated that recent experiments in France had proved the malady to be decidedly contagious.—Dr. Bellingieri announced his intention of repeating his experiments on the anterior and posterior radices of the spinal marrow, to the first of which he attributed the sense of touch, and to the latter that of movement. He requested that a commission might be named to aid him in coming to an opinion on this point. Professor Panizza hoped that members would be named for such a commission, and that, as much time would be required for the experiments, which ought to be most carefully made, that they should not report on their labours till next year's meeting.

2. *Geological Section*.—Professor Sismonda exhibited to the Section his new geological map of all the continental states of his Sardinian Majesty, and explained the method he had followed in making the principal divisions of formations, &c.—A conversation took place on the position of the anthracitical formations of the Alps.

3. *Physical, Chemical, and Mathematical Section*.—Professor Belli presented to the Section three apparatus of his own construction: one an hygrometer; another, a kind of electrometer, distinguishing between positive and negative electricity; the third, an instrument for presenting the fundamental facts on which the currents of the voltaic pile depended. Professors Cassiani, Botto, Moasotti, Configliachi, &c., explained their views of the origin of voltaic electricity.—A message was delivered from the President of the Congress, that in future the Chemical branch of this Section would form a separate division, and that Professor Configliachi would be its president.

4. *Agronomical and Technological Section*.—Signor Bonafous presented to the Section some plants of the *Polygonum tinctorium*, and specimens of the indigo extracted from it. Most of the members spoke strongly in favour of introducing the cultivation of this plant into Italy.—Signor Garneri read a paper 'On the Better Preparation of Potato Flour;' and Signor Ferrari one 'On the Best Means of Preparing Seed for the Ground by Solutions of Lime,' &c.—A note was read from M. de Caumont, inviting the members of the Section to next year's meeting of the Scientific Congress of France at Lyons.

5. *Botanical Section*.—Dr. Nardo read a memoir 'On the Structure and Habits of the *Stiffia Hildenbrandia*,' and exhibited specimens. Professor Decandolle and Dr. Moris made some observations. Dr. Moris exhibited some specimens from the herbaria of Allioni and Bellardi of *Veronica Romana*, *Epilobium hirsutum*, and *Sedum hirsutum*; he also exhibited a specimen of the *Sedum glanduliferum* of Guas.—Dr. Blasialetto read a paper 'On the Fecula contained in the Cellular Tissue of the Stalk of *Convolvulus Batatas*;' and also exhibited

drawings of the *Aurucaria imbricata*, from the gardens of the Cavaliere Ridolfi.

6. *Zoological Section*.—Signor Caffer communicated a notice 'On the Ichneumon called *Herpestes Mungo*,' found by him in Brazil; and of the water-hog, or *Hydrocoerus Capibata*, found at Sariga di Azzara.—Dr. Bruno read a memoir 'On a New Species of Cat.'—Dr. Nardo presented specimens of silicious spongiacal animals from the Adriatic, and described two small species of fishes hitherto little known from the same sea.—The President mentioned his intention of compiling an elementary manual of ichthyology.

The first volume of the Transactions of the Congress is published; its title is as follows: "Atti della Prima Riunione degli Scienziati Italiani tenuta in Pisa, nel 1839: Pisa, tip. Nistri, 1840."

A deputation of the Royal Academy of Sciences of Turin has been admitted to present to the king a copy of the second volume of the second series of the Transactions of that body; the contents of which, divided into the two heads of *Memoirs of the Class of Physical and Mathematical Sciences*, and *Memoirs of the Class of Moral, Historical, and Philological Sciences*, are this year unusually interesting.

Schiavada.

Il secondo fugge calere  
Fende l'aere, e va lunge:  
Il primiero lo segue stabile  
E in un attimo lo giunge:  
Ma però se al mio primiero  
Necessario fia l'interro,  
Si dimanda; senza questo  
Lo può giunger coel presto?

Answer to the last:—In-can-te-si-mo.

## FINE ARTS.

### NEW PUBLICATION.

*Engravings after the Best Pictures of the Great Masters*. Dedicated, by Command, to Her Majesty. Part I. London: Colnaghi and Puckle; and Ackermann and Co. Edinburgh: Hill.

THE work contains in this, the first part, three subjects—"The Taking Down from the Cross," from the pencil of Sir Peter Paul Rubens, and engraved by Henry Haig; "Landscape and Cattle," Claude Lorraine, engraved by William Forest; and "The Charge to Peter—Feed my Sheep," by Raphael Sanzio, engraved by Alexander T. Alkman.

We consider this publication as coming in juxtaposition with one which has for some time been in the course of periodical appearance,—a selection from pictures exhibiting the talents of native art: but we are not about to institute a comparison between the past and the present: we may, however, say that we have no fear of such comparison being made to the disadvantage of the latter. In the eye of candid criticism, we think they will mutually assist in leading the public taste to a knowledge of the principles of the fine arts, and of the advantages arising from such knowledge.

The execution of the engravings from the above masters is certainly creditable to the talents of those employed in the undertaking; but we were most struck with the luminous and brilliant effect produced in "Landscape and Cattle," by Claude, engraved by William Forest. "The Taking Down from the Cross" has the besetting sin of blackness to a degree of obscurity in some parts, making the effect more like that of Rembrandt than of Rubens. "The Charge to Peter" is in a clear and finished style of engraving, but which we never

thought suitable to the character of the Cartoons.

The publication is accompanied by an account of the paintings, and remarks on their merits, &c. both in English and French.

## THE DRAMA.

*Adelphi*.—We put our little favourite, which commenced its season on Monday, first on our dramatic notices this week, for it truly deserves it. The whole of the front of the house has been rebuilt, and many most judicious changes made in order to add to the public convenience. The best of these is the alteration of the gallery, which has been elevated, and otherwise much improved; and the ventilation of the theatre has thus been perfected. A new staircase to the boxes does away with any crowding on entering the theatre, and much has been done in the way of augmenting the light. At first sight, the beauty of the decorations is very striking; their softness in shading and colour very pleasing; and the new chandelier very beautiful. The return of Mrs. Yates to the stage was an event that was greeted as it should be, and she was evidently affected by the warmth of her welcome. Two new pieces were produced, and both with great success. The first is called *Robespierre; or, Two Days of the Revolution*: Mr. Yates playing the hero and his wife the heroine, and both acting in their best styles. The drama is divided into two epochs, one of joy, the other of fear, and ends with the downfall of the tyrant. *The Flip-Flap Footman* is as laughable as possible, and capably acted by Mrs. Keeley, Mr. Wieland, and Mr. Nightingale, whose imitations are the most perfect we ever heard or saw. If our wishes and Mr. Yates's exertions deserve success, it is sure to be obtained; for our good wishes are most cordial, and Mr. Yates's exertions greater than we are accustomed to, even from him.

*Covent Garden*.—*Two in the Morning*, a scene between Mr. Charles Mathews and Mr. Keeley, has been introduced between the play and afterpiece here: it is impossible to notice it, for even while we write our sides are aching with laughter at the bare thoughts of it: it is decidedly the most merry little thing that has been produced for a very long time.

*Haymarket*.—Mr. Maywood has repeated the character of *Sir Pertinax M'Sycophant*, and has now firmly established himself with the public. It is long since we have enjoyed a fine old comedy so much as we have the *Man of the World*, as it is acted here. *My Aunt* has been resuscitated, and Mr. Wallack has resumed his original character in this amusing farce.

*Princess's Theatre*.—The internal arrangements being now perfected, the music is heard to great advantage; and the beauty of the theatre is an attraction to many to pay second and even third visits. The decorations are really of the most beautiful description; and, in fact, so dazzling with gold, and satin, and velvet, that we fear they would detract from the best scenery that could be painted. This remains to be proved, and, if report speak truth, it soon will be: for rumour says that Messrs. John and Morris Barnett have become the lessees, and are going to bring out operas in the most attractive style.

*Olympic*.—Miss J. Mordaunt, Miss M. Glover, Mr. Balls, and Mr. Horton, have been added to the company here; and the entertainments have been varied by the production of a capital interlude, called *My Grandmother's Estate*, which is very amusing. This, the

\* We have received the new number of "Finders Roy's" Gallery, and shall notice it in our next.

Three Brothers, and pieces of like stamp, afford a very pleasant evening's amusement.

### VARIETIES.

**British Association.**—As an indication of the consideration in which the meeting at Glasgow was held, we may quote the following apology (the first leading paragraph) in "The Courier" of the 22d:—"To the exclusion, we are afraid, of matter of more general interest, we continue our report of the proceedings in this city of the British Association. In the exercise of a little self-denial, we must therefore refrain from any lengthened remarks on the more prominent topics of the day."

**Entomology.**—Mr. Connell, of the High School, Glasgow, has made a collection of the insects found in Arran; a list of which is inserted in the "Statistical Account of the Parish of Kilbride." Amongst the beetles are the *Chrysomela fulgida* and *Cicadela campestris*. Amongst the butterflies and moths are the *Cynthia cardui*, *Hyperichia blandina*, an Arran specimen of which first announced to entomologists the fact that it was a native of this country; *Hyperichia ligea*, *polydama*, *pamphilus*, *hyperanthus*, *janira*, and *semale*; *Polyommatus albus* and *Alexis*; *Vanessa urtica*; *Gemra vinula*; *Anthrocerus filipendula*, &c.

**Embalming.**—The family of the late Marshal Macdonald have sent for M. Gannal, for the purpose of having the body of the marshal embalmed by the process which we have lately noticed as having been introduced into this country by Mr. Smith.

### LITERARY NOVELTIES.

#### LIST OF NEW BOOKS.

Low's Illustrations of the Breeds of the Domestic Animals of the British Isles, Part V. (Sheep, No. 11), 4to. 21s.—Howitt's Visits to Remarkable Places, 2d edition, 8vo. 21s.—Elements of the Practice of Physic, by D. Craigie, M.D. 2 vols. 8vo. 21s.—Cemetery Interment, by G. **THE WOMEN OF ENGLAND:** their Social Duties and Domestic Habits.  
By Mrs. Ellis.  
"If we could have our own way, every family should order a copy of 'The Women of England.' If the eyes of the public are not opened to the nefarious practices of the apothecaries by his exposures, verily they deserve the treatment they receive at the hands of these cold-blooded impostors." Dr. Dickson has placed it in the power of the invalid to take care of himself. Poor Lord Durham had read this volume he might have still been living."—*Metropolitan Mag.* for September.  
H. Baillière, 219 Regent Street, and all Booksellers.

Cloth, lettered, 8vo. price 10s.  
**FALLACIES OF THE FACULTY.**  
By Dr. DICKSON.  
"We cannot too highly compliment the Author on his fearlessness and firmness of purpose; and if the eyes of the public are not opened to the nefarious practices of the apothecaries by his exposures, verily they deserve the treatment they receive at the hands of these cold-blooded impostors." Dr. Dickson has placed it in the power of the invalid to take care of himself. Poor Lord Durham had read this volume he might have still been living."—*Metropolitan Mag.* for September.  
H. Baillière, 219 Regent Street, and all Booksellers.

With Maps, 8vo. 8s. 6d.  
**THE BRITISH EMPIRE in INDIA.**  
By M. DE BORNSTERN.  
Member of the Royal Swedish Academy of Sciences, and of the Academy of Military Science.  
"We know of no other work that contains so much in so few pages, no work that so ably offers a compendium, not alone of our empire, but of India generally; and we would recommend it to be read in preference to all others, by any individual desirous of obtaining a general idea of the past and present state, and even future prospects, of our vast possessions."—*United Service Journal*, No. 142, Sept. 1840.  
"This comprehensive volume will be read when bulkier tomes will be laid aside. The reading which was requisite for a foreigner to digest such a mass of information must have been very great; and the comprehensive mind of this Swedish nobleman is apparent in every page."—*Colonial Magazine*, No. VI. June, 1840.  
John Murray, Albemarle Street.

**PROFESSOR GRANT'S OUTLINES OF COMPARATIVE ANATOMY.** 8vo. Part VI. price 3s.  
Part I. to VI. 11s. 6d.  
Professor Thomas Graham's Elements of Chemistry, including the application of the Science in the Arts. 8vo. Part I. 4s. Part II. to V. 15s.  
Dr. Robert Willis's Illustrations of Cutaneous Diseases. Part XX. containing Four coloured Plates, folio, price 5s. Parts I. to XX. 5s.  
H. B.'s New Catalogue of Foreign Books is just out, and will be delivered gratis, on application.  
London: H. Baillière, Publisher and Foreign Bookseller, 219 Regent Street.

VAN BUTCHELL ON FISTULA, &c.  
4th edition, in 8vo. cloth boards, price 7s. 6d. enlarged,  
**FACTS AND OBSERVATIONS** relative to a Successful Mode of treating Piles, Fistula, Hemorrhoidal Excrecences, Tumours, and Strictures, without Cutting or Confinement: illustrated with numerous Cases. Being a Familiar Exposition of the Practice of Mr. S. J. Van Butchell, Surgeon Accoucheur.  
"This volume presents to us a number of illustrations of his singular success under circumstances that would have induced despair in any professor of less mastery, or less accustomed to accomplish cures where cures seemed impossible. The statements made are most convincing, and place beyond doubt the superiority of the treatment to which they refer."—*Courier Journal*.  
Published by H. Renshaw; Sold also by the Author, No. 16 Percy Street, Bedford Square.

Intended for the use of the Heads of Families, the Clergy, Commanders of Ships trading to Foreign Ports, and the Benevolent who frequent the Sick Chamber.  
To be published in Six Monthly Parts, with Practical Illustrations, at 2s. 6d.

**THE CYCLOPEDIA OF DOMESTIC MEDICINE.**  
Intended for Popular Use.  
By KEITH IMRAY, Esq. M.D.  
Fellow of the College of Physicians, Edinburgh, and Licentiate of the Royal College of Surgeons in Edinburgh.  
Part I. will be published on the 1st of October.  
London: Ball, Arnold, and Co.

**THE CHURCH AND UNIVERSITIES.**  
**THE BRITISH MAGAZINE** for October. Leading Contents:—The Charcoal Burners, or Carbonari—Photius, No. VI.—Disposal of Higher Church Prebends (continued). The Hymns of St. Ambrose, Bishop of Milan. Original Correspondence.—On the Education of a Nobleman among the Swiss Churches. No. II.—The Wesleyans—Baptism—Professor Rosetti and Swedenborg—Mr. Milman and Joseph Mede—On Hebrews, xii. 28–29—Church Rates—Rubrics—Liverpool Collegiate Institution—The Egypto-Tuscan "Aet"—Mormonism—Restoration of Cathedral and Collegiate Churches. Documents.—The Tithe Amendment Act.—The Church Building Act.—The Church Discipline Act.—An Act to Provide for the Solemnisation of Marriages in the Districts in or near where the Parties reside, place of the Proceedings. Church Matters: Letter of Sir Robert Peel to the Bishop of Durham.—Ordinations—Clerical Appointments—Preferments—Births and Marriages—Clergy Deceased.—And its usual varied and copious Summary of Events of the past Month relating to the Church and Universities.  
J. G. F., and J. Rivington, St. Paul's Churchyard, and Waterloo Place, Pall Mall; J. Turill, 250, and T. Clerc Smith, Regent Street.

In 8vo. price 12s. 6d. cloth.  
**LECTURES ON NATURAL PHILOSOPHY.**  
By the Rev. JAMES WILLIAM M'GAULEY, Professor of Natural Philosophy to the National Board of Education, &c.  
London: Longman, Orme, and Co. Dublin: W. Curry, Jun. and Co. Edinburgh: Fraser and Crawford.

Price 12s. in boards.  
**LECTURES ON THE MORBID ANATOMY OF THE SEROUS AND MUCOUS MEMBRANES.**  
Vol. I. Part I.  
By THOMAS HODGKIN, M.D.  
Also, Volume I. price 10s. in boards.  
"Dr. Hodgkin is well known as a zealous morbid anatomist. His situation at Guy's Hospital gave him opportunities which his talents and his zeal have seized. The volume before us is the first of a series, and judging from this, we may confidently prognosticate that all will be acceptable to the profession."—*Medico-Chirurgical Review*, Jan. 1837.  
"The importance of the subjects embraced by these Lectures, and the reputation which Dr. Hodgkin has justly acquired as a zealous cultivator of pathological anatomy, are sufficient to claim the earnest attention of every reader to the work before us. It is in every respect an excellent production, calculated to advance the progress of pathological science; and destined to take a permanent place in the higher order of the medical classics of this and other countries."—*British and Foreign Medical Review*, July 1837.  
London: Simpkin, Marshall, and Co.

In 5 vols. 12mo. price 11. 10s. in cloth and lettered, the 9th edition of  
**SACRED HISTORY,** selected from the Holy Scriptures; with Annotations and Reflections, particularly adapted to facilitate the Study of the Bible in Schools and Families.  
By the late MRS. TRIMMER.  
Rivingtons, St. Paul's Churchyard, and Waterloo Place.

In small 8vo. price 7s. 6d. in cloth and lettered, and other Poems.  
**THE CHERWELL WATER-LILY;**  
By the Rev. FREDERICK WILLIAM FABER, M.A.  
Fellow of University College, Oxford.  
Rivingtons, St. Paul's Churchyard, and Waterloo Place.

In 12mo. price 5s. boards, the 9th edition of  
**A COMMENT** upon the COLLECTS appointed to be used in the Church of England, before the Epistle and Gospel, on Sundays and Holydays throughout the Year.  
By the Rev. JOHN JAMES, D.D.  
Prebendary of Peterborough, and Vicar of St. John Baptist Parish, in that City.  
Rivingtons, St. Paul's Churchyard, and Waterloo Place.  
Also, by the same Author,  
**Christian Watchfulness, in the Prospect of** Sickness, Mourning, and Death. 3d edition, 12mo. 7s.

In 18mo. price 3s. 6d. the 4th edition of  
**LYRA APOSTOLICA.**  
(From the "British Magazine.")  
Rivingtons, St. Paul's Churchyard, and Waterloo Place, Pall Mall; and J. H. Parker, Oxford.

KEITH'S MEASURER, ENLARGED BY MAYNARD.  
In 18mo. price 5s. bound, a new edition of  
**THE COMPLETE MEASURER;** or, the whole Art of Measuring; being a plain and comprehensive Treatise on Practical Geometry and Mensuration. For the Use of Schools, and Persons concerned in Measuring, Gauging, Surveying, &c.  
By THOMAS KEITH.  
Corrected and enlarged by SAMUEL MAYNARD.  
Longman and Co.; Rivingtons; Hamilton and Co.; Duncanson and Co.; Whittaker and Co.; Simpkin and Co.; Sherwood and Co.; Cowie and Co.; Houlston and Co.; Smith, Elder, and Co.; M. Taylor; and Wilson and Sons, York.

REV. DR. JAMES'S NEW WORK.  
In 12mo. price 1s. 6d. in cloth and lettered, or 12s. bound neatly in morocco, dedicated, by permission, to His Royal Highness Prince Albert.  
**PROPER LESSONS** to be Read at Morning and Evening Prayer, on the Sundays and other Holydays throughout the Year. With a short Practical Commentary, and Explanatory Notes.  
By JOHN JAMES, D.D.  
Prebendary of Peterborough, and Author of "A Comment upon the Collects," and "Christian Watchfulness."  
Rivingtons, St. Paul's Churchyard, and Waterloo Place.

ELECTROTYPE, WITH SPECIMENS.  
Price 1s. 6d. No. VI. of  
**SAVAGE'S DICTIONARY OF PRINTING,** containing, among other interesting Matters, a full Account of the Electrotype Process, with Impressions from Wood Engravings, and from Electrotypes Copies of them; and also an Impression from an Electrotypes Copy of a Page of Types.  
London: Longman, Orme, and Co.

Now completed, in 8 vols. price 12s. containing 2254 pages of closely printed letterpress.  
**ELEMENTS OF THE PRACTICE OF PHYSIC,** presenting a View of the present State of Special Pathology and Therapeutics.  
By DAVID CRAIGIE, M.D. F.R.S.E.  
Fellow of the Royal College of Physicians, Edinburgh; Physician to the Royal Infirmary, Emeritus President and Extraordinary Member of the Royal Medical Society, &c. &c.  
"A very valuable compendium of the present knowledge possessed by the profession."—*Johnson's Journal*.  
"We are inclined to regard Dr. Craigie's 'Elements' as the best we at present possess."—*London Medical Gazette*.  
Adam and Charles Black, Edinburgh; Longman, Orme, and Co. London.

In 4to. with Woodcuts and a Frontispiece, price 18s.  
**A GUIDE to the STUDY OF HERALDRY.**  
By J. A. MONTAGU, Esq. B.A.  
William Pickering, Publisher, Chancery Lane.

In 4to. price 6s. cloth.  
**THE LOST ANGEL, and the HISTORY** of the OLD ADAMITES, found written on the Pillars of Beth.  
By THOMAS HAWKINS, Esq.  
William Pickering, Publisher, Chancery Lane.

**DR. DONNE'S DEVOTIONS.**  
In fcap 8vo. price 6s. a new edition of  
**DEVOTIONS** by JOHN DONNE, D.D.  
Dean of St. Paul's.  
With Two Sermons: I. On the Decasse of Lady Danvers. II. Death's Due: his own Funeral Sermon.  
William Pickering, Publisher, Chancery Lane.

Printed by HANNAH PAGE MOVES, of Brook Green, Hammer-smith, and GEORGE BARLEY, of Number 2 Pullin's Place, Islington, both in the County of Middlesex, Printers, at their Printing Office, Number 28 Castle Street, Leicester Square, in the said County; and published by WILLIAM ANIMORE SCRIPPS, of Number 13 South Molton Street, in the Parish of Saint George, Hanover Square, in the County aforesaid, at the LITERARY GAZETTE OFFICE, Number 7 Wellington Street, Waterloo Bridge, Strand, in the said County, on Saturday, October 10th, 1840.  
Agents for New York—Wiley and Putnam, 161 Broadway.

REVIEWS OF NEW BOOKS.

*History of the British Turf, from the Earliest Period to the Present Day.* By James Christie Whyte, Esq. 2 vols. 8vo. London, 1840. Colburn.

THE history of the British turf is entertaining as the history of a sport, and important as the history of animal improvement, by which the agricultural labours, the enjoyments, and the wars of the country, have been brought to as high a state of advantage as the employment of horse fit for their various ends could accomplish. Our farms, our roads, and our cavalry regiments, are not yet independent of steam; and a good account of the turf affords us a knowledge of the means by which the several breeds that supply them have reached the perfection at which they are seen throughout the British Isles.

We must, however, leave the serious and business portions of the work to that numerous class whom it most concerns, whilst we merely diversify our columns by a few of the miscellaneous and anecdotal extracts which it affords. To begin with the beginning:—

"The earliest mention of horsemanship on record, we find in the Bible, where, in the 50th chapter of Genesis, verse 9, horsemen are named as forming part of the funeral procession of Jacob; and again, in the 14th chapter of Exodus, verse 9, horsemen are enumerated among the troops with which Pharaoh chased the Israelites on their departure from Egypt. Homer, who is generally supposed to have been contemporary with Joshua, frequently dwells on the beauty of the horses which drew the chariots of his heroes; although it may be remarked, as a singular fact, that he makes but two references to horse-riding in his great poem the 'Iliad,' and but one in the 'Odyssey.' The first in the 'Iliad' (K 513) is where Ulysses and Diomedes, having stolen the horses of Rheus without the chariot, mount and gallop them to the Grecian camp. That in the 'Odyssey' (E 371) is in describing Ulysses after his shipwreck, as bestriding a beam of wood among the waves, in the attitude of a man on horseback:—

Ἀμφὶ ἔνι δούρατι βαίνει κίχλη περ  
ἵππων ἰλαυνών.

a passage the exact meaning of which is preserved in none of the published translations.

Strabo asserts that the Medes, Persians, and Armenians, were the first that broke in the horse to the saddle; and when we call to mind, that in all probability the fertile plains between the Tigris and Euphrates were the early nursery of this noble animal, this opinion would appear the most correct.

"We will here relate an anecdote of a mare called Aura, the property of one Phidolas, a Corinthian, which threw her jockey in the race, but continued her course as if he had kept his seat, increasing her pace at the sound of the trumpet, which was used as the signal of the coming in; and having been first at the winning goal, presented herself to the judges,

\* Mr. White is either a very indifferent Greek scholar, or excessively careless in selecting quotations. Being absolutely unable to make anything of his Greek, we turned to Homer himself, and find the line to be—

Ἀμφὶ ἔνι δούρατι βαίνει, κίχλη ὡς ἵππων ἰλαυνών.

as if conscious of having won. The Elians declared her the winner, contrary to the present custom in such cases. These judges, called Hallanodics, regulated all matters at Olympia, exercising a power which would not be relished at the present day; for we find them not only excluding from the games, and imposing fines upon, such as were convicted of fraud, but even inflicting upon them bodily correction.

The earliest mention of race-horses, or as they were called in those days, running-horses, in our national annals, is of those in the ninth century, sent by Stugh, founder of the royal house of Capet, in France, as a present to King Athelstan, whose sister, Ethelswitha, he was soliciting in marriage. In the reign of William the Conqueror, according to Cambrensis, Roger de Bellesme, a follower of the king, and created for his military services Earl of Shrewsbury, imported some stallions from Spain into his estate in Powisland; and we find their produce celebrated afterwards by Drayton the poet. This is the first well-authenticated step we can find towards the improvement of the breed of horses.

Charles I. 1625.—The first races which were held at Newmarket took place in this reign, in the year 1640, although the round course was not made till 1666; and as a further proof of the rapid progress already made in the improvement of the national breed of horses, we find one Sir Edward Harwood ignorantly complaining of what he calls the scarcity of able horses in the kingdom, there not being so many as 2000 that were equal to a like number of French horses; the cause of which he supposes to be the strong addiction which the nation had to racing and hunting horses, which, for the sake of swiftness, were all of a lighter and weaker mould. We may here remark, as highly probable, that the invention of gunpowder and the general use of fire-arms, which caused heavy armour to be disused, did much towards effecting this change, by bringing lighter and fleet horses into general demand. Butcher, a writer of this period, informs us, in his 'Survey of Stamford,' that a race was annually run for in that town, for a silver and gilt cup with a cover, of the value of seven or eight pounds, provided by the care of the alderman for the time being, out of the interest of a stock formerly made by the nobility and gentry in the neighbourhood.

These are the earliest traces of horsemanship and horse-racing. From them we pass to an interesting notice of the Arab courser:—

"The pure Arabians are smaller than our race-horses, seldom exceeding fourteen hands two inches in height, and are never known, in tropical countries, to turn roarers or to have curbs. Count Rzeizusky gives the following account of the docility and sagacity of the kohlan, or first class of Arabian breed of horses, translated by an English writer, and which we give as being very curious, although we think it highly exaggerated:—'Above all horses in the world,' writes the Count, 'the kohlan is distinguished for the goodness of his qualities and the beauty of his form. He possesses uncommon mildness of temper; an unalterable faithfulness to his master; a courage and intro-

pidity, as astonishing as they are innate in his noble breast; an unfailing remembrance of the places where he has been and of the treatment he has received; not to be led, not to be touched, but by his master; in the most dreadful confusion of battle, cool and collected; he never forgets the place he came from, and though mortally wounded, if he can gather up sufficient strength, he carries back his desponding rider to his defeated tribe. His intelligence is wonderful: he knows when he is sold, or even when his master is bargaining to sell him. When the proprietor and purchaser meet for that purpose in the stables, the kohlan soon guesses what is going on, becomes restless, gives from his beautiful eye a side-glance at the interlocutors, scrapes the ground with his foot, and plainly shews his discontent. Neither the buyer nor any one else dares to come near him; but, the bargain being struck, when the vendor, taking the kohlan by the halter, gives him up to the purchaser with a slice of bread and some salt, and turns away, never more to look at him as his own,—an ancient custom of taking leave of a horse, and his recognising a new master,—it is then that this generous and noble animal becomes tractable, mild, and faithful to another; and proves himself immediately attached to him whom his passion, a few minutes before, might have laid at his feet, and trampled under his hoofs.'

The poverty of the Arabs enables them to afford but scanty nourishment to their horses. Besides the dry aromatic herbage they may chance to pick up, the Arabian horse usually has but one or two meals in twenty-four hours. At night it receives a little water, and five or six pounds of barley or beans, and a little straw. In Nedjed the horses are regularly fed on dates, and the fragments of any provisions that may be used by the inhabitants; and some writers have even asserted that flesh, raw as well as boiled, is given them by the wealthy people,—a practice in the prevalence of which we are not inclined to place much faith. Very little water is given, as the Arabs conceive (and justly) that much liquid injures the horse's shape, and affects his wind. The colt is mounted after its second year, when the Arab, on all other occasions so kind to his horse, puts it to a cruelly severe trial. The colt, or filly, is led out to be mounted for the first time; its master springs on its back, and rides at full speed for perhaps fifty miles, over sand and rock of the burning desert, without one moment's respite. He then plunges it into water enough to swim, and if, immediately after this, it will eat as if nothing had happened, its purity of blood and stanchness are considered incontrovertible. Such is the account handed down to us by respectable authorities, who, in their turn, received it from the Arabs themselves; but some allowance should be made for the proneness to exaggerate for which all Eastern nations are remarkable, more especially the Arabians; and, glorying, as they justly do, in the prowess of their beautiful steeds, it is not to be wondered at if they should sometimes enlarge upon it to foreigners."

Many stories of extraordinary performances of horses and riders will be found scattered

through these pages; but we must be content with a few references by way of specimen:—

"1786.—On the 4th of December of this year, Mr. Hull's horse, Quibbler, by Minor, dam by Sampson, grandam by Cade, was engaged to run twenty-three miles within one hour, round the flat at Newmarket, for a thousand guineas. He performed the distance in fifty-eight minutes and ten seconds: five to two in his favour at starting. He was rode by a boy about 4st. 7lb., who did not appear in the least fatigued. Considerable sums of money were betted on the event, it being the greatest performance ever done in England, by one horse, before that time.

A singular case respecting a man whipping and injuring the race-horse Doricles, whilst running at Ludlow, occurred in the year 1799, at the Salop assizes. Mr. Hemminge was plaintiff, and Chipp defendant. The action was brought against the defendant for maliciously whipping and striking the plaintiff's horse Doricles, while running a race on the Ludlow course, against Mr. Corbett's mare Carnation, whereby the plaintiff lost the chance of winning the 50l. plate, for which they were running, and whereby also the plaintiff lost his horse, of the value of 300 guineas. The fact was proved beyond all doubt of the defendant striking the horse several times; but as it was doubtful whether the injury the horse received, which was the breaking of the thigh-bone, was occasioned by, or in consequence of, the defendant's conduct, the jury gave a verdict for the plaintiff, with 150l. damages only. The defendant was a publican at Ludlow. The learned judge, Mr. Justice Rooke, reprobated the conduct of the defendant very highly; and said, while horse-racing was continued, such behaviour should be severely punished, and was by no means an action for mere nominal damages, even though the jury should not be satisfied that the horse received the injury which occasioned his death by the defendant's means."

In June 1800, "A naval officer undertook, for a wager, to ride a blind horse round Sheerness race-course, without guiding the reins with his hands; this he performed, to the no small amusement of the spectators, by cutting the reins asunder, and fastening the several parts to his feet in his stirrups."

In a match between Lord Grosvenor's "colt, by Gimmerack, and the Earl of Abingdon's Cardinal York, that Mr. Elwes, the celebrated miser, is said to have lent the former 3000 guineas to make up his stakes. Although the betting was three to one in his favour, he would have been compelled to have allowed his opponent's horse to have 'walked over,' but for the unsolicited liberality of the eccentric miser, who on his return from seeing his lordship win the race, scrambled over the Devil's Dyke, at Newmarket, at the risk of breaking his neck, to avoid paying a turnpike."

The Duke of Grafton "being fox-hunting, near Newmarket, a Quaker, at some distance, upon an adjoining eminence, pulled off his hat, and gave a view holla! The hounds immediately ran to him, and being drawn off the scent, were consequently at fault, which so enraged the duke, that, galloping up to the offender, he asked, in an angry tone,—'Art thou a Quaker?'—'I am, friend,' replied Broadbrim. 'Well, then,' rejoined his grace, 'as you never pull off your hat to a Christian, I will thank you in future not to pay that compliment to a fox.'"

Richard Shepherd, a trainer on the northern turf, died at Langton Wold, after a short illness, aged forty-three. His first master was Old Sykes,

a very excellent trainer, but an original of the first water; and under his able tuition, he soon shewed promise of that skill in training for which he was afterwards distinguished. Many are the droll stories told of his master, Sykes, but we will content ourselves with one anecdote, which sufficiently shews the character of the man. Being on a sick bed, he wrote a letter to an intimate crony, containing this advice:—'I have done many in my time, Tommy, but never did you; don't be agen Merlin for the Leger.'"

With one or two miscellaneous notices we conclude:—

*The Importance of Water.*—"The best water for horses is soft, fresh, and pure rain, river, or pond water; and it is absolutely necessary, to preserve health in the stable, that a constant and ample supply should be on the premises. In order to effect this, when well or spring water is the only water to be obtained, it should be put into troughs, having some clay and chalk at the bottom, and softened before use by exposure to the sun and air. Such is the effect a change of water has been known to produce in a horse, that in some instances even the loss of a great race has been, with much show of reason, ascribed to this cause, alone; and careful trainers have even gone so far as to carry with a horse, on the eve of an important engagement, a supply of the water he has been accustomed to."

In racing we are told:—

"The use, or rather the abuse, of whip, is to be avoided as much as possible, especially with a timid or a sulky horse; for when a horse is doing his best, blows of the whip will often throw him out of his stride, and with those of the latter description, may occasion the loss of the race, by causing them to 'shut up,' which means, shrink to avoid the blows, to such a degree as materially to interfere with their pace. In most cases where punishment is required, the spur, properly used, is to be preferred, and in more than one instance we could name, the spur has worked wonders with horses which were supposed to have stood no chance in the race."

We must leave the pedigrees, calendars, &c. &c. &c., and all the drier parts, to the curious or interested in such matters, and only hope that our little cento of anecdote may recommend Mr. Whyte's laborious performance.

*Flowers of my Spring. Poems.* 12mo. pp. 197. 1840. London: Groombridge. Keighley: Aked.

"It is an exceedingly difficult task for the young and inexperienced author to come before the public, and more especially before the critics—those hawks whose eyes are ready to detect every flaw, and whose talons are as ready to pick and mangle as the eyes to see. But far be it from the author of these to crouch beneath the feet of any critic, and supplicate for a miserable lenience; he wishes to be judged by another standard than the compassion of the critic. \* \* \* But there are certain characters in this age,—the author does not mean to allude to any sect or party,—from whom he expects direct condemnation. To be judged by their vices which he has lashed, he is careless; yet he would remind them, with all love, that he has not lashed individuals, but the vices which degraded them. \* \* \* By the way, the venerable Christopher North, the king of critics in our age, has said somewhere, that all who have struck the lyre are worthy of immortality. Hear that, ye small fry of critics, who try to

assume greatness, as the frog in the fable tried to be as huge as the bull which he envied!"

How very kind all this is! Who would not be a critic, and sit, and read, and bore their "hawks' eyes" out in endeavouring to point out those passages that have a little—oh, how little!—merit? Whoever this author may be, he thinks no little of himself. We might say that our "greatness" is grown to its full size, that we belong not to the "small fry of critics;" but who would believe us after this sweeping tirade against the whole tribe (saving Christopher North)? What a sensation will this preface create! there will be no peace in the world until this bold—this mighty author, is discovered! Where can he live? wherever does this second Napoleon reside—this bard, "unknown to few," who has dared to throw down his gauntlet to us all? How the earth must shake wherever he treads! how the people must tremble who look at him! And his poetry?—assuredly it can be nothing less than the thunder of old Homer! Perhaps the following four lines may throw some light on his "whereabout:—"

"I ween it was not, for I knew  
What time he dwelt with us, and drew  
From them who told me, that from home  
He at that time away did roam."

The last two lines are gems; the ease and freedom of the rhythm flow "like a jaunting-car o'er rough and rugged stones."

We copy the two following lines for the sake of the very original note which illustrates the text:—

"A luckless wight upon that luckless day,  
With aged mother," on a luckless May."

On reaching his eighteenth year, he says:—

"Here am I living 'mid a busy world,  
But little known and far less loved withal,"

which, from the tenor of the preface, we are not at all astonished at.

But here he lets a little secret out, and wishes, in spite of his abuse, to be "known more than one fleeting hour:—"

"Why proud Ambition thus would answer me,  
While haughty fire glazes from his sparkling eye:  
'Who, who would seek to live a fool like thee,  
Nor hated nor beloved, thus growling die?'"

"Tis this ambition's fire that spoils our life,  
Holding a candle to our dazzled sight,  
Luring to grasp at nothing with all strife,  
A courted nothing, fraudulently bright."

All they once eminent have courted this;  
And, though we rail, we still may feel its power;  
Ay, and to own a secret joyous bliss  
At thoughts of being known more than one fleeting hour."

His wish shall be gratified.

The pleasant feelings with which he anticipates returning home, after visiting York, shew that he lives in a very "low neighbourhood:—"

"Leave I the openness of thy good homes,  
To be insulted by a pig's crew,  
Which strut and swell, all ill'd with empty wind,  
Whose inmost feelings noble thoughts ne'er knew?"

And now, having paid him back "in his own coin," we will honestly confess that there are glimpses of the "true spirit" in his work, passages of really beautiful poetry,—were there not, after his abuse we would not have wasted a word on his book. Wishing that we may meet him again in a better temper, we conclude with the following extracts, which all our readers will peruse with pleasure:—

"The Retired Spot.  
It was a fair and lovely spot,  
A sweet retirement, a celestial grot,  
Far 't the centre of yon aged hill,  
Within the sound of many a tinkling rill;

"If any one should be curious to know who this 'luckless wight' and his 'luckless mother' were, and what business they had there, they were the author's 'SUBLIME SELF' and his mother, on a pilgrimage from one county into another."

While trees grew round, the guardians of the green,  
And lowly bushes grew their stems between,  
Wreath'd with sweet woodbine, clad in fairest dress,  
Which spread its arms in many a fond caress,  
And here and there a moss-grown stone was laid  
In ease luxurious 'neath the spreading shade.

There the wild songsters met as in their choir,  
That spot in their cathedral which their love

(Their vast cathedral was the forest grove)  
Had bid them offer to the sacred lyre

The fairest maid in all the heavens above.  
There on the boughs they tuned their cheerful song,  
Seated in rows from branch to branch along;  
And wildly echoing the shrill notes were borne  
In lofty cadence on the summer air;

'Twas heard at night, 'twas heard at morn,  
And care's hard burden aye seem'd less to bear."

"The Village Lane.

See where the primrose 'neath the prickly thorn  
Heaves its sweet head soft blushing to the morn,  
Too humble to provoke its neighbour's ire,  
Who vents on taller weeds its envious fire.  
In feathery pride, see where the yellow palm  
Hangs its light head and sheds its fragrant balm.  
How noble look these elms, whose spreading boughs  
O'erhang the lawn whereon the milch-cow lows,  
And the proud peacock swells its glittering train,  
Shedding in splendour the sun's beams again.  
And farther down the winding path appears  
The village church tower, hoary in its years,  
With scatter'd graves around, and tree of solemn yew,  
Mourning above the earth from which it grew.  
Here is no pride of heart, no chilling care,  
No swelling passion that smuffs the vital air;  
But each lays quiet in his mossy rest."

#### MACKAY'S THAMES AND ITS TRIBUTARIES. [Concluding notice.]

FOR the present we quit the Thames, to give a little to the Medway:—

"Proceeding up the stream, and passing between a great number of low swampy islands, mere marshes, unfit for the habitation of man, we arrive at the little village of Gillingham, and the fortress of Upnor Castle, pleasantly situated on a gentle eminence on the right of the narrowing river. This place, with Chatham, at which we shall presently arrive, was celebrated, before the Reformation, for its wonder-working virgin, who was called Our Lady, and sometimes the Rood of Gillingham. An old legend, repeated in Kent when Lambarde wrote his *Perambulation* of that county, thus accounts for the cessation of the miracles at her shrine. The dead body of a man floating in the Medway was cast ashore in the parish of Chatham, where it was buried, after due inquiry, by the churchwardens. The parish clerk, who officiated at the funeral, retired home to rest; but a sense of oppression was upon him, and his sleep was disturbed and broken. About midnight, however, he fell into a more refreshing slumber, from which he was awakened by a loud knocking at his window. Still more inclined to sleep than to get up, he turned on his side, after asking in his roughest voice, 'Who was there?' The answer sent a cold shudder through his frame. Being a holy man, he knew the solemn voice of Our Lady of Chatham, who commanded him to arise and follow her. He arose immediately, and came down into the street, where she awaited his coming, sitting on the steps of the door. A halo of glory was around her head, and he bent before her in reverential awe. 'Follow me, O clerk!' said she; 'for this day ye have buried beside my grave the corpse of a sinful man. He so offends my eyes by his ghastly grinning, that unless he be removed, I can do no more miraculous workings in your town. That so great a calamity should not befall the poor people, take thou mattocks and pike, and come with me, take up the body and cast it again into the river.' Though the night was cold and wet, and he was not accustomed to such labour, he procured mattocks and followed her in silence. That he might not doubt her divine power, he noticed that, wherever she placed her foot,

the grass immediately grew, and the flowers began to blossom; and at one place where she rested for awhile, a whole garden of verdure and beauty started up around her. At last they arrived at the churchyard, which was a good distance from the clerk's house, where Our Lady pointed out the spot of her own sepulture, and then that of the drowned man, telling the clerk to set to work immediately, and relieve her sainted ashes from the ghastly presence of that sinful neighbour. The big drops of perspiration stood on the brow of the clerk. He could not speak to the being of another world, but he did her bidding in solemn silence. He dug for many hours until he arrived at the coffin, Our Lady looking on with a melancholy and dignified smile. She motioned him to open it, and take the body on his back, and cast it into the Medway. He did so. The corpse grinned horribly upon him, but he had no power to let it fall, and he walked away to the river's brink. He had the curiosity to look back, when he saw the figure of Our Lady melting gradually away into the thin air, and seeming no more than the light silver mist that floats upon the mountain. With a violent effort he threw the corpse into the river; the water bubbled furiously; a ray of light danced cheerily above the grave of Our Lady; and the clerk, feeling his mind relieved from a load of sorrow, walked back to his own home, and slept comfortably till the morning. Anxious to know whether this occurrence were not a dream, he arose early and walked forth to the churchyard. He was convinced that it was no night vision, that he had indeed seen the Virgin of Chatham, long before he arrived at that place; for, from his own door, all the way they had passed, he noticed the track of verdure where the unearthly feet had trodden, and the little parterre of flowers that still grew on the place where they had rested. From that day forth he was a calmer and a better man, and the townspeople long pointed with reverence to the little tufts of grass—the earthly witnesses of the miracle. But, alas! for Gillingham, it suffered by the good fortune of Chatham. The body of the drowned man was wafted down by the stream, and found by a fisherman of that village. He took it ashore, and it was decently buried in the churchyard. The Lady of Gillingham was wroth at the pollution, but caring less for the good people in whose parish she wrought miracles, or not having the good sense of the Lady of Chatham to apply for mortal aid in the removal of the nuisance, she withdrew her favour from the place for ever, her shrine lost its healing virtues, and the prayers of the faithful were of no avail. It was observed at the same time that the earth where the drowned man was buried began immediately to sink, and so continued for many years, until the body was deposited in the great pit of perdition, when the earth was heaved up again, by no mortal means, and restored to its former smoothness. Lambarde says, this legend, though only known to some very old people in his time, was not long previously 'both commonly reported and faithfully credited of the vulgar sort,' having been received by tradition from the elders of a former age. When part of the church of Chatham was pulled down in 1768, several fragments of ancient sculpture were discovered, and among others the headless figure of a virgin and child, having a mantle fastened across the breast by a fibula set with glass in imitation of precious stones. This was generally supposed to be the figure of Our Lady of Chatham."

From Penshurst—

"Leaving this ancient seat of the Sidneys, the Medway is lost; four streams, two of which rise in Sussex, one in Surrey, and the other in Kent, claim the honourable name; but to neither of them can it in strict justice be applied. The honour must be divided among them; neither is the Medway, but each contributes to produce it. In most maps the name is given to the Surrey branch, that rises near Bletchingley, and flows past Eaton bridge to Hever Castle, Chiddington, and Penshurst. The Sussex branch rises near East Grinstead, and flows to Hartfield, Groombridge, and Ashurst, and joins the former at a short distance south-east of Penshurst. Obligated to make a selection, we shall pursue the windings of the Surrey stream, and leaving Penshurst and its patriotic and literary reminiscences behind us, tramp along the by-roads to Hever Castle. This venerable ruin was built by William de Hever, in the reign of Edward III., and is chiefly remarkable for being associated with the names of two of the queens of Henry VIII. It was purchased from the family of Hever by Sir Geoffrey Boleyn, from whom it descended to his grandson, Sir Thomas Boleyn, the father of the luckless Queen Anne Boleyn. Upon his death, it was claimed by Henry VIII. in right of his wife, and afterwards granted by him to his repudiated consort, Anne of Cleves. That quiet and amiable person lived here in seclusion for some months after her divorce, and some authorities say that here she ended her days. This, however, is not true. De Thou, in his history, is also in error when he says that she retired to the court of her brother, the Duke of Cleves, and that there she died. By the provision of an act, whereby estates in several counties of England were granted her for life, she was forbidden to leave this country, and she died at her house in Chelsea, and was buried in Westminster Abbey. From this place we follow the river to Eden, or Eaton bridge, remarking by the way, that by some this branch of the Medway is called the Eden. The village is small, but pretty and rural, and is remarkable as one of the very many places in England that were affected by the great earthquake at Lisbon in the year 1755. A pond, of about an acre in extent, was observed to be agitated in a very peculiar manner on the day in question; but no further mention was made of the matter until the news arrived in England of the calamity in Portugal, when it was brought again to the recollection of the neighbours, and public notice taken of the fact. The Medway, which we have thus tracked from its junction with the ocean, where it is a broad, rapid, and deep river, to the neighbourhood of its source, where it is but a few feet in width, and so shallow that sometimes it may be traversed dry-shod, flows altogether about eighty miles, for about sixty of which it is navigable. It is spanned by twenty-three bridges, and its navigation is aided by fifteen locks. It flows through a delightful country, and is remarkable as the deepest river in England."

And now, to conclude, what can we do better than tell all we are told about old Father Thames at top and bottom?—

"Within two miles of Cirencester is the source of the Thames—a clear fountain in a little rocky dell, known by the name of Thames Head. This is the little infantine stream, so great a giant when it arrives at its full growth. What reflections we might make upon human affairs in general, from the mere sight of this oozing well! what a homily we might preach

upon this text—the small beginnings of great things, and what encouragement might be held out to humble genius from it! Truly the course of a river bears no bad comparison with the career of an able man, who makes his own fortune in the world. How slight is his beginning! yet, how full of confidence he runs on in his career, dashing over some obstacles, and turning round others—obliged to take a tortuous course, that his waters may not be changed into an inland lake, or be dispersed in ponds over a marshy country; and that he may arrive at the sea of death, whither he must come at last, with a wealthy and powerful name! See, too, how he gathers tribute as he passes—how smaller minds bear homage unto his, and are content to obey his impulses, and run with him in a mingled stream! See, too, how by his well-acquired wealth he increases the wealth of others—how, by the judicious distribution of his capital, he affords employment, and consequent profit, to thousands!—Thus we have seen our Thames: here he is a little child at play, crawling timidly about, and ignorant of his own strength; by and by he becomes able to walk alone, as at Lechlade, where he is first navigable. Still gaining strength, and increasing in stature, he becomes like a boy, lingering in quiet nooks, and in woody places, and leading a happy life of it. Next we have him at Oxford, a youth at college—his mind filled with reminiscences of antiquity, and assuming a classical name which does not belong to him, half for frolic and half for ambition. Next, emancipated from college, we have him turning courtier at Windsor—dallying in the consciousness of his youthful grace to gain a smile from royalty, and push his fortune in the world by means of royal favour. This he soon discovers is an idle fancy; and his good sense tells him to trust to his own strength for success, and to make himself useful to the world at large, and not a mere hanger-on at a palace. He therefore quits the court, widening and deepening as he journeys on; his mind expands, as it were, while his physical strength increases. He now makes himself a reputation—his character is known over the world—he becomes concerned in mercantile speculations, in which he is universally successful, and so full of probity, that traders from all parts of the world give him unlimited credit. They would as soon believe any monstrous improbability, as his failure or bankruptcy. Now he is rich indeed; and his house (which may be called all London) becomes the mart of the world, and thousands of merchant princes attend every day at his levees. He spreads wealth wherever he goes; and a whole population live by him. This is his prime of life—his busy period—and he goes on, full of years and honour, till he is swallowed up in the dark ocean of death! The little dell, whence issues the gentle stream, is, in hot seasons, perfectly dry; but the drought that stops the supply at the fountain head has but slight effect upon the course of the stream. It has so many different feeders from various parts of the country, that at Lechlade and Cricklade it runs on its usual course, uninfluenced by the scarcity at the head. There is an amusing story told of a simple Cockney, who, on his way from Bristol to London, turned aside to visit the source of the river he was so proud of. It was a warm summer;—there had been no rain for three weeks, and the spring was dried up:—“Good God!” said he, with an expression of the utmost alarm and sorrow, “what ruin this must cause at London! What ever will the poor people do for water!” and his busy

fancy conjured up a direful picture of a thousand ills consequent upon the stoppage of the stream: no more ships arriving at London, laden with the wealth of the world—the bankruptcy of rich merchants—the shutting up of ‘Change—the failure of the Bank of England—the anguish of ruined families—and the death of thousands in the agonies of thirst! The Germans tell a similar story of a traveller who visited the springs of the Danube, and which, as we are upon this subject, may serve as a pendant to the story of our Cockney. The traveller, in this case, was a Swabian, and whenever the Germans wish to palm off a joke, a Swabian is sure to be the butt. On noticing in what a small stream the water trickled at the source of that great river Danube, he formed the bold resolution of stopping it up! He put his hand across it; and as he fancied the various cities upon its course deprived of their supply of water by his deed, he exclaimed, in the pride of his heart, ‘What will they say at Vienna?’

On the Kentish side lies the low coast of the Hoo, and the Ile of Grain, with the insulet called Yantleet; none of them possessing any attractions to stay the progress of the traveller. The Thames now mingles itself in the ocean. Its waters have long since lost their freshness; and the Nore light, stationed in the midst, gives notice to all that the course of the great stream is over. From the Essex to the Kentish shores the breadth of the *embouchure* is about six miles. From its source to the Nore the river has flowed for a space of two hundred and thirty miles, and been navigable for one hundred and eighty-eight. A mere brook in comparison with some of the mighty floods of the Old and New World; a rivulet compared with the Volga, the Danube, the Don, and some other streams of Europe; but richer and more glorious than them all. Over its placid bosom passes more wealth; upon its banks resounds the hammer of more industry; and in its ports are stationed more wonders of art and civilisation, and more engines of power and conquest, than in all the streams of Europe put together. And though its history abounds in no wild legends or startling traditions to please the lover of romance, yet its association with the names of the great, the good, and the learned, who have dwelt upon its banks, and loved it, recommends it to the friend of his country. At every step of our course some recollection has been excited, which was worthy of being noted; and if we, in the course of our rambles up and down, and on either side of it, and its tributaries, have brought little or nothing to light which was new, at least we shall be allowed the merit of having diligently culled from a thousand different and scattered sources all the memorabilia of the river, and put them into shape and form. We have striven to be exact without being elaborately learned; we have endeavoured to be a chatty companion, and not a prosing Dr. Dryasdust; and have loved to conduct the reader into green woods, and lanes, and lovely nooks, as well as into old castles and mouldy churches, possessing few attractions but their age to recommend them. If without parade of erudition we have informed the reader; if without the exercise of fancy or invention we have amused him, we have done well, and are satisfied. In pursuance of our original plan, we proceed to trace, with similar objects, the sister stream of the Medway; and, inviting our readers to accompany us, bid farewell to the Thames.”

## ARTS AND SCIENCES.

THE BRITISH ASSOCIATION.

[Fifth notice.]

## PROCEEDINGS OF MONDAY.

THE proceedings of Monday, though a great deal of business was gone through, was expected to be, and was chiefly, remarkable for Mr. Murchison's description of the geology of Russia in the Section C, and Mr. Russell's exposition of the best form of vessels in Section G; and we might, perhaps, add the continuation of the statistical papers and discussions to which we have already so largely referred.

SECTION A.—*Mathematics and Physics.*  
*Papers and Communications.*

1. Sir J. Herschel's 'Report on the Nomenclature of Stars.'
2. Sir J. Herschel's 'Report on the Reduction of Meteorological Observations.'
3. Mr. Kennedy, 'On Electricity.'
4. Sir David Brewster's 'Account of the Method of Daguerreotype Drawing.'
5. Dr. Forbes, 'On the Apical Angles of the Moon's Orbit.'
6. Mr. R. W. Fox's 'Report on Subterranean Temperature.'
7. Mr. Eaton Hodgkinson, 'On Subterranean Temperature.'
8. Professor Forbes's 'Report on the Temperature and Conducting Power of different Strata.'
9. Mr. Baily's 'Reports on the Reduction of the Stars in the 'Hist. Céleste,' and on the Extension of the Royal Astronomical Society's Catalogue.'
10. Sir D. Brewster, 'On the Phenomena of *Musca volitans*.'
11. Sir D. Brewster, 'On the Line of Visible Direction, along with the Axis of Vision.'
12. Dr. Reade, 'On the Iriscope.'

Major Sabine read the Reports Nos. 1 and 2. —The first stated the progress made in the revision, involving, also, the history of the nomenclature of the stars. Those of the northern hemisphere had already been revised and examined by Sir J. Herschel, errors detected, and the true magnitudes determined. His details in like manner of the constellations and stars of the southern hemisphere were nearly completed. It was, however, a work of much time and labour. A portion, only, of the grant had been expended, but the whole would be required.—Professor Forbes explained to the Section that changes occur in stellar brightness, and therefore the scale of magnitude varies. Within the last eighty years the magnitudes have greatly altered, and the object of the grant was to correct, enlarge, and render more perfect, the old scale, in which stars only of the sixth magnitude were included. Sir J. Herschel has extended the new one to eighteen magnitudes or states of relative or consecutive stellar brightness.

The second report was merely of progress, and tabulated specimens were submitted for inspection; they promise that the reduction, arrangement, and projection, under the superintendence of Sir J. Herschel, will be most complete. The observations have been divided into groups; the chief are those of the British Isles, of the Continent of Europe, of North America, of South Africa, and of India. The very brief abstract read was considered by Sir D. Brewster so highly satisfactory, and so promising of most interesting results, that he moved a vote of thanks, which was unanimously carried, to Sir J. Herschel.

A long dissertation by Mr. Kennedy, 'On the Laws of Electrical Phenomena,' followed; but as the illustrations were purely mathematical, they would be unintelligible to the general reader without diagrams. His theory may be stated to be that of Franklin, divested of idiosyncrasy and invested with the theory of the influence of equivalent spaces. Mr. Kennedy considers that he has entirely overthrown the two-fluid theory of Dufay.

Sir D. Brewster, at the request of the Chair-

man, exhibited and explained a daguerrotypes, made by Mr. Thomas Davidson of Edinburgh. Splendid specimens of drawings made by this instrument were handed round the room.

Dr. Forbes, of St. Paul's, read a most elaborate paper, accompanied by very abstruse mathematical formulæ, 'On the Apsidal Angle of the Moon's Orbit,' on which the Astronomer Royal, Professor Airy, made a few remarks.

Professor Forbes then communicated the paper by Mr. Fox, 'On Subterranean Temperature;' which was followed by papers on the same subject by Mr. Hodgkinson and Professor Forbes.

Mr. Baily's report, and the papers by Sir David Brewster, were then severally read.

The only popular paper in this Section was one by Dr. Reade, on what he denominated the *Iriscope*: the experiments exhibited in illustration were two. A solution of Castile soap in water is put into a bottle to about half the depth, which, when shaken, leaves a soap "bubble" across the diameter of the vessel: this film, or bubble, exhibits "all the colours in nature." The other was exhibited by coating a piece of plate-glass with a solution of Castile soap in water, which after being dried, was polished. This being breathed upon through a glass tube instantly produced all the colours of the iris, in a circle surrounded by a dense black ring.

#### SECTION B.—Chemistry. Papers and Communications.

1. Mr. Mallet's 'Report on the Action of Salt and Fresh Water on Cast and Wrought Iron, and Steel.'

2. Mr. Griffin, 'On a New Mode of Crystallographic Notation.'

3. Professor Penny, 'On the Action of Nitric Acid on the Chlorates, Iodates, and Bromates.'

4. Dr. R. D. Thomson, 'On the Tests for Sulphuric Acid when thrown on the Person.'

5. Professor Johnston, 'On the Resin of Sarcocolla.'

Dr. Thomson in the chair.—The first paper read was by Mr. Mallet, 'On the Action of Salt and Fresh Water on Cast and Wrought Iron, and Steel.' The author read a similar paper to the Mechanical Section on Saturday. The voluminous results are, so far as they have been obtained, tabulated, so as to afford to the engineer valuable practical data. The investigation is still in progress, and will, when complete, exhibit the ratio of corrosive action on cast and wrought iron, and steel, under every circumstance in which these materials are employed.

Dr. Clark proposed a vote of thanks to Mr. Mallet, for the extraordinary activity and ability he had displayed in conducting the investigations on this subject at the request of the Association.

The next paper was by Mr. Griffin, 'On a New Mode of Crystallographic Notation.' The author proposes to divide crystals into seven elementary classes, or "forms," which, in the several states of combination, will constitute the planes of crystallised minerals. The different modifications of these forms he denotes by the signs plus and minus; and when combinations of forms occur, by a system of notation in reference to the sections, axes, and poles of the different crystals.

Professor Johnston considered the meeting very much indebted to Mr. Griffin, and that the thanks of the Section were due to him for the very clear manner in which he had described a system of notation of crystals, which would be no less useful to the private student than to the lecturer in the class-room.

Professor Penny, 'On the Action of Nitric Acid on the Chlorates, Iodates, and Bromates.' The author's object had been to obtain further confirmation of his researches in equivalent

numbers. In this he had failed with these materials, but he considered he had obtained new results as to the action of nitric acid on the chlorates, iodates, and bromates of potassa and soda. He detailed the *experimenta crucis*, and proposed the action of nitric acid on these three classes of salts as a distinguishing test.

Dr. Thomson, 'On the Tests for Sulphuric Acid when thrown on the Person.'—Several cases which have recently occurred in the author's practice in London, and in which he has been consulted in a medico-legal point of view, induced him to bring the result of some of his experience before the Section. The usual modes of inferring that free sulphuric acid was present in hats and clothes he found to be exceedingly liable to fallacy, and this was particularly instanced in the case of the hat of the person upon whose face a quantity of sulphuric acid had been thrown for destructive purposes. He found that a portion of the hat which had been uninjured contained sulphuric acid, as well as that portion which was injured. The solution of both possessed an acid reaction, and the question came to be, Was the acid in either case free or combined? The author shewed that there was only one way of determining to demonstration the presence of free or combined acid, viz. by a quantitative analysis—by first weighing the acid contained in the entire hat, and then that contained in the injured hat. The excess of the one over the other might be considered as free acid. The usual method of proving the presence of neutral sulphates by boiling them with carbonate of lead, and concluding that if a sulphate was formed free sulphuric acid was present, he shewed experimentally to be quite fallacious; because sulphate of soda, potash, &c., decompose carbonate of lead. The author also shewed, that wherever oil of vitriol occurs we may expect to find nitric acid, because all the acid of commerce contains nitric acid. The presence of the latter acid could only be detected, in his opinion, by its property of dissolving gold and platinum when mixed with muriatic acid. The test of morphia he considered liable to produce great mistakes, as pure morphia gave no reaction with nitric acid; and the only change produced was when the morphia was accompanied with resin—that is, had been prepared pure. The author concluded by offering some strong cautions against the careless mode in which evidence is too frequently given in courts of justice on medico-legal matters, and affirmed that evidence was only of value when it was given with all the details of the experiments.

The last paper was that by Professor Johnston, 'On the Resin of Sarcocolla,' which, like all this gentleman's other discourses, was full of useful matter. Instead of consisting of a substance like sugar, the result of his numerous experiments shewed that this resin consisted of four other substances, in the following manner:—The resin of sarcocolla of commerce is separated by water into three parts:—

1. A gum, A, which does not dissolve in water or alcohol; but which is, in a great measure, washed out by means of the former solvent.

2. A portion, B, insoluble in water, but soluble in alcohol, which is of a resinous aspect, and is represented by C 40, H 32, O 14. The hydrate is C 40, H 32, O 14 + 2 H O, when dried at 60°. This portion, B, is separated (decomposed?) by bases into two or more organic compounds, the alcoholic solution giving with neutral acetate of lead a salt containing an organic constituent, represented by C 40,

H 25, O 16. Ammonia throws down from the mineral solutions a second salt of lead, the constitution of the organic constituent which has not yet been determined.

3. The portion taken up by water from the crude sarcocolla, when evaporated to dryness, is separated by alcohol or ether into a soluble (C) and an insoluble part (D).

The soluble portion, C, dried at 212°, gives discordant results, approaching to C 40, H 32, O 15; but when treated with bases, gave salts containing organic constituents of a different constitution.

A neutral acetate of lead throws down a salt represented by P 60 + C 40, H 28, O 15; and the subsequent addition of the neutral tris-acetate, a salt represented by 2 P 60 + C 40, H 32, O 16.

The portion D, insoluble in alcohol but soluble in water, consists of a gum and of a substance which is precipitated by neutral acetate of lead in curdy flocks. The investigation is still in progress, and the results are to be considered as open to correction.

#### SECTION C.—Geology. Papers and Communications.

1. Mr. J. Craig, 'On Coal Formations of the West of Scotland.'

2. Mr. Murchison, 'On the Geology of Russia.'

3. Rev. D. Williams, 'On the Geology of some parts of Devonshire.'

4. Mr. Milne, 'On Earthquakes in Scotland.'

Mr. Craig's paper possesses great interest, and we purpose giving it hereafter at length in a corrected form; meanwhile we proceed to the other sectional doings.—Mr. Lyell, in the chair, made some remarks on Knipe's Map of England and Wales being published apparently under the sanction of the Geological Section of the British Association, whereas it had only been patronised by individual members. A gentleman present pointed out how the error, which was only a partial one, had been committed, and the subject dropped.

Mr. Murchison then proceeded to give a sketch or outline of his recent geological tour in Russia, which he had not yet had time to put into a proper form, as he hoped to do, in order to lay it before the Geological and other Societies. He spoke in high terms of the countenance he had received from the Russian authorities, and the assistance afforded him by several eminent natives of the country, whose names he mentioned.\* He also alluded to preceding works on the subject, and the paucity of information which had been furnished by former geologists in this field. Previously to examining the country, he had thought that his Silurian system of sedimentary deposits must prevail in it to a great extent, but he had no idea of the vastness of the proof of the correctness by the prodigious range covered by these deposits, and also of the overlying rocks, which added most valuable evidence of the very same formation. Here he found an immense area, not interfered with by igneous rocks, and extending for thousands of miles from the north to the neighbourhood of Moscow. He had, indeed, experienced very considerable difficulty in investigating the geological features of the country, in consequence of the great quantity of detritus, of drifted mud, sand, and boulders, and masses of granite, which had been borne down and left on the surface of the original formation. No evidence of succession could be obtained, and it was not till on going to Petersburg that he had

\* The chief parties named were Baron Brunow, Count Cancrin, Count Nesselrode, Count Alexander Stroganoff, Baron A. de Mayendorf (who aided the expedition), and Count Kaysersling. Professor Blasius, and Lieut. Koksharoff, who rendered their personal and valuable services: the two former, naturalists; the latter, a young geologist.

met with such intelligence, as enabled him to pursue his object to a successful result. Mr. Murchison again spoke of the aid given him by the Russian government, and warmly thanked the Director-General of the Mining School, General Tchekfinkine, and the Consul-General of the Empire, M. Benchausa, who were present in the Section Room, for that support to his undertaking. Thus helped, he had clearly established the fact that the oldest sedimentary deposits were decidedly Silurian.

1. The blue clay of St. Petersburg, in which no organic remains were discovered.

2. A peculiar sandstone, in which he found two fossils of a new character.

3. Limestone, exactly like that of Dudley, though with some difference in the mineral masses it contained, but agreeing in the shells, trilobites, ammonites, &c. which abound in immense quantities.

[A section of the country was exhibited, which Mr. B. Ibbetson had drawn and coloured with extraordinary expedition, and which distinctly, though roughly, pointed out the exact position of these strata. — See woodcut.]

Mr. Murchison then described the course he had taken, and the means by which he had identified the Russian formation with the upper Silurian. He had examined all the deep ravines through which rivers flowed in a transverse direction. In this manner he detected the order of superposition; and found that the formations spread to the east and west, and were lost in the north under immense masses of granite detritus of varied character. Returning to the stratification already specified, he observed that an enormous stratum of flagstone overlaid the limestone of the Silurian series;—a great red formation which he had previously thought to be the new red sandstone, characterised by salt and gypsum, but, on examination, he found it to be in reality the true old red sandstone of the Devonian system. It contained the same fossils, and the same fishes, with the same scales as were obtained in Scotland and England; and thus unquestionable proof of identity of rocks was offered, and set the question at rest for ever. He expressed his delight at gathering this result from the remarkable collocation of shells and fishes found so abundantly in Russia, and the confirmation of the theory seemed to give great pleasure to the geologists in the meeting. Higher up, above the red sandstone, was marl and impure limestone, in which, besides the holoptichius, new fishes were found which he would call on M. Agassiz to point out. The holoptichius was the same as was largely found in Scotland, and of which there is a specimen in the British Museum no less than three feet five inches in length. They abound in the Russian sandstone for many hundred miles, and are in vast quantities near Dorpat.\* Mr. Murchison dwelt on the benefit conferred on science by the British Association, which put it in their power to bring these things together and avail themselves of the value of comparison. He then adverted to Waldai, half-way between Petersburg and Moscow, as a place where the superposition of the strata he had been describing, was most beautifully illustrated. Ascending still higher they arrived at another series—the carboniferous system, with entirely different shells. It consisted, first, of a yellow sand; and, secondly, of coal, shale, with plants, the same as in Scotland. He particularised the

\* Some of the new fossil fishes were on the table among the other numerous known specimens, and were of extraordinary form. One, in particular, had wings so like a butterfly that it was hardly possible to discriminate it from the insect.

*Megalichthys* and the *Holoptichus Nobelissimus* (so named after Mr. Noble) as belonging to this formation. Above it lay the carboniferous system proper, yet marked by some mineral

discrepancies as in the white limestone of Moscow, but with the same products and other fossils as occur in the carboniferous limestone

of England. This limestone resembles our chalk, and ranges a thousand English miles, in flat normal masses which have never been disturbed. Thirty or forty of its fossils were the same as those described by Mr. Sowerby and Mr. Phillips. Mr. Murchison noticed his astonishment at seeing wonderful cliffs of white alabaster, interlaminated by calcareous bands, in which were fossils, perhaps new to the science. Next in the series was a deposit widely separated from the foregoing in age, and presenting the startling fact of there being no intermediate beds between the carboniferous system and the oolites. No tertiary deposits of eocene or miocene periods, nor of the age of pliocene. He had, however, made the important discovery on the Dwina, above Archangel, of a blue shale with a multitude of shells identical with those left on the shores of the White Sea. He had gathered there a tray full of them, of existing species, and yet 300 feet above the level of the sea. The result of the whole was, that at a recent geological period all Russia was covered by the sea to the banks of the Ural mountains. He had traced the mighty blocks of northern Scandinavian origin, diminishing in size and number as they descended towards the south, and where the drift changed. The Silurian system was complete, and the white formation added with bands of silex of the true carboniferous system, and not chalk-flints. There were also peculiar trap-rocks, showing the exact line of the drift from the north, or N.N.W.

Mr. Murchison concluded with much applause; and Mr. Lyell, the chairman, congratulated the meeting on the proof of the Silurian system being now complete. To Mr. Murchison and his successful campaign in the north they were indebted for the clear classification of the Silurian and Devonian formations. The link that was wanting in that classification, is now appeared, the geology of Russia was admirably calculated to supply. Some of the descriptions they had heard agreed very much with what he had witnessed in Sweden and Norway—the fact, for instance, that these very masses of Silurian strata run for thousands of miles, in a horizontal position, over a large portion of Europe. There was here, too, evidence of a gradual rising in Russia, such as was now taking place in Sweden—either such an upheaval as that going on in Sweden, or such a depression as is now going on in Greenland. He also remarked on the gradual loss of species in the fossil remains, and the introduction of new: not the extinction of whole races, but partial operations in different localities of the same age; for deposits containing different animal remains might be going on at the same time, and there was nothing universal. Yet the organic characters were the only guides they had to the age of the various strata of which the crust of the globe was composed; though Alps and Pyrenees might be appearing whilst all was tranquil in the deposits here. He inquired about what height the shale was to which Mr. Murchison had alluded, and was answered about 500 feet.

Some conversation ensued respecting the Baltic shells, and the number of oceanic remains found, more than 200 feet above the level of the sea, near Stockholm. This was considered to demonstrate a more moderate date for the geological formation of Russia.

Mr. Smith, of Jordanhill, said it must have been the same as the valley of the Clyde; and, after some observations from Mr. Delabecche, this interesting communication concluded.

In the course of it, we should state, very

high compliments were paid to Mr. Miller, a stonemason of Cromarty, who had devoted himself with great zeal and ability to geological pursuits, and made many curious discoveries of fossil remains in the strata of that neighbourhood. We heard afterwards that some of the remarkable insect-looking fishes were found by Mr. Slight near Banff,—some specimens of which M. Agassiz will have an opportunity of examining in Edinburgh before he leaves Scotland.

And, speaking of this very intelligent gentleman, whom we had the pleasure to meet after the separation of the British Association, and he had made a tour to Ben Nevis and the terrace roads of Glenroy, we should mention that he has there found the strongest confirmation of his theory of the transport of rocks by icebergs; and considers that, throughout all this part of Scotland, the most perfect traces are to be made out of the prevalence and effects of the phenomena he observed among the glaciers of Switzerland.

The following appears in "The Scotsman" on the subject, the great interest of which involving the confirmation of his views, in addition to his communication to the Geological Section, induces us to insert it here, and so far anticipate Tuesday's proceedings:—

"*Discovery of the Former Existence of Glaciers in Scotland, especially in the Highlands, by Professor Agassiz.*—Professor Agassiz, of Neuchâtel, has recently been studying the glaciers of the Alps with great care, and has been led by his investigations to certain bold, novel, and highly interesting conclusions respecting the part which these angular bodies have acted in the physical history of the globe. We were present when he explained his views in the Geological Section of the British Association at Glasgow, and subjoin a short outline of them, drawn up, we believe, under his own eye. To this we are enabled to add a most interesting communication addressed by him to Professor Jameson, bringing out the important fact that he has discovered distinct indications of the ancient existence of glaciers at Ben Nevis, and elsewhere in the Highlands. There are other geological phenomena which lead us to conclude that the climate of this country at a former, but, geologically speaking, a recent epoch, was much colder than it now is; and that such a state of things is consistent with the course of nature, is shewn by the fact that Mr. Darwin found glaciers reaching down to the level of the sea on the west coast of Chili, in latitude 46°; that is, 11° nearer the equator than Ben Nevis. The evidence on which M. Agassiz's experience in the Alps has taught him to rely, consists, first, of the striated and smoothed surfaces of the rocks, the direction of the striae being along the valley; secondly, of moraines, or long narrow ridges of gravel, which are deposited on the flanks of the glaciers; and, thirdly, of large transported fragments of rock, which are borne along by the glaciers in their course, or floated off by icebergs when the glaciers reach the sea. In a work just published, he has adduced powerful arguments to shew that the great valley of Switzerland, between the Alps and Jura, fifty miles in breadth, was formerly covered by one great sheet of ice. The following is a brief notice of the communication made by Professor Agassiz, *visu voce*, to the Association, 'On the Glaciers and Boulders of Switzerland':—Professor Agassiz, of Neuchâtel, gave a most valuable communication upon the glaciers of Switzerland, in which he particularly drew their attention to facts relative to the man-

ner of their movements, which he attributes to the continual introduction of water into all their minutest fissures, which, in freezing, continually expands the mass. The effects of the movement produced by this expansion upon the rocks beneath the ice are very remarkable. The bases of the glaciers, and the sides of the valleys which contain them, are always polished and scratched. The fragments of the rocks that fall upon the glaciers are accumulated in longitudinal ridges on the sides of the ice by the effects of the unequal movement of its middle and lateral masses. The result is longitudinal deposits of stony detritus, which are called moraines; but as the glaciers are continually pressed forwards, and often in hot summers melted back at their lower extremity, it results that the polished surfaces, occasioned by friction on the bottom and sides, are left uncovered, and that the moraines, or curvilinear ridges of gravel, remain upon the rocks formerly covered by the ice: so that we can discover, by the polished surfaces and the moraines, the extent to which the glaciers have heretofore existed, much beyond the limits they now occupy in the Alpine valleys. It even appears to result from the facts mentioned by Professor Agassiz, that enormous masses of ice have, at a former period, covered the great valley of Switzerland, together with the whole chain of the Jura; the sides of which, facing the Alps, are also polished, and interspersed with angular erratic rocks, resembling the boulders in the moraines, but so far different, that the masses of ice not being there confined between two sides of a valley, their movements were in some respects different—the boulders not being connected in continuous ridges, but dispersed singly over the Jura at different levels. Professor Agassiz conceives that at a certain epoch all the north of Europe, and also the north of Asia and America, were covered with a mass of ice, in which the elephants and other mammalia found in the frozen mud and gravel of the arctic regions, were imbedded at the time of their destruction. The author thinks that when this immense mass of ice began quickly to melt, the currents of water that resulted have transported and deposited the masses of irregularly rounded boulders and gravel that fill the bottoms of the valleys; innumerable boulders having at the same time been transported, together with mud and gravel, upon the masses of the glaciers then set afloat. Professor Agassiz announced that these facts are explained at length in the work which he has just published, 'Etudes sur les Glaciers de la Suisse,' illustrated by many beautiful plates, which were laid before the Geological Section. Professor Agassiz is also inclined to suppose that glaciers have been spread over Scotland, and have every where produced similar results. If we understood him rightly, he means to follow up his valuable researches in the Highlands of Scotland during his stay in this country, where he confidently expects to find evidence of such glaciers having existed, particularly around Ben Nevis. The letter to Professor Jameson was intended to appear in the 'Philosophical Journal,' which, however, was published some days ago, and the Professor has obligingly transmitted it to us for insertion in 'The Scotsman,' with the following note:—'I enclose an extract of a letter received from Agassiz, dated Fort Augustus, October 3, which has just reached me, but too late for the 'Philosophical Journal.' As it is of great importance in a geological point of view, I send it for insertion in your journal. It proves the

former existence of glaciers in Scotland, and gives what may be considered the true explanation of the parallel roads of Glen Roy, &c. &c. Ever since I published the account of the great moraines in Norway, in districts where no glaciers are now to be seen, I have kept a lookout for further information on this important subject, and have not failed to lay before the public, in the 'Edinburgh New Philosophical Journal,' the results of the observations of the most accurate travellers and naturalists on the physical history of glaciers, such as of Esmark, Scoresby, Latta, Wachsenberg, Charpentier, Venetz; and, in the late numbers of the 'Edinburgh New Philosophical Journal,' also of Studer, Renoir, and above all, the truly original and beautiful investigations and views of Agassiz.

"Extract from a letter from Professor Agassiz to Professor Jameson, dated Fort Augustus, Oct. 3d; received, Oct. 6th:—'After having obtained in Switzerland the most conclusive proofs, that at a former period the glaciers were of much greater extent than at present, nay, that they had covered the whole country, and had transported the erratic blocks to the places where these are now found, it was my wish to examine a country where glaciers are no longer met with, but in which they might formerly have existed. I therefore directed my attention to Scotland, and had scarcely arrived at Glasgow when I found remote traces of the action of glaciers, and the nearer I approached the high mountain chains these became more distinct, until, at the foot of Ben Nevis, and in the principal valleys, I discovered the most distinct moraines and polished rocky surfaces, just as in the valleys of the Swiss Alps, in the region of existing glaciers; so that the existence of glaciers in Scotland at early periods can no longer be doubted. The parallel roads of Glen Roy are intimately connected with this former occurrence of glaciers, and have been caused by a glacier from Ben Nevis. The phenomenon must have been precisely analogous to the glacier-lakes of the Tyrol, and to the event that took place in the valley of Bagné. It appeared to me that you would be glad to be able to announce, for the first time, in your extensively read journal, the intelligence of the discovery of so important a geological fact.'"

The Rev. Dr. Williams (No. 3) remarked on the impossibility of the culm and plant-rocks of Devonshire being contemporaneous with the English coal-field, or the great Devonian group with any portion of the old red sandstone. The small per-centage of the carboniferous species of carboniferous testacea in the former, and the absence of the ichthyolites in the latter, as compared with the English coal-field and the old red sandstone, were to him conclusive on this point. The Cornish killas, it had been stated, were only a modification of the old red sandstone; near Tavistock, however, the culm measures dip beneath the killas. If, then, Dr. Williams observed, the culm measures be the true equivalent of the English coal-field and the killas of the old red sandstone, then the English coal-field must underlie the old red sandstone.

Mr. David Milne then gave an account 'Of the recent Earthquakes in the North of Scotland.' Since the year 1788 shocks have been remarked, and have been partially registered. Three-fourths of these seem to have issued from Comrie, in Perthshire, and most of the others from the banks of Loch Ness. The district of Comrie contains mica slate, clay slate, and greywacke, with hills of granite and compact feldspar, which have elevated the other rocks, the conglomerate of the greywacke

containing no pebbles of granite or feldspar; but on the former rocks is old red sandstone containing these pebbles. There are also some remarkable greenstone dykes, which seem to run parallel to each other from sea to sea, in east and west direction, and cutting the oldest and newest strata. The shocks emanated from a granite hill, or from the junction between it and clay slate, about two miles off Comrie. In October 1839, there were sixty-six shocks; November, twenty-one; December, nineteen; January 1840, eight; February, six; March, thirteen; April, eight; May, five; July, six; the severest being on the 23d of October, at half-past ten p.m. It was felt as far north as Lochaber and Dingwall, and south as Carlisle and Coldstream; varying in intensity in different places. The shocks appear to come from a central point, as their direction is different at different places: at Comrie being from the north, at Dunkeld from the south-west, and at Loch Earn Head from the east. There was an upward motion at Comrie, and at other places it was oblique. There was, likewise, a diminution of intensity and sound as the distance from Comrie increased; and there was, in each place, a marked difference in the damage done to houses. The shock was more severely felt where the soil was alluvial; although, in this case, the sound was not heard as in rocky places. Occasionally there was a fall of fine black powder, and in some places there was a sensible smell. Various explanations may be given as to the rationale of these shocks; but one of the readiest is the passage of water down to some heated mass below, and its consequent conversion to steam. As bearing on this, the shocks are found to have been more frequent at the time of the year when the greater quantity of rain falls, and when the barometer is lowest. During the last fifty years, 198 shocks took place in the winter half year, and 61 in the summer. Mr. Milne mentioned that a gentleman in Comrie is making accurate observations of these phenomena, and described a simple but ingenious set of instruments he employs. The latest shock had occurred on the 12th of August this year.

Professor Buckland remarked, that as we were now in the land of earthquakes, he would tell them what to do when an earthquake occurred. He had been at Palermo, and learned that. If an earthquake were to occur at present, those sitting in the centre of the room would be in the greatest danger; he who was sitting at a window would be in the least. In such circumstances, let them betake themselves to a door or a window, for the roof and flat beams give way first, and the upright walls longest withstand the shock.

#### SECTION D.—Zoology and Natural History. Papers and Communications.

1. Mr. Danson, 'On the Alpaca;' living specimens of which were exhibited.
2. Dr. Lizars, 'On the Organs of Sense in the Salmon.'
3. Mr. Strickland, 'On the True Method of Discovering the Natural System in Zoology and Botany.'
4. Professor Agassiz, 'On the Animals of the Red Snow.'
5. Professor Agassiz, 'On an Animal Inhabiting the Ice of the Glaciers.'

The communication respecting the Alpaca was of great interest, both to manufactures and agriculture; several living specimens of the animal being exhibited in the Square of the College, by Hunter's Museum. They looked healthy and vigorous; and, we have no doubt, will soon be naturalised in this country, and spread like sheep or goats over its hills and pastures. An enterprising individual at Liverpool is engaged in the undertaking, and has given large sums for their importation from South America. The wool is beautifully long

and fine; and we have seen a small quantity of it woven into a fabric of peculiar delicacy and utility.

Mr. Strickland read a paper 'On the True Method of Discovering the Natural System in Zoology and Botany.' The object of this paper was to shew that the affinities of species and groups follow no regular or symmetrical order, such as is exhibited in artificial systems, but that they radiate and ramify irregularly in all directions. He consequently inferred that the only means of arriving at a knowledge of the true system is, to discard all *a priori* considerations, and to trace out and delineate the affinities of species by an inductive process, similar to that of a geographical survey. To do otherwise was not to follow Nature, but to clip her into forms as they saw yew-trees clipped by curious gardeners. In illustration of this he exhibited some sketch maps, intended to shew the true order of affinities in certain families of birds.

Mr. Vigors defended those who had adopted artificial arrangements, whether rotary, quinary, or lineal. All they attempted to do by their various modes was to exhibit affinities and assist the memory. There was only one natural system—the system of the universe.

Dr. Lizars read a paper 'On the Organs of Sense in the Salmon.' After alluding to the importance of combining the investigation of the structure of animals with their external character, and stating that the anatomy of the salmon had hitherto been almost entirely overlooked, he proceeded to describe it, and the functions of the organs of the senses in this animal. After dissecting the skin, he arrived at the conclusion that it was not very highly organised for the function of touch. He arrived at the same conclusion with regard to the organ of taste. The organs of smell, sight, and hearing, he minutely explained, and demonstrated satisfactorily that these organs were highly developed. In the course of his interesting remarks he shewed the analogy of these organs to the organs of sense in man, and illustrated his subject by a series of fine paintings and drawings.

The paper was followed by some valuable observations from Professor Agassiz, who stated that he agreed in almost every point with the views so ably advanced by Dr. Lizars.

In consequence of the day being so far spent, the discussion, on the suggestion of Dr. W. Jardine, was postponed till next day.

Professor Agassiz, who spoke at considerable length in French, announced the extraordinary discovery, lately made by him, that the *Protococcus nivalis*, a minute substance which colours snow red, is not, as has been hitherto supposed, a vegetable, but the egg of an animalcule, a species of rotifer. This he had proved by examining the protococcus in all states of development, and by finding the ovaries of the rotifer filled with it. He also gave an account of an insect of the podura tribe, a new genus, which he has discovered in great numbers inhabiting crevices in the ice of the glaciers. This creature is supposed to feed on the animalcules which abound in the ice. The learned Professor illustrated his remarks by exhibiting a number of beautiful drawings, and was listened to throughout with marked attention.

#### SECTION E.—Medical. Papers and Communications.

1. Dr. Charles Williams, 'Report of Experiments on the Physiology of the Lungs and Air-Tubes.'
2. Dr. Sym, 'On the Physiology of the Ear.'
3. Dr. Rees, 'On the Preparation of Subjects.'
4. Dr. Fowler, 'On the Fifth Pair of Nerves.'
5. Mr. A. Ure, 'On the Operation for Squinting.'

Dr. Watson, President, in the chair.—The Secretary read a 'Report of Experiments on the Physiology of the Lungs and Air-Tubes,' by Dr. Charles Williams, of London University College. The objects of the investigation were to test the existence of muscular irritability in them, and determine its character. Dr. Williams was assisted by Dr. Sharpey of London, and others; and the experiments seem to have been judiciously planned, and performed with great care. The experimenters having completely satisfied themselves of the existence of muscular irritability in the air-tubes, proceeded to investigate how it was influenced by various medicinal agents which medical men are in the habit of employing in diseases of the lungs. Almost all of the experiments prove that the air-tubes are endowed with irritable contractility, excitability, electric, chemical, and mechanical stimuli; and, probably, they possess also tonic contractility, but it does not appear to exist in the vascular terminations of the air-tubes. This contractility resembles that of the intestines, or arteries, more than that of voluntary muscles, the oesophagus, or heart; the contractions and relaxation being more gradual than those of the latter, but less tardy than those of the former. The irritability of the bronchial muscles is soon exhausted by the action of a stimulus, and may be, in some degree, restored by rest, even when the lung is removed from the body for an hour or more. But when the stimulation is long continued, as by intense irritation of the mucous membrane during life, the irritability is not restored by rest, and the tonic contractility alone remains. The contractility of air-tubes is much influenced by the mode of death, and several vegetable poisons impair or destroy this contractility. Extracts of stramonium and belladonna produced this effect. Strichnia, conium, and morphia, also impair this property considerably; but hydrocyanic acid in no degree produces this effect. These poisons, and different modes of death, do not act on the irritability of the bronchial tubes in the same degree as they do on that of the heart and other contractile tissues, and they do not seem to act equally on the irritability and on the tonic contractility of these tissues. Mechanical and galvanic irritation of the vagi had no effect on them; and, passing a galvanic current through the nerves to the lungs, caused much less contraction than passing it through the trachea. A vote of thanks was unanimously given to Dr. Watson; and, after a short discussion, the report was ordered to be printed.

Dr. John Reid then read an elaborate memoir 'On Asphyxia.' It was an analysis of an experimental investigation into the cause of arrestment of the blood in the right side of the heart in asphyxia, and of the arrestment of the sensorial functions. The former was proved to depend upon the cessation of the chemical changes at the lungs, and the latter upon the circulation of venous blood through the brain.

Dr. Brown, and others, having made a few remarks, Professor Buchanan gave an account of some experiments which he had performed, for the purpose of determining the nature of the coagulium of the blood.

Dr. Sym read a paper 'On the Physiology of the Ear,' and came to the following results:—

1. The external ear protects the membrana tympani, and at the same time gives a knowledge of the direction of sounds.
2. The membrana tympani presents a large recipient surface for sonorous impulses, which draw its apex outwards.
3. The ossicula of the tympanum constitute a system of levers, by which motions

of the membrana tympani are transmitted to the fenestra ovalis with their extent diminished, and their momentum preserved. 4. The laminae of the cellular bones which surround the ear convey vibrations from the larynx by means of the ossicula to the f. ovalis, and these have their extent increased, whilst their momentum is preserved. 5. The combined effect of the difference of extent of the membrana tympani and f. ovalis, and the difference of range of motion of the point of the malleus, and base of the stapes, is to concentrate the impulses of the air, and adapt them for being transmitted, without loss, to a denser fluid. 6. The stapes is raised from the f. ovalis by the impulses of the sonorous undulations. 7. The muscles of the tympanum restore the membrana tympani and the base of the stapes to their quiescent positions. 8. The fenestra rotunda permits the pressure of the atmosphere to act through the Eustachian tube upon the water of the labyrinth, so as to enable the stapes to be raised. 9. The water of the labyrinth oscillates over the auditory pulps by the alternate suction and pressure of the stapes, and this excites the sensation of hearing. 10. The extent of oscillation is regulated by the cochlea, the laminae of which expand and contract according to the degree of friction to which they are exposed. 11. The aqueducts are *diverticula* for receiving the water displaced by the expanded laminae. 12. The petrous bone deafens the internal ear by excluding such vibrations as are not transmitted by the ossicula.

Dr. Cooper, of Glasgow, complimented the author, and dwelt on the philosophical manner in which he had conducted his researches.

Dr. Rees made some observations 'On the Preservation of Subjects for Dissection,' and shewed some specimens prepared by the injection of pyroxyllic spirit into the aorta.

Professor A. Thomson, and others, expressed their entire satisfaction with the working of Mr. Warburton's bill; but were of opinion that it was, nevertheless, of the highest importance to be able to preserve bodies for several months, and thought a clause might, with advantage, be introduced, allowing teachers to keep subjects for a longer period than the law at present sanctions.

The subjects of Dr. Fowler's paper (No. 4.) were:—1. The sensation of tension felt (on approaching any metallic point, or even that of a pen, to the forehead between the eyes), probably by the muscular sense in the adductor muscles, first noticed by Bishop Berkeley as the sense by which we judge of angular distance. 2. The contraction of the iris as often as a rod or tube of silver is passed high up a nostril, and brought in contact with a plate of zinc, under or upon the tongue. 3. The reciprocal influence which the organs of sense have in exciting the adjustments of each other. 4. That sensibility and contractility generally are supplied, not by the brain, but by the arteries of the parts through which they are distributed.

Dr. Cooper, one of the Secretaries, read a paper by Mr. A. Ure, 'On the Operation for Squinting.'—Dr. Laurie said that, though the operation was an excellent one, it was not in all cases successful. Professor Buchanan thought the want of success depended on defect in the associating power of the different muscles.

Dr. H. Lonsdale exhibited two interesting pathological preparations. The one was an ossified *tendon Achilles*, and the other a case of exostosis. He stated that his object in exhibiting the latter preparation was to counteract those exclusive opinions which many entertain

on the subject of ossification, and considered that it was of value in shewing that bone may be formed by vessels which belong to the soft parts, even in muscular fibres adjacent to one of the long bones, and more especially pointing out the caution which we ought to observe in placing a limit to Nature's powers.

Dr. J. R. Cormack, thought that the preparation was not in itself sufficient evidence that the soft parts could produce bone, for the exostosis was connected with the femur, and might have proceeded from it; and, then, it would have been well had the author made a chemical examination of the osseous deposits not connected with the femur, to discover whether they were really of a bony nature. Dr. Lonsdale referred to the difference of structure between the exostosis and the bone itself.

Dr. John Reid detailed the experiments of Mr. Syme on the regeneration of bone. They shewed that the periosteum had the power of producing new bone, but he did not consider them as establishing that it was by the vessels of the periosteum only that new bone was deposited; nor did Mr. Syme hold this opinion, as far as he was aware.

#### SECTION F.—Statistics. Papers and Communications.

1. Dr. Allison, Conclusion of Paper commenced on Friday.

2. Dr. R. Cowan, 'On the Vital Statistics of Glasgow, illustrating the Sanitary State of the Population.'

Lord Sandon in the chair.—The proceedings began by the reading of a paper entitled 'Vital Statistics of Glasgow, illustrating the Sanitary Condition of the Population,' by Robert Cowan, M.D., Professor of Medical Jurisprudence and Police in the University of Glasgow. The Tables were very extensive.

Dr. Alison concluded the paper which he commenced on Friday (*Lit. Gaz.* No. 1238, p. 657), illustrative of the Scottish system of the management of the poor as follows:—

"I stated that the grounds of expediency on which the non-execution of the Scottish poor-law is chiefly rested are two; the anticipated effect of a legal provision on which the poor know they can rely—first in their number, second in their character; and my object is to shew, by statistical facts, that the system now in force has, at all events, had no beneficial effect in either of these ways, and affords no good reason for continued neglect of the laws. I had nearly concluded what I had to state as to the evidences of redundant population, and to their attendant evils, and the imperfect provision for their relief. I can produce returns, received only this morning, from the Provost of St. Andrew's, now present, and from one of the magistrates of Aberdeen, exhibiting results as to the destitution of old and infirm persons, the miserably scanty provisions for them, and the neglect of the education of pauper children, very similar to those which I quoted from Edinburgh, Dumfries, and from the small towns examined by Mr. Chambers. I said further, that I believe, as Malthus and many others have shewn, and as Dr. Cowan has this day amply illustrated, that the frequent extension of epidemic fever is one of the surest indications of redundancy; and that we have good evidence of such fever prevailing much more frequently and extensively in Scotland than in England, or, I believe, in any other country in Europe where a legal provision against destitution is regularly enforced. I mean continued, contagious, often spotted fever, not the intermittent or remittent fever, which is now almost extinct in Scotland. I understand that the mortality from continued fever, in some of the great towns in Scotland, has been not only

much higher than the average in England, but much higher than in any great town in England; exceeding the mortality, by consumption, for one year in Glasgow, and for four years together in Dundee: whereas in the English towns it is rarely above a third, and hardly even above a half, that by consumption. I said, also, that I believe this difference as to the mortality from fever between the English and Scotch towns is greater than appears by the reports to the register-general of England. The number of cases of fever returned were greater than I expected, and I suspected some ambiguity existed as to the cases called fever. This suspicion is fully confirmed in Dr. Cowan's opinion, as well as my own, by a Table communicated to me by Mr. Chadwick, shewing the deaths from fever in the Bethnal Green district in London—the worst district there. In 1838 there were 264 deaths from fever, which might imply about 300 cases; but 115 of the 264 were under the age of ten, and we know that under that age the mortality from contagious fever is trifling: not above 1 in 35—according to Dr. Cowan's Tables—in Glasgow, and at least as small in Edinburgh: 115 fatal cases would imply above 4000 cases below ten. I infer, therefore, with perfect confidence, that many of the cases reported as deaths from fever, in the English reports, were cases of febrile disease indeed, but not of the contagious fever which we speak of as the curse of the Scottish towns. If it is true, as I have stated, that the inadequacy of the legal provision is a powerful cause of disease existing in the great towns, beyond what exists in England, it will naturally be expected that the mortality will decidedly be greater, and I have no doubt that this is the case; but, after taking some pains on the subject, I have come to the conclusion that we must wait another year before we can give perfectly satisfactory evidence in regard to it. All estimates of the increase of population since last census in the year 1831 are somewhat uncertain; and, of course, all estimates of mortality having reference to such estimates are only approximations." After disposing of the arguments on the part of the defenders of the Scottish system of managing the poor, with respect to restraining the growth of the population, and to maintaining the independence of the Scottish poor, the learned Doctor proceeded to read an extract on this subject from "Researches on Pauperism in France," by Sir John McNeill, and from memoranda of an account by Mr. Wallace (the latter also quoted), of the administration of the poor in Edinburgh, by Mr. Chadwick. He agreed with Dr. Chalmers as to localisation; but the Rev. Doctor might continue to urge his views, but would be unsuccessful if further means were not placed in the hands of the proper parties. In conclusion, Dr. Alison stated that, before an improvement could be effected, four things were required: viz. "1. That there should be a compulsory and effectual provision, defined and regulated by the law, for the relief of destitution, whether resulting from age, or infirmity, or want of employment. 2. That this relief be so administered as to make the situation of every able-bodied pauper receiving it less eligible, on the whole, than that of an independent labourer. 3. That a system of strict inspection be exercised over all who receive this relief, with a view to its being always apportioned to their real wants, and so suited to their character as to favour the effect of religious and moral instruction. 4. That in order to fulfil these conditions, particularly in the case of able-bodied persons, in the case of orphan children,

in the case of old and infirm poor, or without relatives, and in the case of persons of immoral conduct, well-regulated workhouses be always at the command of those who administer this legal relief. These propositions seem to me to contain the general result of the lessons of experience on this subject in all countries where it has been carefully and successfully studied. If you do not choose to examine the practice, or to trust to the experience of England, let us look to the example of Holland, of Prussia, Austria, Bavaria, Wirtemberg, Switzerland, Denmark, Sweden, America, Russia, or even Siberia; in all, I think, we shall find, under some slight variety of practice, the same principles admitted and enforced. But if we decline to compare the results of the system now in force in Scotland with the systems elsewhere established, and persist in the belief that our own experience is sufficient to guide us, that our practice is superior to that of other nations, and that the theory on which it has been rested is a sound one,—I venture, with all possible deference and respect for the opinions of others who have thought differently, to assert that we are trusting to a broken reed; that we are falling behind, not preceding, other nations in the advance of civilisation; and, what is far more important, that we are mistaking, and, because mistaking, neglecting a duty which is equally recommended to us by nature and revelation,—the faithful performance of which has been expressly enjoined on the more fortunate members of society as an acceptable service to Him in whom we put all our trust, and without the faithful performance of which we have been expressly warned, that ‘Whosoever liveth is accounted dead before Him.’”

Dr. Chalmers stated that he would not enter into the question to-day; but, since the Committee had kindly allowed so much discussion on this question, he would enter upon it to-morrow.

#### SECTION G.—*Mechanics, Papers and Communications.*

1. Mr. Milne, ‘On an Improved Gas-Regulator.’
2. Mr. Coles, ‘On Railway Carriages.’
3. Professor Gordon, ‘On the Turbine Water-Wheel.’
4. Mr. Whitworth, ‘On Producing True Plane Metallic Surfaces.’
5. Mr. Scott Russell’s ‘Report on the Forms of Vessels.’
6. Mr. Vignoles, ‘On the Economy of Railways, in respect of Curves and Gradients.’

Sir John Robison in the chair.—Mr. Milne described the Gas-Regulator, and illustrated the same with a drawing and dissected instrument. He entered largely into the beneficial results to be expected from the use of this instrument, particularly to dwelling-houses and manufactories of three, four, or more stories high, and stated that one of his regulators was exhibited in the Model Room, having attached to it several gas-burners, by extinguishing one or more of which the effect would be discovered. The effect was not so great in Glasgow as in other places, in consequence of the very small pressure at which coal-gas is distributed in Glasgow.

Mr. John Taylor expressed his great satisfaction at seeing such an instrument. The want of it was much felt in London. In his own house he felt great inconvenience. In the early part of the evening he had not more than the required supply, while in after-hours he had too much.

Mr. Andrew Liddell stated that Mr. Taylor might have been supplied with instruments to produce the effect wanted in a very great degree; for, upwards of twenty years ago, Mr. Samuel Clegg invented a gas-regulator. Since that period many individuals had made similar instruments. Mr. Milne’s instrument included

all the advantages of the older instruments, with some peculiar to itself, and explained why it was that the pressure of gas was so much less in Glasgow than elsewhere, and consequently less required the governor.

Mr. Roberts stated that the instrument now before the Section might answer the purpose, but that it was rather expensive. In 1817 he invented an instrument that would produce the desired effect, and could be made for eighteen pence: he described this, and made a drawing of the same on the board.

Mr. Milne said that Mr. Roberts, fifteen years ago, had supplied him with a similar drawing, from which he made an instrument, but it had not the effect.

Mr. Liddell said Mr. Roberts’s instrument, being extremely simple, could be made very cheap; but as useful effect is what is wanted, he would like to hear if Mr. Roberts had actually tested his instrument by applying it to houses or factories. If so, their description; and to state the varied pressure in the gas mains; and to state the highest and lowest, say if it ranged from  $\frac{1}{2}$  to  $1\frac{1}{4}$  inch.

Mr. Roberts said he had taken no notice of this.

Mr. Thomson read a paper from Mr. Coles ‘On Railway Carriages.’

Professor Gordon then read a paper ‘On the Turbine Water-Wheel,’ which might be used most advantageously on all falls above fifty feet and under ten feet.—The particulars in our next number.

Mr. Whitworth exhibited two iron plates to illustrate the improved method of getting up metallic surfaces, or rather to shew the result obtained. The practice hitherto has been grinding; filing and scraping are the new modes, especially the latter. On the old plan the original irregularities were propagated throughout the process, but by covering the surface with colouring matter after planing and filing, the scraping-tool, under the direction of an experienced workman, produces a true plane. The plates attracted great attention, and elicited the praise of the Section. When one was placed carefully on the other they adhered with considerable force; so strongly, indeed, that one could be lifted by the other, and the weight was not small. But if no care were taken in this experiment there would be no contact, the upper one would slide off on the film of air as though there were grease between the plates. A human hair between caused the plates to revolve with the slightest touch, and when one was allowed to fall on the other there was no metallic sound. Mr. Whitworth observed that possibly absolute truth was unattainable; the present, however, was an approach to it, but he considered the practical limit not yet reached.—Mr. Russell remarked that by these means we might almost get rid of friction altogether.—Mr. Roberts pointed out the great value to be derived from this new working to solid pistons, &c.—Sir J. Robinson directed attention to its application to the production of Mr. Nasmyth’s specula.

Mr. Scott Russell next submitted (No. 5) the proceedings of the Committee appointed last year at Birmingham to conduct experiments on the forms of vessels, for which purpose 200*l.* had been voted. At the time the Committee commenced their investigation it was well known that a great number of experiments had already been made, at an enormous expense and on a gigantic scale, to ascertain the form of a vessel that would pass through the water with the least resistance. No practical

use of them, however, had been made, and ship-builders continued to act upon empirical laws or rules of thumb, not knowing, but leaving to chance, the result of their operations. The first object, then, was to conduct the inquiries so as to secure precision, and to entitle them to the confidence of practical men. After describing the errors and inconveniences of the methods previously adopted, Mr. Russell proceeded to relate, and to submit to especial notice, the simple apparatus by which they had been enabled to arrive at accurate conclusions, and the principle on which it depended. At the end of the channel, say of a mile in length, a kind of pyramidal structure was erected, and a horse-road made. At the top of the pyramid were fixed two wheels or pulleys, also two at the bottom, and attached to the ground. The rope from the boat at the farther end of the channel passed along to the lower wheel and round it, up and round one of the wheels above, through a pulley to which a weight was attached, and suspended in the bight by the rope again leading up over the other wheel at the top, and again down under the second lower wheel, and thence to the horses. By these means, any sized boat may be drawn any distance with a constant pressure. When every thing is prepared and the boat let go, attention should be directed to the suspended weight, which will immediately begin to move if the horses remain still; but if they go on and draw away the slack rope rapidly enough, the weight will remain absolutely at rest. This is the principle of the operation, and the weight may be suited for drawing the boat from twelve to seventeen miles an hour: the friction is almost nothing. Exactly similar results may be obtained from experiments on a small scale, with hand-power, and by means of a light concentric wheel great rapidity may be attained. Another very important piece of apparatus for the correctness of the experiments is Robert’s instrument for measuring short intervals of time;—an exquisite apparatus, Mr. Russell termed it, by which observations may be made to two-tenths of a second, and registered; and any leaning or desire, so difficult to control, to help the experiment the way you wish it to go, put out of the experimenter’s power to indulge. A spring, and not the holder of a watch, was the observer, and a spring recorded the observation. Thus there had every possible means been employed to ensure accuracy in the experiments, the nature of which was twofold.—to ascertain in what way water resisted vessels, or how the particles of water acted or behaved themselves when bodies moved through them; and the form most suited to meet such behaviour. The first was a most important point. It had been imagined that the particles of water pressed upon by the vessel passed underneath: this, however, could not be the case in a full channel, where the pressure would be equal on all, and where there could be no room for them to pass down: nor is it so in any case. The only effect produced is what is termed a wave under the bow of the vessel, which wave causes motion in the water and moves it away. What, then, is the best form of vessel to meet this action? Many experiments were made about six years ago, and then the spoon-bow was considered to be the *ne plus ultra* of form. The water, it was thought, lifted the spoon-bow, and did not go out of the way, but moved in lines called the riband lines, instead of horizontally. These were arranged to suit this movement, and the spoon-bow build was deemed the best possible construction. The question, however, investigated next by the Committee

was how the water, when disturbed or displaced by the protrusion of a solid surface, got together again; and this furnished a most important result. It was supposed that the same particles displaced came together again from the sides horizontally; but this is not the case—entirely new particles come from below vertically. Whatever the form of the vessel moving along, the particles almost entirely from below rise in a wave perpendicularly into the space she is leaving, as though they lifted her out of the water. The object, then, was to produce the easiest way for the water to get up. At the bow, remember, the principal or only motion in the water is horizontal displacement; and at the stern, vertical replacement. Thus, then, had they arrived at a point which led to valuable results. They first, however, previously to experimenting on the best form of water-line and vertical-line, went to ship-builders, and inquired of them what sort of vessel they best liked and most wanted; and, on those principles pointed out, they proceeded to make trials by alterations in water-lines. The favourite amongst shipwrights, then, was what Mr. Russell termed, and technically correct, the cod's-head principle and the mackerel-tail principle, or round at bow with a fine line aft; and on this, at the time of their inquiry, general principle, they conducted a series of experiments which led to the construction of the wave form, or principle—a most extraordinary one as to practical results. If a wave, they discovered, be produced in water, it propagates itself to a great distance; and this mere motion passing along occasioned in the particles of the water the same horizontal displacements that the progress of a foreign body would. And hence they concluded that the form exhibited in the wave would be the form of least resistance, and they constructed a vessel on the wave principle—of a convex shape with large capacity in centre, fine in bow and stern; modified, however, eventually, to exactly the reverse of the cod and mackerel principle before explained. With this shape passing through the water, a most remarkable circumstance corroborative of their views was observed. Under the bows of the old form a large wave or crest was constantly foaming, and offering resistance; with the new, on the contrary, even going at the rate of seventeen miles an hour, there was not even spray, but only a wave or swell which propagated itself to a great distance. The water-lines of the new form, if we understood Mr. Russell rightly, were straight lines. It is not, however, of such moment that we should be critically correct in this our necessarily hurried notice, because the Committee have left nothing undone to establish this important improvement and its general adoption in naval architecture. They have caused drafts to be made, not of models for ship-builders to follow out on a large scale, but accurate representations of large vessels. And, moreover, it is their intention to publish the drawings and results of all the cases. In the course of the experiments one or two curious results presented themselves, when high velocities were employed, in relation to the form of the vessel, and to the behaviour of the particles of the water. On a model of a bluff entrance and fine mackerel-tail being drawn through the water at a certain speed, the water rises abruptly at the bow, and the vessel falls down greatly abaft—a sign of great displacement; but, with a model of the new form, the case is totally different: instead of the white surge under the bows, there is nothing but a gentle, and almost invisible, swell, which propagates itself at high velocities.

At greater speed, still with the new form, a remarkable phenomenon occurs:—the water rises above the vessel on each side like large gossamer-wings, and the vessel flies along with the bow and stern entirely out of the water. Mr. Russell would scarcely venture to state what may be the result of this exquisite phenomenon; the speed to be attained with ease may be railway pace; and when a ship mounts her gossamers she may truly be said to be riding on the waves, or, for others' fancy, to be taking flight. The form best adapted for this very swift passage appears to be a bow exceedingly fine and sharp, with the stern very full and very capacious. These results, however, were merely given for others to draw their own conclusions. Already 2800 separate experiments had been made; it was intended that 10,000 should complete the series, when it was conceived the question would be for ever set at rest. At present they were so far completed as to justify the Committee to point out the results to shipwrights to approve and adopt. Eight vessels are now building and built on the new principle.—A discussion ensued with reference chiefly to the mode Mr. Russell adopted to illustrate one of the old experiments on this question, with the vessel fixed in the running stream, namely, billiard balls and cushion; but it led to no result worthy of notice.

Mr. Vignoles read an able paper 'On the Economy of Railways, in respect of Curves and Gradients.'

The proceedings of the General Committee on this day we have already reported; and a repetition of the Evening Promenade, with which it concluded, offers nothing new for remark.

#### PARIS LETTERS.

Academy of Sciences, Oct. 6, 1840.

1. SITTING of September 28th.—M. Guyon, chief surgeon of the army of Africa, addressed to the Academy the result of his medical observations in that country. At Philippeville, the ancient Rusucada, the intermittent fevers of the country, to which the French soldiers were subject, had been much aggravated by ophthalmia; and it was also a curious circumstance, in all parts of the provinces, that the soldiers, during the great heats, would suddenly fall down as if suffocated. Some had three or four such attacks and then died. At Philippeville, an ancient tomb shewed that a native of Cyrene who had come thither had lived to the age of 108. At Constantine, a case of goitre had been observed in a Kabyle from the mountains; and an individual of one of the native tribes, from the same district, had been found nearly in a state of cretinism. Near Miloh he had observed an Albinos of fifteen or sixteen years of age; although the day was cloudy, the boy was obliged to shade his eyes with his hand. At the same place there had been an unfortunate female idiot of eighteen years of age, whose origin was entirely unknown. She went always in a state of nudity, and wallowed in the mire like a hog; her skin was covered with filth and flies, which it was her amusement to catch and eat. She fed on blood and raw meat, and was universally regarded as a saint: the natives were glad to get her to put one of their bornouses on for a minute, and then considered the garment as sanctified by her touch.—M. Gauthier de Claubry announced that in cutting a trench for a railroad at the collieries of Bert, a fresh-water formation, containing a great quantity of fossils, had been gone through. Among the objects found were the vertebra of a palæotherium, the remains of a crocodile, a

tortoise, and some fish. This formation lay in a small basin, surrounded by the primitive rocks which circumscribed the coal-field of Dampierre and Bert.

#### RIUNIONE DEGLI SCIENZIATI ITALIANI. (Italian Scientific Association.)

Turin Meeting, Sept. 25, 1840.

1. *Medical Section.*—The controversy relative to the stimulative or non-stimulative powers of the bearded rye was resumed, and several professors delivered their opinions on one side or the other. Professor Corneliani thought it to be a decided antistimulant; Professor Garibaldi was of the opposite opinion. Dr. Polto opposed the idea that the communications of the glands from a horse to a man was not possible. Professor Lessona maintained that the disease was not transmissible, and alleged several experiments. Dr. Polto replied that the experiments ought to be so conducted as that the hostile principle should be made to act on parts of the body the most liable to admit contagion.

2. *Geological Section.*—General Rachia communicated to the Section that the Sardinian government was about to make a new road by the Mont Cenis, which would pass through a tunnel of some thousand yards in length, about 650 yards below the level of the highest point of the present pass.—The Cavaliere De Rio read a report 'On the Geographical Part of Captain De Bartolomeis' Topographical and Statistical Notice of the Sardinian Territories.'—M. Michelin communicated his 'Chart of the Principal Geological Formations,' with the fossils, animal and vegetable, characterising them.—The Marchese Pareto, President of the Section, exhibited his 'Geological Map of Liguria and the adjacent Districts,' and explained the principal divisions.

3. *Physical, Chemical, and Mathematical Section.*—Professor Pacinotti communicated a notice 'On the Force and Direction of Electric Currents.'—The Engineer, Signor Michela, read a short memoir 'On the State of Navigable Canals in Piedmont, and on various Ameliorations of which they were Susceptible.'—In the Sub-section of Chemistry, constituted according to a previous resolution, Signor Canobbio read a curious memoir, and exhibited tables, 'On the Composition of Rain-Water.'

4. *Agronomical and Technological Section.*—A discussion was entered into on the best means of cleansing and dressing flour.—A committee was named to report on a new plough invented by the Vice-President.—The Cavaliere Bonafous presented two specimens of wheat, the *Zea cryptosperma* and the *Zea cristata*, with a variety of the *Zea Pennsylvanica*.

5. *Botanical Section.*—Professor Notaris expressed his opinion that the genus *Stiffia*, proposed to be so characterised by Dr. Nardo on a previous day, was nothing more than a variety of the *Padina omphaloides* of Montague. Dr. Nardo maintained that the genus was a true one, but was willing to adopt the name *Zanardinia* instead of *Stiffia*, which was already a botanical term.—A letter was read from M. Michelin, starting the question as to what plants more particularly grew upon white geological soils, &c. Professor Decandolle, Signor Moretti, and others, took part in the discussion that ensued on this point.

6. *Zoological Section.*—Signor Verany distributed among the members a systematic table of the *Cephalopodi* of the Mediterranean, in which each species is represented by an engraving. The author gave a verbal explanation of the more remarkable species, and exhibited some beautiful drawings of the several

species made from the living objects.—Signor Pasini suggested that the tables of the mollusci which had been drawn up and engraved by the late Professor Renier, of Padua, should be published. Most of the members approved of this idea.—M. Bassi read some observations contesting the accuracy of M. Verany's notion, that the argonauta produced its own shell.—Signor Rizzo read papers on various species of fish from the Mediterranean, and from several rivers of Italy.

September 26.

1. *Medical Section*.—Professor Riberi read a paper 'On the Cure of Diseased Breasts in Mothers.'—Dr. Cantu mentioned a peculiar case of the oral and intestinal evacuation of lizards in a female. Dr. Nardo contended that this was zoologically impossible.—A long discussion was gone into on various uterine complaints.—Dr. Maior exhibited to the Section his manner of making improved warm bandages for ligatures, in cases of amputation, &c.

2. *Geological Section*.—The Secretary, Professor Pasini, read an extract from his synoptical table of the various formations of Italy, drawn up in compliance with a recommendation of the Section in the last meeting at Pisa.—Dr. Filippi and Professor Balsamo gave some information relating to the composition of the Milanese territory.—The Cavaliere Alberto della Marmora communicated a short notice 'Of the Geological Structure of the Island of Sardinia, together with a Synoptical Table of the Formations that occurred in it.'—Professor Sismonda read a notice 'On the Fossile Echini of Piedmont.'

3. *Physical, Chemical, and Mathematical Section*.—Professor Maiocchi read a paper 'On the Methods of Determining the Conductibility of Liquids for Electricity.'—Dr. Gatta communicated some 'Meteorological Observations on the Climate of Ivrea.'—M. Bellingeri read a memoir 'On the Electricity of the Blood.' *Sub-Section of Chemistry*.—M. Righini gave an account of his researches into the composition of the oil of the *Lauro-ceraso*.—Professor Cenedella mentioned some curious facts concerning the action of dry chlorates on the deut-oxide of mercury.

4. *Agronomical Section*.—Various agricultural instruments were exhibited, of a new construction. The Cavaliere Vegerri read a project for compiling a complete popular account of agricultural sciences for Italy.

5. *Botanical Section*.—An excursion in the neighbourhood of Turin.

6. *Zoological Section*.—Signor Rizzo distributed to the Section several new species of crustacea, ascidia, armelides, acalephi, &c. from the Mediterranean, not noticed in zoological works.—Dr. De Filippi read a memoir 'On a New Natural Classification of Animals.'

September 28.

1. *Medical Section*.—The business of the day turned principally on various methods of curing croup, worms, and uterine complaints.

2. *Geological Section*.—Professor Sismonda exhibited to the Section a catalogue of the principal fossils found round Turin. He also exhibited fragments of an aerolite which fell at Cereseto on the 17th of last July.—Professor Pasini read a brief memoir 'On the Tertiary Euganean Formations.'

3. *Physical, Chemical, and Mathematical Section*.—Memoirs were read by M. Porro 'On certain Optical Combinations applicable to the Improvement of Optical Instruments;' by M. Michela, 'On some Hydrometric Instruments;' and by Professor Obici, 'On the Laws of Motion in Bodies impelled against

each other.' *Sub-Section of Chemistry*.—Professor Peretti read a memoir 'On the Properties of Animal Carbon in removing Red Stains, or decomposing Red Vegetable Matter.' He alleged experiments to prove that the fermenting matter in grapes was a yellow substance found in all vegetable bodies.—Signor Luigi Quaglia read a paper 'On the Composition of the Greek Fire of the Lower and Middle Ages.'

4. *Agronomical Section*.—The Rev. Canon Bellani communicated a new method of drying and preparing mulberry-leaves for silkworms.—The Count Vitali explained an improved method of reclaiming marshy lands; and M. Novarese presented the models of some improved mills.

5. *Botanical Section*.—Dr. Bertola communicated a catalogue of Piedmontese plants.—Professor Moretti read a paper 'On the Absorption of Watery Particles by the Leaves of Plants.'

6. *Zoological Section*.—An excursion.

September 29.

1. *Medical Section*.—Professor Civinini mentioned the existence of a passage in the construction of the ear which was not commonly known, and which existed only in adults. Professor De Micheli shewed that he was already acquainted with such a passage or vessel.—A controversy on the merits of phrenology ensued, in which Doctors Riboli and Bonacossa advocated, and Professors Rusconi and Speranza opposed, its existence.—It was announced to the Section that Milan had been selected as the head-quarters of the Medical Commission for drawing up the medical statistics of Italy.

2. *Geological Section*.—A request was communicated from Professor Agassiz, that Italian naturalists and geologists would send him the details of every new discovery made of fossil fish.—M. Ball read a memoir 'On the Formation of Valleys.'—Professor Pasini mentioned some curious dislocations of the cretaceous and greensand formations in the tertiary district of the Vicentino.—The Marchese Pareto read a memoir 'On the Physical Configuration of Idguria.'

3. *Physical, Chemical, and Mathematical Section*.—Professor Mossotti read some observations 'On a Capillary Phenomenon,' adduced by Dr. Young against the theory of Laplace.—Dr. Chio read a memoir 'On Certain Converging Series, and other Mathematical Formulae.'—Professor Laurie adduced some experiments of interest upon the electrification of mercury.—Captain Menabrea recommended the Section to act upon the idea of Professor Babbage, and to compile a collection of the Constants of Nature. *Sub-Section of Chemistry*.—Signor Demarshi read a memoir 'On the Causes of Spontaneous Combustion.'—The President communicated a paper 'On Lactical Acid.'

4. *Agronomical Section*.—Several papers 'On the Culture of Silkworms and Mulberry-trees,' were read; and various instruments for the dairy, for silk-dressing, &c. were exhibited.

5. *Botanical Section*.—Excursion.

6. *Zoological Section*.—Dr. Nardo described a new species of gasteropod, called by him *Canulus*, a native of the Adriatic. Several letters, and other minor papers, were also read and discussed.

September 30.

A grand final meeting of all the Scienziati was held in the Great Hall of the University; on which occasion the President delivered an eloquent address, in which he gave a summary account of the principal results of the Congress.

He announced that the meeting for next year would be held at Florence on the 1st of September.—The King of Sardinia has conferred the order of the Nunziata on the President.

Answer to the last *Sciarada*.—Occhi-all.

Academy of Sciences, October 13, 1840.

2. Sitting of October 5. *Date of the Great Pyramid*.—A letter was read from M. Thilorier, 'On the Interpretation of certain Hieroglyphics in the Chambers of the Great Pyramid of Memphis, discovered by Colonel Vyse in 1838.' The inscriptions in question contained the name of the King Schoufou, or Cheops of Herodotus; and it appeared that they stated that, under the reign of that monarch, the principal star of the constellation *Lyra* rose at noon on the day of the summer solstice. This could only have happened when the winter solstitial point was at 90° east of the present one; that is, in the year 4550 before the Christian era. M. Thilorier had been led to discover the sense of the inscriptions from an old Arab tradition, preserved by the historian Abou Zeid el Balkhy, who stated that there had been found on this pyramid an inscription to the effect that it had been constructed when the *Lyra* was in the sign of *Cancer*. M. Thilorier inferred that this passage meant that the rising of the *Lyra*, at the time of the construction of the pyramid, coincided with the solstitial point. The Arab historian farther said that this was twice 36,000 years before his day. Now, these years, according to the form of ancient chronology, observed M. Thilorier, must be taken as indicating revolutions of the moon in her orbit, in lunar months; and therefore if 27·03 days (the time of the lunar month) were multiplied by 72,000, the result would be 1,967,760 days, or 5387 solar years; which, according to the calculation of the Arab astronomer, had intervened between the date of his writing (225 of the Hegira) from the day when the *Lyra* rose at noon on the day of the summer solstice. This gave 4540 years before the Christian era, which coincided pretty nearly with the date in the inscription of the pyramid just discovered. Also, if a calculation were made, going back from 525 B.C., which was the date of the invasion of Cambyse, of the years of the twenty-two dynasties of Manetho, and the four reigns of the fourth dynasty, which preceded the reign of Mycerinus, and by adding to these the seventy-eight years which, according to Pliny, intervened between the death of Mycerinus and the construction of the pyramid, it would be found that a date of 4484 years was obtained, which was a third coincidence of no small value.

A letter was read from Mr. Fox Talbot, claiming priority of invention for M. Jordan as to the manner of registering meteorological observations by photogenic impressions. This new art had been applied by M. Jordan at least a year before the subject had been communicated to the Academy.

The Academy of Inscriptions and Belles Lettres has just given out the following subjects for prizes for 1841:—A prize of 400f. for the best work on Numismatics, to be published since 1st of April, 1840. Three gold medals, 500f. each, for the best works on French Antiquities.

Professor Mickiewicz, the Polish poet, has accepted the chair of Slavonic languages and literature at the Collège de France; vacating, thereby, his chair of Latin literature at Lausanne.

A Central Historical Society for Switzerland has just been formed out of the delegates from the cantonal societies. It is to meet every two

years, and is to hold its first sitting next year at Berne. Professor Ott, of Zurich, is the secretary.

Professor Ollmar Frank, who held the chair of Persian and Sanscrit at Munich, and had been sent by the King of Bavaria to Vienna to purchase a collection of Indian antiquities, died in the latter capital not many days since. Dr. Luigi Brera, a scientific physician of great eminence at Venice, died there on the 4th of October, aged sixty-eight.

The Swedish Bishop Tegner, whose poems are well known to Scandinavian scholars, has just been attacked with insanity, and has been put into confinement.

Two shocks of earthquake were felt in the Abruzzo Citeriore, and at Sulmona, on the 19th September.

#### THE DRAMA.

*Drury Lane.*—On Monday, the *Concerts d'Hiver* made a most auspicious commencement; for the house was crowded to the roof, and the *promenade* part so excessively crammed that it was literally impossible to move about: this inconvenience, however, did not seem to put the audience out of temper, for they generally bore the squeezing and treading on each others' toes with great good-humour. The decorations are much more beautiful than they were in the summer season, and many changes have been made in order to accommodate both the performers and the public. The orchestra has, to all appearance, been considerably enlarged, and does not seem to be so closely packed as it was formerly, though it still contains an equal number of musicians. The music selected was of the same class as that which drew so well last season, viz. overtures, vases, and quadrilles; and was played in an equally effective manner. The band is conducted by the celebrated Musard, who proceeds in the most business-like manner with his duties: there is no foppery or flourish about him, and it would be very difficult to misunderstand the meaning of every movement of his *bâton*. The solo performers have also been increased in number, and several celebrated Continental names now grace the ample list of the Drury Lane band: among them we may mention M. Willent Bordogni, who makes most surprising music on the bassoon, and Messrs. Dantonet, Prosper, De Loffre, Pilat, Faivre, Müller (father and son), &c. Of last year's favourites we have Herr Konig, who is a more skilful player on the cornet-à-pistons than he was last season, and appeared to astonish even experienced musicians with his tremulous execution. We did not think the instrument capable of producing any thing like the soft yet thrilling notes which he apparently brought from it, without very great exertion. Messrs. Collinet and Frisch are likewise retained; and, altogether, we should say that Mr. Ellason has selected one of, if not the most perfect, band that ever performed in England.

*Adelphi.*—*Jack Sheppard*, with its original cast, has been revived, and is as popular as ever.

*Olympic.*—On Monday a farce, entitled *The Moving Statues*, met with well-merited applause at this agreeable theatre; it is one of the best little pieces that has been acted for some time. The characters were sustained by Messrs. Balls, Turnour, Baker, Roxby, and Mrs. Garrick, who all performed with much spirit. On Thursday a drama, called *Venus a Vestal*, was produced with similar success. Miss J. Mordaunt, who looked and sang charmingly, playing *Venus*; and Miss M.

Glover, who was also very pretty, *Apollo*. A very beautiful duet was sung, in an effective though simple manner, by these ladies, and they were well supported by Mrs. H. Beverley and Mrs. Garrick, and Messrs. Horton, Brooks, and Turnour. The dresses and scenery are good and appropriate.

#### ORIGINAL POETRY.

##### THE HYMN OF THE COMET.

By James Macaulay, M.D.

I COME to revisit this star remote,  
A guest for a time in its skies to abide;  
Where my light will be half'd by many a note,  
Of the peasant's awe and the sage's pride;  
When he boasts he can trace my times and my way,  
Though in pathless error I seem to stray.  
Men say that I bring with me wo and death,  
That sickness and sorrow are in my train,  
That Pestilence wakes with his poison'd breath,  
And War shakes his bloody lance again;  
When my beams, like some meteor-flag unfurl'd,  
Shed their dire influence o'er the world.

Meet thought in the sinful breast to spring!  
Meet wo for the guilty heart to fear!  
But whence these augur'd ills could I bring?  
For where in Creation's widest sphere—  
Where else but on earth's polluted ground,  
Is sin, is sorrow, is death, to be found?  
When first they came from their Maker's hand,  
All His works were in perfect beauty made,  
And the spirits that peopled each starry land  
In wisdom and virtue alike were array'd;  
Earth alone of its pristine splendour is shorn,—  
Man alone has a glory departed to mourn.

Yet I love to revisit this fated earth,  
Though a curse on its fields and its people may rest,  
For much of the beauty that beam'd o'er its birth  
Still is left to adorn its stunted breast;  
And to fallen man many pleasures flow,  
That unchanging spirits can never know.

Though labour oppress with its galling power,  
All the sweeter is rest when the toil is gone by;  
And the sorrow that lasts for a passing hour  
Gives intense bliss to succeeding joy;  
Death itself, while it bears from the scenes men love,  
Gives an entrance to happier mansions above.

Of as I pass by some planet fair,  
A heavenly melody floats around,  
Full well would I linger ere,  
So soft is the ravishment breathed in the sound:  
But sweeter far than these sweetest strains  
Are the songs that ascend from earth's lowly plains.

The glory of God is best sounded on earth,  
Of His mightiest works 'tis the favour'd field;  
By man are His praises best shewn forth,  
For to him is the Deity fullest reveal'd:  
His wisdom, His justice, all nature has known,  
But His mercy has gladden'd this planet alone.

Could a spirit from earth 'midst some seraph choir  
Appear with his lofty Christian lay,  
Mute, mute would remain each golden lyre,  
And each voice be hush'd in deepest amazement:  
Creation has many a glorious theme,  
But the songs of Redemption far nobler would seem.

And bright though these happy spirits shine,  
In Eden where Spring has unbroken reign'd,  
Where sin has ne'er marr'd the forms divine,  
That in glory immortal have ever remain'd—  
By a greater than these has this planet been trod,  
The earth has been blessed by the footsteps of God.

Edinburgh, August 1840.

#### VARIETIES.

*Public Spirit: Derby Arboretum.*—"The Derby and Chesterfield Reporter" presents us with a very interesting account of the opening of the *Derby Arboretum*, the patriotic gift of an individual whose family has acquired vast wealth in that neighbourhood, and who, in this instance, has chosen to make a noble use of it, and set a bright example to others who are equally favoured by fortune. The individual to whom we allude is Mr. Joseph Strutt, who has conveyed to the town a fine piece of land, and employed Mr. Loudon to convert it into a beautiful and instructive arboretum, for the recreation and enjoyment of the people at large. In Mr. Loudon's skilful hands the ground has been speedily laid out with great taste, and filled with plants, as full of scientific information as they are delightful to the senses. On the 16th ult. a

grand festival attended the public transfer of this property from Mr. Strutt to his fellow-citizens; and he had the pleasure to receive those demonstrations of respect and affection to which his generous deed so justly entitled him. It must have been a truly affecting scene, and one in which the dearest feelings of humanity were strongly elicited on all sides. The land consists of eleven acres; and we are informed the value of the donation altogether is little, if at all, under the magnificent sum of 25,000*l*. Mr. Loudon, much to his honour, lent his talents gratuitously to perfect so splendid a purpose; and report speaks loudly of the ability he has displayed in executing his work.

Sir C. Lemon, we observe from a Cornish Journal, has, in a different manner—founding schools, &c.,—been emulating this example in his native soil. The honourable baronet has devoted some 10,000*l*. to public institutions.

H. B.—Even during the holidays H. B. has not been idle, for we have a portfolio with five very clever Sketches, called "Vacation Amusements," and two more humorous Caricatures, from his popular pencil. Of the "Vacation Amusements," No. 1, is "Pheasant Shooting;" Lords Melbourne and Normanby about to shoot at the Duke and Duchess of Beaufort. No. 2 is "Swing, Swong;" Lord Howick and Mr. Charles Wood in a swing, which the latter does not seem to relish much. No. 3, "Cricket;" eight or ten eminent politicians engaged in this popular recreation, the Conservatives endeavouring to bowl out the Whigs, who have had a "long innings." No. 4, "Cultivating the Fine Arts. Etching, &c.; or, H.B.'s Ascendancy in Danger!" The Queen, Prince Albert, and Lord Melbourne, engaged at their easels, with Hayter looking at a portrait which the last has just finished; and who, in answer to the prince, says, "I'm endeavouring to make a study of John Bull, and think I am making a pretty good thing of it, although my friend Hayter says that I have drawn him out of all proportion, and given his face a most woful twist." Her Majesty's rejoinder is very pointed:—"John Bull is a good subject when well treated." No. 5, "Angling;" Lord John Russell fishing in Conservative waters, and complaining that he has not had even a nibble, while Lord Palmerston declares that he baits his hook in vain. The Duke of Wellington and Sir R. Peel are standing on the other side of the stream, and the former "Suspects those gentlemen may angle a long time in that quarter before they catch any fish." The Caricatures are, first, "Dives and Lazarus," portraits of the Archbishop of Canterbury, the Bishop of London, and the Rev. Sydney Smith; and secondly, "The newest edition of Mrs. Partington and her Mop," in which O'Connell appears as the encroaching sea, and Lord Fortescue as Mrs. Partington. The seven are respectively numbered from 651 to 657.

*The French Language.*—Since the Catalan refugees have been in France it has been remarked that the *patois*, or provincial language of Dauphiny, is much better understood by them than the current French of the day; and in the same way the domestics attached to the suite of Don Carlos, at Bourges, understand the idiom of the Bressois much better than ordinary French. There is an ample field for the philological scholar in the numerous ancient languages that still hold their ground in many parts of France,—all of them preferable, had they been cultivated, to the bastard tongue now in use. To mention only a few—there are the Provençal, the Basque, the Auvergnais, the Li-

mousin, the Breton, the Old Norman, and the Brabangon.—*Paris Letter.*

**Novel Instruments.**—At the last meeting of the London Medical Society, Mr. J. Harrison Curtis, one of the fellows, who has just returned from the Continent, exhibited two new instruments which he brought with him: the one is an *Aeriscope*, which, by the aid of a lamp and condensing lens, enables the practitioner to examine the internal ear with great facility, and minutely to observe its condition. The other instrument is remarkably curious; it is the invention of Dr. Jager, the oculist of Vienna, and is called a *Phantom*: by its means every kind of operation on the eye may be performed, either on a dead subject or any animal, just as if they were in the living head.

The remains of the Rev. Dr. Carpenter, of Bristol, who was drowned on the night of April the 9th on his passage from Naples to Leghorn, have been recovered. The body was washed ashore between Naples and Civita Vecchia, forty miles S.E. of Rome, about the middle of June, and, according to the sanitary laws of the country, was consumed by fire. His watch, seals, and pocket-book, found on his person, sufficiently identified him. The Consul at Rome transmitted these articles to his agent in London, for Dr. Carpenter's representatives.—*Wills Independent.*

### LITERARY NOVELTIES.

#### LIST OF NEW BOOKS.

The Poetical Works of Thomas Moore, now first Collected by Himself (10 vols. fcap 8vo.), Vol. I. 5s.—Ecclesiastical Chronology, by the Rev. J. E. Riddle, 8vo. 12s.—Human Physiology, by J. CHARLES HENRY ADAMS.

### ADVERTISEMENTS.

Connected with Literature and the Arts.

#### THEATRE ROYAL, LIVERPOOL.

**TO BE LET**, for a term of years to commence on the 17th January, 1841, the Theatre Royal, in Williamson Square, Liverpool; with the adjoining Dwelling-House, fronting the Theatre, and such Machinery and Stage Apparatus, and other Furniture, as belong to the Proprietors of the Theatre, and now used by Thomas Denison Lewis, Esq., the present Lessee, who has indicated his intention of retiring from the management.

This well-regulated Theatre is established under Letters Patent, granted by His late Majesty, King George the Fourth, by virtue of an Act of Parliament passed for its erection, and is the only Theatre in the Town possessed of Patent Rights.

It is capable of affording Receipts, at the present prices of admission, to the amount of £3000.

The Dwelling-House will accommodate a small family, and is conveniently adapted for the residence of the Manager.

The Premises will be let subject to covenants on the part of the Lessee, to perform only regular theatrical entertainments, and to keep the Theatre and Property in repair, and to restrictions to insure a respectable management of the Theatre.

Separate security of undoubted respectability will be required by the Proprietors in addition to the engagements of the Lessee. Persons desirous of taking the Theatre are requested to send sealed tenders or proposals on or before the 7th of November next, addressed to Messrs. Foster and Lloyd, Solicitors, Exchange Alley, Liverpool; from whom any further particulars may be had.

#### THEATRE ROYAL, LIVERPOOL.

**THE LESSEE**, intending to retire from the Management of this Establishment at the close of the present Season, offers for Sale the whole of the Extensive Stock (now on the premises) of Framed Scenery, Side-Wings, Set-Pieces, Drop-Scenery, and such Machinery and Fittings, Gas-Stoves, Chandeliers, Looking-glasses, Ornamental Gilding, Stage Furniture, Upholstery Work of the Boxes, Stage Properties, Machinery, Pictures, &c. &c. Price 1800*l.*, or a well-secured annual payment of £24*l.* for seven years. The Warehouse, Books, and other Furniture may be taken as a separate lot. The Furniture in the Dwelling-house adjoining the Theatre to be disposed of.

Further particulars may be known on application to Mr. Clarke, Acting Manager, at the Theatre Royal.

### WESTMINSTER MEDICAL SOCIETY.

—The First General Meeting of this Society will be held at the Society's Rooms, Exeter Hall, Strand, this Evening, October 17th. The Chair will be taken at Eight o'clock precisely.

EDWARD JOHN CHANCE, Hon. Secretary.

### MUSIC.

#### CHORAL SERVICE.

Just published by Mr. Barnes, 17 Portman Street, is a handsome 8vo. vol. price 2s.

**CHURCH MUSIC:** A Selection of Chants, Sanctus, and Responses; together with the Litany and Versicles, as used in Choral Service; also, Psalm Tunes adapted to the authorized Metrical Versions.

Arranged and Edited by RICHARD REDHEAD, Organist of Margaret Chapel, St. Marylebone. In this Selection the Chants are adapted to the Psalms appointed for each day, according to their particular character, an arrangement which, it is hoped, will render the work especially useful in the celebration of Daily Service.

The Music is printed in full score, with an Organ accompaniment; so that it may be used either in a full choir, or for one, two, or three voices, as may be preferred. In this respect the volume, from its size and cheapness, possesses, perhaps, an advantage peculiar to itself.

Also, as a Companion to the above,

**The Psalter, or Psalms of David, with the Hymns of the Church marked for Chanting, on such a Plan as to enable a Congregation to join and keep time with the Choir without difficulty.** Price 4s. 6d. cloth; 5s. Morocco; with full allowance to Clergy and Congregations.

Jam. s. Barnes, 17 Portman Street.

### BOOKS IN THE PRESS.

Just ready, in fcap 8vo. uniform with Wordsworth's Poems, &c. **CHAUCER'S POEMS MODERNISED.**

By William Wedderburn, R. H. Horne, Richard Monckton Milnes, Thomas Powell, Leigh Hunt, Barry Cornwall, Lord Thurlow, Robert Bell, and others.

The First Volume will contain various Poems and Tales, and an Introductory Preface by R. H. Horne, and a Life of Chaucer by Professor Leonard Schmitz.

Whittaker and Co. Ave Maria Lane.

### NEW WORK BY MISS PARDOE.

On the 1st of November will be published, in 5 vols. cloth, price 1*l.* 11s. 6d. with Engravings,

**THE CITY OF THE MAGYAR;** or, Hungary and her Institutions in 1839-40.

By MISS PARDOE, Author of "The City of the Sultan," "The Beauties of the Bosphorus," &c. London: George Virtue.

### BOOKS PUBLISHED THIS DAY.

Handsomely bound in cloth, with edges marbled, price 2s. the First Volume of

**MASTER HUMPHREY'S CLOCK:** containing Chapters One to Thirty-Eight of the OLD CURIOSITY SHOP.

By "BOZ."

With a Frontispiece and upwards of Sixty Illustrations, by George Catermole and Hablot Browne. London: Chapman and Hall, 186 Strand.

### MR. GRANT'S NEW WORK.

In 5 vols. post. 8vo. bound, and to be had of all Booksellers and at all the Libraries.

### PORTRAITS OF PUBLIC CHARACTERS; or, Personal Sketches of the most Eminent Men of the Day.

By the Author of "Random Recollections," "The Great Metropolis," &c. &c. Saunders and Otley, Publishers, Conduit Street.

18th edition, price 2s. 1/2; 11s. 6d.

### THE WOMEN OF ENGLAND: their Social Duties and Domestic Habits.

By Mrs. Ellis. "If we could have our own way, every family would order a copy of 'The Women of England.' Husbands, especially young husbands, should buy it for their wives; fathers, for their daughters; brothers, for their sisters."—*Melodist Mag.* Fisher, Son, and Co. London: Chatham Street, Manchester; and Hunter Street, Liverpool.

VAN BUTCHELL ON FISTULA, &c. 4th edition, in 8vo. cloth boards, price 7s. 6d. enlarged,

**FACTS and OBSERVATIONS relative to a Successful Mode of treating Piles, Fistula, Hemorrhoidal Excrescences, Tumours, and Strictures, without Cutting or Confinement:** illustrated with numerous Cases. Being a Familiar Exposition of the Practice of Mr. S. J. Van Butchell, Surgeon Accoucheur.

"This volume presents to us a number of illustrations of his singular success under circumstances that would have induced despair in any professor of less maturity, or less accustomed to accomplish cures where cures seemed impossible. The statements here made are most convincing, and place beyond doubt the superiority of the treatment to which they refer."—*Contest Journal.*

Published by H. Renshaw; Sold also by the Author, No. 16 Percy Street, Bedford Square.

### NEW WORKS published by Messrs. SAUNDERS and OTLEY.

I. The Ninth Volume of the Works of Sir E. L. Bulwer, Bart.

WARTON'S HISTORY OF ENGLISH POETRY.  
 In 3 large vols. 8vo. price 36s. bound in cloth,  
**THE HISTORY OF ENGLISH POETRY,**  
 from the Close of the Eleventh Century to the Commencement of the Eighteenth Century: to which are prefixed Three Dissertations.—1. On the Origin of Romantic Fiction in Europe; 2. On the Introduction of Learning into England; 3. On the Gesta Romanorum.  
 By THOMAS WARTON, B.D. Oxon.  
 From the Edition of 1824, superintended by the late Richard Price, Esq. including the Notes of Mr. Ritson, Dr. Ashby, Mr. Duce, and Mr. Park.  
 The present Edition has been prepared and superintended by Richard Taylor, F.S.A.; numerous Corrections and additional Notes having been communicated by Sir F. Madden, F.S.A. &c. and other eminent Antiquaries, whose contributions are acknowledged in the advertisement of the Editor.  
 London: Printed for Thomas Tegg, 73 Cheapside.

In super-royal 8vo. on the 1st of November, Part I. price 3s. 6d. to be continued in Monthly Parts, each to contain Two Engravings of Scenery, upon Steel, a Map of a County or District, carefully revised, and collated with the Ordnance Maps, and about Fifteen beautifully executed engravings on Wood,  
**IRELAND; its SCENERY, CHARACTER, &c. &c.**  
 By Mr. and Mrs. S. C. HALL.  
 Many valuable and important works descriptive of Ireland already exist; but they are, for the most part, local histories, or present to few attractions to the general reader, that they contribute little to induce intimacy between two countries whose interests are mutual and inseparable, or to promote that good understanding so essential to the welfare of both.  
 It is unquestionable that Ireland has, of late years, materially improved; it has participated in the benefits derived from the general spread of literature and science; and the facilities for intercourse with England, while they have introduced most beneficial changes into Ireland, have been effectual in dispelling prejudices and popular errors that for ages prevailed concerning it.  
 The reader will be presented with the general results of five several Tours made by the Authors together, in Ireland, since the year 1825 (the latest of which took place during the autumn of the present year), and of a still earlier acquaintance with the country, and the character of its people. They have laboured with zeal and industry to obtain such topographical and statistical information as may be useful to those who visit Ireland, or who desire the means of judging correctly as to its capabilities and condition; and it will be their duty to associate with more important details such legends, traditions, incidents, descriptions, and personal sketches, as may excite interest in those who might be deterred from the perusal of mere facts, if communicated in a less popular form.

will be sufficiently numerous to give every object—from the most important to the most insignificant, that must be considered and treated as peculiarly Irish.  
**THE TOWERS, THE CASTLES, AND THE REMAINS OF MONASTIC EDIFICES,**  
 will be described, by the pencil, in the page that relates the more remarkable events in their several histories, and contrasts their present ruins with their former greatness.

**THE MANNERS AND CUSTOMS OF THE IRISH**  
 will also afford ample scope from which to draw both entertainment and information;—the Béal-féirings on Midsummer Eve; the Patrons; the Courtships; the Weddings; the Christenings; the Wakes; the Pilgrimages to Holy Wells; the Sports on All-Hallow Eve; and the observances of Christmas; the peculiar Dances and the Music of the Country; the National Instruments, Ancient and Modern; the Faction Fights (now, happily, but shadows of what they were); and many other national points, usages, and ceremonies will supply material for the pencil of the Artist, as well as the pen of the Writer.

**THE LEGENDS AND TRADITIONS OF IRELAND**  
 are full of interest, and its Superstitions are rich in romance. It is, indeed, rare to find a single mile without encountering an object to which some marvellous fiction is attached. Every lake, mountain, ruin of church or castle, rath and breen, has its legendary tale; the Fairies people every wild spot; the Banshee is the follower of every old family; Phookas and Currauns are—if not to be seen, to be heard of, in every solitary glen. These stories the Authors will collect; and not as gleaners merely, for the harvest, notwithstanding that so many labourers have been in the field, is even now, but partially gathered in. For this department of the work, too, the services of the Artist will be put into requisition.

In fact, the Engravings will describe every object peculiar to Ireland that may serve to illustrate and explain the course through which the traveller passes, and may be better understood by being pictured to the eye as well as the ear. The co-operation of many distinguished Artists has already been obtained.  
 London: How and Parsons, 132 Fleet Street.  
 Sold by W. Curry, jun. and Co. Dublin, and by every Bookseller in the Kingdom.

**NEW WORK BY THE AUTHOR OF "THE ANGLER IN IRELAND."**  
 In 2 vols. with Maps,  
**TWO SUMMERS IN NORWAY.**  
 By the Author of "The Angler in Ireland."  
 Saunders and Otley, Publishers, Conduit Street.

In 8vo. price 6s. Part II. of  
**MALTE BRUN'S AND BALBI'S SYSTEMS OF GEOGRAPHY** abridged. To be completed in Five Parts.  
 (Part I.) "Executed with masterly ability. . . . No pains have been spared to render it comprehensive and accurate, and it not only contains a full and complete picture of the world, but it contains, but it exhibits the utmost precision in their treatment and arrangement."—*Atlas*.  
 London: Longman and Co. Edinburgh: A. and C. Black.

8 New Burlington Street, October 17, 1840.

# MR. BENTLEY'S LIST OF NEW WORKS, PREPARING FOR IMMEDIATE PUBLICATION.

I.

A NEW VOLUME OF

## THE CLOCKMAKER;

OR, SAYINGS AND DOINGS OF SAM SLICK, OF SLICKVILLE.

Third Series, post 8vo. with numerous Illustrations.

II.

## THE LIFE, JOURNALS, AND CORRESPONDENCE, OF SAMUEL PEPYS, Esq. F.R.S.

Secretary to the Admiralty in the Reigns of Charles II. and James II.

INCLUDING A NARRATIVE OF HIS VOYAGE TO TANGIER.

The whole now first published from the Originals. 2 vols. 8vo. with a Portrait from an original Picture.

III.

## MERCEDES OF CASTILE;

A ROMANCE OF THE DAYS OF COLUMBUS.

By J. FENIMORE COOPER, Esq. Author of "The Last of the Mohicans," "The Spy," &amp;c. 3 vols. post 8vo.

IV.

## MEMOIRS OF THE COLMAN FAMILY.

By R. B. PEAKE, Esq.

INCLUDING THEIR CORRESPONDENCE WITH THE MOST DISTINGUISHED PERSONAGES OF THEIR TIME.

2 vols. 8vo. with Portraits.

V.

## THE NEW VOLUME OF THE STANDARD NOVELS

Will comprise Mrs. Trollope's celebrated Novel,

## THE WIDOW BARNABY.

To be published with the Magazines at the end of the present Month,

WHICH WILL BE FOLLOWED BY OTHER POPULAR WORKS.

NEW WORKS NOW READY:—

I.

## THE DOWAGER;

OR, THE MODERN SCHOOL FOR SCANDAL.

By MRS. GORE, Author of "Mothers and Daughters," "Stokeshill Place," &amp;c.

3 vols. post 8vo.

II.

## THE CLANDESTINE MARRIAGE;

A Story of the Present Day.

By MISS ELLEN WALLACE. 3 vols. post 8vo.

"A very entertaining story. The character of the heroine is forcibly conceived, and worked out with skill and spirit; and the dialogues throughout are singularly light and lively."—*Sun*.

III.

The 2d edition of

## THE MAN AT ARMS;

Or, Henri de Cérone. A Romance.

By G. F. R. JAMES, Esq.

Author of "Darnley," "De l'Orme," "Charles Tyrrell," &amp;c. Post 8vo.

IV.

MR. BENTLEY'S COMPLETE EDITION OF

## THE LETTERS OF HORACE WALPOLE, EARL OF ORFORD.

To be comprised in Six Volumes, price 14s. each. The First, Second, Third, Fourth, and Fifth Volumes of this Work are now ready, embellished with numerous Portraits.

\* \* \* The Sixth and concluding Volume (consisting chiefly of Letters to Miss Berry, &amp;c. and now first published) will be issued with the Magazines, at the end of the present Month.

RICHARD BENTLEY, NEW BURLINGTON STREET,

Publisher in Ordinary to Her Majesty.

Printed by HANNAH PAGE MOYES, of Brook Green, Hammersmith, and GEORGE BARCLAY, of Number 3 Pallin's Place, Islington, both in the County of Middlesex, Printers, at their Printing Office, Number 22 Castle Street, Leicester Square, in the said County; and published by WILLIAM ARMIGER SCRIPPS, of Number 13 South Molton Street, in the Parish of Saint George, Hanover Square, in the County aforesaid, at the LITERARY GAZETTE OFFICE, Number 7 Wellington Street, Strand, in the said County, on Saturday, Oct. 17th, 1840.

No. 1240.

LONDON, SATURDAY, OCTOBER 24, 1840.

PRICE 8d.  
Stamped Edition, 9d.

### REVIEWS OF NEW BOOKS.

*The Ancient Music of Ireland, arranged for the Piano-forte; to which is prefixed a Dissertation on the Irish Harp and Harpers, including an Account of the Old Melodies of Ireland.* By Edward Bunting. Dublin, 1840. Hodges and Smith.

IN the commencement of our notices of Mr. Chapell's valuable and important "Collection of National English Airs" (*Lit. Gaz.* No. 1233), we alluded to an Irish work, which for several weeks had been on our table, and which we ought also to have said had been frequently during the time on our music-desk. If Mr. Bunting should be inclined to complain of our tardiness in reviewing his interesting volume, we are fully prepared to prefer a counter-charge against him, for his so long delaying its appearance; as we perfectly recollect (although no doubt Mr. Bunting has entirely forgotten the circumstance) that exactly one-and-twenty years ago, on the very day we are writing, we had the pleasure of meeting him at the house of the late Mr. Power (the publisher of Moore's "Irish Melodies"), and of hearing at Mr. Bunting's own hands some of the melodies now published by him. He was at the time understood to have the present volume prepared for the press. We give our notes upon Mr. Bunting's performance exactly as we find them:—

"13 August, 1819.

"Mr. Bunting has another volume of Irish Melodies ready for the press; he played three or four of them for us. They were very characteristic, but his performance, though full of taste and force, wants that peculiar charm or expression which Moore gives to an Irish air. Moore excels in the performance of a simple, melancholy, or wild melody; Bunting in giving effect to enthusiastic or martial strains. He played an Irish march in such a manner as absolutely made the heart leap up to arms. A melody called the 'Bredogh' was very pleasing; but his most effective performance this evening was a kind of lamentation and chorus which, according to tradition, were sung by the women who after the siege of Limerick were prevented embarking with their husbands. The wild burst of the Ullalu which occasionally interrupted the beauty of a magnificent and pathetic melody, was produced by Mr. Bunting in such an astonishing manner that (although on a small piano-forte) it gave the effect of the outcry of a thousand voices."

Of these three melodies we now only recognise in the present publication the two last, viz. "Young Bridget," at p. 82, which is said to be "very ancient," and—alas for the fame of musical genius!—the "author and date unknown." It is stated to have been procured by Mr. Bunting from "an old man at Deel Castle," in 1792. The other will be found at p. 84 of Mr. Bunting's work, and is called "The Wild Geese:" like the former it is described as "very ancient, author and date unknown;" and was procured from "P. Quin, harper," in 1803.

Now, the phrase "very ancient," as applied to the year 1691 and Irish music, according to our recollection of Mr. Bunting's account,

composed in that year, startled us as to the accuracy of our notes, but upon turning to what appears in the volume in which this "very ancient" appropriation occurs, we find "The Wild Geese" described as "the finest of this class of melodies, and the most affecting, both in its origin and in the frequent allusions made to it throughout the modern songs of the Irish. It was composed, as a farewell to the gallant remnant of the Irish army, who, upon the capitulation of Limerick in 1691, preferred an honourable exile to remaining in the country when their cause was lost, and who afterwards so well sustained the national reputation under the name of the Irish Brigade, in the Continental wars. It is commonly believed that the air was sung by the women assembled on the shore at the time of embarkation. From the following account of that event, it would appear that the occasion was one by no means unlikely to call forth such a demonstration. 'Barbarous and inhuman hath been Wahop's usage of the poor Irish, which lately were shipped from Kerry. He, finding while they lay encamped (waiting for transport ships) that they began to desert him upon account of the ill-condition of their wives and families in this kingdom, promised to take them also with him; and a declaration to that effect having been issued by Sarsfield and Wahop, they accordingly were brought to the water-side, when Wahop, pretending to ship the soldiers in order, according to his lists of them, first carried the men on board; many of the women at the second return of the boats for the officers, catching hold to be carried on board, were dragged off with the boats, and, through fearfulness losing their hold, were drowned: others who held faster, had their fingers cut off, and came to the same miserable end, in the sight of their husbands and relations.' A very affecting allusion to this 'flight of the wild geese' occurs in a county Cork *caoine*, composed by a father on the death of his sons, who had been drowned at sea:—

"My long grief and my loss that you had not gone on ship-board,  
In company with Sir James, as the wild geese have done;  
Then my loving trust would be in God that I would have your company again;  
And that the stormy sea should not become the marriage-bed of my children."

The entire of this *caoine*, or, as the English reader would call it, *keen*, we printed in the *Literary Gazette*, No. 366 (January 24, 1824), when noticing Mr. Crofton Croker's "Researches in the South of Ireland;" and, for the sake of comparison, we reprint the two versions in translation of an orally preserved Irish poem. Mr. Croker's runs thus:—

"Great is my grief and sorrow that you did not all go from your father on board ship! Or if my sons had left me for a season, like the wild geese, to go to a foreign land, then might I have expected from my Maker the help of my four mild and clever young men at some future time."

In a note, Mr. Bunting adds:—"The following beautiful lines on the 'Wild Geese' are from the pen of a lamented friend, written many years since expressly for this work, in imitation of the Irish:—

"How solemn, sad, by Shannon's flood,  
The blush of morning sun appears!  
To men who gave for us their blood,  
Ah, what can woman give but tears?  
How still the field of battle lies!  
No shouts upon the breezes blown!  
We heard our dying country's cries,  
We sit deserted and alone.  
Ogh hone, &c.  
Ah, what can woman give but tears?  
Why thus collected on the strand,  
Whom yet the God of Mercy saves?  
Will ye forsake your native land?  
Will ye desert your brothers' graves?  
Their graves give forth a fearful groan:  
Oh, guard your orphans and your wives!  
Like us, make Erin's cause your own;  
Like us, for her yield up your lives.  
Ogh hone, &c.  
Like us, for her yield up your lives."

But we will proceed to glean from the volume before us some account of the revival of the Irish harp, and of the support and patronage which the last bards received in "the land of song." The melancholy conclusion of which history is, that, at the present moment, there may be no hand capable of waking the silent wires of the national instrument of Ireland, and that the voice of "the queen of music," as it has been called, will probably be heard no more.

The first attempt to revive the taste for the national music of Ireland was made in 1781, by Mr. James Dungan, an Irish gentleman resident in Copenhagen. He remitted funds for the purpose of giving to such harpers as could be collected, premiums, according to the merit of their respective performances; and a meeting, which was followed by a splendid ball, was accordingly held in Mr. Dungan's native town, Grauard, in the county of Longford. Seven minstrels only attended.

"The harpers present were Charles Fanning, Patrick Kerr, Patrick Maguire, Hugh Higgins, Charles Berrecon, Rose Mooney, and O'Neill, from whom we have the following characteristic account of the meeting:—"Charles Fanning got the first premium, ten guineas, for 'The Coolin'; I got the second, eight guineas, for the 'Greenwoods of Truagh' and 'Mrs. Crofton'; and Rose Mooney got the third, five guineas, for 'Planxty Burke.' The judges at the first ball were excellent; and there was some difficulty in deciding the first premium between Fanning and me; but, in consequence of my endeavouring to appear on this occasion in *my very best*, they decided in favour of Charles, who was careless in his dress, saying, at the same time, that he wanted money more than I did; however, I received many handsome verbal compliments. To the best of my opinion, there were at least 500 persons at the ball, which was held in the market-house. A Mr. Burrowes was one of the stewards; he was a tolerable judge of music, and was so angry at the decision of the premiums, that he thrust his cane through one of the windows."

At the second meeting, which was held in the following year, "two new candidates were all that presented themselves, in addition to those already enumerated. The names of the new-comers were Edward M'Dermott Roe and Catherine Martin. The premiums were adjudged as before. Mr. Dungan himself came from Copenhagen to be present at the last ball,

which was, in consequence, the most splendid of the three. The only new names in the list of harpers on this occasion were Laurence Keane and James Duncan. Unfortunately, the meeting appears to have been marred by private jealousies, which had so disheartening an effect on the munificent originator and patron, that he did not afterwards attempt the renewal of those interesting assemblies."

In 1792, a similar effort in favour of Irish music was made at Belfast, which meeting was attended by ten harpers, five of whom had not been at the assemblies at Granard. These were Denis Hempson, who was at the time nearly a hundred years old; "aged," says Mr. Bunting, "97 years, but there is reason to believe he was older by several years;" Charles Byrne, aged 80; Daniel Black, aged 75; Patrick Quin; and William Carr, the latter a mere boy, being only 15.

Mr. Bunting was engaged to note down as many as possible of the airs played on this occasion; and he tells us that, in the performance of the office assigned to him, "he first imbibed that passion for Irish melody which has never ceased to animate him since. It was well," he adds, "that the security of notation was so soon resorted to, for, even in 1809, two only of the ten harpers assembled at Belfast on this occasion were surviving, and these two are long since dead. The Irish harpers," at this meeting, "were succeeded by a Welshman" (named Williams, who died on ship-board soon after) "whose execution was very great: the contrast between the sweet, expressive tones of the Irish instrument and the bold, martial ones of the Welsh, had a pleasing effect, as marking the difference of character between the two nations."

In 1792, Fanning also obtained the first premium, and O'Neill the second. We are told that "Fanning was not the best performer, but he succeeded in getting the first prize, by playing 'The Coolin,' with modern variations; a piece of music at that time much in request by young practitioners on the piano-forte." After the proceedings at Belfast had terminated, "all the harpers were invited to dinner by Doctor Macdonnell; and if we had all been peers of the realm," says O'Neill, "we could not have been better treated; the assiduity of the Doctor and his family to make us happy was more than I can describe." It may be interesting to the reader to know something of the personal appearance of these last representatives of a class so famous in song and history. They were in general clad in a comfortable homely manner, in drab-coloured or grey cloth, of coarse manufacture. A few of them made an attempt at splendour, by wearing silver buttons on their coats, particularly Higgins and O'Neill; the former had his buttons decorated with his initials only, but O'Neill had his initials surmounted by the crest of the O'Neill's, engraved on silver buttons the size of half-a-crown. Some had horses and guldies when travelling through the country—(we should observe that of the ten harpers, six were blind); others, their attendants only, who carried their harps. They seemed perfectly happy and contented with their lot, and all appeared convinced of the excellence of the genuine *old Irish music*, which they said had existed for centuries, and, from its delightful melody, would continue to exist for centuries to come. The editor well remembers the anguish with which O'Neill contemplated the extinction of the old strains, which he said had been the delight of the Irish nation for so many years; he called them, with tears coursing down his

aged cheeks, "*The dear! dear! sweet old Irish tunes.*" The third attempt at reviving our music," continues Mr. Bunting, "was the formation of the Belfast Irish Harp Society, instituted for the support of a teacher, and the tuition of a number of boys, from the age of ten years, among the blind and indigent, who were supplied with lodging and board. It was conducted with much zeal at its commencement in 1807; and it terminated in consequence of a decline of pecuniary supplies in 1813. From that time Arthur O'Neill, the blind teacher, was paid an annuity of 30*l.* till his death, by a few members of the society, in consideration of his abilities and good conduct in the school. This society had the credit of preserving the Irish harp from being, perhaps, for ever lost; as it appears that six years afterwards the new society, instituted in 1819, by the bounty of friends in India, discovered no harpers in Ireland, save those who derived their education from Arthur O'Neill, master of the first school."

The remittances from India in support of a school for the cultivation of Irish music exceeded 1100*l.*, and for a few years the establishment seemed to prosper, "under the superintendence of Rainey, a nephew of the Scotch poet Burns, who had been educated in the school of the former society, under O'Neill, and become a very good harper; but since his death the affairs of the society have been in a declining state, and the following copy of a letter to the editor from the secretary will shew that it is now nearly extinct, with little prospect of its ever being revived:—

"Donegal street, 30th July, 1839.

"Dear Sir,—In answer to your inquiries respecting the Harp Society, I am sorry to inform you that the funds will be exhausted about the first of February next. After the first of August we shall have only two boys; we are anxious to prolong the time, that one of the boys (William Murphy) may have as much instruction as can be afforded, he having his eyesight perfect, and a natural taste for music. We were most desirous to have one Irish harper who could read music, and thereby keep alive, for some time longer, a number of those national airs which, so far as the Irish harp is concerned, were about to be lost for ever. I mentioned to you that we might probably keep up the society for a few years longer by private subscription, but from the fact that the young harpers can only earn their bread by playing in hotels, where they are too liable to contract fatal habits, we think the money could be more usefully laid out in other charities. Our gentry in Ireland are too scarce, and too little national, to encourage itinerant harpers as of old; besides, the taste and fashion of music no longer bear upon our national instrument. It had its day, but, like all other fashions, it must give way to novelty.—Truly yours,

"JOHN M'ADAM."

"Edwd. Bunting, Esq."

Here for the present we must pause; in our next notice we will have to exhibit the King of Oude's love for Irish music, with some extracts from Mr. Bunting's fifth chapter, containing "Anecdotes of the more distinguished harpers of the last two centuries."

*Oriental Outlines; or, a Rambler's Recollections of a Tour in Turkey, Greece, and Tuscany, in 1838.* By W. Knight. 12mo. pp. 356. London, 1840. Low.

THIS is a volume of very unpretending dimensions, but contains, not only a pleasing narrative of the writer's personal movements and observations, but much that will be useful to

other tourists who may tread in his footsteps. We will not, in treating of a production of its class, deem it necessary to follow descriptions of places so often described as Leghorn, Pisa, Smyrna, &c. &c., but endeavour to afford readers a competent idea of the publication by dipping here and there, where we discover the greatest novelty. A trip from Syra to Tino offers us the first opportunity:—

"When I got under weigh from Syra, we pulled round the Transit warehouses, and made sail when abreast of the adjacent islet, with its small chapel on our left. But in less than a quarter of an hour the wind failed us, and it became necessary to have recourse to 'sweeping.' Thus we did not reach St. Nicholas till after a five hours' pull. In returning from Tino to Syra I embarked at Nisternia, and in this instance we merrily ran the distance in one hour and a quarter. When midway the scene is superb. Islands meet the eye on every side; while in the various channels between them 'the glad waters of the dark blue sea' play around the prows of many a goodly craft, now bravely breasting each opposing billow, or doggedly enduring the miseries of a calm. The nearest isles are, Andros on the left, and Myconi and Delos on the right, of Tino.

The mountainous island of Andros is as fertile as Delos is barren. It received its name from a son of Anius, one of its kings, who lived in the time of the Trojan war. It was then noted for a harbour, near which Bacchus had a temple; whose waters, on the 7th of January, tasted like wine. In the present day, the inhabitants are great drinkers, consuming nearly the whole of the wine made in the island, which amounts to a considerable quantity. Whether indulgence in drunkenness be occasioned by remorse for past deeds, it is difficult to determine. The men of Andros still bear a very indifferant character. They have certainly deserved it during the last thirty years. Their piracies in the Doro Passage—which separates Andros from Euboea, or Negropont, itself divided from the main by the Trikeri Channel and the Euripus—are but too well remembered by many a poor fellow who has had the misfortune of falling into their hands. Proof upon proof of the fiendish character of the men inhabiting this island may easily be procured from the naval officers, and masters of British merchantmen, who, during the last ten or twenty years, have visited the Archipelago. The vicinity of Andros to the main may probably account, in some measure, for the character of its inhabitants, inasmuch as the people may have gradually fallen victims to the temptation and example of the Continental brigands with whom they frequently came in contact, and who, from one or two successful captures, appeared to derive more wealth than the islanders could hope to obtain in many years by other occupations. The hope of gain has sapped their honesty. Piracy is even now held up to them as an honourable profession. I have myself heard the question discussed, whether or not the vocation of a corsair was a praiseworthy means of obtaining a supply of the necessaries of life. This debate took place in a *caïque*, becalmed off Cape Colonna; and all on board, myself alone excepted, came to the conclusion, that if a man chose to risk his life in such a war against the world, his gains and profession were perfectly honourable. The question whether cruelty to captives was justifiable was not raised. Were the natives of Andros not villains, but good men and true, still the Klephtes are continually landing on the island, being

pursued by Otho's soldiery and police, for various little affairs on the main, whence many of them manage to escape, and generally fly to Andros as a convenient place of refuge. There can be little doubt that such fellows would at once launch a boat and make an attack, were any vessel becalmed in the Doro Passage during their temporary sojourn. That there are still very numerous bands of Klephtes in Continental Greece has been recently proved by the late attack upon Marathonisi; I believe, in the month of April or May, in the present year, 1839; of which place, some hundreds of these fiery spirits retained possession several days, retreating only on the approach of a strong force of regular troops.

The island of Myconi, now upon our right, is said to be famous for red wine; but, nevertheless, badly supplied with water. It appears about forty miles in circumference, and was formerly so subject to earthquakes, that it remained a long time uninhabited. Its present population is five thousand, many of whom become bald at a very early age; a fact which has for centuries been observable. The ancients believed that several of the giants defeated by Hercules were buried under this island. They, however, moved not in their graves during my stay in the Cyclades, and I felt no earthquake till I reached the pride of the East, the city of the Sultan, the incomparable Constantinople.

Our author landed at St. Nicholas in Tino, and rode to a village called Pyrgo; a convent near which he visited with the respected papas of the parish, and thus describes his visit:—

"He was about to perform a christening, which was the first I witnessed in Greece. On the arrival of the party, the ceremony was immediately commenced. Before reaching the chapel, the 'charm' which had hitherto been worn by the child, in accordance with the national custom, was cut off from its neck. The godmother then took the infant in her arms, remaining at the door of the chapel, while the priest, standing but a few paces within the entrance, read a few short prayers. He next advanced, and breathed upon the child, making the sign of the cross three several times upon her body, with the thumb and two fingers of his right hand, which were closely pressed together; then taking her in his arms, he carried her himself towards the altar, and here, whether terrified or not at his bushy grey beard, the youngster began to cry and bawl most lustily. Prayers were then continued, and the child entirely stripped of its apparel. A tub was now filled with warm water, in which the priest washed her from head to foot with soap. After this, he again made the sign of the cross upon the girl's body with a wax taper, cut off some of her hair, and again putting on her clothes, carried her three several times round the font, accompanied by the godmother, bearing two lighted candles of enormous size; the godfather also following with a third. This done, the lips of the child were pressed against the pictures of the Saviour and the Virgin; and thus the ceremony concluded. The father was asked, about the middle of the service, for the name he had selected; upon which demand he gave one long enough for an empress. The common one of Dudo, which signifies a parrot, suited not his taste. On leaving the chapel, all present retired to an upper room in the convent, to drink coffee prepared for us by the nuns; and here the godmother presented ten leptas to each of the poor women of the village who had just witnessed the christening of her granddaughter. In the evening the parents gave

a dance in Oxomaria, at which I was present. All Greeks are passionately fond of this amusement, which is encouraged by the priests, who sanction its indulgence even on the Sabbath. Any exclusion from a village ball is unknown; no invitations are necessary. The doors of a house are thrown open, the guitar and fiddle strike up, accompanied by the stentorian voices of the musicians, and the rooms are instantaneously filled, as it were by magic. Even women with infants in their arms are admitted. The occasional squalling of these brats adds to the fun. No waltzing, no quadrilling, has yet reached Pyrgo. The old Greek dance is all-sufficient; it maintains its ground on an earthen floor, and laughs at innovation. Some people even bring their own provisions; and the host is seldom expected to be prepared with more than a 'clean-swept floor,' and a few musicians. A man of the name of Stratti is the Weippert of Oxomaria. His costume is purely Hellenic, with one exception—a pair of English top-boots. With these, he stamps out the time in a manner that out-Herods Herod; and, as he thus is enabled to confine his fiddle-stick to the strings of the instrument, instead of flourishing it in the air for the mere purpose of beating time, which his boots more strikingly effect; the chief charm of Oriental music—noise—is, much to the gratification of his audience, considerably increased. Old Astley, the equestrian, who once threatened to discharge the trumpeters of his orchestra for not playing in some part of an overture where they happened to have several bars rest—an arrangement which he himself could never understand—would, in the East, have been considered the best musical manager out of Paradise. Now that fairs are, unfortunately, going out of fashion in England, the poor unprotected showmen may perhaps find it a profitable speculation to forward all their gongs and big drums to Greece and Turkey. Although, as I have already said, he who gives a dance is expected to prepare but his rooms, and to 'find out Sneak's noise;' nevertheless, even this, the music, is not at his sole expense. For after each bout, the young men who have figured in the dance always throw the musicians a few leptas or a drachma, which contributions, during the afternoon or an evening, generally amount to a sufficient sum to remunerate them handsomely."

The following are also characteristic:—

"During a ramble in the mountains, which I took the morning after the christening, I entered the small church of St. George, overlooking the strait between Tino and Andros. I here found a party of wood-cutters, who had just lit a candle before the picture of the patron saint. There are many of these small churches in the hills, which, although ever open, are never robbed. Oil and candles are always left in the interior, in order that no one may lack the opportunity of thus honouring his favourite saint. Being in many cases distant from any village, the visits of the clergy to these chapels are not very frequent. When I now quitted St. George, the wood-cutters had finished their devotions, and we strolled onwards together. They kindly endeavoured to persuade me not to pursue my intention of ascending the heights, stating as a reason that 'the hills were infested with an enormous serpent; that his head was as large as a bull's, and his tail as long as the lighthouse at Sira!' From this description I apprehended that, in these days of travelling, the American sea-serpent might have taken it into his head to indulge in a terrestrial tour, or that perhaps a resurrection of the dragon of

Wantley had occurred. That there are immense snakes and serpents in Tino cannot, with any truth, be denied; which circumstance led to its being formerly called Ophiussa. The Tineote serpent of 1837 had been seen by many. All agreed that his head was enormous. None of the wood-cutters denied that it was very thick, but some would not admit that it was very long, while others differed upon its breadth. One asserted that it had been fired at several times without effect; that it was bullet-proof; and that, having actually chased its last assailant, people were now more afraid than ever."

From the immense number of fasts rigidly observed by the Greeks, it is occasionally very difficult for an Englishman to obtain, in some of the villages, a meal exactly suitable to his desires. Thus, if he suddenly want mutton on a day when meat is forbidden, his only remedy is to have a sheep slain for his own use. In Pyrgo, such an order does not entail much expense. When once placed in this carnivorous necessity myself, I had a lamb killed, of twelve pounds weight, for which I was only charged ten English pence; being a less price than that of an astako, or lobster, in the very same village, notwithstanding its vicinity to the sea. Wine is generally sold at a penny a bottle. Nevertheless, intoxication is rarely met with in the island. Although Pyrgo contained three thousand inhabitants in 1837, there was no shop for the sale of bread. All was then home-made, and generally excellent."

These few, brief, and partial examples of Mr. Knight's slight and amusing sketches will, we hope, recommend his little book to general circulation; of which, notwithstanding the numerous big ones relating to the same routes, it is well worthy.

#### BUNN'S STAGE.

[Third notice.]

BEFORE this work, completed, saw the light, we had an opportunity to amuse our readers with some notices from its first volume, which helped to assuage the eager curiosity wherewith the performance of an individual so distinguished as the writer must be expected in an enlightened age. This was, no doubt, equally agreeable to the author, the world, and ourselves. But it would be to leave our *Gazette* quite incomplete as the reflective mirror of the literature of our time, were we to abstain from a further review of the three volumes that have now been some time published. Their connexion with the stage—a subject of general interest—would forbid such neglect, even if they did not recommend themselves by a variety of matters which float on the surface of society, and, to a certain degree, reflect the manners (good and bad) of the day.

Mr. Bunn has been for several years a conspicuous figure in the concerns of our national drama. He was stage-manager and viceroy over Captain Polhill, whilst that gentleman threw away (and it is difficult to say who picked it up) a very considerable sum—it is said fifty or sixty thousand pounds—on the mania of being lessee of Drury Lane Theatre. His deputy informs us that he had then the honour of the succession thrust upon him, in consequence of the transcendent talents he had evinced in governing the house and ruining its occupant. To Drury Lane his ambition joined the rival rose of Covent Garden, and still his enormous abilities triumphed. But 'tis not in mortals to command success; and, somehow or other, notwithstanding Mr. Bunn's merits, the stage fell first into a decline, then into wondrous disrepute, then into the worst

possible condition, and then went out like the offensive snuff of a candle in the socket of a dirty candlestick. And so the reward of all his experience, of all his toils, of all his efforts to elevate the drama, of all his elegant refinements and luxurious combinations, was a commission of bankruptcy. We always pity and compassionate the unfortunate; but, after all, we do not feel so acutely for this lamentable catastrophe as the softness of our nature would seem to imply. In the first place, the adventurer began this career with very little or nothing to lose. While it lasted he lived, agreeably to his account, the gayest of lives and upon the fat of the land. And even when it terminated in what to most men would have been a calamitous privation of means and comforts, it does not appear that Mr. Bunn was very severely victimized.

Some raised aloft come tumbling down again,  
And fall so hard they bound and rise again.

But our manager seems to have fallen soft; and, in fact, never ceased to enjoy the same luxuries in his adverse as in his prosperous condition. This is a strong ground for consolation in tribulation.

Truly, and we say it upon our honour without the slightest allusion to the case before us, bankruptcies in London are frequently not so disastrous to the immediate parties as might be imagined. The first time it may be troublesome to manage matters; but after that the arrangements are so easy, that if a fellow can only contrive to break three or four times, you are sure to see him with the same, or a superior, residence—the same, or richer, furniture—and, what is more extraordinary, the same wines which were in his cellar, and the same carriages and favourite horses which he drove in his palmy estate before his first calamity. Poor devils don't usually find creditors so easy, and attorneys so sweetly delicate and honestly forbearing!

But to return to Mr. Bunn: the chief burden of his song, respecting the decline of the drama, is the overpaying of the actors, and especially of those luminaries who come within the *starry* system. We are inclined to agree with him that this is a great evil; but we can see no reason for the hate he shews towards the whole profession, out of whose exertions he contrived so long to maintain himself in his dashing position. Here is a burlesque jeremiad:—

"The season of 1837-38 having drawn to a close with so unsatisfactory a result to the treasury of Drury Lane Theatre, I was anxious to bring my connexion with that establishment to a termination. My rival seemed pretty much of the same turn of mind as respected Covent Garden Theatre, for he had relinquished the management towards the latter end of the season, which wound up, if I remember rightly, under the direction of the proprietors. The fag end of the season of a metropolitan theatre is literally disgraceful; arising from the total neglect of business by the performers, and the shameful mode of conducting it by all the mechanics and operatives. Ducrow once gave me a much more graphic description of the finale of one of his seasons than I have the power of transcribing. 'I don't know how you find it,' said he to me, 'but as soon as I once announce the last few nights of the season, the beggars begin to shew their airs. I went into the theatre t'other night, and seeing a prime little roasting-pig on a nice white napkin in the hall, I told 'em to take it up to Mrs. D——. The fellow said it wasn't for me—'twas for Mr. Roberts.' I naturally inquired who Mr.

Roberts was, and Ducrow as naturally replied:—'Why, he's the chap as orders the corn, and I'm the chap as pays for it; so he gets the pig, and I don't. Then those b—— carpenters sneak in of a morning with their hands in their breeches' pockets, doubled up as if they'd got the cholera, and at night they march out as upright as grenadiers; 'cause every one on 'em has got a deal plank at his back, up his coat. Then the supernumeraries carry out each a lump of coal in his hat, and, going round the corner, club their priggings together, and make the best part of a chaldron of it. As to the riders, they come into rehearsal gallews grand, 'cause they've had all the season a precious deal better salary than they were worth; and at night they come in gallews drunk, from having had a good dinner for once in their lives; and forgetting that they may want to come back another year, they are as saucy as a bit of Billingsgate.' This is about the case with all theatres; and while the manager is blamed for all these ill doings, and most assuredly is the only sufferer by them, the real criminals escape unpunished. Scenes such as this add to the disgust a manager must perpetually feel, if he has any feeling at all."

Mr. Bunn's enmity to the performers extends even to their charities:—

"June 2.—Present at the Drury Lane Theatrical Fund Dinner. Lord Glengall did the honours of the chair, Harley did the duties of the master, and the stewards did—the company out of about 9000. The annual nonsense written by good Master Daniele, and delivered by good Master Harley, had this year a slap at Ducrow, and through Ducrow at me. Knowles took up the cudgels, and left the master prostrate; albeit Harley, in all the relations of private life, is an exemplary character, and an old ally of mine, whose excellencies it rejoiceth me to respect. These funds are nowadays little else than inducements for performers to be more improvident and impertinent than their ordinary nature and avocation make them, and that 'more' was not wanting.

The stewards! (in plain English, the actors) of the Drury Lane Theatrical Fund dined at the Star and Garter, Richmond (not a bad house to pick out) on the monies of the said fund. So, the public is to be taxed for a dinner, and subscription afterwards, to find these mummerys an annual jaunt into the country, and a feast into the bargain! It is high time this humbug was blown into 'thin air,' or greatly reformed."

We sincerely hope, with all his folly and arrogance, that the writer may never stand in need of the aid of this abused fund, which has carried comfort to many a cheerless home.

The next grand evil in Mr. Bunn's path—the spectre that was to meet him at Philippi—the Mrs. Grundy that was to haunt and cross him every where, existed in the shape of Mr. Macready. Against him, and all his friends and admirers, fully one half of these volumes is directed. His acting is depreciated, his conduct maligned; and every endeavour, with the grossest misrepresentations, is made to hold him up to ridicule and dislike. But the world will not be led by Mr. Bunn; and whilst crowds continue to witness his performances; whilst all who know (including every performer who was engaged at Covent Garden during his tenure of it) respect him; and whilst he may fearlessly put this question to his slanderers—"What act unbecoming a gentleman did ever William Macready commit?" he need only

\* Perhaps his bestowing personal correction on Mr. Bunn may, by some, be held an exception.

smile at the egotistical comparisons and detractions of his fallen rival.

In theatrical phraseology we are told, when Mr. Macready became lessee of Covent Garden:—

"Previous to his assumption of the curule chair, Mr. Macready had received from the press the meed of as much approbation as was due to his abilities—he was frequently very justly condemned, occasionally deservedly commended. On his seating himself in the said chair, he became the idol of most who wrote concerning him; for while the sentiments of the established journals remained unchanged, and were not to be changed by any venal means, a host of others sprang up that were to be influenced only by such means. I firmly believe that Mr. Macready put upon the free list of Covent Garden Theatre almost every metropolitan publication,—reviews, magazines, journals, penny pamphlets, halfpenny squibs, and so on; and I will tell the reader *why* I believe so: because, for the first time during my long management, scores of writers in such productions, of whom, until that moment I had never heard, applied to me for the freedom of Drury Lane Theatre, alleging as a reason why they ventured to apply, and why I ought to comply, that Mr. Macready had obligingly placed them on the free list of Covent Garden. Presuming this to be the case, any 'outrageous exaggeration' thus insured 'in the public press' outraged all 'previous outrage.' Employing the aforesaid Forster as a whipper-in, the lessee had only to signify his wishes, and 'the sons of freedom' would 'exaggerate' for him until they were 'black in the face.' Do you not see through the whole affair now, good master reader? Do you not see that a manager, being an actor, could not, possessing Mr. Macready's modesty, absolutely puff himself in his own plays, and uphold his own exertions by his own 'outrageous exaggerations?' And the easier and more obvious mode, therefore, was to let the scribes attached to his staff do it for him, passing it all off as 'the voice of the public press.' Do you not see all this? and do you not see, in the background, the really eminent writers in our leading journals and periodicals, smiling with ineffable contempt at this shameful prostitution of the strength of opinion and value of judgment they, on all occasions, deal out without prejudice to all alike? But herein lay the secret. Mr. Macready was, by the press, to be written into the position of a leading tragedian; so that, even if he should lose any money in his speculation as manager of Covent Garden Theatre, it was easily recoverable by the terms he would be enabled to demand of other managers, when he ceased to be one himself."

The old adage, "set a thief to catch a thief," is admirably exemplified in this quotation. Mr. Bunn charges his own notorious tricks on Mr. Macready; and yet, by a singular inconsistency, tells us that the plot was successful, notwithstanding the "really eminent writers (Heaven bless the mark!) in our leading journals and periodicals smiled with ineffable contempt" at this shameful prostitution of the strength of opinion," &c., whilst they, i. e. the half-dozen whom Bunn feted and petted, pursued the honest tenor of their way, bespattered him and his theatre with panegyrics, and threw cold water on, or abused, every thing Macready did.

\* In spite of these immaculate and powerful critics against him, we are told only four pages on:—

"But then he was in possession of 'the voice of the public press' (as before described), and for the moment they who read believed all they did read."

The result was, that Macready, by his second season, retrieved the expenses and loss of his first, restored the stage to respectability, made every performer his friend, and retired infinitely to the regret of every lover of the drama; in justice to himself and family to exercise the fine talents with which Providence has blessed him, and his art cultivated in the highest degree, for their advantage, and not for the mere triumph of re-establishing the British Theatre. Whilst, on the other hand, Mr. Bunn, with all his measureless boasting, has miserably failed,—upon which failure we will not pass a comment that might hurt an honourable spirit, but we will say that it is a subject for congratulation and hope to all who love the drama, and desire to see it an engine of innocent amusement and moral example.

The third of Mr. Bunn's evils, with which the stage impersonated in himself had to contend, is comprised in the proprietary and managing committees of the theatres. They could nohow be convinced in the long run that he was doing every thing in the best manner for their interests. The new renters were particularly and unreasonably clamorous, because this body, three hundred in number, though called *new renters*, felt that it was in a *new* sense, as they received *no rent*. But then, says Mr. Bunn, they could come to the theatre every night and see what I was doing, occasionally shewing them (I, the abuser of stars and inordinate salaries) Malibran at 125*l.* nightly, and Taglioni, with her father, brother, sister-in-law, &c. by way of tail, at 200*l.* per night. Yet the fools grumbled, and so did the proprietors, and so did George Robins, and the Committee of Management; and, after all, the accounts were not 30,000*l.* in arrear when the bubble burst!

The infringement of the patent by which the theatre was held was the fourth and last we shall notice of Mr. Bunn's evils. There is a great deal too much about disputes with the Lord Chamberlain in the work. The discussions are deadly-lively. To arrive at something more entertaining, we shall copy a few anecdotes and lighter passages; but must first observe on the unfair and ungentlemanly act of ripping up some private correspondence of Serjeant Talfourd from the repose of years, and trying to convict that gentleman of ingratitude or insincerity, in revenge for his doing his bounden duty as counsel for Macready in the action for assault brought by Mr. Bunn against him. Does not Mr. Bunn see that within much less space than three years a person may, by his own misconduct, forfeit the opinion entertained of him by another and by society; that his character may have become actually worse, or more notorious; and his claims to respect altogether changed? After all, Serjeant Talfourd's letters are merely highly complimentary civilities; a little of the exaggeration, up or down, in which almost all dramatic circumstances are dressed.

And now for our extracts. In rehearsing "The Maid of Artois," Mr. B. relates:—

"I had occasion, during its last rehearsal but one, to express myself in strong terms at her leaving the stage for more than an hour and a half, to go and gain 25*l.* at a morning concert. Neither the concerted pieces of music, nor the situations of the drama in which she was involved, could possibly be proceeded with, and the great stake we were then contending for was likely to be placed in jeopardy by an unworthy grasp at a few pounds, to the prejudice of a theatre paying her nightly five times as much. She knew she had done wrong, and

she atoned for it by her genius, while her pride would not have permitted her to do so. She had borne along the two first acts on the first night of performance in such a flood of triumph, that she was bent, by some almost superhuman effort, to continue its glory to the final fall of the curtain. I went into her dressing-room previous to the commencement of the third act, to ask how she felt, and she replied, 'Very tired; but (and here her eye of fire suddenly lighted up), you angry devil! if you will contrive to get me a pint of porter in the desert scene, you shall have an *encore* to your finale.' Had I been dealing with any other performer, I should perhaps have hesitated in complying with a request that might have been dangerous in its application at the moment; but to check her powers was to annihilate them. I therefore arranged that, behind the pile of drifted sand on which she falls in a state of exhaustion, towards the close of the desert scene, a small aperture should be made in the stage; and it is a fact that, from underneath the stage through that aperture, a pewter pint of porter was conveyed to the parched lips of this rare child of song: which so revived her, after the terrible exertion the scene led to, that she electrified the audience, and had strength to repeat the charm, with the finale to 'The Maid of Artois.' The novelty of the circumstance so tickled her fancy, and the draught itself was so extremely refreshing, that it was arranged, during the subsequent run of the opera, for the negro slave, at the head of the governor's procession, to have in the gourd suspended to his neck the same quantity of the same beverage, to be applied to her lips on his first beholding the apparently dying Isoline."

This is letting us behind the scenes: so much for heavy wet. Again:—

"June 19.—Lord Castlereagh and Grisi's husband, De Melcy, fought at Wormwood Scrubs; Castlereagh maintaining his ground, and maintaining at the same time the lady's honour like a *preux chevalier* of the olden time. How little do his political assailants know Lord Castlereagh! who, in addition to a finished specimen of a nobleman, has ten times the intellect of all the fellows put together that descend to vituperate what they cannot aspire to imitate. During the rehearsals of 'Ildegonda,' last year, at the Opera House, Melcy, the husband aforesaid, called Marliani, the composer of the work, to account for apparent familiarities during the rehearsals with his wife. Marliani assured him that nothing of the kind had taken place since their separation (and this was previous to her marriage with De Melcy), but that he was quite ready to fight, concluding his expression of willingness thus:—'Si je vous tue, vous serez un cocu mort; et si vous me tuez, vous serez un cocu vivant!' Monsieur De Melcy retired, and no more passed thereon: he is the veriest puppy extant, and the one he affects to love will bolt from him as sure as he deserves that she should."

[To be continued.]

#### MISCELLANEOUS.

*The Gem of the Peak; or, Matlock and its Vicinity, &c. &c.* By W. Adam, author of "Remarks on the Condition of Man," &c. Pp. 351. 1840. London: Longman and Co. Derby: Mozley and Sons; and W. and W. Pikes: and other local Booksellers.

ANY one spending a few weeks in, perhaps, the most interesting part of England, will do well to make this volume their companion. It is a precise and useful guide to the ancient and noble residences which short excursions around

the famous Peak offer for the tourist's observation. Then there are the beauties and the wonders of nature in majestic tors, and marvellous caverns, and lovely streams, and sylvan dales, and ebbing wells, and other remarkable objects, all within the compass of a few miles.

With a decent purse, there is plenty of health and happiness to be found in these rounds.

*Smith's Standard Library.*

THREE agreeable additions to this pretty cheap edition of our popular standard authors have just made their appearance: first, "Essays," &c. &c., by Oliver Goldsmith; second, "The Poetical Works of John Keats;" and, last, "A Simple Story," by Mrs. Inchbald.

*Humphrey's and Westwood's British Butterflies.* No. II. London, 1840. Smith.

A BEAUTIFULLY illustrated continuation of this work, as charming in its floral as insect representations. The letterpress in this number touches on a subject of infinite importance, viz. the confusion of nomenclature, which is disgraceful to the science, and often repulsive where it is not destructive to its study.

*Religion and Education in America; with Notices of the State and Prospects of American Unitarianism, Popery, and African Colonisation.* By John Dunmore Lang, D.D. Pp. 474. London, 1840. Ward and Co.

STRONGLY against the Kirk submitting to a state connexion, and arguing from American premises that Scotch presbyters should now resist the authority claimed by government and the law.

#### ARTS AND SCIENCES.

THE BRITISH ASSOCIATION.

[Sixth notice.]

PROCEEDINGS OF TUESDAY.

WE have anticipated two important communications made to Sections A and C on Tuesday:—Sir John Herschel's report 'On Terrestrial Magnetism;' and Professor Agassiz's paper 'On the Glaciers of Switzerland.' We refer to them not only for their importance, but also because it will be necessary to the full understanding of the discussion thereon, and of the letter, especially, of Professor Boguslawski, extending the facts of the former attractive subject, that they should be borne in mind or that the memory should be refreshed. Proper reference will be made in the place they should have occupied according to the lists of papers read. Their omission in Tuesday's Proceedings, and possibly the postponement of a Section or two, will enable us to bring up some of our arrears, and to fulfil our promises.

SECTION A.—*Mathematics and Physics.*  
*Papers and Communications.*

1. Sir J. W. F. Herschel's 'Report on Terrestrial Magnetism.'
2. Dr. Lamont, of Munich, 'On the Magnetic Observatory of that Place.'
3. Dr. Lamont, 'On Meteorological Observations in Bavaria.'
4. Professor Jacobi, 'On the Principles of Electro-Magnetic Machines.'
5. Mr. W. Bald, 'On Tide Observations at Glasgow.'
6. Professor Kelland, 'On the Conduction of Heat.'
7. Dr. Anderson, 'On Meteorological Observations at Perth.'
8. Sir D. Brewster, 'On the Increase of Colour, caused by the Inversion of the Head.'
9. Mr. Snow Harris's 'Report on Whewell's Anemometer.'
10. Professor Forbes, 'On Paper for Tabulating Curves.'
11. Sir David Brewster, 'On Illuminating Microscopic Objects.'
12. Sir David Brewster's 'Improvements in Polarising Microscopes.'

After No. 1 (see *Lit. Gaz.* No. 1237), referring to the Magnetical Observatory at Breslau, mentioned in Sir John Herschel's Report,

Major Sabine read the following letter from its director, M. von Boguslawski, received since the meeting had commenced.

"Breslau, September 7, 1840.

"My dear Sir,—I have the pleasure to inform you that, during the last magnetic term, viz. on the 28th and 29th August, I have made observations with the two magnetic instruments provided by the British Association. Notwithstanding the Michaelmas term of our University has begun, I have succeeded in engaging and instructing a double number of observers, sufficient to place them at the declination magnetometer in the magnetic cabinet, as well as at the horizontal, and at the vertical force magnetometers in the great room of the University. The observations hitherto made can, however, only be considered as observations of the magnetic variations, because there are several masses of iron fixed in the buildings. The prospect of obtaining a separate magnetic observatory being still distant, I feel myself highly indebted to Professor Lloyd for the assistance his paper 'On the Mutual Action of Permanent Magnets,' &c., has afforded me. By these instructions I have succeeded in effecting what at first seemed to be impossible, namely, to place the declination magnetometer, the bifilar instrument, and the vertical force magnetometer, in the same room of the present magnetic cabinet, and to put them in equilibrium. How this is to be done by three small subsidiary magnetic bars I shall hereafter explain to Professor Lloyd, and if he agrees with me, all three instruments will be placed in the magnetic cabinet at the next term. However, I shall use for a declination magnetometer the second magnetic bar received with the horizontal force magnetometer, instead of the present bar of four pounds, in order to obtain small correction constants. I shall then expect, with patience, the establishment of a proper magnetic observatory, so as to begin to make absolute and daily observations. Please to communicate this, in my name, to the meeting of the British Association at Glasgow; and have the kindness to express to them my regret that, on account of the necessary arrangement I have to make, I am prevented from accepting their honourable invitation, and assisting at their instructive assembly.

(Signed) "HENRY VON BOGUSLAWSKI."  
"Major Edward Sabine."

Major Sabine also presented to the Section, at the request of M. Kupffer, Director-General of the Magnetical Observatories of Russia, several copies of a report addressed by that gentleman to the Imperial Academy of Sciences at St. Petersburg, entitled "Sur les Observatoires Magnétiques, fondés par ordre des Gouvernements d'Angleterre et de Russie, sur plusieurs Points de la Surface Terrestre." In this report the Russian observatories, acting on the same system as those of England, are described as follows:—"La science doit au gouvernement Russe, et surtout à la protection puissante du Ministre des Finances, M. le Comte Cancrin, et à l'incessante activité du chef de l'état major du corps des Ingénieurs des Mines, M. le Général Tcheffkine, l'établissement des stations magnétiques suivantes:—

Stations.		Directeurs.
Helsingfors (Finlande) ..	M. Nervander ..	Professeur Extraordinaire à l'Université d'Helsingfors. Membre de la Mission Ecclésiastique."
Pekin (capitale de la Chine) *	M. Gaschkevitch ..	
St. Pétersbourg	M. Kupffer .....	Directeur-général.
Catherinebourg	M. Roschkoff ..	
Barnaoul .....	M. Prange, 1er ..	Ingénieurs des Mines.
Nertchinsk ..	M. Prange, 2ème ..	
Kasan .....	M. Simonoff .....	Directeurs des Observatoires Astronomiques.
Nicolaeff .....	M. Knorre .....	
Tiflis .....	M. Philadelphine ..	Professeur au Gymnase de Tiflis.
Siska (Côte N. O. de l'Amérique) .....	MM. Homann et Fwanoff ..	

A letter was also read from M. Kupffer, expressing his regret that the necessary and pressing duty of preparing instructions for the directors of the Russian observatories prevented him from attending the meeting of the British Association at Glasgow, which he had otherwise hoped to have done.

Major Sabine briefly expressed the satisfaction which the members of the Section felt in having amongst them the distinguished foreigner, General Tcheffkine, whose services in the establishment of the Russian magnetic observatories had been so honourably mentioned in M. Kupffer's Report. In reference to the aurora which had been seen at Toronto, in Upper Canada on the 29th of May (see Sir J. Herschel's Report, No. 1), and to the magnetic perturbations by which its appearance had been accompanied, the Astronomer-Royal stated that the term-day of the 29th and 30th of May had also been kept at the Royal Observatory at Greenwich; that an aurora was seen there also on the 29th; and that the disturbance of the declination magnetometer exceeded in amount any which had been observed there on previous occasions. Not having brought the observations with him, Mr. Airy could not state whether their comparison with the curves of the Toronto observations, which Major Sabine had laid before the Section, would manifest an accordance between the disturbances at the two stations,—a point of the highest interest as to the nature and extent of these perturbations.

The magnetic observations at Munich, Dr. Lamont stated, conducted under royal ordinance, and with the support of government, have been made under circumstances the most conducive to accuracy. A capacious observatory, of an octagon form, had been constructed to secure an equable temperature, so that no errors should arise from that cause, thirteen feet below the surface of the ground, lighted from above to its utmost extent by reflecting mirrors, and supplied with every requisite instrument; which, together with the advantages from arrangement, &c. were severally described. Every known means, it appeared, had been adopted to further the views of the British Association, and to render the series of observations as complete as possible.

After a few remarks, by Professor Forbes, on the great importance of uniformity of temperature, &c. in magnetical observations, Dr. Lamont proceeded to recount the number of, and the admirable central system of registry in, the observatories in Bavaria. They may be divided into three classes: Government Observatories, the head of which was that at Munich; those conducted under the Superintendence of Meteorological Societies; and those of the Districts (250 in number), the direction of which was intrusted to the physician or other intelligent individual of the locality. The observations of the whole of the three classes are reduced and forwarded to Munich, and there compared, classified, and published annually.

Professor Jacobi, in presenting, as he termed it, an historical sketch of the law regulating electro-magnetic machines, which he conceived would lead to the general use of this force as

\* "A la station de Pekin nous aurons, si non autant d'observations que des autres stations, au moins les observations les plus importantes."

a moving power, entered into an elaborate detail of numerous experiments made by him to determine the laws which regulate electro-magnetic phenomena, and illustrated these laws by the several formulæ derived from the results. Any brief notice would fail to convey a satisfactory knowledge of the laws established by these experiments; and the peculiarity of the Russian Professor's pronunciation prevented our following him so closely as to insure an accurate report. The papers, however, containing the data, &c. have been read to the Academy of Science at St. Petersburg, and already published. In the conclusion of his paper Professor Jacobi stated, that by means of machinery, which he was ready to explain privately, he had succeeded in propelling a boat twenty-five feet long, seven feet broad, drawing 2½ feet water, and containing fourteen persons, at the rate of three miles an hour, by means of electro-magnetism, the force produced being equal to five-sixths of one horse power. This was accomplished by a battery of sixty-four plates, of the area of thirty-six square inches each.

Mr. W. Bald read a paper 'On the Subject of the Tides in the Clyde, at the Harbour of Glasgow.' The results were given in Tables. Of the first series of observations, extending to 158, the mean rise and fall of the tide in the harbour was six feet seven inches; while in 1755, Smeaton stated the tide to be only sensible at Glasgow Bridge. A series of 1200 observations was afterwards made, which gave a mean result of six feet nine inches for the rise and fall of the tides when not affected by floods. A most elaborate section was exhibited of the rise and fall of the tides for each tide of the 1200. The velocity of the tide in the Clyde exhibited a strange result. The velocity of the tidal wave from Port Glasgow to Bowling was at the rate of 14½ miles an hour; from Bowling to Clyde Bank it was only 6·82 miles an hour, probably arising from the curves in the river; while above Clyde Bank on to the harbour the velocity of the wave was 10·85 miles an hour. In the conversation which followed, Mr. Miller alluded to some observations he had made on the same subject, and shewed that instead of the difference in the time of high water between Glasgow and Greenock being two hours, it was only one hour five minutes, and the difference between Glasgow and Ayr was only one hour forty-six minutes, instead of two hours forty minutes. The Tables which illustrated this paper were of extraordinary labour and minuteness.

Professor Kelland then discussed his researches 'On the Conduction of Heat,' communications similar to which he had previously made to the Royal Society of Edinburgh, and published in their "Transactions." He noticed the theories of Newton and Fourier, and considered the former was erroneous for high temperatures, while the latter was the correct one for all. He proposed, however, to alter the mode of expression adopted by Fourier. His theory was that heat was conducted along solid bodies in a ratio proportionate to the temperature, while the radiation of heat was proportional to an exponential function of the temperature. Professor Kelland considered heat in both these cases as subject to the same law, and he proposed to substitute the word *temperature* instead of *temperature* for the expression used in Fourier's theory. The Chairman said, the Association had agreed to ask Professor Kelland to prepare a report on this subject.

Dr. Anderson read a long paper 'On the

Meteorological Observations at Perth and at Kinfauns, of great local interest, and forming a valuable link in the extensive chain of facts collected and being recorded and tabulated under the auspices of the Association.

The report of Mr. Snow Harris (No. 9), and the remarks of Professor Forbes (No. 10), may also be similarly designated. The latter, however, were directed to the facilitating accurate representations of observations and reductions.

Sir David Brewster's papers (Nos. 8, 11, and 12) evinced the clearness and minuteness of the philosophical investigator, and added to the store of facts already brought forward by Sir David to the elucidation of that branch of science to which more particularly his attention has been so successfully directed. The increase of colour caused by looking at a landscape, when the head is inverted, has been hitherto attributed (and has been so explained by Sir J. Herschel) to the rays of light falling on a part of the retina not accustomed to the excitement of direct vision. This view was entertained by Sir David Brewster, until experiment, protecting the eye from the lateral ray, &c. proved that it could not be the cause. In the perplexity of this proof, the exaggerated vision and the increase of colour, even to a painful degree, occurring to the eye in a state of inflammation, presented themselves to Sir David Brewster's thoughts, and reflection induced the belief that the phenomenon is the effect of a physiological and not of an optical cause. The increase of colour and the heightened tints observed are the consequence of the additional blood pressed into the vessels of the eye by the inversion of the head.

1. Professor Thomson, 'On the Minerals of Glasgow.'
2. Professor Johnston, 'On the General Constitution of Resins.'
3. Professor Clark, 'On a New Mode of Detecting Minute Quantities of Arsenic.'
4. Professor Bunsen, 'On a New Mode of Estimating Nitrogen in Organic Analysis.'
5. Mr. Macgregor, 'On the Quantity of Carbonic Acid evolved from the Lungs in Health, and some Forms of Disease.'
6. Professor Redtenbacher and Dr. Varrentrapp, 'On the Constitution and Products of the Distillation of Fat Acids.'
7. Professor Penney, 'On a New Salt obtained from Iodine and Caustic Soda.'
8. Dr. Buchanan, 'On a Method of Separating the Coagulable Lymph from Liquid Blood by Filtration.'
9. Professor Johnston, 'On some Varieties of Peat.'

Dr. Thomson described the mineral riches of the neighbourhood of Glasgow. The Lead-hills, especially, abound in ores, which were worked so far back as the time of James the Fourth. Nine different kinds, in addition to galena, are there to be found: viz. 1. Sulphate of lead. 2. Carbonate of lead, analysed by Klaproth. 3. Cupreo-sulphate of lead, described by Mr. Sowerby. 4. Sulphato-carbonate of lead; 5. Sulphato-tricarboxylate of lead; and 6. Cupreo-sulphato-carbonate of lead, analysed by Mr. Brooke in 1820. 7. Phosphate of lead; and 8. Chromo-phosphate of lead, analysed by Dr. T. Thomson. 9. Vanadate of lead, analysed by Dr. R. D. Thomson in 1834. Blende, sulphuret, and silicate of zinc, also occur. The trap-rocks, running from Stockey to Dumbarton, are full of cavities, in which several crystallised minerals present themselves. Dr. Thomson enumerated thirty-four, as follows:—1. Stellite; 2. Thomsonite; 3. Natrolite; 4. Mesolite; 5. Scolecite; 6. Lomonite; 7. Chabazite; 8. Analcime; 9. Cluthalite; 10. Stilbite; 11. Heulandite; 12. Harmotome, or Cross-stone; 13. Carbonate of magnesia, at Bishoptown; 14. Dihydrous peroxide of iron, at Gourrock; 15. Sulphate of barytes;

16. Calcareous spar; 17. Fibrous sulphate of lime; 18. Arragonite; 19. Wollastonite; 20. Prasolite; 21. Fluor spar; 22. Phrenite; 23. Augite; 24. Amphibole; 25. Felspar; 26. Labradorite, one of the constituents of a variety of greenstone at Campsie Glen and at Gleniffer; 27. Mica; 28. Epidote; 29. Steatite; 30. Iron pyrites; 31. Carbonate of iron; 32. Grey ore of manganese; 33. Kilpatrick quartz; 34. Sulphuret of cadmium—rare, and lately discovered occurring with phrenite at Bishoptown. Amongst those exhibited were beautiful specimens of the latter, termed also Greenockite, which is so very scarce that a small crystal is valued at 10*l*. The author, when these were first shewn him, thought they belonged to an entirely new description of mineral, but he had since learned that it had been known amongst dealers in Glasgow for the last ten years. After the conclusion of the paper,

Professor Graham said it was quite unnecessary for him to state what had been Dr. Thomson's labours in this field of science, as the results were so generally known; but he was sure the Section could not but feel deeply indebted to him for the trouble he had taken in bringing forward such a valuable paper on the mineralogy of this part of Scotland.

Professor Johnston said they were indeed

deeply indebted to Dr. Thomson for elucidating the mineralogy of this country; and, not only for that, but for his analysis of the substances of the various minerals: for, perhaps, no man living had made so many analyses as Dr. Thomson.

Professor Johnston, 'On Resins.' In this paper the author drew attention to the following facts, apparently established by the annexed Table of analytical results. 1. That the resins differ from each other in the quantity of oxygen they contain. 2. That in those in which the atoms of oxygen are the same, the hydrogen may vary; and that this is another cause of difference in the properties of the resins. 3. That in all the resins hitherto carefully analysed, the number of atoms of carbon is constant. 4. That the resins, as a natural family, may be represented by a general formula containing two variables. 5. That the known resins divide themselves into two groups, possessing unlike chemical and physical properties; that of one of these groups, colophony, may be considered as the type, and that it is represented by  $C 40, H 32, \pm x Oy$ ; that gamboge, or dragon's blood, may be considered as the type of the other group, which is represented by  $C 40, H 24, \pm x Oy$ .

Professor Clark, of Marischal College, Aberdeen, explained a 'New Mode of Detecting Minute Quantities of Arsenic.' This was a mode that the Professor had found particularly

applicable to the detection of arsenic in commercial specimens of tin and of zinc. These metals were to be dissolved in purified muriatic acid, and the hydrogen evolved was to be made

pass, first through a solution of nitrate of lead, and then through another of nitrate of silver. If any arsenic were in the original metal, it would cause a bluish black precipitate in the second solution. This precipitate falls, and may be collected with much facility. Dried and exposed to heat in a little tube-vessel, such as permits access to the atmosphere; the precipitate affords a sublimation of arsenious acid, and a remainder of metallic silver. The arsenious acid may be recognised by its appearance, and, after solution, by well-known tests. The examination of the precipitate is not superfluous, because the metal antimony produces a precipitate similar in appearance. The use of the solution of lead is to put out of the question any precipitate occurring in the solution of silver, owing to sulphur in the original metal. In that case the lead-solution would become black. During the whole time of the solution of a pound of grain tin, which lasted more than a day, the characteristic appearance of the precipitation from the nitrate of silver was observed. This could not be done by the usual test of burning the evolved hydrogen. Arsenic had been detected in specimens of zinc by this process, although not indicated by the usual process; and the new process appears to afford the means of settling some recently controverted questions in medical jurisprudence.

The new mode of conducting organic analysis, explained by Professor Bunsen, gives results of great accuracy, and closely agreeing with theory. The subject of the analysis mixed with oxide of copper, and with a few pieces of metallic copper in addition, is placed in a glass tube, and affixed to Döbereiner's apparatus for generating hydrogen. After the complete expulsion of atmospheric air the tube, then hermetically sealed and immersed in an iron vessel of moist gypsum, is subjected to the usual analytical process of heat; and, after complete combustion, the tube with its contents is placed under a graduated receiver, in which is a ball of hydrated potash, and over mercury, and the point broken off. The result is the absorption of the carbonic acid by the potash, the conversion of the hydrogen into water by the oxygen of the oxide of copper, and consequently the detection of the proportion of the remaining free nitrogen.

Mr. Macgregor shewed the increase of carbonic acid exhaled during disease varying from four to eight per cent.

The details of No. 6, tending to correct the constituents hitherto given to the fat acids, will be found in one of Liebig's recent journals.

Professor Penney considers the new salt obtained by him by the action of iodine on carbonate of soda, to be the sesqui-iodide of iodate of soda.

Dr. Buchanan exhibited four specimens of coagulable lymph, obtained from liquid blood by filtration, and explained the process. Of the four specimens exhibited, one consisted of the red particles gradually deposited, while the fibrinous coagulum, with only a slight tinge of red at its lower part, floated above; the other three consisted of fibrin separated by the filter, one of the masses floating in serum, the other two in water. These yellow masses were of a cellular texture, and their colour is owing to the serum contained in their meshes; but, by ablution with water, they become of a pure white colour.

Professor Johnston, 'On some Varieties of Peat.' The author exhibited some varieties of peat from the moss near Paisley, which he stated were illustrative of a transition from the

comparatively fresh and vegetable matter to a substance resembling coal, but which he affirmed to be ulmic acid. The author stated, that the same substance might be obtained from peat by digesting it in ammonia, and afterwards precipitating the brown solution by an acid; while, on the other hand, caustic potash extracts another acid, which he proposed to term humic acid.

Dr. Playfair observed, that Liebig had recently conducted a series of experiments on humic acid with contradictory results. Dr. Playfair had no doubt, he said, that the analysis made by Professor Johnston was accurate, but until the same acids were found in other peats it would be dangerous to consider them as definite bodies.

9. Mr. Jeffries, 'On the Solvent Action of Water at an Intense Heat on Silicious Minerals.'
10. Mr. Yates, 'An Account of a New Locality in which Fossil Footmarks are found.'

Mr. Smith, of Jordanhill, in the chair.—Mr. Lyell directed attention to the discovery of the *Conus concavus*, the *Conus cadonensis*, &c. in the lias formation of Fontaine, near Caen, by the French geologists, shewing that these fossils occur in older strata than the tertiary strata.

And, *à propos* of this allusion to the tertiary formation, we may as well take this opportunity of pointing out more literally than in our first report the system of Mr. Smith himself, as he defined the tertiary and post-tertiary system to be in Scotland. The newest of the post-tertiary deposits formed since the appearance of man furnished no evidence of any change in the sea level; but, anterior to this, there must have been a period of stationary level of great duration, in which the sea stood about forty feet above its present height, and during which the great inland cliff and terrace which every where skirts our coasts must have been formed: the shells and marine remains belonging to it agree with those of our present seas. The tertiary beds of Scotland are arranged, as he thinks, in the descending order as follows:—

1. Beds of sand, gravel, and clay, containing marine remains: 15 per cent of the shells are extinct, or unknown in the British seas.
2. Submarine forests, indicating a previous movement of depression.
3. Stratified beds of sand, &c.
4. Diluvium, or boulder clay; termed in Scotland, till.
5. Stratified beds, similar to No. 3. All the shells still existing, but not in the British seas, are to be found in the Arctic regions; from whence he infers that the climate must have been colder during the pleistocene period than it is at present.

Mr. Griffith offered observations on the yellow sandstone of the carboniferous limestone of Ireland, and displayed the alternations in a fine map, which he had carefully constructed from actual survey. He considered this peculiar sandstone to be the lowest of the carboniferous series; it did not occur every where with the limestone, but only here and there alternating with it, and always in the lower beds. It is largely developed in the counties of Tyrone and Londonderry.

The Duke of Argyll, in person, took the

floor as the Americans say, and was received with great applause. His Grace called the attention of the Section to specimens of veins of copper ore found in Argyshire. These had been discovered several years ago, and after an investigation of the district, the ore was found in such quantities, and of such quality, as to induce him to adopt measures for working it, and arrangements for this purpose were now in progress. Similar specimens had also been found in the Island of Iona, on the estate of Mr. Malcolm, of Poltalloch, and various other places of Argyshire, although Mr. Malcolm had never discovered the veins to which the ore belonged. He would be glad if any of the geologists took an opportunity of visiting the district, and promised them every facility in their investigations. His Grace also exhibited several of the beautiful marbles of the district, including the white marble of Iona.

Dr. Buckland shewed a pair of ancient gold armlets, which the Duchess of Argyll possessed, and which had been found (somewhere) in Argyshire. The Doctor spoke of them as British ores, but they were, evidently, Danish or Roman. We could not examine them closely enough to determine. They appeared to be massive, and truly the wealth and currency of antiquity.

On the subject of Scottish mines, Mr. Milne, who communicated the next remarks from Lord Breadalbane, in his Lordship's absence, and calling upon his steward to corroborate the statement, seemed to us to establish himself as a high authority upon this very important question to Scottish, and especially Highland, proprietors. The wealth under the earth may enrich many of them who have but moderate revenues from widely extended surfaces, and if lead, copper, and other ores, can be discovered and wrought in Scotland (as we have no doubt they can), it will give another tremendous impetus to the industry of the country. On this subject Mr. Milne stated, that not merely copper had been discovered on Lord Breadalbane's estate, but lead, cobalt, iron pyrites, &c. They rested in joints or fissures of schist, occurring in the neighbourhood of granite. This was a fact of some importance, and perhaps his Grace of Argyll would state whether the same union held in his neighbourhood?

The Duke of Argyll stated that there was granite in the neighbourhood of the veins he had mentioned.

Mr. Lyell remarked that copper ore generally occurred in the neighbourhood of large masses of granite, and that, especially, was the case with the silver ore in Norway, which uniformly occurred where the granite pierced the gneiss in veins.

Mr. Milne added, that the same conjunction occurred at Strathearn and Lochdoon, where copper ore was found in the neighbourhood of granite.

M. Agassiz developed his new theory of the geological phenomena and transportation of rocks by ice, which has already been expounded more completely by our reference to his exploration of the north of Scotland after the meeting at Glasgow (*Lit. Gaz.* No. 1239). In this theory he is considerably opposed to Mr. Mallet, whose idea is founded on the hydrostatic pressure of water in the fissures of rocks. M. Agassiz holds that whole regions have been under the dominion of the thick-ribbed ice; that no current occurs but in the lower mountain parts, whilst rocks have descended (as his own observations proved) more than 2000 feet, polishing and striating the rocks over which they were borne: to this ice-agency

he referred all erratic rocks of Scandinavia and of Scotland; and spoke of thousands of floating masses, stranding their masses as they grated along.

[As this theory is one of the most signal matters which have occurred at the meeting we shall, no doubt, have often to occur to it; and only remit a particular report of M. Agassiz's explanation, in consequence of having post-anticipated it by later communications.]

Mr. Smith described the geological peculiarities of Madeira, and attributed some of the deposits containing shells to the newer pleiocene period.

Mr. Forbes stated that he did not appear as a geologist, but as a zoologist, desirous of contributing to the progress of geology. In the course of his investigations, as a member of the Dredging Committee, he was frequently led to compare the present state of the sea with that of the land bordering it, and the results were such as mutually illustrated zoology and geology. The northernmost part of the Isle of Man, coloured white in Mr. Greenough's map, is composed of a great bed of pleistocene sand, and marl, called by the people red marl, to distinguish it from the white marl, which fills up basins in the former, and in which the bones of the fossil elk are found. The red marl is marine, the white marl fresh water. The pleistocene tract so composed, extends from the slate mountains to the sea, terminating in high cliffs of sand and clay. The portion immediately bordering the mountains is composed chiefly of sand, and in it there are no organic remains; that farthest from the mountain is red marl, and the remains of shells are found in beds in it. These shells are associated together exactly as those are which at present exist in the neighbouring sea. There is even an exact correspondence between the elevated tertiary tract and the present sea bottom. The latter, for from two to four miles from the shore, is composed of sand with groups of boulders, to which laminaræ are attached, thinly scattered in places. Beyond the sand commences a great bed of living shells on a clayey or gravelly bottom, exactly corresponding with the position and nature of that part of the marl in which the shells are found. In the marl, the shells most abundant and characteristic are nuculæ; so also in the shell bank: but there is this important difference, that the species are not identical. The *Nucula oblonga* characterises the fossil bed, the *Nucula margaritacea* the recent; but the shells not characteristic are identical as species. The pleistocene bed appears to correspond exactly with that of Cheshire and the Clyde. Near Ramsay it is bordered for about one mile by a triangular tract of gravel and clay. This tract was formed within the memory of man, in consequence of changing the course of Sulby river. It is most interesting in a geological point of view, as it presents all the appearance of a pleistocene clay-bed, containing shells now extinct on the Manx shores, for the diversion of the course of the stream has caused the destruction of *Listera compressa* and *Tellina solidula*, two shells not now found alive on that shore. Mr. Forbes concluded by illustrating the importance of the dredging researches now going on, by the circumstance of that Committee having this summer settled the question of the identity of *Phytocrinus* with *Comatula*; the Sub-committee engaged in dredging on the coast of Ireland having proved the former animal to be the young of the latter.

The oxy-hydrogen microscope in conjunction

with the daguerreotype apparatus has been employed by Mr. Ibbetson, with great success, to procure magnified drawings of fossils.

Mr. Jeffries described the method by which he had dissolved silica in large quantities by means of steam. And Mr. Yates stated that Rathbone Street, Liverpool, was the new locality in which fossil footmarks are found.

#### SECTION F.—Statistics.

##### Papers and Communications.

1. Professor Johnston's 'Report of the Progress of the Committee to Inquire into the Statistics of Coal-Fields.'
2. Mr. Bryce's 'Report of the Committee of the Ulster Statistical Society on the Linen Trade of Ireland.'
3. Mr. Porter, 'On the Mont de Piété System of Pawnbroking.'

4. Professor Adrian read his paper 'On the Principal Libraries of Germany.'

5. Dr. Chalmers gave the result of his experience with regard to the Pauperism of Glasgow.

Lord Sandon in the chair.—The Section met shortly after eleven o'clock, when the Chairman stated that they would take up first a few of the short papers, and get through them as soon as possible, in order that they might have more time to devote to the other important papers on the list.

Professor Johnston reported the progress of the Committee appointed to inquire into the statistics of the mining districts of the north of England. After a few words by Mr. Mill on the importance of such inquiries in districts similar to those referred to, and in such as were around Glasgow, the Report was received.

Mr. Porter read a paper 'On the Evils arising from the System of Pawnbroking in Ireland,' and shewing the advantages of the establishment of a Mont de Piété, on the principle of those institutions in Paris. Since he came to Glasgow, through the kind assistance of the Lord Provost and Captain Miller, he had made himself acquainted with the system of "wee" or little pawns in Glasgow; and he could assure the Section that the evils arising from them were neither "wee" nor little. In order to make himself acquainted with the extent of pledging in Ireland, and the profits to the pawnbrokers, &c. he had at one time 300 articles of his own in pawn. He had no time, of course, to proceed in this way since he came to Glasgow; but as in Ireland he visited the poor in the lanes, alleys, and garrets, so in Glasgow he had gone through the wynds and vennals, in order to see the actual condition of matters. In almost every door there was a "wee" pawn-shop; and he was astonished at the control which Captain Miller, who accompanied him, had over this class. They received the Captain with kindness, and gave him every information. The result of his inquiry was, that there were 400 of these receptacles within the police bounds, and 300 without; in all, 700. In one there were 58,172 articles pawned in the course of a year. The money advanced was from "a bawbee" to one shilling, average fourpence; making, upon the whole, about half-a-million of money borrowed in this way, in all the pawn-shops. The interest obtained was 433½ per cent; or, for 100l. lent, there are 433l. of interest obtained. Mr. Porter, at considerable length, pointed out the advantages of a Mont de Piété, and concluded by offering to give further explanation of the institution, should it be required.

Colonel Sykes proposed a vote of thanks to Mr. Porter for his valuable paper. Lord Montague seconded the proposition, and took an opportunity of confirming many of the statements made by the author.

Professor Adrian, from Giessen, read an interesting statement of the public libraries in Germany.

Dr. Chalmers then proceeded to read his paper 'On Pauperism in Glasgow.' The proper title of the paper which he proposed to read, he said, should be a statement of his experience in regard to the pauperism of Glasgow. A good many years ago he would have called it an account of his experiment; but now that the results are obtained, he was happy to substitute the word experience for experiment. For the first four years of his ministry in Glasgow he was connected with the Tron Church parish, and he was as much dissatisfied with the system of managing the poor in Glasgow as Dr. Alison was with the state of pauperism in most of the large towns. It was a most inadequate way of supplying the wants of the poor; and really the object of the learned Doctor and himself was the same,—their object simply was to elevate the condition of the working classes, and more especially the poorer classes. His next parish was St. John's, and he got this parish on the express condition that he should be allowed to manage the parishioners in his own way. All his difficulties were of a political nature—and he used the word political in contradistinction to natural difficulties. He had much difficulty in getting magistrates, directors of the town's hospital, to agree to any change, and he had to go through the ordeal of all the church courts. The Rev. Doctor then described the actual state of the parish when he came to it, shewing that it was the poorest of all the parishes in Glasgow; and then went on to describe the practical workings of the system he introduced. The principles, he said, on which he calculated upon success, and which were at the foundation of the whole system, were:—1. The great principle of self-preservation, by the operation of which a man would rather work than starve, and rather save a little to-day than be in want to-morrow. 2. The law of relative affection, by which the assistance of one relative was brought to bear upon the wants of another. This was a virtue never wholly destroyed in the heart of man; even in the case of forty fathers, whom he had seen advertised in one Manchester paper for deserting their wives and families, this feeling was not extinct: for they knew that their children would be left to the care of the public hospitals. 3. The law of common sympathy—that law of our nature which led man to extend to his fellows the aid and sympathy he might require. This he illustrated by a reference to the gaol of Bristol, where the aliment given to criminal prisoners was very small, while no aliment whatever was given to debtors. The debtors were thus thrown upon their own resources, and they would frequently be left to starve were it not for the kindness and sympathy of the malefactors. Now, he would carry this experience from the prison to the parishes, and leave much to the operation of the common sympathies of mankind; and he was able to add to it the result of his own observation, which was, that, in very well-authenticated cases of distress in St. John's, it was speedily followed up by an expression of this common sympathy and affection. 4. The law of compassion between poor and poor, by which the poorer classes themselves were prompted to extend aid to each other. This might be small in each case, but it became large when given by numbers. 5. The law of sympathy among the working classes, and the law of sympathy between the rich and the poor. The Rev. Doctor then proceeded to shew that the system he had put in operation, founded upon these laws or principles of nature, were equally practicable in a poor as in a rich parish; and

he observed that were he to make the experiment again he would prefer beginning with the poorest of the poor. He did not know any aggregate population, of even 2000, in which there did not exist all the elements of sufficiency for the supply of the poor. After rebutting the notion that his system was founded on the Malthusian theory—with which, he observed, it had as much connexion as with the Newtonian theory of the universe, though he was a believer in both—the Rev. Doctor explained more particularly the practical workings of his system, through the agency of deacons, each of whom had the supervision of a particular district allotted to his care. The first step taken by a deacon, on an application for relief being made, was first to inquire if the applicant could not get work; and here was brought into play the first principle laid down for their guidance—that a man would rather work than starve. The next inquiry was, what friends the applicant had, and then an attempt was made to get those friends, if any such existed, to give the requisite support to their relative. He must say that the operation of this part of the plan was so successful, that it gave him greater respect than he had ever before held for the general population. In these ways many persons who applied for relief were put off, and thrown upon their own resources; but it was a mistake to suppose that starvation followed to the poor. Only 321. worth of pauperism was created in the parish of St. John's, with a population of 10,000, in the period of three years and nine months; and yet there was the reverse of starvation among the poor. A stimulus was given to their better feelings; they were sent back upon their own resources; or they were the objects of the kindness and sympathy of their relatives and neighbours. His system, in fact, was a resurrection of all the Christian and kindly feelings of our nature. Having expressed the gratification he felt to Dr. Alison for bringing the important subject of pauperism before the country, and shewed that their object was one and the same, the Rev. Doctor pointed out the complete success of his system, and the little trouble which the deacons experienced in working it out. He also gave some examples of the working of Sabbath Schools, and the good which was found to follow from leaving the parents to their own resources, instead of resorting to the practice of aiding them with clothes, or for their children. He stated that experience had proved that the most ragged and loathsome of the juvenile population might, by the patient operation of Sabbath Schools, be converted into decent and cleanly scholars. We cannot possibly give any thing like a complete report of the Doctor's lengthened address, as it would occupy too much of our room. Towards the conclusion he answered some of the arguments brought forward by Dr. Alison on the subject of an assessment for the poor. He controverted the notion that the higher standard of enjoyment in England was caused by the poor-law. On the contrary, he contended that a poor-rate tended much to diminish the standard of enjoyment. On this subject it was futile to compare England with Ireland; the north of England should rather have been compared with the south of England: both of them were under the same poor-law, and yet the standard of enjoyment was much higher in the former than in the latter. The controversy stood thus: the one party said, raise the economical comfort of the people, and the moral results would follow; but his view was, first, to raise the moral tone of the people, and then the economi-

cal would necessarily follow. Dr. Alison said, give a man, who is without clothing, a new coat, and it will inspire him with a desire to go to church; but he (Dr. C.) held that the way was, first, to give a man a desire after religion, and a desire to go to church, and then he would exert himself to get a new coat to enable him to go in decency. The Rev. Doctor then proceeded to prove that his (St. John's parish) scheme was imitable in every other parish. He described the nature of the endowment they were seeking—they wished an endowment to enable them to give cheap seats, but, as a *quid pro quo*, they offered to give up the collection for the support of the poor. The question here was, Were they willing to pay 800,000*l.* a year to provide for the poor, or would they give some 200,000*l.* for an endowment? What he did with a population of 10,000, could surely be done with a population of 2000. He could make six parishes out of St. John's; and, if capable of being subdivided like the polybus, could carry out his system in them all. If nine tailors made one man, surely six average clergymen would make one Dr. Chalmers? It was alleged that what he had done could not be so well done by any other. He was praised for eloquence, and all that kind of talent, phosphoric and meteoric, and almost every other kind of eloquence, were attributed to him,—every thing, in short, but the possession of common sense. It was very pleasant, no doubt, to be regaled with compliments; but he was always very suspicious when they reached his ears; for, while he was getting praise from some parties, they always took care to keep all the common sense to themselves. The Rev. Doctor went on to shew that the resources of the poor themselves were infinitely more valuable, and more calculated to relieve their wants, than any relief could possibly be from without. Dr. Alison had shewn that 1,200,000*l.* was spent on one species of liquor alone, in Glasgow, and that chiefly by the working classes—as much as was required for the complete system of pauperism through the whole of Scotland. What a fund was here to operate upon, with a population refined and elevated, and acted upon by a class of men who knew and understood their feelings! His argument was much strengthened that day by the facts laid before them relative to pawnbroking: here was another fund—a large and profitable fund, which was ready to be turned to a great and good purpose; and he asked if they would not be infinitely better with 6000*l.* got *ab intra*, than with the same sum procured for the benefit of the poor *ab extra*? The way to check the evil of pauperism was to throw themselves upon the population, to remonstrate with them on the indecency of coming upon the public funds when they had the means of providing for themselves—to remonstrate with them upon the evil of parents neglecting their children, and to encourage them by a prospect of the increased comforts of a life of industry and frugality. The Rev. Doctor concluded by an eloquent declaration of the objects equally contemplated by the Messrs. Alison and himself, which was to elevate, by the best possible means, the condition of their fellow-creatures.

On the conclusion of the address the Section separated.

Here follow three papers (in arrears) with the days on, and Sections in, which they severally were read.

SECTION F.—Statistics.

THURSDAY.

'On the Progress of the Blind Asylum in

Glasgow,' by Mr. Alston, Honorary Treasurer to the Asylum:—"It is not my intention to enter into any account of the first printing for the blind, this having been already done by the Rev. William Taylor of York, who, at the request of the British Association, reported on that subject at their meeting held at Liverpool in 1837, as recorded in the Report for that year, page 88. Nor do I enter into any discussion as to which of the various systems that have been suggested is the best, my object being merely, first, to give a brief account of what has been done in printing in relief in Roman letters for the use of the blind, being the system of reading which is in operation in the Glasgow Asylum, and which has been adopted in all the other institutions in this country, with the single exception of Liverpool; and, secondly, to detail our mode of instruction, and give a short general account of the institution.

"Education.—By the system of printing in relief in Roman letters, an easy method is opened up of communicating information. The blind can be taught this mode of reading at home by their relations, or they can be sent to school with those who see, the Roman character being equally used by both. We cannot, indeed, open their eyes, but we can teach their hands to serve the purpose of eyes; and by means of the power of touch, we pour in the light of information on the eyes of their understanding. The blind have this advantage over the seeing, that in the darkest hour of the night they can finger the pages of their books, and derive from them comfort and instruction, without giving trouble to others. This invention forms a new era in the history of literature, and no limits can be set to the benefits which future generations of the blind may derive from it. The mode of instructing them is this. After the pupils have acquired a knowledge of the shape of the letters of the alphabet, words of two or three letters are submitted to their touch. They are then made to feel the words with two or three of their fingers on adjoining letters, by which means they are able to decipher two or three letters at once, which, by practice, will give a dexterity and fluency to their reading. They are then taught orthography, and next proceed to study the derivation of words and their relation to each other. Their finger nails are kept short, to prevent them from injuring the surface of the letters. By this system of tuition, the sense of touch becomes the channel through which instruction is conveyed to the understanding and the memory. There is an advantage not to be overlooked from this system, when we take into consideration the lonely and solitary situation of the blind, often treated by their relations as burdensome, and the utmost difficulty being experienced, even in institutions erected for their reception, to keep the young mind in exercise. It is of incalculable benefit to them, now that they are furnished with books, to be able at all times to obtain instruction or amusement without occasioning trouble to those who have the charge of them. Nothing can be more delightful than the contrast betwixt their present advantages and their former situation. The branches of education taught in this institution are reading, English grammar, arithmetic, geography, the elements of astronomy and geometry, music, &c. At present there are above thirty individuals, whose ages vary from ten to thirty-two years, who can read; and the attainments of some of them will bear a comparison with those of the same age and time under tuition who are in possession of

every natural advantage. One of them is a young woman, who, after being educated in the institution for the deaf and dumb here, lost her sight about seven years ago. She may now be seen daily receiving instruction from one of the more advanced blind children, tracing by the touch the form of the letters, which she still remembers, and then indicating them by spelling the word on the fingers to her blind companions. Afterwards she takes her slate, and writes down the passage she has read. The restoration of this interesting individual to intercourse with the rational world is a source of exquisite pleasure to herself, and of gratification to all connected with her.

**"Printing.**—As has been already mentioned, the books are printed in the Roman character, the capital letters being only used, deprived of the small strokes at the extremities. In such of the letters as bear any resemblance to each other I retained the hair-strokes, so as more strongly to mark the distinction. All the modifications of the types were made after repeated experiments upon the blind themselves. I brought out my first specimen of printing before a large and influential public meeting, at the examination of the inmates of the Asylum, on the 25th October, 1836. Being satisfied that the demand for books for the blind must for a long period be so limited as to hold out no adequate inducement to a publisher, I resolved to raise a fund distinct from that of the institution, to be devoted exclusively to the printing of books, and to their diffusion at a cheap rate throughout the country. With this view I made my first appeal to the ladies of Glasgow and its neighbourhood, and I am proud to acknowledge that to their generous exertions I owe the origin of the printing fund. My next application for assistance was to the different institutions for the blind, and other benevolent societies, and I am happy to say that their aid and co-operation were cheerfully granted. These institutions receive copies of the books at nett cost. All profits accruing from this and other sources go to the printing fund. After I had procured two founts of types, one of double pica and the other of great primer, I commenced my printing at the end of January 1837. Having brought out several elementary books, I proceeded to print the New Testament in great primer, in super-royal 4to. size. After the completion of this undertaking, and wishing to add other books for the use of the blind, I made a fresh application in 1838 to my fellow-citizens, stating the object I had in view. I printed a circular in the raised letters as a specimen of the work; and such was the interest excited, that I was not only enabled to perform what I had contemplated, but was encouraged to undertake the printing of the whole Bible. With this view, in March 1839, I completed the book of Genesis in a new type cut for the express purpose, the punches being struck and the types cast in this city, under my own inspection. But before proceeding farther, I visited, in April, all the institutions for the blind; and, as on former occasions, I found the utmost readiness to aid in this undertaking, by purchasing such of the different volumes as they required. My funds being very limited, I made application to the British and Foreign Bible Society in London, who kindly lent their assistance, by purchasing a few copies of the volumes I had got printed. The London Society for Promoting Christian Knowledge also purchased a few; and the Edinburgh Bible Society voted me an additional grant to that formerly given. But the funds at my disposal being still inadequate for the

undertaking, I at last, with the assistance and co-operation of James Oswald, Esq., M.P. for the city, presented to her most gracious majesty the Queen, through the Home Secretary, Lord John Russell, the book of Genesis as a specimen of the work, at the same time stating my object, and praying that her majesty would be graciously pleased to aid me in the undertaking. This was transmitted to the Lords of her Majesty's Treasury, and I am happy to record that they granted four hundred pounds, with the following letter:—

"London, Treasury Office, 11th September, 1839.

"SIR,—The Lords of her Majesty's Treasury having received a communication from the Secretary of State for the Home Department, upon the steps taken by you connected with the printing of the Bible in raised type for the use of the blind throughout the kingdom, their Lordships have commanded me to express to you their great approbation of your philanthropic exertions for an meritorious and object, and they have been pleased to direct that an issue of four hundred pounds be made to you from the royal bounty for the purpose of assisting you in prosecuting the work.

(Signed)

"G. J. PENNINGTON."

"To John Alston, Esq."

Thus, with public and private contributions, I shall be able next month (October) to complete for the blind the first copy of the whole Bible ever printed for their use. It is gratifying to know that many of the blind have not failed justly to appreciate and earnestly to improve their new privilege. The Bible will be in fifteen volumes, super-royal 4to., double pica. The work will consist of nine volumes of 200 copies each, and six volumes of 250 copies each,—in all, 3300 volumes. There will be 2470 pages, each page containing thirty-seven lines; 1160 reams of paper, weighing 8½lbs. each ream,—9860lbs. The paper was made on purpose, strongly sized to retain the impression. In order to account for the great size of the work, it must be borne in mind that it can only be printed on one side of the paper, and that the letters require to be of considerable size in order to suit the touch. We began with a smaller type, but successive experiments obliged us to increase it to the present, which may be regarded as the minimum size. The printing is effected by a copperplate printing-press. The types being strongly relieved, and liable frequently to give way under the heavy pressure required, it has been necessary to have them no less than four times recast during the progress of the work. There are in the operative department one man and one boy as compositors, who were taught in the Institution, and one pressman, the ordinary teacher acting as corrector of the press.

**"The New Testament.**—This is completed in four volumes, super-royal 4to., in great primer. There are 623 pages, forty-two lines in each page; 450 reams of paper, the same as made for the Bible, weighing 3825 lbs.; 250 copies. Of the Gospel of Matthew, 500 copies; and 500 of the Acts. There have been published—

First Lesson Book .....	400	copies of 20 pages.
Second do. do. ....	400	.. 46 ..
Church of England Catechism ..	600	.. 16 ..

Acts, with the other portion of the Epistles .....	150	
Map of England and Wales .....		

10,860 volumes.

**"Institution.**—John Leitch, Esq. of this city, was the benevolent founder of the Glasgow Asylum for the Blind. He suffered under a partial infirmity of sight, and bequeathed the sum of 5000*l.* towards opening and maintaining this Institution. By his deed of settlement, his trustees were to pay over the funds to the Directors of the Royal Infirmary to carry the measure into operation; but the then (in 1826) directors, with the concurrence of his trustees, thought that the benevolent intentions of the founder would be more effectually attained were it put upon the same popular footing as the Infirmary. But before that could be done, it became necessary to obtain an Act of Parliament. There being no opposition, this was readily obtained, constituting it into a body corporate—the Lord-provost for the time being always chairman, with three annually chosen by the Directors of the Royal Infirmary from their number, one from the Town Council, one from the College, two from the Merchants' House, two from the Trades' House, one from the Faculty of Physicians and Surgeons, one from the Ministers of the Established Church, and nine from the qualified Contributors to the Institution. The buildings were erected by voluntary subscription in 1827, and opened in 1828. By the Act of Parliament, an annual subscriber of one pound one shilling, or a contributor of ten pounds or upwards, is a member. By the constitution of the Asylum, a contributor of 10*l.* is constituted a member for life; and a donation of 50*l.* from an individual, or 100*l.* from a parish or corporation, entitles each to recommend a child for education into the Asylum for three years, free of expense. Contributors of 10*l.* and upwards, uniting to the amount of 50*l.*, have the like power to recommend. Hitherto this Institution has solicited no annual subscriptions, but depends for its support on its own industrial exertions, with contributions and legacies from the pious and benevolent. The patronage of the public, also, does much in its behalf by purchasing its manufactures. The Table annexed, exhibits the progress of the industry of the inmates, and the amount of proceeds since its commencement, with the number of blind persons admitted into the Asylum, and the causes of their blindness, so far as known, till the 1st of January, 1840.

**"Employment.**

This Table shows how the inmates are occupied:—

	Twine	Baskets	Mattresses	Mats.	Rugs	Weaving	Knitting and Netting	Spinning and Weaving	Total
Men ....	11	9	1	1	1	13	8	..	36
Boys ....	6	2	..	..	..	3	..	..	19
Women ..	..	..	..	..	..	..	..	8	8
Girls ....	..	..	..	..	..	..	17	..	17
Porters ..	..	..	..	..	..	..	25	2	2
	17	11	1	1	1	16	25	8	82

"Thus the manufactory consists of seventy blind people, and twelve not blind: viz. five men, six wheel-boys, and a woman, the wages of the latter being chargeable on the different branches of manufacture in which they are engaged.

## SECTION C.—Geology.

## MONDAY.

Brief abstract of Mr. Craig's paper "On the Coal Formation of the West of Scotland."—Mr. Craig began with a brief account of the general features of the district he had surveyed at the suggestion of the Local Committee of the British Association in Glasgow. The geology of the district which comprehends the whole of Dumbarton and Renfrew shires, and the greater portions of Lanark, Ayr, and Stirling shires, the Islands of Bute and Arran, and part of the Argyleshire coasts, were delineated on a large and beautifully coloured map, and a number of longitudinal and vertical sections of the strata. After alluding to the general character of the superficial deposits, and mentioning that he had found the *Mytilus edulis*, the *Littorina littoralis*, and other recent sea-shells, at the elevation of 360, 100, 80, and 40 feet above the present level of the sea, Mr. Craig proceeded to describe the different portions of the strata, as subdivided and coloured in the map and sections. These he classed as follows:—

- 1st. The upper red sandstone series;
- 2d. The upper or fresh-water coal series;
- 3d. The upper marine or limestone series;
- 4th. The lower coal series;

5th. The lower marine limestone series;

6th. The old red sandstone.

"1st. The upper red sandstone, consisting of red and variegated sandstones, shales, some thin seams of coal, and a very few traces of coal plants, extends over very considerable portions of the regular coal-beds, both in Lanarkshire and Ayrshire. On the south of the deposit in Lanarkshire it appears not to be conformable with the upper coal series as on the north, but occurs in actual contact with some of the lowest members of the lower coal series at Crossbasket. It is not traversed in Lanarkshire as in Ayrshire by trap-dykes.

"2d. The upper, or fresh-water coal series, contains about thirty seams of coal, seven or eight of which are workable. The first workable coal lies generally about forty-five or fifty fathoms below the red sandstone; but at Rosehall the red colour prevails as low in the series as the third workable coal. The first or upper coal measures from two and a half to three feet thick in the parishes of Old and New Monkland; but in those of Dalziel, Dalserf, and Hamilton, it sometimes measures from six to ten feet. When so thick, it is probably a junction of the first and second seams. The second and third coal, when separate, average each about four feet; when united, as is sometimes the case, they form an eight or nine feet coal. The fourth coal is generally too thin to be workable, but in the neighbourhood of Glasgow it measures two and a half feet. The fifth or splint coal measures from two and a half to six feet thick. The coals that underlie the splint are not so regular, either as to thickness or geographical distribution. There are three seams workable in the Monklands—the first is two and a half feet, the next four feet, and the lowest two feet thick. Below these, in the parish of Shotts, there is a cannel coal. The distance from the first or all coal to the fifth or splint coal is about thirty fathoms; from the splint to the under coal is nearly forty fathoms. The area in which these valuable beds of coal occur extends in Lanarkshire from Glasgow to Carlisle, a distance of twenty miles. In breadth it varies from six to fifteen miles; fifteen to twenty square miles of this area are occupied by the upper red sandstone. The fossil shells found in this formation are all of fresh-water origin. There are from seven to ten varieties of the genus *Unio*. The different species are characteristic of different portions of the stratification, the larger species being lowest, and the smaller highest in the series. The remains of the *Megalichthys Hibernicus* prevail from the lowest coal to the upper black-band ironstone. This is also the case with the *Gyracanthus formosus* of Agassiz. The *Clenocanthus*, and two other species not yet described, are also found in the upper ironstone, and in the roof of the splint coal. These and other ichthyological remains are found in great abundance in the roof of the Shott's coal, which is the second seam below the splint coal. The shales of this series abound in fossil ferns, *stigmara*, *lepidodendra*, *asterophyllitis*, *sigillaria*, and other coal plants. The *Sternbergia approxima* has been found in the roof of the splint coal. It is worthy of remark, that the *Stigmara ficoides* is very frequently found in the shales, with the leaves attached to the stem, and spread out laterally, in a manner which never could have occurred had the plant been drifted from a distance. The ripple marks, which are observable on almost all the shales and laminated sandstones, not only in the upper series, but through the whole of the carboniferous formation, tend also to shew that these

portions of the coal strata, at least, were deposited in shallow water. The vegetable origin of coal is now universally admitted; but whether the plants grew on the spot, or were drifted from a distance and accumulated in rafts, are questions not easily solved: but perhaps much light may be thrown upon the subject by those indications of repeated subsidence observable in our coal-fields. Fossil trees in a vertical situation are rare. I have only seen them in three places: that at Balgray Quarry, near Glasgow, is the most remarkable, as there were many stems seen in the stone, with their roots ramified through it, and the stems quite vertical,—circumstances which clearly indicate that they grew in their present position. It does not appear that these isolated instances tend to throw much light on the question, whether the whole of our coal is derived from plants which grew on the spot, or which were drifted from a distance; but, coupled as the fact is with the ripple marks, in almost every portion of the stratification which assumes the laminated form, the presumption is certainly in favour of the subsidiary hypothesis. Mr. Craig then described the different carboniferous black-band ironstones found in the upper coal formation. These he classes as the upper, which is about fourteen inches thick, and lies twenty-four fathoms above the first, or ell coal. It is only wrought in the parish of Old Monkland, at a place called Carnbroe. The middle, or Airdrie, black band lies about sixteen fathoms below the splint coal, and measures from fourteen to twenty-two inches thick. The lowest lies much lower, and the stratification is about the same quality and thickness as the Airdrie black band. Below the coals and ironstones already noticed we arrive at a marine series, containing three or four limestone, which, with their associated shales, contain encrinites, bellerophones, nucula, enomphili, orthoceras, and other remains decidedly marine. This portion of the strata contains only two or three very thin seams of coal; it is about 200 yards thick. This group Mr. Craig denominates the upper limestone series. We now arrive at the lower coal series, which contains no limestone, but a number of coals; the lowest of which is the cannel coal, measuring from two to three feet thick. The main coal lies fifteen fathoms above the cannel coal. These, and some other thin seams, are associated in some localities with valuable black-band ironstones. These are wrought at Keppoch, near Glasgow. The upper ironstone measures from fifteen to sixteen inches. The under band varies from four to ten inches in thickness. The black-band ironstones of the Glasgow coalfield contain very little clay, and about as much carbonaceous matter as serves to calcine it; on which account it is considered more valuable than the clay ironstones hereafter to be noticed. Below the lower coal series there occur several small groups of clay ironstones embedded in shale, each separated from the other by beds of sandstone and an occasional stratum of limestone. Mr. Craig shewed a vertical section wherein all these beds were exhibited, the ironstones of which amount to sixty-six in number, twenty feet of which might be wrought in different veinings in the same pit. Underneath these ironstones, shales, &c. lies the main limestone, measuring from four to six feet thick; beneath which is a layer of aluminous shale, from which alum is manufactured. This bed is followed by a seam of coal, from four to five feet thick, of a sulphureous nature, and containing nodules of iron pyrites. These beds are succeeded by

limestones, shales, and sandstones; then by an extensive formation of thin compact limestones embedded in shale; and finally by old red sandstone.—Such is the general description of the strata as developed on the Clyde and its tributaries, from Lanark to the Vale of Leven, as described by Mr. Craig. Mr. Craig then entered upon a description of the different coal-fields in Ayrshire. The coal-field there divides itself into several basins, among which are those of Irvine, Kilmarnock, Ayr, and Dalry. These contain from four to six or seven workable coals, measuring from two and a half to seven feet thick each, a valuable black-band ironstone, and a great many clay ironstones, the whole based upon marine limestones of great thickness. Mr. Craig's paper was illustrated by large maps, and sections of the various coal-pits and borings which had been made through the extensive district, amounting to 3600 square miles, which he had surveyed. These were taken at various points in the stratification, and developed the whole in depth to the extent of above 1000 yards. At the conclusion, the paper was described by Dr. Buckland as one of the most important ever laid before the British Association. Mr. Smith of Jordanhill, Mr. J. S. Menteith of Closeburn, and Mr. D. Milne, also bore testimony to its great value and accuracy.

## MONDAY.

## SECTION G.—Mechanics.

Mr. Gordon, 'On the Turbine.' The subject is brought before the Section solely in the desire that the attention of British machinists may be directed to a water-wheel—a recipient of water power, which is but little known in this country, but which has for some years excited the greatest interest on the Continent of Europe. The fundamental principle upon which the construction of the turbine is based, is that by which the maximum of useful effect is obtained from a given fall of water; depending on the relative velocity of the water and its recipient, which ought to be such that the water enters the wheel without shock and quits it again without velocity. Borda, Burdin, and Poncelet, have successively proposed wheels on this principle; and the well-known Barker's mill has recently been attempted to be so constructed as to include this principle, by Mr. Whitelaw of Glasgow, whose large wheel at the Shaws Water-works is said to have produced admirable results; the efficiency being reported to be ninety per cent of the theoretical effect of the existing power. Barker's mill, in any form hitherto employed, has not yielded as much as fifty per cent. The turbine of Fourneyron differs very materially from all that had been previously proposed. A notion of its construction may readily be formed by supposing an ordinary water-wheel, with curved buckets, laid on its side, the water being made to enter from the interior of the wheel by the inner circumference of the crown, flowing along the buckets, and escaping at the outer circumference. A drawing was exhibited of a turbine of about five-horse power, the fall being three feet, and the expenditure of water equal to twenty cubic feet per second. The machine consists essentially of, 1st. A reservoir; the bottom of which is divided into radial compartments by curved plates, serving to guide the water to take a particular direction of efflux. 2d. A circular sluice, capable of nicety of adjustment. 3d. The wheel with curved buckets. Reference was then made to the principal turbines erected in France and Germany: particularly to that at Inval near Gisors, and those at Müllbach and

Moussay, as instances of falls of from 6' 6" to 11 feet, from twenty to forty-two horse power. And again to those at St. Blazien in the Black Forest, as instances of very high falls, the one being 70½ feet, the other 345 feet. The one wheel weighs 105 lbs. the other 35 lbs. The conclusions, drawn from a series of careful experiments on these wheels, with a perfectly constructed brake dynamometer, or friction strap, conducted by Mr. Morin, are these:—1st. That turbines are with equal advantage applicable for high and for low falls. 2d. That their net useful effect equals seventy to seventy-eight per cent of the theoretical effect of the power. 3d. That they may work at very different speeds above and below that corresponding to the maximum of useful effect; the useful effect varying, nevertheless, very little from the maximum. And, 4th. That they work at very considerable depths under water, the relation of useful to theoretical effect not being thereby notably diminished. The power of the one wheel at St. Blazien is fifty-six horse power; that of the other, of which a drawing full size was shown, is fifty-eight horse power. This is 14½ inches diameter. Its extreme depth or breast is 22½ inches, or less than one quarter. It makes 2200 to 2300 revolutions per minute. Its efficiency is reported to be eighty to eighty-five per cent. The factory consists of 8000 water-spindles; 34 fine, and 36 coarse, carding engines; 2 cleansers, and other accessories. Mr. Gordon stated that the theory of the effects of the turbine is very perfect, and he purposes shortly to publish it; and that Poncelet has published an admirable pamphlet, entitled "Théorie des Effets Mécaniques de la Turbin Fourneyron," where the theory differs very little from that to be offered.

In the afternoon of Tuesday the general Dinner of the Association took place: but space will not permit more than this announcement in our present number; our detailed notice must unavoidably be reserved for a future *Gazette*.

## PARIS LETTER.

Academy of Sciences, Oct. 20, 1846.

SITTING of October 12.—M. Duvernoy read a memoir 'On a newly discovered Parasitical Isopodal Crustacea,' which he considered might form a third family in the section of Mr. Milne Edwards's sedentary isopodal crustaceous animals. They were found on the under sides of the bronchies of the prawn. He had examined them carefully with powerful microscopes, and gave an account of their formation. They were to be considered as intermediate between the families of the *Bopyri* and the *Iones*.—M. Cauchy contributed a further memoir 'On the Variations of the Elements of the Planetary Orbits.' In the formulae at which he had arrived there were no further integrations to be made concerning time, and by aid of these formulae the necessary equations could be constructed. He found that on applying his formulae to the determining of the variation of the second order of the first elliptic element, he was led back to the theorem laid down by Poisson, and according to which, the purely secular irregularities disappeared in the part of that variation which is due to the variability of the elements of the orbit.—A new solar regulator, portable, and giving directly the mean time, invented by M. de Saulcy, was reported on by M. Mathieu in terms of high commendation.—M. Cagniard Latour explained a new machine for effecting the vibration of a cord, with a view to ascertain the number of its vibrations compared with the synchronal vi-

brations of a hammer, in the production of musical sounds. He employed a small nodule of glass, at the extremity of a cord vibrating between two upright pillars or supporters. He still found that the number of the vibrations so obtained was only one half of the synchronal ones.

*Modification of Marsh's Apparatus for Testing Arsenic.*—M. Lassaigne read to the Academy the following method of operating with Marsh's apparatus, as being equally sure, and requiring less skill and dexterity on the part of the experimenter. The gas, disengaged by Marsh's apparatus, is made to pass into a solution of pure nitrate of silver, when the arseniated hydrogen gas, mixed with the pure hydrogen gas, is decomposed by little and little by the oxide of the silver. The latter is then reduced, the liquor becomes brownish, and the metallic silver is deposited in black flakes, and there is a production of arsenic acid, which remains in solution, and is mixed with the excess of the nitrate of silver employed. All the arseniated hydrogen gas having been absorbed and decomposed, some chlorhydric acid is added to the solution, little by little, in order to decompose the excess of the nitrate of silver, and transform it into a chlorure. A filtration is then made, in order to separate the chlorure, which is mixed with the metallic silver, and which is precipitated by the passage of the arseniated hydrogen. An evaporation is afterwards made, at a gentle heat, in a small porcelain saucer. During the concentration and evaporation, the nitric acid contained in the liquor reacts on the arsenious acid, and makes it pass into the state of regular arsenical acid. This latter substance forms the residuum of the operation, and its chemical properties may be readily tested. By this method one milligramme of arsenious acid, dissolved in 1000 grammes of distilled water, or one quart, had been detected.

Dr. Turnbull, whose cures of deafness have attained for him so much celebrity in London, has been operating here at the Deaf and Dumb Institution with wonderful success. The medical men of that establishment acted with great jealousy towards him, and threw every impediment in his way: they gave him also two of the worst cases there. He applied his liquid to the ears of two of the pupils, and in less than a quarter of an hour they could hear the ticking of a watch two feet off. They could also hear the Doctor pronounce the words *mamma*, *papa*, &c., near them, and actually repeated them immediately. This has made a great sensation in Paris.

There is a poet in the south of France, named Jasmin, a native, we believe, of Toulouse or Agen, and by trade a barber, who has excited for some years great enthusiasm among his compatriots by the originality, vigour, and good feeling of his effusions. He goes about from town to town, like a minstrel of old, and he publishes from time to time songs, fables, and fugitive pieces, something in the style of Béranger. A short time since he was at Pau, and was present at one of Lady Fitzgerald's *soirées*, when he was quite the lion of the evening. A few days before a public dinner had been given him in that town, when he recited some verses; which, though in honour only of the monument of Despourrins, to which he had paid a visit, contain much animated poetry, and are curious as a specimen of the Béarnais dialect of the present day.

When Jasmin's health had been proposed and drunk after dinner, he returned the compliment in the following strain:—

**"Moussus!"**

"Souy bengut saluds sul clot de Despourrin,  
 "Sa pungirique (colonne) que tan brillo;  
 Et bous ey bie truqua las mas a moum nefrin,  
 Et me festajas tous de famillo en famillo,  
 Oh! Mercio! estacas uno triplo quousquillo  
 A moum mantel de pelerin!!"

An uncommonly piquante *chronique scandaleuse* has just appeared (we have not had time to read it) in the "Memoirs of M. Giquet," late Prefect of Police, whose trial against the editor of "The Messenger" for a libel accusing him of malversation, made so much noise, and completely ruined his character. He had been in office during the times of the Fieschi attempt and the passing of the laws of September, and he threatened to publish all he knew of the secret proceedings of Thiers, Molé, and the "Great Unnamed." They say he has kept his word, and that he is one of those "qui ont tout vu et qui n'ont rien oublié." It is a four-volume affair.

### FINE ARTS. NEW PUBLICATION.

*The Earl of Stafford going to Execution.*  
 Painted by Paul de la Roche; Engraved by George Sanders. Budd; Molteno; and Ackermann and Co.

This painting, as well as its companion "Charles the First in the Guard-room," by the same artist, when exhibited at the British Gallery along with works of the old masters, excited very considerable attention, from the high qualities they possessed and from the historical interest of the subjects, to which our pages bore ample testimony.

We have now before us an engraving which, from its character and style of execution, cannot fail to have a wide circulation; and, like the "Sacking of Basing House" (recently noticed in our *Gazette*), aid the cause of humanity, by shewing the effects of brutal violence when under the influence of bigotry, superstition, and party animosity. We speak this of the two subjects conjointly.

No language can convey a deeper pathos, or excite a more lively interest, in the fate of the unfortunate Earl of Stafford, than the pencil of Paul de la Roche has expressed. And it is gratifying to see these high qualities of art so ably borne out in the engraving by Mr. George Sanders, which, as an example of the great improvements made in mezzotint, may justly rank with the best specimens which have appeared in that class of art; uniting as it does the richest varieties of execution, and in which the beautiful character of the detail is accurately rendered: while the effect, as a whole, is most skilfully preserved.\*

**THE DRAMA.**

*Covent Garden.*—By a great oversight we, last week, omitted to notice the successful revival of Beaumont and Fletcher's fine comedy *The Spanish Curate*; and it is now almost too late to repair our fault, for it has become quite a popular piece. We must, however, mention that it is most effectively cast and acted; Mr. Farren playing the *Curate*, and Mr. Bartley the *Lawyer*; the heroine is sustained by Madame Vestris; and, in fact, the whole force of the theatre is called into requisition to make out the remaining *dramatis personæ*. Some trifling alterations have been made in the text to bring the play nearer to the more refined manners of the present day, but we do not think they improve it. — *The Greek Boy* is

\* We understand this fine mezzotint engraving is copied from a fine engraving by a French artist.

nightly gaining in public favour; it is one of Mr. Laver's most happy dramatic efforts.

*Haymarket.*—Mrs. Fitzwilliam has been making a few more "last nights" before starting across the Atlantic, and on Monday came out in a new farce called *Out of Place*. It is a laughable trifle, almost dependent on the comic powers of Mrs. Fitzwilliam for its success; which, however, was unequivocal enough. Lord Byron's tragedy of *Werner* has been added to the amusements here; Mr. Wallack resuming his original part, *Utric*, and Mr. Macready playing *Werner*,—a part which is universally acknowledged to be one of his best, if not his finest conception.

*The Prince's Theatre.*—Another amateur society, denominated Theatians, has started into existence, and commenced a series of "nights" at this house on Monday. The play was *Macbeth*, which was followed by *High Life Below Stairs*. The acting was fair enough for novices, and the audience (a very large and respectable one) seemed inclined to be pleased with every thing, and in a most forgiving disposition.

**VARIETIES.**

*Napier's Bones.*—We have been favoured with a sight of an original specimen of these singular instruments, which were invented by the celebrated Napier for the facility of computation, before his masterstroke invention of logarithms. The box contains five series of seven rods, and one extra table containing the squares and cubes of single digits. His little work, entitled "Rabdologia," published at Edinburgh in 1617, contains a minute account of the method of operating with these rods; but until we saw the present, we were not aware that any specimen of them had been preserved. In "Hudibras," the astrologer Sydrophel is mentioned as an adept in the art of using them.

*Almanacks.*—Messrs. Tilt and Bogue have issued a number of sheet and other almanacks, varying in price from one penny to one shilling, and suited for all purposes and places; among them we may mention the pretty little "Miniature," the "National," the "Paragon," the "Useful," and the "Hat." While speaking of almanacks let us call attention to our old favourite, "The Sudbury Pocket-book," which is as neatly embellished, and contains as pleasing matter as ever: and this is no faint praise.

The little "Bijou" is announced for early publication. Mr. Schloss has this year confided the poetic illustrations to the popular pen of the Hon. Mrs. Norton.

*The Alpaca*, now endeavoured to be naturalised in Britain, is an animal of the llama tribe; native of the Cordilleras, or mountain district of Peru; very valuable for its wool, importations of which have already taken place to the extent of 3,000,000 lbs. It is used as deer in the parks of the Spanish grandees in Peru, and its flesh is equal to any venison. Some are white, others brown and mottled. (Patterns of manufactures from the wool, as fine as silk, were exhibited at the Glasgow Model and Manufactory Rooms.) The alpaca does not perspire as sheep do, and therefore requires no smearing, which will be an immense saving to the Scotch farmer; and the heavy coat of wool on its body (fine as silk) is sufficient protection in the Peruvian mountains, where deluges of rain fall four months in the summer season; and, from the alpacas living under the line of perpetual snow, it proves

\* Published by Fulkner, Sudbury; and Longmans and Co. London.

that a cold climate is congenial to them even in winter. The alpaca lives on "zeho," a kind of withered grass which grows on all mountains above a certain altitude,—proving that they will exist where sheep will not. Supplies of the animal were at Glasgow for sale, and we believe Lord Breadalbane bought some to try on his estate at Taymouth, where the capercaillie already flourishes. There were, also, samples of the raw alpaca silky wool, assorted black (without dye), white, red, brown, foxy, grey, mottled, &c. No animal grease in this wool—illustrative that the animal requires no washing before shearing, and the wool can at present be sold at 20d. per lb. During the panic of 1837, when highland wool sold at 3½d. per lb., upwards of 1,000,000 lbs. of alpaca realised 2s. and 2s. 6d. per lb. Specimens of different kinds of manufacture from alpaca, in imitation of silk,—some black as jet (without dye), others white, coloured, dyed, and wove in great variety of figures; can be manufactured at one-third the price of silk, and is said by the manufacturer to be three times more valuable than Scotch wool.

*James Cleland, Esq. LL.D.*—This gentleman, who for many years held a prominent civic station in Glasgow, and devoted himself with so much success to the illustration of its statistics, died there on Wednesday evening, the 14th instant. He was too ill to attend the British Association during its recent meeting, but highly valuable information from his pen was communicated to it.

*The Eccelesobion.*—Fifteen ostrich eggs were deposited at this place for hatching one day last week; they were sent by the Earl of Derby from Knowsley, where they had been laid in his lordship's aviary.

**LITERARY NOVELTIES.****LIST OF NEW BOOKS.**

The Natural History of Society in the Barbarous and Civilised State, by W. C. Taylor, Esq. LL.D. 2 vols. post 8vo. 21s.—Lives of British Admirals, by R. Southey and R. Bell, 6 vols. fcap 8vo. 30s.—The Catline and Jugurthine Wars of Sallust, translated into English, 8vo. 8s.—Tabular View of the History and Literature of the Materia Medica, by J. Pereira, 8vo. 1s. 6d.—Crutwell's Original Housekeeper's Account-Book, 4to. 2s.—De Porquet's Key to Portuguese Trésor, 12mo. 3s. 6d.—Statutes, royal 8vo. Session 1840 (3d and 4th Victoria), 12s.—Heads of the People, 2d edition, 8vo. 14s.—The Art of Oil Painting, by J. Cawes, translated 8vo. 12s.—Story Training System, new edition, 12mo. 5s.—Treatise on the Law of Lien, by J. Cross, 8vo. 15s.—A Journey Round my Room, from the French of Maitre, post 8vo. 3s. 6d.—Robinson Crusoe, Strange's edition, 8vo. 10s.—History of Napoleon, Strange's edition, Vol. I. 8vo. 8s.—Howard and Napoleon Contrasted, 18mo. 1s.—Dr. Thwaites's Scenes of Death, 2d edition, 18mo. 2s. 6d.—Scenes in Foreign Lands, by the Rev. Isaac Taylor, 12mo. 3s.—The Sporting Almanack, 1841, fcap. 2s. 6d.—Two Summers in Norway, by the Author of "The Angler in Ireland," 2 vols. post 8vo. 21s.—Chronological and Prophetic Numbers of the Bible, by D. Macdougall, medium 8vo. 10s.—Smith's Standard Library: Poetry, Vol. II. medium 8vo. 10s. 6d.—Goldsmith's Miscellaneous Works, medium 8vo. 3s.—Church Tracts, by J. A. Thorthwaite, 18mo. 3s.—Wilson's Tales of the Borders, Vol. VI. 4to. 8s. (completing the work.)

CHARLES HENRY ADAMS.

## ADVERTISEMENT.

Connected with Literature and the Arts.

**MARYLEBONE LITERARY and SCIENTIFIC INSTITUTION**, 17 Edwards Street, Portman Square.—Lectures, by Eminent Professors, are delivered every Monday Evening. The French Class is superintended by Monsieur Delle, and the Vocal and Instrumental Classes are under the Direction of Mr. Le Jeune.—Six Concerts will be given during the Season, to four of which Member of the Institution, with a Lady, will be admitted gratuitously. The Discussion Meetings will shortly be resumed.

**Terms of Subscription.**—For the Lectures, Reading Room, Library, and Literary Meetings, Two Guineas per annum, or One Guinea half-yearly.—Each Member is allowed to introduce One Lady to the Lectures.

**ELECTROTYPE, or ELECTRO-GRAPHY.**—Engravers, Booksellers, and Publishers furnished with Duplicates of their Engraved Plates in Copper, of all sizes, either from Copper or Steel originals, by E. Palmer, Philosophical Instrument Maker, 108 Newgate Street, London, where Specimens in great variety may be seen.

This day is published,  
**MR. SANDERS'S ENGRAVING** of the beautiful Historical Picture of LORD STRAFFORD going to EXECUTION, painted by P. Delaroche, and in the Collection of His Grace the Duke of Sutherland; engraved in the highest style of Mezzotint by George Sanders. Size of the Engraving, allowing of a suitable margin for framing, is 18 inches by 16. Prints, 12s.; Proofs, 21s.; ditto, before Letters (of which only Fifty are taken), 51s. 6d.

London: Published by James Budd and Co. 14 Dalton Rise; Ackermann and Co. 25 Strand; and may be had of every Book and Printseller in the United Kingdom.

## BOOKS IN THE PRESS.

**NEW WORK BY MISS PARDOE.**  
On the 1st of November will be published, in 3 vols. cloth, price 11. 11s. 6d. with Engravings,  
**THE CITY OF THE MAGYAR**; or, Hungary and her Institutions in 1830-40.  
By MISS PARDOE,  
Author of "The City of the Sultan," "The Beauties of the Bosphorus," &c.  
London: George Virtue.

13 Great Marlborough Street.  
**THE NEW VOLUME** of Sir E. L. BULWER'S WORKS for November will contain  
**Pelham**;  
Or, the Adventures of a Gentleman.  
Illustrated uniformly with the preceding Volumes.  
Henry Colburn, Publisher, 18 Great Marlborough Street.  
\*Orders received by all Booksellers.

Immediately will be published, in 2 vols. post 8vo.  
**CHRONICLES OF LIFE.**  
By MRS. C. BARON WILSON.  
By the same Author, just published,  
**A Volume of Lyrics.**  
18mo. cloth, elegant, gilt leaves, price 10s. 6d.  
T. and W. Boone, 25 New Bond Street; Oliver and Boyd, Edinburgh.

**ALMANACKS** for the YEAR 1841,  
printed for the Company of Stationers, to be published on Thursday, Nov. 19th.

## COUNTY ALMANACKS, each 6d.

- With useful Tables, adapted to each County, viz.:—  
1. Middlesex, Hert, Essex, Kent, Surrey, and Sussex.  
2. Cornwall, Devon, Somerset, and Dorset.  
3. Gloucester, Worcester, Hereford, Monmouth, and South Wales.  
4. Norfolk, Suffolk, Cambridge, Ely, Huntingdon, and Bedford.  
5. Warwick, Northampton, Leicester, Rutland, Lincoln, Nottingham, and Derby.  
6. Cheshire, Lancashire, Shropshire, Stafford, and North Wales.  
7. Wilts, Hants, Oxford, Berks, and Bucks.  
8. York, Durham, Northumberland, Westmorland, and Cumberland.
- \*All the above Almanacks are distinguished by the Arms of the Company, and by the Words  
"Printed for the Company of Stationers,  
And sold by George Greenhill,  
At their Hall, in Ludgate Street, London."

On the 31st of October will be published,  
**MR. HEATH'S ANNUALS, &c.**  
for 1841.  
Keepsake. Edited by LADY BLESSINGTON. 21s.  
Picturesque Annual: Belgium. By T. Roscoe. 21s.  
Book of Beauty. Edited by LADY BLESSINGTON. 21s.  
Legends of Venice. 12 Designs by HERBERT. 46s. 51s.  
Children of the Nobility. 4to. Third and Last Series, 21s.  
London: Longman, Orme, and Co.

ANNUALS FOR 1841,  
UNDER THE SUPERINTENDENCE OF  
MR. CHARLES HEATH.  
**THE BOOK OF BEAUTY.**  
Edited by the COUNTESS OF BLESSINGTON.  
The Engravings are sixteen in Number, and highly finished by eminent Artists.  
This Book contains Darnley's Portrait of Her Majesty.  
The Picturesque Annual,  
Also contains sixteen splendid Engravings.  
Edited by Thomas Roscoe, Esq.  
The Caustic mode of binding has been applied by these experienced Binders, Messrs. Westley and Co. for the purpose of displaying the Plates in all their brilliancy and elegance, and to prevent them detaching, as in the old mode, whilst it enables the reader to enjoy the literary part with delightful ease, free from the stiffness so objectionable in these books when sewed.  
Bound with embossed Saxony, super-royal 8vo. 11. 1s.; India Proofs, 21. 12s. 6d.  
London: Longman, Orme, Brown, Green, and Longman.

## NEW WORKS JUST READY.

8 New Burlington Street, Oct. 24, 1840.  
I.  
**A NEW VOLUME OF The Clockmaker;**  
Or, Sayings and Deeds of Sam Slick, of Slickville.  
Third Series. Post 8vo. with numerous Illustrations.  
II.  
**The Life, Journals, and Correspondence, of Samuel Pepys, Esq. F.R.S.**  
Secretary to the Admiralty in the Reigns of Charles II. and James II.  
Including a Narrative of his Voyage to Tangier. The whole now first published from the Originals.  
3 vols. 8vo. with a Portrait from an Original Picture.  
III.  
**NEW ROMANCE BY THE AUTHOR OF "THE PILOT," &c.**  
**Mercedes of Castile;**  
A Romance of the Days of Columbus.  
By J. Fenimore Cooper, Esq.  
Author of "The Prairie," "Last of the Mohicans," &c.  
8 vols. post 8vo.

IV.  
The Sixth and concluding Volume of the Collected Edition of  
**The Letters of Horace Walpole,**

(Real of Lord.)  
(Consisting chiefly of Letters to Miss Berry, &c. now first published), will be issued with the Magazine at the end of the present month, and will be embellished with Portraits of Miss Berry, Horace Walpole (after Eckardt), Margravine of Anspach, Hon. Mrs. Damer.

Fisher, Son, and Co. London; Chatham Street, Manchester; Hunter Street, Liverpool.

## BOOKS PUBLISHED THIS DAY.

In 8vo. price 16s. cloth,  
**BIBLIOTHECA CLASSICA; or, a Classical Dictionary**, on a plan entirely new; containing an authentic and minute account of the proper names which occur in Greek and Latin Authors.  
By JOHN DYMCKE, LL.D., and THOMAS DYMCKE, M.A.  
"We sincerely hope that this elaborate and excellently executed work will be duly appreciated. If a person totally ignorant of classical history and learned allusion were to read this over attentively, we might almost venture to say, that the maxim 'could be discovered, that there is no royal road to learning.' We should think it to be a necessary appendage to every study, and a library where it was not to be found, incomplete."—*Metropolitan Magazine.*  
London: Longman, Orme, and Co.

**CAVEN POPULAR THEOLOGICAL WORKS, viz. LIVES of the MOST EMINENT FATHERS of the CHURCH**, new edition, revised by the Rev. Henry Cary, M.A. Worcester College, Oxford; 3 vols. 8vo. price 36s. bound in cloth.  
2. **Primitive Christianity; or, Religion of the Ancient Christians**; new edition. By the Rev. Henry Cary, M.A. 8vo. price 8s. cloth.  
3. **Lives of the Apostles and Evangelists**, new edition. By the Rev. Henry Cary, M.A. 8vo. price 8s. cloth.

Also, in 1 vol. 18mo. price 4s. 6d. cloth,  
**The Genuine Epistles of the Apostolical Fathers**,—St. Clement, St. Polycarp, St. Ignatius, St. Barnabas, the Pastor of Hermos, and the Martyrdoms of St. Ignatius and St. Polycarp. Translated by Archbishop Wake.  
Oxford: Printed for Thomas Tegg, 78 Cheapside, London; and sold by all other Booksellers.

In 3 vols. neatly bound in cloth, price 7s. 6d.  
**A CATECHETICAL EXPLANATION of the LITURGY of the CHURCH of ENGLAND.**  
By MRS. S. MADDOCK,  
Author of "The Collects of the Church of England Catechetically Explained."  
"Few works are better adapted to awaken the minds of youth to a serious consideration of their moral and religious duties."—*Hamshire Chronicle.*  
London: Houlston and Co. Paternoster Row.

**SIR WALTER SCOTT PROFUSELY ILLUSTRATED.**—The Novels, Tales and Romances, Poetical and Prose Works, with Life by Lockhart, 98 vols. Illustrated by 435 Proof or early impressions of Engravings by the most eminent Artists.  
As only a few Sets can be made up, early application must be made to H. Wainhouse, Salisbury Square.  
\*Either Portion may also be had separate, with or without the additional Plates.

**FOR AUTHORS PUBLISHING.**  
2d edition, price 8s. 6d. cloth gilt.  
**THE AUTHOR'S PRINTING and PUBLISHING ASSISTANT**, a Guide to the Printing, Correcting, and Publishing new Works; comprising Explanations of the Process of Printing, Preparation, and Calculation of Manuscripts; Choice of Paper, Type, Binding, Illustrations, Publishing, Advertising, &c. With an Exemplification and Description of the Typographical Marks used in the Correction of the Press.  
"Every one who has written, or who may write, for the press, should possess this work."—*Metropolitan.*  
Saunders and Ouley, Conduit Street; to be had of the Booksellers, or sent, post free, to orders addressed to the Publisher.

**READING and BOOK SOCIETIES. HINTS for the FORMATION of READING and BOOK SOCIETIES**; with an improved Plan for rendering them more extensively available and efficient. To be had of the Booksellers, or forwarded gratis, and post free, to orders addressed to the Publishers.  
Messrs. Saunders and Ouley, Conduit Street.

In royal 8vo. price 16s. cloth, lettered.  
**THE PRODUCTIVE RESOURCES of INDIA.**

By J. FORBES ROYLE, M.D. F.R.S. &c.  
Lect. of the Medical Staff of the Bengal Army, and Superintendent of the Hon. East India Company's Botanic Garden at Saharanpore, and Author of "Illustrations of the Botany and other Remains of the Natural History of the Himalaya Mountains."  
"We feel that, with every disposition to do justice to Dr. Royle's labours, we have failed in giving any thing like an idea of their value and importance. The contents of his volume are so varied and interesting that it is absolutely impossible, in so short a notice, to do justice to it."—*Bell's Messenger*, Oct. 10th, 1840.  
"The early pages of the Essay are a lucid and well-written sketch of the arts of culture in other parts of the world."—*Examiner.*  
London: Wm. H. Allen and Co. 7 Leadenhall Street.

Tilt and Bogue, 36 Fleet Street.

# A JOURNEY ROUND my ROOM.

"It is a novelty, and that will attract the public notice. It is interesting, and that will engage for it the sympathies of the general reader. It is philosophic, and that will render it permanently popular. So deep is the interest which the reader takes in the narrative, that he comes to the concluding page with regret. We heartily thank Mr. Thomas for the gratification he has afforded us."—*New Bell's Messenger*.  
London: Joseph Thomas, 1 Finch Lane, Cornhill.

## THE NEW NOVEL.

Now ready at all the Libraries, in 3 vols.

# THE HISTORY of a FLIRT.

Related by HERSELF.

"A capital novel."—*Weekly Chronicle*.  
"An admirable novel."—*Dispatch*.  
"Among the best novels of the kind for many years given to the world by the English press. Easy in manner, sound in moral, various in its display of commonplace and uncommon character, the lively Louisa Vansittart's chronicle of her misdeeds thoroughly succeeds in enchainment attention, and makes up a healthy, wholesome, agreeable book. We heartily recommend it, as a genuine, useful, and interesting antidote to the long evenings of the coming winter."—*Albion*.  
Henry Colburn, Publisher, 15 Great Marlborough Street.

## THE CONCLUDING VOLUME OF

COLONEL NAPIER'S HISTORY of the WAR in the PENINSULA and the SOUTH of FRANCE, with Plans; and the 3d edition of the Third Volume, are now ready.

The Six Volumes sold separately, price 30s. each.  
T. and W. Boone, New Bond Street; and Oliver and Boyd, Edinburgh.

# MRS. SOUTHEY'S WORKS.

**SOLITARY HOURS.** A new edition, in f.cap 8vo. price 5s.

**THE BIRTHDAY, AND OTHER POEMS.** F.cap 8vo. price 7s.

**CHAPTERS ON CHURCHYARDS,** originally published in "Blackwood's Magazine." 2 vols. f.cap 8vo. price 12s.

**TALES OF THE FACTORIES.** F.cap 8vo. price 2s.

**THE CAT'S TAIL;** being the History of Childe Merlin: a Tale. With Three Illustrations by George Cruikshank, 2s.

"All who read thy writings must be thy friends; and all lovers of nature must feel, as they peruse them, that few have painted its beauties with a more delicate hand of truth."—*Blackwood's Magazine*.

"We do not remember any recent author whose poetry is so unmixedly native; and this English complexion constitutes one of its characteristic charms. No purer models of our genuine home feeling and language could be placed in a young foreigner's hands than Mrs. Southey's works. Moreover, her versification, especially in her two later volumes, is not only generally correct, but, in several instances, of very great beauty and perfection. In her latest poem, 'The Birthday,' she has attained to a still higher excellence of style."—*Quarterly Review*, Oct. 1840.

"This little poem contains the first true poetry we have met with for many a day, not only shewing a poetical power in the author, but developing it. Caroline Bowles is not a mere versifier, who shadows forth some dim commonplace thought, or some indistinct generalisation of an image, in empty words and sounding strain. She looks round upon nature and life with the eye which nature bestows upon the poet. She separates the essential characteristics of things from their material concomitants; extracting an intellectual beauty from the plainest, investing the homeliest with attraction, and exciting an interest in the most simple occurrences of domestic life, by appealing to those deep-rooted sympathies which are coextensive at least with the youthful experience of a civilised people."—*Spectator*.

"There is a delightful home feeling about Miss Bowles's writings. They come to us charged with memories of the hearth round which we have drawn of a winter's night, or of the garden, filled with fruits and flowers, where we have played many a sunny morning, step and heart as light as the wind that lifteth our hair."—*Literary Gazette*.

"Passages full of pure eloquence, and throughout marked by a chaste morality and deep feeling, as exquisitely expressed as they are creditable to the genius of Miss Bowles."—*Atlas*.

William Blackwood and Sons, Edinburgh; and T. Cadell, London.

NEW WORKS,  
Printed for Longman, Orme, and Co.

**THOMAS MOORE'S POETICAL WORKS.** Vol. I. Portrait and Vignette, 6s. cloth, lettered.

CLAY, of Number 2 Pall Mall Place, in the County of Middlesex, Printers, at their Printing Office, Number 38 Castle Street, Leicester Square, in the said County; and published by WILLIAM AKRIGER SCRIPPS, of Number 13 South Molton Street, in the Parish of Saint George, Hanover Square, in the County aforesaid, at the LITERARY GAZETTE OFFICE, Number 7 Wellington Street, Waterloo Bridge, Strand, in the said County, on Saturday, October 24th, 1840.

Agents for New York—Wiley and Putnam, 161 Broadway.

REVIEWS OF NEW BOOKS.

*Fishers' Drawing-Room Scrap-Book*, 1841.

With Poetical Illustrations by Mary Howitt.  
London and Paris. Fisher, Son, and Co.

THIS book comes before us like the holy and beautiful image of the dead, and we open it with a strange feeling of melancholy; for there is still the "sweet lingerings" of that voice amongst its leaves which soothed and saddened us for years—the nightingale that mourned over this rose! The flower is here, but, alas! the sweet songster is flown. Yet a few of these pages retain her last notes, and they fall upon our heart like music heard midway between earth and heaven, dying away among the loosened silver of the bright clouds—low, sweet, and more sacred as they, near the "golden gates." But she is gone, and we have not even left us here her hallowed grave to weep over;—she, who should have slept "her long sleep" in some green English nook, with the daisies growing around her silent grave, and the trees overhanging with their twilight shadows, sleeps in the sultry courtyard of a castle, no stone to record her genius, and only the wild ocean waves to sing the requiem of one so young, so well-beloved, so "heaven-gifted!" Peace to her spirit!—holy and eternal peace! And here we pull another flower from her clay-cold hand, and plant upon our pages a parting bud from the well-earned wreath of the lamented L.E.L. "It comes," as Mary Howitt says in her brief but beautiful preface, "like the scent of the violet after it is withered, and cannot fail of being loved and treasured by all."

"Nefthah in the Jerzed."

"The word *Jerzed* implies the Country of the Palm Branches; and the little azure sparrow, the subject of the following poem, is peculiar to that district; and is called The Father of Friendship."

It is a little azure bird,  
It has a plaintive cry,  
It singeth mournful to the eve,  
When none beside are nigh.

But not the less its gentle song  
Ariseth for the noon;  
The day has not a lonely hour,  
Unknown that sweet tune.

It loveth those with whom it lives,  
It loveth where it dwells;  
When the green palm extends its shade  
Above the desert wells.

Never those azure wings expand,  
But on their southern wind;  
At once it dieth, if it leave  
Its native sands behind.

It pineth with familiar love  
For its accustomed sky,  
And even in a golden cage  
It lieth down to die.

And for the love it beareth them,  
The natives hold it true,  
That whoever kills this bird  
Himself must perish too.

A simple, yet a kind belief,  
To keep it free from scath;  
And blessed whate'er in this cold world  
Awakens love or faith!"

The bird sung not for long in another clime.  
Turn we from the dead to the living, to record  
our belief that amongst all the surviving sisters  
of the lyre no one could be found more com-  
petent to take up the chant, and edit the *Draw-  
ing-Room Scrap-Book*; after

"She who hath sung her last sweet song,"

than the gentle Mary Howitt. There is a

feeling and a freshness about her writings which find a way at once to the hearts of her readers, whenever she sings about home, and takes her station by the firesides of England. No living authoress is endowed with a finer perception of the beautiful in nature,—can sooner catch the sweet pictures which are presented in rustic groups, and green, quiet, out-of-door scenery; nor are there any who carry in their bosoms a kinder love, and take a deeper interest, in the welfare of her fair countrywomen, than Mary Howitt. Nor does she fall short in the wider walks of the imaginative, as many of her wild sea-stories, and most original fairy tales, fully witness; they are lays such as none other, saving the Ettrick Shepherd and herself, have chanted in modern times. But it is time we returned to the present work, which is a great improvement on the last year's Annual, and contains several of the most beautiful poems we have ever read from the same pen. The following is full of true poetical painting:—

"The Bridal Eve."

She'll be a bride to-morrow!  
The village is astir;  
Old dames, and men and maidens,  
They talk of nought but her!  
They look upon the sunset,  
And speak the morrow fine,  
For the bride she hath good luck, they say,  
On whom the sun doth shine!

And the laughing brawny ringers  
Are drinking to her health,  
With which, upon the morrow,  
The old church-tower shall reel.  
In honour of the bridal!

She'll be a bride to-morrow!

The evening sunset sheds  
A glory on the shaven grass,  
And on the flower beds,  
And on the dark green cedars,  
That come athwart the light,  
And on the temple in the wood  
With marble pillars white,  
And fountain, grove, and wilderness,  
A joyful aspect wear;

The dullest passer-by can feel

Some present joy is there:—

Some joy like this great bridal!

She'll be a bride to-morrow!

The guests are thronging in,  
And the grave, punctilious father,  
Is busied 'mong the kin;  
With a brave old English welcome,  
He maketh them right glad,  
As if, than of these kinsfolk,  
No other thought he had;  
But he thinketh on the dowry,  
All counted out in gold;  
And he thinketh on the bridegroom's lands,  
Those manors rich and old,  
Which dignify the bridal!

She'll be a bride to-morrow!

Like Christmas-flowers in bloom,  
The stiff-brocaded maiden aunts  
Sit in some inner room;  
And the portly mother sweet accord  
Of grace to all doth shew;  
And, like one greatly satisfied,  
She moveth to and fro;  
White roses, bridal favours,  
She knoweth where they be,  
And cake-piled silver baskets,  
All under lock and key,

To come forth for the bridal!"

The following few lines breathe the spirit of true religion, untrammelled by either sect or party-feeling:—

"Universal Worship."

My soul adores a Universal God,—  
And I can bow wherever man has bowed;  
In little chapels on the lone hill-side;  
By wayside tokens of the Crucified;

In minster aisles where lordly organs sound,  
And all the pomp of worship gathers round:  
Mid mountain steeps, or moorlands brown and bare,  
Where crowds assemble in the open air,  
And 'mid the Sabbath hush, with one accord,  
Lift up their joyful anthems to the Lord!

Creeds matter not to me. I ask no more  
Than that the one great Father they adore;  
And loving him, with better right we call  
On God as Father, who hath loved us all!

Our hearts were made for worship! and we raise  
Ourselves towards Him if but a flower we praise.  
If, walking by the way, we only see  
His goodness in the green leaves of a tree;  
And in the silence of a spirit broken,  
There will be worship though no word be spoken!"

Here take we a poem of another character, which carries its own recommendation in every stanza:—

"The Valley of the Sweet Waters."

"Youth and Summer."

Summer's full of golden things!  
Youth it wearth angel's wings!  
Youth and love go forth together,  
In the green-leaved summer weather,  
Filled with gladness!  
Summer, rich in joy it is,  
Like a poet's dream of bliss;  
Like unto some heavenly clime!  
For the earth in summer-time  
Doth not wear a shade of sadness!

Radiant youth, thou art ever new!  
Thine's the light, the rose's hue;  
Flowers' perfume, and winds that stir,  
Like a stringed dulcimer,

All the forest!  
Joyous youth! thou art fresh and fair;  
Wild as wildest bird of air!  
Thou, amidst thy ringing laughter,  
Look'st not forward, look'st not after,  
Knowing well that joy is surest!

Brighter than the brightest flowers;  
Dancing down the golden hours;  
Thus it is in every land,  
Youth and love go hand in hand,

Linked for ever!  
Youth! thou never dost decay!  
Summer! thou dost not grow grey!  
We may sleep with death and time,  
But sweet youth and summer's prime,  
From the green earth shall not sever!"

And, in conclusion, we give some pretty stanzas, which, by the way, have not much connexion with the print they are intended to illustrate.

"Scene at Antioch."

We sit at home, and all our world  
Lies in a circle small and dull;  
Like reptiles in their shell upcurled,  
We of our tiny selves are full.

We of ourselves alone take heed;  
The little town wherein we bide  
Is all our world; we say 'God speed'  
Unto our own, but none beside.

We buy and sell; we sleep and wake;  
Eat, drink, rejoice, in hope are crossed;  
And still an' all in all we make  
Of our own selves—are self-engrossed!

What cares you portly man of self,  
Whose weightiest business all the day  
Is cheapening luxuries for himself,  
How others wear their lives away?

What cares he of the wo, the strife,  
The thousand ills that others bear?  
What for the various moles of life,  
Whose world is in his easy chair?

Come, child, like him thou shalt not grow,  
With faculties that feebly crawl;  
An ariel-speed thy mind must know,  
Thy heart a love that throbs for all.

Paynim, or Jew, it matters not—  
All are thy brethren; all like thee  
Are born unto the common lot,  
Kaiser or beggar, bond or free.

Good is it when our hearts expand  
Beyond the narrow ties of blood,  
Embracing sons of every land  
In one wide bond of brotherhood."

BUNTING'S ANCIENT MUSIC OF IRELAND.  
[Second notice.]

IN our last Number we left off by a promise to exhibit the King of Oude's love for Irish music. We proceed to do so by the following characteristic anecdote:—

"This potentate (says Mr. Bunting) had contracted a partiality for our harp and music, from the resemblance they bore to the music and to some of the instruments of his own country, which were, like the Irish harp, strung with wire. In consequence, he caused application to be made, through the late John Williamson Fulton, Esq. of Lisburn (then a principal of the mercantile house of Macintosh and Co. at Calcutta), to the editor (Mr. Bunting), at that time one of the managers of the Harp Society at Belfast, requesting that the Society would send him a harper and a piper, for whom he proposed to make a splendid provision. The Society were unwilling to part with Rainey, then master of the school, and there was no other harper who could be deemed sufficiently master of his instrument to support the musical pretensions of the country with credit at a foreign court. However, not to treat his highness's commands with disrespect, the Society forwarded him a very good piper, provided with an excellent pair of Irish union bagpipes. This piper was honourably received, and much caressed, at Calcutta; but having addicted himself to *arrack*, he lost his opportunities, and never reached his destination. The story goes that he was drowned in the Ganges, having fallen off the fore-castle of the pleasure-barge sent to convey him to his highness's residence, while performing on the pipes. It is further said that the tune he was playing when he fell overboard was 'Carolans Receipt'; but this, probably, is an invention."

Mr. Bunting proceeds to preface his anecdotes of the more distinguished harpers of the last two centuries with the following observations:—

"The aspect of society in Ireland during the seventeenth and eighteenth centuries exhibits some very peculiar and interesting features. The same disposition to adopt native manners, which had formerly obtained for the great Anglo-Norman families the character of being *Hibernici ipsi Hiberniores*, now shewed itself, through in a greatly modified degree, among the new residents introduced by the plantation of Ulster, and the other important changes which took place subsequent to that event. And as the Burkes, Butlers, and Fitzgeralds of the feudal period, were always found to become more Irish in proportion as their power was less disputed, so the Cuffes, Cootes, Kings, and other noble families of the latter epoch, began almost immediately, on the first establishment of their ascendancy, to blend the manners of the two centuries; infusing more or less of Irishism into the mixture, as the fortunes of their party appeared more or less predominant. It is to this epoch we are to look back for the formation of that fine and interesting character—the Irish gentleman of the old school; a character which, unfortunately, we can now only contemplate in the retrospect: for, ever since the commencement of the political disputes which have embroiled the latter end of the last, and all that has yet elapsed of the present, century, our nobility and gentry have been gradually conforming again to the English model; a change, no doubt, in many respects desirable and expedient, but one which has, alas! brought about the utter ruin of the Irish harp."

"Rory dall O'Cahan, already alluded to as

being manifestly the Rory dall Morison of Scottish tradition," says Mr. Bunting, "may be taken as the first of these our later harpers, both in point of date and celebrity. He is remembered to this day throughout the north of Ireland as one of the chief O'Cahans of the O'Cahan country; and the names of the estates to which he is supposed to have been entitled were still enumerated in tradition at the time of the meeting of the harpers at Belfast. Being blind (whether from his youth or birth does not appear), he early devoted himself to the harp, but, as may be surmised, not with a view to music as a profession; for the tradition invariably preserved of him in Antrim and Derry is, that he travelled into Scotland shortly before the accession of King James the Sixth of that country to the throne of England, attended by the retinue of a gentleman of figure; and when in Scotland, according to the accounts preserved there also, he seemed to have travelled in the company of noble persons.\* Among other visits made by him to the houses of the Scottish nobility, he is said to have called at Eglintoun Castle, now celebrated in the annals of modern chivalry, when Lady Eglintoun, not being aware of his rank, affronted his Irish pride by demanding a tune in a peremptory manner. O'Cahan refused, and left the castle. Her ladyship afterwards, understanding who he was, sought a reconciliation, which was readily effected. This incident gave occasion to the composition, by O'Cahan, of the appropriate tune of 'Da mihi manum;' or, 'Give me your hand,'† the fame of which afterwards spread throughout Scotland, and, reaching the ear of the king, induced him to send for the composer. O'Cahan accordingly attended at the Scottish court, and so delighted the royal circle with his performance that James walked towards him and laid his hand familiarly on his shoulder. One of the courtiers present remarking on the honour thus conferred on him, Rory observed, 'A greater than King James has laid his hand on my shoulder.' 'Who was that, man?' cried the king. 'O'Neill, sire,' replied Rory, standing up. Such, at least, were the tales preserved of him among the Irish harpers fifty years since; and, making all allowance for national vanity and exaggeration, he must be regarded as having been a man of considerable consequence and great ability. He was the composer of the famous airs of 'Port Atholl,' 'Port Gordon,' 'Port Lennox,' 'Lude's Supper,' 'Da mihi manum,' &c. &c. the first and last of which are given in the present collection. Sir Walter Scott, with his usual skill in employing facts for the illustration of his tales, introduces the name of Rory Dall as 'the most famous harper of the western Highlands' in his 'Legend of Montrose,' where he makes him the instructor of Annot Lyle. It is certain that he died in Scotland, at the house of a person of distinction, where he left his harp and silver tuning-key; and that, during the latter part of his career, he was reduced to very indigent circumstances. The foregoing account," adds Mr. Bunting, "is given chiefly on the authority of Arthur O'Neill and Hempsen."

Of Cornelius Lyons, harper to the Earl of Antrim, and a contemporary of Carolan, we find the following anecdote of the bard and his patron in London:—

"His lordship was both a wit and a poet, and delighted in equality where vulgarity was not too gross. At one time he and Lyons, when in London, went to the house of a

famous Irish harper, named Heffernan, who kept a tavern there; but beforehand he formed the following plan:—"I will call you 'cousin Burke,'" said his lordship. "You may call me either 'cousin Randall' or 'my lord,' as you please." After regaling for some time Heffernan was called up, who was, by this time, well aware of the dignity of his guest from the conversation and livery of his lordship's servants. When Heffernan came into the room, he was desired to bring in his harp and sit down, which he did, and played a good many tunes in a grand style. His lordship then called upon his cousin Burke to play a tune. The supposed cousin, after many apologies, at length took the harp and played some of his best airs. Heffernan, after listening a little while, started up and exclaimed, 'My lord, you may call him cousin Burke, or what cousin you please; but, *dar dich*, he plays upon Lyons' fingers.' What is very extraordinary, Heffernan had never seen Lyons before. His lordship then retired, leaving the minstrels to indulge in Bacchanalian rivalry, which O'Neill assures us they did, like bards of old!"

Of Hempsen, a harper, respecting whom several interesting particulars were given by Lady Morgan in her novel of "The Wild Irish Girl," Mr. Bunting states that—

"It will be satisfactory to such as take an interest in the simple annals of the harpers, and venerate any vestiges of the bardic system, to learn, that the close of Hempsen's long life of 112 years (he died in 1807) was rendered comfortable by the humanity of the Rev. Sir H. Harvey Bruce, from whose hand he was often literally fed. The day before his death, upon hearing that this gentleman had come to his cabin, he desired to be raised up in his bed, and the harp placed in his hands. Having struck some notes of a favourite strain, he sank back unable to proceed, taking his last adieu of an instrument which had been a companion, even in his sleeping hours, and was his hourly solace through a life protracted to the longest span. His harp is preserved in Sir Henry's mansion at Downhill, as a relic of its interesting owner."

A note adds:—"The following lines are sculptured on it:—

'In the days of Noah I was green;  
After his flood I've not been seen;  
Until seventeen hundred and two I was found  
By Cormac Kelly, under ground.  
He raised me up to that degree,  
Queen of Music they call me.'

The sides and front are made of white sawall, the back of bog fir, patched with copper and iron plates."

One more extract from Mr. Bunting's work we must make before closing our notice of it. How would the "Times," the "Chronicle," the "Herald," the "Post," report such an occurrence as the following in the House of Commons; and in what tone, grave or gay, would the editors of these journals comment upon the matter?—

"Some curious tales are told of Jerome Duigenan, a Leitrim harper, born A.D. 1710. One is of so extraordinary a character, that, were it not for the particularity of the details, which savour strongly of an origin in fact, the editor would hesitate to give it publicity. He is, however, persuaded that he has it as it was communicated to O'Neill, between whose time and that of Duigenan there was scarcely room for the invention of a story not substantially true. It is as follows:—"There was a harper," says O'Neill, "before my time, named Jerome Duigenan, not blind, an excellent Greek and Latin scholar, and a charming performer. I

\* "Gunn's Essay," p. 85."

† "Known in Ireland as 'Tabhair dom lámh.'"

have heard numerous anecdotes of him. The one that pleased me most was this:—He lived with a Colonel Jones of Drumshambo, who was one of the representatives in parliament for the county of Leitrim. The colonel, being in Dublin at the meeting of parliament, met with an English nobleman who had brought over a Welsh harper. When the Welshman had played some tunes before the colonel, which he did very well, the nobleman asked him, had he ever heard so sweet a finger? 'Yes,' replied Jones, 'and that by a man who never wears either linen or woollen.' 'I'll bet you a hundred guineas,' says the nobleman, 'you can't produce any one to excel my Welshman.' The bet was accordingly made, and Duigenan was written to, to come immediately to Dublin, and bring his harp and dress of *Cauthack* with him,—that is, a dress made of beaten rushes, with something like a caddy, or plaid, of the same stuff. On Duigenan's arrival in Dublin, the colonel acquainted the members with the nature of his bet, and they requested that it might be decided in the *House of Commons* before business commenced. The two harpers performed before all the members accordingly, and it was unanimously decided in favour of Duigenan, who wore his full *Cauthack* dress, and a cap of the same stuff, shaped like a sugar-loaf, with many tassels: he was a tall, handsome man, and looked very well in it."

Here we must conclude. To our musical readers we would venture to point out the melody at p. 69, called "'Tis a pity I don't see my love," as an excellent specimen of a merry Irish dance, which is said to be "very ancient, the author and date unknown," and to have been procured from Mrs. Fitzgerald, at Westport, in 1802. After what we have remarked, however, in our preceding notice, we must confess ourselves rather sceptical about Mr. Bunting's "very ancient," although we are ready to admit the antiquity of many of the airs in his collection. "The brink of the white rocks," for instance, at p. 22, which was procured by Mr. Bunting at the same time and place from a blind man, we are inclined to regard as an air of remote antiquity, and which may be referred to the age of fire-worship in Ireland. The popular and, we may truly say, martial melody of "The girl I left behind me," to the semi-pathetic, semi-inspiring strain of which all the regiments marched to embark for the Peninsular campaign, under the "unconquered Wellington," is beautifully arranged at p. 43, from the performance of Arthur O'Neill, the harper of whom we have made so frequent mention, and was noted by Mr. Bunting in 1800; "the author and date" he states to be "unknown." "The Princess Royal," by Carolan, at p. 35, we would point out as a noble melody, now familiar to the English ear from its association with the words of Dibdin's spirited song, "On Board the *Arethusa*." Mr. Bunting says, that this "fine air was composed by Carolan for the daughter of Madermoth Roe, the representative of the old princes of Coolavin." As specimens of Irish melodies new to us, and which we think exceedingly beautiful, we venture to call attention to those at p. 14, "In this village there lives a fair maid," and at p. 1, "Sit down under my protection." Of both these we are told that they are "very ancient, author and date unknown." The former was procured by Mr. Bunting at Deel Castle, Ballina, in 1792; the latter from Byrne, a harper, in 1799. We close with regret Mr. Bunting's volume, because we believe that with it we take our leave of the genuine music of Ireland. It must not be regarded as

a curious musical publication alone, but as a national work of the deepest antiquarian and historical interest. Were we, remembering Mrs. Malaprop's speech that "comparisons are odiferous," to institute a literary comparison therewith to perfume our pages, we would say that Moore's "Irish Melodies" had about them all the fascination of poetry and romance; Bunting's collections, all the sterner charms of truth and history.

## ARTS AND SCIENCES.

## THE BRITISH ASSOCIATION.

(Concluding notice.)

Our concluding notice contains the remaining Sectional proceedings of Tuesday and Wednesday. On the latter day, except the Medical, all the Sections met as usual, and a good deal of miscellaneous business was done; at the close thereof the meeting of the General Committee was held, the report of which, including the arrangements for the ensuing year, has already appeared in our columns (*Literary Gazette*, p. 641).

## TUESDAY.

SECTION D.—Zoology and Natural History.  
Papers and Communications.

1. Mr. Smith, 'On the Formation of a Salmon Stair.'
2. Professor Agassiz, 'On the Development of the Fish in the Egg.'
3. Mr. Goodair and Mr. Forbes, 'On Pelonala, a New Genus of Ascidian Mollusca.'
4. Mr. Patterson, 'On Medusa.'
5. Professor Schomburgk, 'On the various Modes of Fishing employed by Indians in West of Gulana' (Communicated by Sir William Jardine.)
6. Mr. Thomson's 'Report on the Irish Fauna (Vertebrata).'
7. Professor Graham's 'Report of the Map Committee.'
8. Sir Thomas Phillips, 'On the Migration of Birds.'
9. Dr. Walker Arnott's 'Remarks on the Synonymes and Affinities of some African Genera of Plants.'
10. Mr. Fox's 'Note on a Communication made by him at last Meeting.'
11. Dr. Lankester, 'On Sea-Island Cotton grown at Manchester.'

Professor Graham in the chair.—Mr. Smith, of Deanstons, gave an interesting account of a stair which he had invented, whereby salmon might be enabled to ascend streams, notwithstanding the existence of natural or artificial obstructions, and so constructed as not to diminish the power of the water, or lessen the supply to mills; it being understood that the disputes between the owners of mills and of salmon fisheries had hitherto led to much disagreement and inconvenience. He illustrated his observations by the model of an experimental erection which he had constructed on the Teith, near Doune, the result of which had been so successful that numerous applications had been made from various quarters for erections of the same kind. Mr. Smith mentioned that, in connexion with this invention, he had in contemplation the construction of an apparatus, or index, whereby the exact number of fish that passed up the stream by the stair might be accurately ascertained, together with the time of their so passing up, and the size and thickness of the fish. It is difficult to give a perfect idea of this ingenious contrivance without a model. It consists of one side of the river, under a weir, or "cauld," being separated from the main stream, and intersected by transverse pieces of wood, or stone (we presume), from each side, crossing, perhaps, two-thirds of the width, and with considerable intervals between the opposite intersections. The fish, it seems, both from the experience on the Teith and at another dam at Blantyre, on the Clyde, immediately adopt this staircase in ascending the rivers,—

"Such a getting upstairs,"—

and, finding resting-places between the inter-

secting materials, abandon the other parts of the stream for this convenience.

Some amusing remarks were made on this communication, which is one of infinite value to local mill and fishing interests. Dr. Macdonald suggested that the ascents might be made circular, to embrace the whole river; and Mr. Smith said they might be so constructed, or spiral, if thought better.

Dr. Fleming noticed a curious old Scottish act of parliament on the subject, which ordained that the slap for fish to pass through should be so wide that a full-sized sow could turn round in it without touching either with her head or tail.

Mr. Smith mentioned a fact in the natural habits of the salmon, that persons fishing by the blaze of light knocked them on their noses in their stupor.

M. Agassiz (in French) gave a lecture on incubation of fish, and described the artificial means by which he had promoted and examined the development of the ova. He selected the eggs of a species of *Coregonus* (Cuv.), so transparent that the whole process could be observed, in all positions, by the use of powerful glasses. His experiments nearly resembled those upon the eggs of birds at the Eccelesbion, only the ova needed no heat to develop them. One of the principal facts ascertained was their wonderful tenacity of life. At the end of ten days a pouch became apparent, and the entire mass was homogeneous. On the 14th, a transverse dark line was visible, which, in time, became the vertebral column of the fish. The heart first shewed itself as a spongy mass, and so the observations went on to the end (the thirty-third day, we believe); the head being very large in proportion to the inferior parts, and the fins the last part produced. The lithographs for M. Agassiz's book on this subject, beautifully executed, were handed round the Section; and as we shall shortly have it in our power to review that work, we will not now further enlarge upon its outline.

Messrs. Goodair and Forbes described a new genus of *Ascidians*, two species of which they had found, one near the mouth of the Frith of Forth, the other near Rothsay; and which, from both having been obtained from muddy ground, were named by the discoverers *Pelonala*. The former, *Pelonala corrugata*, of a darkish brown colour, about two inches and a half long, with transverse rugae; the latter, *Pelonala glabra*, of a greyish-white colour, about one inch in length, smooth, and slightly villous. The new genus is the more worthy of notice, as, from its external and internal symmetry, the chief characteristic of *Pelonala*, it exhibits the relations of the *Mollusca* to the *Annulosa* and to the *Echinodermata*.

Mr. Patterson described at some length the *Acalepha* of the British shores; and deplored the ignorance that exists of the physiology of the *Medusa*.

Mr. Forbes also regretted deeply the slight progress made in the knowledge of these animals. The Frith of Clyde, he said, abounds in medusae, for which our delightful trip to Arran enables us to vouch: amongst them he believed there were species and even genera new to the naturalists of this country; at all events, there was a promising field of research.

Sir W. Jardine exhibited a singular instrument and contrivance for fishing, employed by the Indians in West Guliana, communicated by M. Schomburgk, the zealous scientific explorer of that little-known and important region. He also explained the several modes of fishing practised by those tribes.

The Report (No. 6) was read by Mr. Patterson. It included only the vertebrata of the Irish *Fauna*. The investigation is to be continued and extended: the portion completed will appear at length in the forthcoming volume of the "Transactions," the early publication of which (in four months, the new regulation) will doubtless be a great boon.

Professor Graham's 'Report of the Map Committee' was received. The object of this committee was to prepare skeleton maps for recording the distribution of plants and animals. They are not as yet completed; the progress was exhibited to the Section, and the suggestion of corrections or additions requested.

Sir Thomas Phillips's communication, read by Mr. Vigers, tended to shew the permanence of the migratory instinct of birds; the departure of which from the Irish coast had been recorded in 1684.

Dr. Walker Arnott made some remarks 'On the Synonymes of the Affinities of some South African Genera and Plants.' His object was to shew that a vast number of different names had been given to many plants of the same kind; and to express a hope that some arrangement would be adopted by which the confusion thus created might be removed.

Mr. Fox observed that the paper read by him 'On Cetology' last year at Birmingham, was accompanied by a letter, descriptive of the discovery of the bones of a whale in the crypts of Durham Castle. The letter was forwarded to him by a gentleman, who stated that it was an original composition of John Cosin, bishop of Durham in 1661; and that it came from a collection of papers on Durham Castle, belonging to the late Mr. Surtees. It has recently, however, been communicated to Mr. Fox that the gentleman has admitted that he had fabricated the letter. Mr. Fox has acted rightly in this avowal; and no comment on the gentleman's conduct is necessary.

Dr. Lankester exhibited to the Section specimens of the pods of the cotton plant, grown in Manchester, from seeds of the sea-island cotton, brought from America. The staple was long, and the production was evidently British, from the green state in which they were exhibited. The importance of this experiment was pointed out, as shewing the entire possibility of growing the best American cotton elsewhere than in the American islands. An account of the experiment, drawn up by Mr. Felkin of Nottingham, was read to the Section; and seeds of the American cotton were distributed, for the purpose of repeating it elsewhere in this country. Some interesting discussion ensued on this subject, in which Mr. Felkin, Dr. Arnott, Dr. Burn, and others, took part.

#### SECTION E.—Medical. Papers and Communications.

1. Dr. Charles W. Bell, 'On Bonten d'Alleppe and Baghdad Boil in the East.'
2. Dr. Cormack, 'On the Cause of Death from the Entrance of Air into the Veins.'
3. Dr. Allan Thompson, 'On the Glands of the Intestines.'
4. Dr. Reid, 'On Connexion of Nervous System and Muscular Contractility.'
5. Dr. Reid, 'On Medulla Oblongata.'
6. Dr. Hannay, 'On Pectus.''
7. Dr. Perry, 'On Inflammation.'
8. Dr. McDonald, 'On Mnemonics.'

Dr. Watson in the chair.—Dr. Charles W. Bell read his paper 'On Bonten d'Alleppe, and Baghdad, in the East.' There are two descriptions of this ulcerative disease; one, which invariably lasts six months, and is termed the female, to distinguish it from the other, the male and more common form, and which is never got rid of under twelve months. Its

character is a pimple after pimple constantly renewed, and each time with more severity than the former, leaving, when cured, a permanent scar. Iodine and hydriodate of potash are the most effective remedies, with citrine ointment outwardly applied.

Dr. Cormack read a communication 'On Air in the Veins.' He stated that his object in bringing the subject at all before the Section was humbly to state what appeared to him a sufficient objection to the theory lately published by Sir C. Bell. He would not recapitulate details which he had already submitted to the profession at some length. Sir C. Bell believes that death is produced by the air acting detrimentally on the *medulla oblongata*—that is, on the respiratory column of it. Dr. Cormack had slowly injected large quantities of air into the veins of animals, without causing death; and, indeed, unless much air was quickly thrown in, the animal did not die. Dr. Cormack further stated, that in every case in which the experiment proved fatal, the right side of the heart was found enormously distended, and unable to contract; and he preferred considering this obvious, and constantly-to-be-observed lesion, as the cause of death, rather than any thing founded on hypothesis, however ingeniously that hypothesis might be defended.

Dr. J. Reid believed that the views of Dr. Cormack were correct, and had seen many of the experiments referred to.

Dr. Pagan, of Glasgow, wished to know if Dr. Cormack thought that, in cases of traumatic gangrene, the air evolved might not prove fatal in the manner alluded to.

Dr. Cormack—"In some cases it may. But it would require a large quantity of air, and that suddenly evolved, to cause death in the manner described. I have discussed this question in the last chapter of my 'Thesis.'" Dr. Cormack then read some medical notes regarding 'Tangier, in Barbary, which he had lately visited.

Dr. John Reid read a paper 'On the Anatomy of the *Medulla oblongata*.' The motor and sensitive columns, and the manner in which they traverse the *Medulla oblongata* and *pons varoli*, and their relative positions, were the more immediate subjects of this paper.

Dr. Reid next related the results of an experimental investigation into the connexion between the nervous system and contractility, affording, he conceived, additional evidence of the truth of the Hallerian doctrine.

The President stated that the Association had voted 2004 to bring over Alexis (the man whose bowels can be seen in operation) from America, and he trusted that his visit to the place of meeting next year would throw some light on a dark subject in physiology.

Dr. Allan Thompson then gave an account of the 'Anatomy of the Intestinal Glands,' illustrated by a great many diagrams and preparations. He pointed out the general structure of the mucous membrane of the intestines, and described the three kinds of glands found in that tissue, particularly dwelling upon the circumstance that some of the simplest kinds of glands are at first closed, or are vesicles.

The President complimented Professor Thompson on his clear and philosophical exposition, and Dr. J. Reid corroborated the Professor's views.

Dr. Perry read a valuable paper 'On Inflammation,' and gave a tabular view of 155 *post-mortem* inspections made in a continued series, all under his own eye.

Dr. Hannay, of the Andersonian University, read a memoir 'On Hooping-cough,' in which,

he recommended the application of cold washing to the chest, or rubbing the chest to redness with cold water two or three times a-day. He had also found it useful in *Laryngismus stridulus*.

The Secretary read an elaborate paper by Dr. William McDonald, 'On Mnemonics,' which seemed an attempt to classify mental diseases under three heads.—A vote of thanks to the chairman was proposed by Dr. Sargent, of Dublin, and carried unanimously.

#### SECTION G.—Mechanics. Papers and Communications.

1. Mr. Jeffrey, 'On Warming Vessels by Radiant Heat.'
2. Mr. Smith and Mr. Mitchell, 'On Timber Bridges.'
3. Captain Johnston, 'On the Application of "Native Alloy" for the Pivots of Magnetic Compasses.'
4. Mr. Smith, 'On Propelling Boats on Canals.'
5. Mr. Hawthorn, 'On Certain Improvements on Locomotive and other Engine Boilers.'
6. Mr. Fairbairn, 'On the Fan-blast, as applied to Furnaces.'
7. Mr. Milne, 'On a High-Pressure Filter for Domestic Purposes.'
8. Mr. Dunn's 'Ponton's Electro-Magnetic Telegraph.'
9. Mr. Johnston, 'On a New Wind and Rain-Gauge.'
10. Mr. Fairbairn, 'On Hall's Hydraulic Belt for Raising Water.'

Sir John Robison in the chair.—Mr. Jeffrey read a paper 'On Warming Vessels by Radiant Heat,' descriptive of a fire-grate exhibited in the Model Room.

In consequence of the remarks of Mr. Vignoles (Thursday) 'On Timber Bridges,' and on the economy of their application to railways, Mr. Mitchell related his experience in these constructions in the Highlands of Scotland. He mentioned, amongst several others, three of 75 to 100 feet span over the Spey and Dee. He considered that timber bridges would last from thirty to forty years, but such was the economy of their structure that, in comparison with other bridges, the prime cost would more than allow their being rebuilt. Mr. Mitchell also expressed his satisfaction at Mr. Vignoles's opinion, communicated to the Section on Monday, that railway gradients may be made with a much greater rise than hitherto thought advisable. This was of great importance to Scotland.

Captain Johnston next communicated the results of his experiments to obtain the best material for compass pivots. This he proved to be what he termed "native alloy," the nature of which he did not explain; he stated, however, that it was found with platinum, that it was tough, had no magnetic properties, and that it would not oxidise by exposure to the atmosphere.

This "native alloy" was well known to Mr. Hawkins. He stated that he had employed it for many years for the points of pens, which never exhibited the slightest sign of wear; and that it consisted of native crystals of osmium and iridium, in combination with platinum.

Sir J. Robison corroborated Mr. Hawkins's remarks on the durability of his pens, he had used them for four years without their having undergone any perceptible change.

Mr. Hawthorn read a paper (No. 5) 'On certain Improvements on Locomotive and other Engine Boilers.' The object of this improvement is to prevent what is technically termed "priming;" to heat the steam on its passage to the cylinder, and to employ return tubes, as well as direct tubes for heating the water. The advantages are, that no water is carried with the steam into the cylinder; and the saving of fuel, through this arrangement of the tubes, amounts, in some instances, to from thirty to forty per cent.

Mr. Scott Russell stated that the plan of surcharging steam was much used in America. There they work the steam expansively. Mr. Russell was afraid, however, that the steam returning from the cylinder through the boiler would merely abstract, and not communicate, heat.

Further, but not important discussion ensued.

Mr. Fairbairn then read a paper 'On the Fan-blast as applied to Furnaces.' He thought that the application of fan-blasts to large furnaces would be as successful as its adaptation to the cupola had been. He recommended it to be tried on the belief that the experiment would prove advantageous in respect to expense, and to quality of metal.

Mr. Smith, of Deanston, thought the plan well worthy of being tried. It was not the force of the blast that was necessary, but the quantity of air introduced. In a cupola the iron was brought down in half the time that was necessary with the cylinder. He had no doubt, however, of the success of the fan-blast, the heat being much more uniform.

Mr. Hodgkinson also spoke in favour of the proposition.

Mr. Smith then called the attention of the Section to a mode of propelling boats on canals by huge wheels to act on the bottom of the canals.

Mr. Scott Russell was not so very sure as Mr. Smith regarding the success of the plan. He stated that there would be a very injurious effect on the bottom of the canal. The wheel, too, must be made very heavy in order to give the propelling power, and the weight would cut up the puddle at the bottom.

A discussion followed. Mr. Smith, however, was confident, and, after trying the experiment on a large scale, would report the results to the Association next year.

Mr. Milne explained to the Section a model of a high-pressure filter, for domestic purposes.

Mr. Dunn read a paper 'On Ponton's Electro-Magnetic Telegraph.' As the greater portion of these are exhibited in the model rooms, it is unnecessary to enter into them at length.

Mr. Johnston explained his new wind and rain-gauge, also exhibited in the Model Room.

Mr. Fairbairn explained Hall's hydraulic bell for raising water. Mr. Vignoles, Mr. Snodgrass, Mr. Smith, Mr. Hawkins, Sir John Robison, and others, took part in the debate which followed.

Le Comte de Lille then detailed to the Section a mode of wooden pavement. His mode is to preserve the vertical strength by a slight incline. Mr. Smith of Deanston, Mr. Hawkins, Mr. Johnston, and Mr. Wallace of Kelly, M.P. took part in the debate, and the Section adjourned.

In the afternoon, the general Dinner of the Association took place in the Theatre, and the contractors, therefore, certainly did great injustice to those who trusted them with its provision. It was about the worst public meal to which a thousand persons could possibly sit down; but the company, actors and spectators, looked gay, and the effect of the lower boxes being filled by people all employed in eating, with their faces towards the pit and stage, was extremely amusing. The Marquess of Breadalbane, the President, was in the chair, and supported by the Lord-Provost Dunlop, and many of the noble and scientific individuals who attended the meeting. As usual, on such occasions, the toasts were highly complimentary; but it is only fair to say that much of the compliments were well deserved by the hos-

pitalities of Glasgow and the noblemen around, and by the assiduity and kindness with which other distinguished parties had discharged the onerous duties imposed upon them, as office-bearers and contributors to the *clat* of this year's festival. Among the speeches we shall only particularise the following, delivered by the President, in drinking 'Prosperity to the Association.' He said:—

"This is now the tenth meeting which has been held since the establishment of the Association, and it is very gratifying to me to be able to say that, on no former occasion during its existence, whether we take into account the great numbers who have attended the meeting of the most distinguished men belonging to our own country, or whether we look at the numerous attendance of the brightest ornaments of science, who have come from foreign countries to honour us with their presence, or whether we direct our attention to the great and important objects which it is the intention of the Association to promote, I am perfectly sure that I only express the opinion of all the other members of the Association when I say, that certainly at no former period of its existence has the present meeting been surpassed. What, then, are the objects of the British Association? To answer this question properly, I cannot do better than read the objects from the programme of our proceedings. [His lordship did so, and proceeded.] And now I would ask you whether, on this occasion, as far as regards the proceedings of the annual weekly meetings of the Association—whether as regards the proceedings of the different Sections, all these objects have not been eminently obtained and secured? I would ask even our opponents, if I could even conceive that such an individual was now present—I would ask such, if they are true and accurate observers, whether the objects contemplated by the Association have not been fully, fairly, and eminently obtained? I am sure I need not dilate farther upon this subject, yet I must again congratulate you upon the very distinguished and very numerous assembly which we have seen meet in this city for the promotion of so great and so noble objects as those of the Association—the investigation of truth, and the promotion of the best interests of science and of the world. It has been well observed by an eminent modern author, that the investigation of truth is one of the most ennobling of the pursuits to which the human mind can be directed. This investigation is a duty imposed on all, and in the search for it there is no danger which can possibly arise to religion or to society, provided that search be followed out with the true spirit of sincerity. The British Association was, properly speaking, of foreign origin; but though the idea originated abroad, it has been modified according to our own views, and suited to the circumstances of our own country. Changes of a most useful and essential nature have been adopted, and, in particular, there is one most especially useful change adopted by us, as compared with similar associations abroad—a change which is of a permanent nature, and will, I hope, secure the permanency of the Association, which, though of foreign origin, has now been naturalised in this country, and, like a plant of vigorous and healthy growth, has expanded its leaves and its branches with a luxuriance, and a vigour, and an activity of life, which will soon spread its shade over the whole British empire. I say over the British empire, because I hold the change I have alluded to, to be one of the greatest and most eminent advantages in the British Association, by which it is made one of

its most prominent characteristics that it is an ambulatory association—that it carries itself into all parts of the country—that it visits with its influence all the important cities and towns of the empire. I shall not attempt to detain you from the toast by further observations upon this subject. I am well aware that I have very feebly and imperfectly stated the advantages which must and will result from this noble Association; but this is the less necessary, because your presence here proves that you yourselves are aware of these advantages, that you know them, and that you so appreciate them as to require from me no persuasion to induce you to join me in drinking 'Prosperity to the British Association.'"

The several toasts were, "Prosperity to the Association;" "The Lord Provost, and Prosperity to the City of Glasgow;" "The Universities of the British Isles;" "The Nobility of Scotland, with thanks to those in the neighbourhood who had joined and encouraged the Meeting;" "The Marchioness of Breadalbane and the Ladies;" "The Members of the City;" "The Local Officers, &c. &c.;" "The Foreigners who had honoured the Meeting by their presence." In proposing this toast, Lord Montagu introduced a happy phrase, which was taken up and much dwelt upon in after-speeches. "The toast, as intrusted to him, designated them as foreigners,—*strangers they might be, but foreigners they were not*; for, in the investigation of scientific truths, there was a community of interest and of feeling which bound them together from whatever quarter of the world they came, and which constituted them friends and not foreigners."

General Tcheffkine, M. Benchhausen, M. Agassiz, M. Jacobi, all spoke to this toast; as did Mr. Gurley, as representative of the United States of America, in a rich Yankee dialect.

Sheriff Alison proposed "The Memory of James Watt;" and some other toasts having been disposed of, the company separated about eleven o'clock.

### WEDNESDAY.

#### SECTION A.—*Mathematics and Physics. Papers and Communications.*

1. Professor Nichol, 'On New Glasgow Observatory.'
2. Professor Airy, 'Explanation of a New Apparent Polarity of Light.'
3. Mr. Bowman, 'On a Singular Rainbow.'
4. Professor Forbes, 'On Osler's Anemometer at Edinburgh.'
5. Mr. Fowler, 'On a Calculating Machine.'
6. Dr. Anderson, 'On the Dew Point.'
7. Mr. Hutchinson, 'On a Method of Prognosticating the Mean Temperature of Winter Months.'
8. Mr. A. Bell, 'On a Case of Interference.'
9. Mr. Rowell, 'On Rain and the Aurora.'
10. Colonel Sykes, 'On an Extraordinary Shower of Rain.'
11. Mr. Cumming, 'On a New Barometer.'
12. Mr. Shand, 'On Construction of Rooms with regard to Sound.'
13. Mr. Jeffreys, 'On Meteorological Observations in the Himalayan Mountains.'
14. Dr. Reade, 'On the Theory of the Iriscope.'
15. Mr. Espy, 'On the Causes of the Daily Fluctuations of the Barometer.'

Professor Nichol gave a long and particular history of the progress and present state of the Glasgow Observatory; and, after remarking on the advantages acquired by the change of situation, suggested several improvements for its future management, adding the best-conducted magnetic and meteorological to the most efficient astronomical observations.

Professor Airy recommended the finishing up present observations rather than the accumulating new.

Professor Nichol observed that it was intended, as a condition to the chair, to oblige

the presentation of the reduced observations every half year.

Dr. Lamont, of Munich, stated that he had inspected the Glasgow Observatory, that it was excellent in all respects for astronomical observations, and he had no doubt that it would furnish valuable results.

Professor Airy's communication (No. 2) was with reference to a phenomenon observed by Sir David Brewster, which seemed to defy explanation, and which the laws of light did not appear to embrace. The phenomenon was this:—Suppose in viewing a strictly pure spectrum, the violet end being to the right hand, a plate of glass, or mica, from the violet side, was passed half over the eye, bands would be seen in the spectrum; whereas if the plate were brought from the opposite side no bands would be observed. This was thought to be a new property of light. But whenever the spectrum was beheld as an imperfect image thrown out of focus to any degree, as, for instance, in case of short sight, the peculiarity was visible; although not when strictly in focus: and Professor Airy attributed the phenomenon to refraction in the interior of the eye, in which he was borne out by calculation. The Astronomer-Royal proceeded to the nature of the explanation, but more than once stated the difficulty of giving a clear oral account thereof. This of itself is sufficient to deter a written attempt from notes and memory without diagrams, but it was the principal subject discussed this day in the Section (the other papers being briefly noticed), and, therefore, calls for at least an outline. By the undulatory theory, waves of light are like waves on the surface of water,—a travelling shape only, which pass through a lens more slowly than through air; and the thicker the lens the more slowly still. The waves passing through the middle of the lens of the eye, therefore, would be much more retarded than those which go through the edges. All, however, are pulled back; in consequence of which, and because of the retardation, go on in curves and converge to a point. One wave being known, it may be readily conceived that an indefinite number of units of disturbance might concur, each becoming the origin of a new wave spreading out from each; and thus a good idea of intensity attained. These properties of light borne in mind, Professor Airy observed that the effect of the mica placed half over the eye was not to alter the direction of, but to retard, the light; there would, therefore, be more on one part of the eye than another, and one set of waves would experience a hitch. Thus would the eye experience simultaneously the phenomena of disturbance and intensity, and of retardation; the effect of which is, that fractional parts would be seen out of focus, and hence the image of a point would not be a bright point as in the other case, but an extended surface. When the retardation of the waves of light from a spectrum is a whole number of waves  $\frac{1}{2}$ th, no bands are visible; if  $\frac{1}{4}$ ths, bands are seen; if  $\frac{3}{4}$ ths, also seen, but shifted sideways; and so on, by every successive divergence, the bands are hitched sideways. The waves of the violet end are retarded most and pushed farthest back; and by passing on the mica, the hitching of the images causes the bands to correspond exactly, and the aggregate produces the phenomenon. If the mica be shifted the opposite way, the effect would be reversed: what was light to one would be dark to the other. Professor Airy, in conclusion, said it was a most difficult subject, and he was afraid he had not been intelligible.

Sir David Brewster would not say that Professor Airy was not right in his explanation, but these bands should be seen under every circumstance, and then would be observed peculiar phenomena. They appear to consist of specks of light and dark, and sometimes in the form of screws, or in curves: he could give no explanation, but they seemed to indicate a new polarity of light. Professor Faraday first observed these bands, but only such as Professor Airy had described; they occur, however, in curves: and looking at the spectrum through a series of plates like steps of stairs he had observed the same phenomenon. By means of these steps of plates, possessing high refractive power, the fact may be possibly explained: two spectra may be produced, and the ordinary might be different to the extraordinary.

Professor Kelland gave due praise to the admirable experiments of Sir David Brewster, but the explanation of Professor Airy was to him entirely satisfactory.

Sir David Brewster, in consequence of the press of matter on this short day, had been requested to look over four papers and convey the general substance thereof to the Section. They were Nos. 3, 8, and 14, and another by Mr. Fisher, 'On a remarkable Halo.' They were severally briefly read, and a desultory conversation ensued on each.

Professor Airy then communicated Mr. Fowler's paper. Time did not permit an explanation of the machine; the theory was a ternary scale and decimals. Professor Forbes said the machine was constructed and in work.

Dr. Anderson then read his paper 'On the Dew Point.'

After the other papers had been hurriedly gone through the Section adjourned.

#### SECTION B.—Chemistry.

The papers announced were:—

1. Professor Jacobi, 'On Electrotype.' &c. &c. &c.

Four were read, which, however, it will be necessary to do little more than note.

Professor Jacobi's paper 'On Electrotype,' gave rise to an animated discussion to an audience fit, though few, on the right of priority to the discovery of this mode of engraving; in regard to which, the *Literary Gazette* has already published several communications, with remarks on their relative value. Mr. Spencer (of Liverpool) seems to us, at any rate, not to have been behind Professor Jacobi; though, perhaps, the Chairman, Dr. T. Thomson, was correct in his view, that both parties had been going on with improvements in this branch of art independently of each other.

A paper was read by Mr. Bryson, 'On the Refractive Powers of Minute Mineral Crystals.' The author's investigations on this point shew that the refractive powers of Greenockite were only surpassed by diamond.

Another paper was read by Mr. Espy, 'On the Causes of the Daily Fluctuations of the Barometer;' and a third by Dr. Gregory, 'On the Preparations of Alloxan and Alloxantine.'

In conclusion, a vote of thanks was passed to the President.

#### SECTION C.—Geology.

Papers and Communications.

1. Mr. Murchison, 'On the Researches of Mr. Hugh Miller of Cromarty, in the Old Red Sandstone;' and Professor Agassiz, 'On the Fossil Fishes found therein.'
2. Mr. J. E. Bowman, 'On the Geology of North Brazil.'
3. Mr. Murchison, 'To Exhibit New Geological Maps of Different Parts of Germany.'
4. Mr. Featherstonhaugh, 'On the Physical Geography of the British Territories near New Brunswick.'
5. Dr. Hannay, 'To Exhibit a Section of the Beds of the River Clyde.'
6. Mr. Knipe, 'On the Cloosburn Basin of Dumfriesshire.'

Mr. Murchison, after exhibiting new geological maps of Germany (No. 3), addressed the Section on the geological researches of Mr. Hugh Miller of Cromarty, to whose zeal and success our pages have already borne testimony. Educated in the humbler walks of life, and brought up as a stonemason, Mr. Miller, by his diligence and talent, has established for himself an honourable name among the sons of science. In the present instance reference was chiefly, if not entirely, made to his examinations of the old red sandstone in the vicinity of his place of residence, and of the new fossil fishes he had discovered therein. Of these remains many specimens were on the table, and M. Agassiz was called upon to explain and point out the novelties. The geological formation of the Scottish Highlands appears to be rich in such examples; and we heard afterwards of similar species being found by Mr. Slight in Bamffshire, and deposited in the Highland Society's Museum in Edinburgh, where we believe they were seen by M. Agassiz. The new fishes were also obtained from the middle and upper red sandstone, by Mr. Lyell and Dr. Malcolmson; and a complete account of those discovered by Mr. Miller had been published in "The Witness," an Edinburgh newspaper. But we may briefly state that the particular animals new to paleontology, exhibited to the Section, and animadverted on by M. Agassiz, were, first, a winged fish so nearly resembling crustacea, as with great difficulty to be distinguished from an insect. It is about an inch or little more in length, and the wings are upon the shoulders, nearly in the same position as in the dragon-fly. The second was characterised by a curiously spotted head and tail. Both were found near Forres in the lower red sandstone, and were altogether new in genera and species. The middle formation was full of holopticius of a very large size, and other remains usually prevalent with them.\*

The winged fish was named *Pterichthys Milleri*, in honour of its discoverer; and the other, which had been described by Dr. Malcolmson, was also a pterichthys. All belonged to the same geological age, and it was expected that in a few years, between Cambrian and Russian specimens, we should have the whole *Fauna* before us. Some of Mr. Ibbetson's admirable daguerrotypes copies of them were handed about, and gave, indeed, most perfect representations of every subject.

Mr. Bowman read a paper 'On the Geology of North Brazil,' the results of some investigations by Mr. Gardner, a young botanist, who was educated in Glasgow, and who had examined the geology of the country at his request.

Mr. Featherstonhaugh explained the physical geography of the British territories, the boundary line on the frontier of New Brunswick, avoiding all political reference, but shewing in the clearest manner, upon these data alone, that the American claims could not for a moment be maintained. But as we have sufficiently illustrated this important matter in two numbers of our Journal (see Nos. 1228 and 1236), we shall not travel over the ground again, even with its additional geological and geographical confirmations.

Lord Greenock was called upon to give some account of the lead veins found on his brother's estate on the confines of Galloway and Ayr-

\* In the course of this discussion, very handsome compliments were paid to Lady Cumming Gordon, who was described not as a mere amateur collector, but an active and scientific geologist, who had, herself, formed one of the most rare and interesting museums in the kingdom.

shire. His lordship stated them to be of very considerable and rising value to the industry and wealth of that part of the country. The ore was found, as Mr. Milne had described it to be elsewhere, in the north of Scotland, running N.N.E. and invariably near granite. A red hematite was found still nearer. No copper was discovered, but mineral remains in great quantities. As a proof of the progress which had been made in working this mine, his lordship mentioned that 200 tons of lead were taken in procession to Ayr, much to the delight of the working population around, who saw in this a new source of profitable employment. In answer to a question proposed, he said that the average proportion of silver was five ounces to a ton of the lead, though in some cases there might be eight or ten ounces per ton. The produce was carried to the Liverpool market.

Dr. Hannay exhibited and explained the sectional drawings of the Clyde, prepared by the late Mr. Logan, engineer to the River Trustees.

Mr. Knipe gave an account of the Closeburn Basin of Dumfriesshire.

#### SECTION D.—Zoology and Natural History.

1. Dr. Martin Barry, 'On the First Changes consequent on Fecundation in the Mammiferous Ovum, with special reference to a communication 'On the Development of the Fish in the Egg,' made to the British Association on Tuesday, 29d September, 1840, by Professor Agassiz.'

2. Dr. Burns, 'On Cotton grown in India.'

3. Sir W. Jardine, 'On the Habits of the Genus *Prionites*.'

4. Mr. Murchison, 'On Coloured Water from the Baltic.'

Dr. Burns (No. 2) exhibited several descriptions of cotton, cultivated in Gujerat, to show the variety that existed in the cotton plants indigenous to India. He spoke of the necessity of, and facilities for, irrigation, to bring cotton to perfection there; and, in regard to the failure hitherto in the successful introduction and cultivation of the American cotton, he recommended, rather, attention to be directed to the indigenous seed, so that by culture the former may be equalled.

Dr. Lankester, in the absence of Mr. Forbes, exhibited some coloured water brought from the Baltic by Mr. Murchison.—Dr. Walker Arnott had examined the water; the colouring matter consisted of a filamentous substance. He could not detect, with the small glass he possessed, any articulations in the fibres, and suspected that they were not of vegetable but animal production. Dr. Fleming, who had spoken with Mr. Murchison on the subject, stated that the sea was covered with these floating filaments for miles in extent, producing a dirty white discoloration in the water.

The paper No. 1 was unsuited for publication. No. 3 was not forthcoming, and the Section adjourned.

#### SECTION F.—Statistics.

Papers and Communications announced to be read, but time did not allow.

1. Mr. Heywood, 'On the State of Education in Hull.'

2. Rev. Dr. Chalmers's 'Statistics of the Population and Agriculture of Dumfriesshire.'

3. Mr. Wilson's 'Comparative Views of the Population of Scotland.'

4. Captain Miller's 'Comparative View of Crime in London, Dublin, Glasgow, and Liverpool.'

5. Mr. Rutherglen's 'Statistics of Crime in the Suburban Districts of Glasgow.'

6. Mr. Leadbetter, for Mr. Stow, 'Statistics of Glasgow Normal School.'

7. Dr. Hannay's 'Statistics of the Glasgow Lock Hospital.'

8. Mr. Rawson, 'On the Connexion between Crime and Ignorance.'

Captain Miller read a supplementary paper in reference to the criminal statistics of various

large towns, in which he compared the number of the population in London, Dublin, Liverpool, and Glasgow, with the police force employed, and the number of convictions in each. Papers as to the statistics of Gorbals, Calton, and Anderston police establishments, were also brought forward and read; after which some short remarks were made by Messrs. Chadwick, Rawson, and others.

Lord Sandon having stated that an opportunity would now be afforded to any gentleman who had questions to put on the subject of Dr. Chalmers's paper, read yesterday, to do so.

Dr. Alison said, from the respect which every one bore to Dr. Chalmers, and which he most cordially paid to the Rev. Doctor, he would not enter upon a formal examination, by questions and cross questions, especially as this was not matter to be decided by any flash of oratory, but by reflection on the manner in which statistics could be brought to bear on the points at issue. He proceeded to put some questions through the chairman, which afforded Dr. Chalmers and others an opportunity of answering them, on which a lengthened discussion ensued as to the likelihood of Dr. Chalmers's scheme, of drawing voluntarily from the resources of the working population, succeeding in other parishes where there was less of those influences which the Rev. Doctor had brought to bear on the parish of St. John's. Dr. McFarlan of Greenock, Mr. Colquhoun, Dr. Buchanan, Sheriff Alison, Sir Charles Ferguson, and Mr. R. Owen, took part in the discussion. Dr. Alison contended that, although Dr. Chalmers had shewn there was a diminution of the number of paupers on the poor's roll, he had failed to produce statistical facts, such as he (Dr. Alison) had brought forward in regard to Edinburgh, to prove that the experiment had brought a greater amount of comfort in the dwellings, fuel, clothing, and food of the poor, than there would have been by legal means of provision.

Dr. Chalmers went over in substance what he stated at the previous meeting, shewing that the deacons were in the habit of making a careful scrutiny of cases, and that there was such a result as he had formerly stated of the reduction of paupers without any complaints being made that were not answered.

The discussion was all but interminable.

#### SECTION G.—Mechanics. Papers and Communications.

1. Dr. Patterson, 'On an Improved Life-boat.'

2. Mr. Grime, 'Additional Remarks on an Improved Wrought-iron Locomotive Wheel.'

3. Mr. Clarke, 'Exhibition of the extraordinary Power of an Electro-Magnet, on a Gigantic Scale.'

4. Mr. C. W. Williams, 'On the Prevention of the Generation of Smoke in Steam-Engines and other Furnaces.'

5. Mr. Thom, 'On an Improved Rain-Gauge.'

6. Mr. Thom, 'On the Filtration of Water.'

Sir John Robison in the chair.—The Rev. Dr. Patterson read a paper 'On an Improved Life-boat.' The principles of it are explained as follows:—A life-boat on a new principle was exhibited by the Rev. Dr. Patterson; he calls it a Riddle Life-boat, and is his own contrivance. The reason of the name is that the bottom of the boat is like a riddle; and the characteristic property of the boat is that it cannot fill with water, as the waves get out as fast as they enter the boat. The sides of the boat consist each of a hollow elliptical tube, to be made of sheet-iron, and from this it has all its buoyancy, which is unaffected by any influx of water. This boat will be light, easily propelled, and will draw only a foot or two of water: it may pass through the most dangerous surf with perfect safety; and, besides being

used for reaching vessels in distress, or carrying passengers to steamboats, it might be itself carried as a ship's boat in voyages, to be ready for use in danger or difficult landing.

Mr. Thomson, on the part of Mr. Grime, gave 'Additional Remarks on an Improved Wrought-iron Locomotive Wheel.' Mr. Vignoles, and other gentlemen, took part in the debate which followed.

The chairman then called the attention of the Section to an exhibition of the extraordinary power of an electro-magnet on a gigantic scale.

Mr. Williams's paper (No. 4) related principally to the practical and complete combustion of fuel in a furnace, and to the part which air plays to this end. He contends that the material employed and the air admitted should be in equivalent proportions, that is, the air admitted should be in chemical relation to the quantities of the gases with which it is to combine. And, moreover, that every facility of time and temperature should be given to the perfection of their chemical union. Inattention to these points was the source of incomplete combustion, and the cause of smoke. Every attempt to consume smoke by subjecting to great heat has been, and Mr. Williams said, will be, unsuccessful; the object to be attained is to prevent, and not to remedy, the evil. By a new construction of furnace, by allowing the air to pass therein through numerous jets in no greater quantity than would combine, and by promoting the thorough mixture of the air with the gaseous products of the coal, Mr. Williams has succeeded, on a practical scale, in causing the perfect combustion of coal, and without the formation of smoke. He has, in short, arrived at the *ne plus ultra* of combustion—the greatest economy in the use of fuel.

Mr. Williams and Mr. Fairbairn have been appointed the committee to report to the next meeting of the Association 'On the Combustion of Coals, to ascertain the greatest Calorific Effects, and the least Smoke.'

Mr. Thom gave an account of an improved rain-gauge; also of the water-filters used at Greenock and Paisley; the latter are composed of small pieces of the trap-rock of the neighbourhood mixed with fine sand.

A revolving balance was described by Mr. Lothian: it consists of spirals in one continuous curve,—not intelligible without a sight of the instrument.

This having concluded the business of the Section, Mr. C. Vignoles proposed a vote of thanks to Sir John Robison, for his conduct in the chair throughout the continuance of the meeting, which was most cordially carried.

The finale of the Glasgow Meeting was worthy of the city and its authorities; the splendid dinner given by the Lord Provost and Magistrates to about a hundred and fifty of their visitors: the whole number who sat down being about two hundred.

A repetition of dinner-toasts and speeches is certainly not very scientific, but as part of the picture of the entire meeting, we think it only fair to devote a small portion of our history to this grand assembly of Sections, whose performances were equally zealous and useful.

After dinner the usual loyal toasts were drunk, and "The Army and Navy" called up.

Lord Greenock, who said he might be permitted to observe that this toast was by no means inappropriate even in a meeting of scientific gentlemen, for in this country war was connected with the sciences; and, although not represented in any of the Sections, nevertheless

we had good assurance that, in the present state of our knowledge of that science, we were not behind any other country in the world; and the United Service would be fully ready to give practical proof of it whenever war threatened our country.

Captain Grace, R.N., returned thanks for the navy.

The Lord Provost, after a suitable introduction, gave "The British Association and the Marquess of Breadalbane," who had presided at the meetings in Glasgow with so much credit to himself and honour to the Association.

The Marquess of Breadalbane acknowledged the toast. He considered it a high honour to have his name identified with the British Association, and was not less gratified by being the medium for conveying the thanks of a body so important to a great corporation like Glasgow, for its kindness and hospitality. The noble Marquess concluded by proposing "The City of Glasgow, and the Lord Provost and Magistrates." The toast was drank with all the honours.

The Lord Provost returned thanks, and again stated that it afforded the magistrates the greatest satisfaction to shew the respect which they felt for the British Association, and to the distinguished foreigners who had honoured them with their presence on this occasion.

[We cannot but stop to notice the extent of popularity of the best kind which rewarded the noble President for his discharge of the duties of this office. All parties in politics and religion merged their differences to bestow their meed of applause on his conduct in this instance; and we are the more forward to record it, because it has always been a favourite theme with us, that if the wealthy and the great could only know how much they may obtain at the expense of some little time and countenance given to science and literature, they would all be much more desirous than they are to come forward on their behalf. The Marquess of Breadalbane won golden opinions from all ranks and classes of men by becoming President of the British Association, and devoting a single fortnight to the task; and this in the midst of Non-Intrusionists and Intrusionists as hot as fire, and Whigs, Tories, and Radicals, of every shade of opposition and violent politics. Surely it ought to be a lesson and example to others. By the same means, only more constant and prolonged, as well as by his refined courtesies and amiable manners, the Marquess of Northampton has achieved a most enviable popularity. Lord Sandon, at this meeting, also made distinguished way; and, in short, our theory received such ample confirmation, that we trust we shall see it more generally received and warmly acted upon.—*Ed. L. G.*]

Lord Belhaven proposed "The University of Glasgow, and Principal Marfarlan," and entered into a high eulogium upon that ancient seat of learning, and of the eminent men in science and literature who had presided over its several departments.

Principal Macfarlan, in acknowledging the toast, said the University was an institution of 400 years' standing, and, during that period, had sent forth to the walks of life many noble specimens of her powers of tuition. The rev. gentleman dwelt for a moment on the importance of the study of the classics, coupled with a well-grounded knowledge of the arts and sciences, which it was the province of the University to teach. He then proceeded to give "The Scientific Institutions and Societies of Europe and America, coupled with the name

of General Tcheffkine;" for which the General returned thanks, and proposed "The Memory of James Watt, and the other eminent men who have contributed to the advancement of science."

Sir J. Robison next gave and proposed "The Noblemen and Gentlemen from other parts of the kingdom, who had honoured the meeting of the British Association with their presence."

The Duke of St. Alban's returned thanks.

Professor Airy, in proposing "The Astronomers of the Continent," said he might, in stating some peculiar grounds on which he called the subject of the toast to their attention, advert to some circumstances, which, though of a personal nature, would not be considered altogether out of place on the present occasion. Ten years since he was requested to draw up the report of the Society on astronomy, and he need not say with what rejoicing he went through that labour, for it altered his views materially with regard to the comparative merits of our astronomers and those of other nations. It served to convince him that we were not so great men as we thought ourselves—that we were not the first of astronomers; and he had great satisfaction in thinking that the published efforts of our researches, commenced through the agency of the British Association, had not been entirely without its effect in supporting a similar opinion among other persons who had taken an interest in the subject. When he came to examine particular points, he found that among all the nations to whom merit was due, there were none came up to that nation represented by two astronomers present—a nation with which every individual here might feel proud to be connected by birth—he meant the German nation. When he thought of the steps which had been made by them in different branches of astronomy, he found that their characteristic merits lay in bold speculations and deep research on particular points, while in our own country we excelled in practical applications, in working out details, as in many branches of business. Having said this in support of the German nation, he had only to state that they were honoured by the presence of two astronomers from that nation; and, although it was needless to give any specification of their merits, he could not pass over the name of the illustrious Encke, as the discoverer of the comet which bears his name in every mouth but his own. In conclusion, he gave "The Astronomers of the Continent," coupled with the name of Encke. The toast was drank with great applause.

Dr. Encke said they had heard from a noble lord yesterday, there were no foreigners in science, but he did recognise a difference. There were some who spoke English perfectly, some indifferently, and some still worse. He confessed he belonged to the latter. He regretted that he had been so late in arriving in Glasgow, having been detained by unavoidable circumstances till yesterday. He would not detain them by any remarks, but would remember the present occasion as one of the proudest in his life.

M. Jacobi also returned thanks.

Lord Sandon, who was received with loud cheering, proposed "Railway Communication, and other improvements which tend to facilitate intercourse between mankind, and thereby to promote friendly relations." The principal topic of his toast had been already touched upon by General Tcheffkine, with great grace and eloquence. He had shewn the peculiar

facility with which, by means of railway communication, travelling from one country to another was now attended, and without which so many distinguished men of all countries could never have hoped to meet in this part of the world. After commenting on these facilities, and the results they promised—"universal peace," and referring to the peculiarity of the present year as regarded railroad achievement,—the opening of such an immense extent of way,—Lord Sandon, in conclusion, observed: "But, while boasting of these wonders of science, and these mighty works, perhaps it would be permitted to one who had mingled much in the business of life to touch, upon the present occasion, a graver note; perhaps they would allow him, in the words of an eloquent writer, to mingle a bunch of myrrh in the festal goblet—to make the wine, if more bitter, at least more wholesome. Let him remind them that the splendid outside they saw was not the whole which, as citizens of the world, as citizens of this country, as men and as Christians, they were called on to consider. They were called on not only to consider the extent of these wonders, but the happiness of the men that produced them. We had thousands and tens of thousands of men, women, and children, who were, from day to day, the objects of suffering and sorrow; let them, therefore, be careful, lest in admiring the wonders of the machine, they forgot the happiness of the citizen. The consideration of these points was the peculiar province of the Statistical Section; and, perhaps, he might be allowed to refer to the nature of many of the papers read there, which disclosed, by the admission of all the antagonist parties who met, a fearful amount of misery, degradation, and crime. It was not the business of that Association to suggest a remedy for these evils. It was the province of other associations of moralists, divines, and philosophers, to suggest what the remedy ought to be; but it was no unworthy business of science to detect the evil, and, if possible, to trace it to its source. He hoped he would be excused for having touched upon this graver note; but the subject was one of great importance, and one which the British Association had admitted as a part of their investigations, and he felt it his duty thus slightly to refer to the topic. He would not trouble them longer, but propose the toast."

Professor Encke had the honour, he said, to be a member of the Royal Society of London, of which the Noble Marquess (Northampton) was the illustrious head; that Society was the most ancient, as it was the most illustrious of all our learned associations. It had done much to promote the physical sciences, and by its southern expedition had conferred a benefit upon the world at large. He proposed "The Royal Society and its Noble Chairman, the Marquess of Northampton."

The Marquess of Northampton returned thanks in name of himself and of the Royal Society. That Society was proud to number among its sons such men as the celebrated astronomer who had just proposed the toast, and they had much reason to be proud of so honourable a connexion. When a sovereign receives a company of subjects, he or she receives them all with courtesy and with respect; but when there passes before the throne one of the most distinguished of her subjects—a hero or a legislator—then she justly feels proud of having such a subject within her dominions. In like manner was the Royal Society proud of such a man as Professor Encke. He had alluded to the expedition to the southern regions; and he

begged leave, in addition to that, to refer to the extensive researches that were going on under the authority of government, by means of fixed observations in different parts of England. He would also take the opportunity to express the acknowledgments of the Royal Society to other governments besides our own for the assistance they gave in obtaining accurate observations; and he might state that, only a short time ago, he had received from the Russian ambassador in this country a letter, which shewed strikingly the great attention the Russian government paid to these researches. He observed that a toast had been committed to his charge, and he was sure it was one which they would all respond to with the greatest enthusiasm; it was "The Foreigners who have contributed so much to the interest and success of the meeting of the British Association."

Count de Lille acknowledged this honour; and M. Mohr, the eminent German chemist and author, being loudly called for, also expressed his sense of the compliment. This was participated by all his countrymen present.

[We may notice that, in some opinions, it was thought that the German philosophers who attended the meeting were not brought as prominently forward on these public occasions as their great talents and fame entitled them to be, in comparison with the most distinguished foreigners from other lands. This, perhaps, was the case; but it is extremely difficult to do justice to all where so much merit is collected into one focus.]

Professor Buckland gave "The Ladies," with much good-humoured praise; naming Mrs. Somerville, Joanna Baillie, and Miss Sinclair.

Some local toasts followed: then

Sir David Brewster, who was received with loud cheers, proposed "The Health of his Highness the Rajah of Travancore, the great promoter of science in the East." This prince was only twenty-eight years of age, and had not reigned more than ten years, yet, during that short period, he had caused himself to be distinguished by his accomplishments as well as by his liberality. They would, no doubt, be interested in learning that this prince was educated by his prime minister—a rare tutor for a sovereign. The prime minister was a Brahmin, from Tanjore, and, what was also remarkable, he had been educated by a man of science and a missionary, Elias Swartz, the well-known author of the "Flora Botanica." This excellent man had sent home many exotic plants that grew in the favoured clime of India; but he had left behind him what was far more valuable, the seeds of knowledge and civilisation,—seeds that were beginning to germinate in India, and which would soon exhibit their natural growth of stems and leaves. Might they not hope, too, that he had left there some of the seeds of morality and religion, and that these might yet overshadow, by their extensive foliage, the land in which they had been planted? They had, at one of their meetings, voted a sum of money for determining how long physical seed might lie in the ground, and yet retain life; but they required no money to know that the seeds of morality and religion never died, and that, in the arrangements of Providence, one day or other they would bear a certain harvest. The Rajah had established schools within his dominions—he had established a mathematical school under English superintendence; but he had done more—he had done what, he was sorry to say, had neither been done in England, Scotland, nor Ireland—he had established a

school in every village of his dominions—and he gave education to every child, male and female—he begged them to mark the word, female—a change in Indian customs that might lead to the happiest results. He was informed, on good authority, that there was not a child who had reached eight years of age not capable of reading and writing; but this distinguished prince, not satisfied with advancing the interests of elementary education, had established an observatory, and placed in it an English gentleman, a member of the Royal Society of London, and who was in that room—he meant Mr. Caldecott. In this observatory, observations were carried on with the same success as under British interests. The Rajah had also established a magnetical and meteorological observatory, having been led to do so by becoming acquainted with a report on meteorology, published by the British Association. And the observations taken there were found to be as accurate as those taken in Edinburgh, Philadelphia, and other places. Sir David then proposed "The Health of the Rajah of Travancore," and, along with his name, coupled that of Mr. Caldecott.

Mr. Caldecott shortly returned thanks.

Lord Montagu proposed "The Commercial and Manufacturing Interests of the Country, which owe so much to Science for their advancement." There was not a stroke of industry that was successful here that did not extend in its great and glorious consequences throughout all the nations of the earth. And in like manner, as Science had advanced us in the power and production of wealth, she had taught us also to deal with the subject of wealth and commerce; and that the wealth and commerce which God and Nature had placed at our disposal were not to be viewed as only for our own benefit, but as blessings committed to us for the benefit of mankind.

Mr. Lyell gave "The Health of M. Agassiz, the celebrated Naturalist," which was drunk with loud cheering. In the course of his remarks, Mr. Lyell stated that while M. Agassiz was making observations on the Alps, he discovered the existence of a small insect living in the very ice.

M. Agassiz replied with great feeling and energy; and repeated his warm acknowledgments in the terms "Vive la Société Britannique!"

Other toasts called Mr. Gurley (U. S.), and others, and particularly Mr. Murchison, who, in returning thanks for his health being drank, described the first meeting of the British Association at York, where it was first and most zealously cherished by five natives of Scotland, Sir D. Brewster, Professor Forbes, Sir J. Robison (we believe), another, and himself. He took glory to his native country for this fact.

The company broke up at a late hour after a most sumptuous entertainment, in which the *utile et dulce* were delightfully mingled.

#### SATURDAY.

##### SECTION F.—Statistics.

Colonel Sykes in the Chair.—Mr. Alexander Watt read the following paper:—"Comparative View of the Vital Statistics of Edinburgh and Glasgow during the year 1839; also, Tables of Mortality for Edinburgh and Leith for 1835, 1836, 1837, 1838, and 1839: with some Remarks on the Sanatory State of Large Towns, and on the Present State of the Registers of Births, Marriages, and Deaths, in Scotland," &c.—"The sanitary

condition of large towns has of late years excited much attention, and any statistical information regarding it must be considered important. The mass of information lately given to the public by the Select Committee of the House of Commons, the Poor-Law Commissioners of England, Dr. Alison, Dr. Cowan, Mr. Simons, and others, together with that contained in a late able article in the 'Quarterly Review,' renders it unnecessary for me to indulge in any lengthened remarks. It clearly appears that the high excess of mortality in large towns arises in a great measure, if not altogether, from the wretched state of the dwellings of the poor, from the want of proper ventilation, cleanliness, proper food and clothing, sewerage, &c. That the evil may be to some extent remedied, by removing these as the sources of it, cannot be doubted, after examining the evidence before us. And since these salutary improvements 'are not less necessary for the welfare of the poor than the safety of the property,' and the preservation of the health, of the rich, it may be hoped that vigorous efforts will speedily be made to carry them into effect." Mr. Watt proceeded, at considerable length, to describe the very imperfect state of the registers for births, marriages, and deaths, in Scotland; and to urge the necessity that a legislative measure, similar in its provisions to the Registration Act for England, should be extended to other great divisions of the empire, in order that many interesting facts in relation to the state of the population may be established. He continued,— "There are many interesting speculations which a full and correct system of registration will enable us to solve. In connexion with the sanitary state of large towns, as the weather is known to have great influence on the human frame, it becomes an interesting speculation what state of the atmosphere is most prejudicial to health, and whether or not these pernicious effects are more fatal when combined with local circumstances in large towns than in the country, and how they can be most effectually guarded against. To attend to these with proper advantage, it would be necessary to have a complete set of meteorological tables published in connexion with mortality bills. It is not only necessary to know the temperature or weight of the air at particular times, but also the direction and force of the wind, with the quantity of moisture it contains; also its electrical state, together with the quantity of rain that falls. As there is to be brought into immediate operation a complete set of meteorological instruments at the Glasgow observatory now erecting, Dr. Nichol, the astronomer, has kindly offered to give these observations for insertion in the mortality bills of this city; and should similar observations be taken and published in other parts of the country, some light may be thrown on this interesting and important subject. In order to shew what effect the weather has in the mortality of Glasgow, I have calculated the proportionate mortality of the different seasons on the average of the five years, commencing with the 1st of November, 1834, and find that for every 1000 deaths which have taken place during the winter months, these five years there have died, during the spring months, 994.09; during the summer months, 779.56; and during the autumnal months, 825.92. But of these numbers, the greater proportion of deaths during winter and autumn is of children under five years of age; and in spring and summer of those above that age, including adults. As the mortality bills of Glasgow, previous to 1835, do not give the deaths

monthly at the different ages, I am under the necessity of taking the average of the deaths of children during the four years commencing with the 1st of November, 1835. They run thus: for every 1000 deaths among children under five years of age, during the winter months for these four years, there have only been 898.32 during spring; 758.98 during summer; and 893.15 during autumn. While the deaths of children under five years of age were as 1 to 72.01 of the estimated population of Glasgow in the year 1839, they were only 1 to 141.95 of the estimated population during that year in Edinburgh; or otherwise, while the deaths of children under five years of age amounted to 50.19 per cent of the whole deaths in Glasgow during that year, they amounted only to 33.07 per cent of the whole deaths in Edinburgh. I regret that my time did not permit me to construct tables of mortality as fully, for the preceding four years for Edinburgh, as I have done for 1839, while it appears that there was a somewhat corresponding increase and decrease in the mortality of Edinburgh and Glasgow, in consequence of the state of the weather or some other unknown cause. I am unable to state what the average mortality among children has been these five years in that city. It appears, however, that the deaths under these years have been considerably greater in Glasgow than in some other towns: in 1839, they have been excessive, when compared with those of Edinburgh. This high state of the mortality of children in Glasgow must be attributed to different causes. It is stated by Mr. Porter (from the returns of Christ's Hospital for the period of twenty years) that when children are furnished with substantial clothing, an abundance of wholesome food, good lodging, healthful exercises in the hours allowed for recreation, and immediate attention on the first appearance of sickness under the care of skilful medical men, the mortality among them is very low indeed. A deficiency of these, therefore, during the present high price of food, may be one of the principal causes of the excess of mortality among children in 1839; and the excess of these deaths, during the winter months, may be considered as in some measure corroborative of this. Much has been said as to the fatal effects of intemperance which prevails among our labouring population; and this worst of all evils, where it does exist, must operate most perniciously. At the same time, I am by no means prepared to admit that the bulk of our more respectable working classes are less temperate in their habits than are the more wealthy classes either in Glasgow or elsewhere. When I first turned my attention to the introduction of a classified list of the diseases which caused death into the Glasgow mortality bills, it was principally with the view of ascertaining what might be done to obtain a correct knowledge of the general character of those diseases that were most prevalent and fatal in the city and suburbs, and I am indebted to Dr. Corkindale, and also to Dr. Cowan and other medical gentlemen, for their assistance in this matter. These gentlemen, as well as myself, however, are well aware that the arrangement adopted is still defective. And it would be an object of great importance, were some general plan well digested and arranged for the use of all tables of this description throughout the British dominions. Different opinions are held regarding the method best adapted for the attainment of this object. For myself, I am not satisfied that, under any system of registration, the method of so minutely recording the different diseases which the Registrar-general of Eng-

land has adopted, can be relied on for its accuracy in a community like this, more especially in the minute details of those diseases which may not at all times be easily discriminated. Such a method as that suggested in the paper read by Dr. Allison before the British Association at Dublin, in my opinion, would be more to be relied upon, so far as the working of it in the registers is concerned, than any other I have yet seen. I am glad to learn that that gentleman intends again to bring the subject before the Association on the present occasion. I trust, however, that one uniform plan will shortly be adopted for the use of all mortality bills, when much good may be expected to result. One of the more difficult tasks attending the making out of annual bills of mortality for large towns is to estimate correctly the population during the intermediate years of the census. With regard to the population of Edinburgh and Leith, I have estimated them on the supposition that the one is increasing, and the other slightly decreasing, at the same rate that they did between the census of 1821 and that of 1831. From the best-informed on this subject in Edinburgh, I am given to understand that the population of that city has not increased in the same ratio since 1831 as it did during the preceding ten years. But as the population of Glasgow is estimated to have increased at a considerably greater ratio than it did between the two last censuses to the amount of 14,000 on the whole ten years, and as one of the chief objects of constructing these Tables was to give a comparison of the vital statistics of these two cities, it is, therefore, difficult to say which of the two estimates will be nearest the truth when they come to be corrected by the census of 1841. My impression is, that the comparison will be found to be rather favourable to Glasgow than otherwise. I subjoin the mode I have adopted in estimating the population of Edinburgh and Leith. The estimate for the population of Glasgow is made out on similar principles, although the ratio of increase is higher than that which took place during the ten years preceding the census of 1831." [Mr. Watt here expressed his cordial thanks to many gentlemen and public bodies in Edinburgh for the facilities they had afforded him in the course of his research.]

"*Estimate of the Population of the City of Edinburgh, including the Suburban Districts of St. Cuthbert's and the Canongate, for the intermediate years of the Census of 1831 and that of 1841:—*

The population of Edinburgh in 1831 was 136,054  
And in ..... 1821 was 112,235

Being an increase in 1831 of ..... 23,819

Therefore, as  $136,054 + 23,819 = 5.71$ , or the ratio of increase at the commencement of the next ten years. Assuming the rate of increase to be the same from 1831 to 1841 as it was between 1821 and 1831, it is found by simple proposition thus:—

1821. 1831. 1831.  
112,235 : 136,054 :: 136,054 = 164,927 the pop. of Ed. in 1841  
From which deduct ..... 136,054 ditto 1831

Showing an increase in 1841 of 28,873:

Therefore, as  $136,054 + 28,873 = 4.71$ , or the ratio of increase at the end of the ten years. Find the medium rate of increase.

At 1831 the ratio of increase was 5.71  
And at 1841 do. do. 4.71  
Divided by 2  $\frac{10.42}{2}$   
Medium ratio ..... 5.21

Then by this method the increase will be  $\frac{1}{10}$  of 5.21, or:—

136,054	= Increase 1st year,	136,054 = Population in 1831.	
52.1		2,611	
138,665	= Increase 2d year,	138,665	Ditto 1832.
52.1		2,661	
141,326	= Increase 3d year,	141,326	Ditto 1833.
52.1		2,712	
144,038	= Increase 4th year,	144,038	Ditto 1834.
52.1		2,761	
146,802	= Increase 5th year,	146,802	Ditto 1835.
52.1		2,817	
149,619	= Increase 6th year,	149,619	Ditto 1836.
52.1		2,871	
152,400	= Increase 7th year,	152,400	Ditto 1837.
52.1		2,926	
155,416	= Increase 8th year,	155,416	Ditto 1838.
52.1		2,983	
158,399	= Increase 9th year,	158,399	Ditto 1839.
52.1		3,040	
161,439	= Increase 10th year,	161,439	Ditto 1840.
52.1		3,098	
By simple proportion,		164,537	Ditto 1841.
		164,927	Ditto 1841.
		390	

There are, therefore, 390 less by this mode of estimating the increase during the intermediate years of the censuses than by simple proportion; but, as the population is stated in round numbers in the Tables, it is of less consequence. The population of Leith and of Glasgow are estimated on similar principles. The ratio of increase for the population of Glasgow, according to the estimate, is considerably higher than the rate of increase which took place between 1821 and 1831. At the same rate of increase as took place between these two censuses, by simple proportion, we have the population of 1841,—

1821. 1831. 1831.  
147,043 : 208,426 :: 208,426 = 278,688 population in 1841  
By estimate ..... 233,346 ditto 1841  
14,578

The estimated population of Glasgow, therefore, exceeds the rate of increase which took place between 1821 and 1831, by 14,578." [Twelve Tables, containing full information upon the births, marriages, and deaths of Edinburgh and Leith, were here laid upon the table, giving comparisons upon the subject betwixt these towns and Glasgow.]

"*General Remarks.*—I have spared no effort to procure complete and correct materials for the construction of the preceding Tables, in which the results turn out so favourably for the city of Edinburgh. And as the different registers are kept in a manner highly creditable, not only to those who have the immediate charge of them, but also to those under whose authority they are conducted, I have no reason to doubt of the accuracy of the results. And although, from the want of a burying-ground register at Newhaven, and from other causes, the parishes of South and North Leith are given separately from Edinburgh, yet the results given in the Tables for Leith cannot be far from the truth. It is only in the amount of mortality at Newhaven that they can be considered as doubtful.

"*Births and Baptisms.*—Abstracts of Births and Baptisms, as engrossed in the different registers of Edinburgh and Leith, are given in the Tables; but as these, like all the other registers of births in Scotland, are incomplete, they cannot afford data for any calculations in vital statistics, till some legislative measure is obtained for their improvement."

"*Marriages.*—After a few introductory remarks on marriage statistics, Mr. Watt pro-

ceeded:—"The proportion which the resident marriages in Edinburgh bear to the estimated population in 1839 is as 1 to 153,996, or 0.649 per cent; and in Leith, as 1 to 104,634, or 0.955 per cent. The proportion which the resident marriages of Edinburgh and Leith inclusive bear to the united population in 1839 is as 1 to 144,449, or 0.692 per cent. In Glasgow, in 1839, the proportion which the resident marriages bear to the estimated population is as 1 to 124,942, or 0.800 per cent.

Marriages in Edinburgh and Leith inclusive...	Per Cent. 0.692
... in Glasgow .....	0.800

Greater proportion of Marriages in Glasgow by 0.108

Could these marriages of 1839, therefore, be taken as the average number, 0.108 per cent more marriages take place in Glasgow than in Edinburgh and Leith; but these Tables must be made out for a series of years before this can be established.

**"Deaths.**—There is a remarkable difference of the ages at which the deaths took place in Edinburgh and Glasgow in 1839. The number of deaths which took place in Edinburgh under twenty years of age, during that year, was only 43,060 per cent of the whole deaths; while in Glasgow they were 62,312 per cent. And while the deaths above twenty years of age in Edinburgh were 56,939 per cent of the whole deaths, they were only 44,30 per cent in Glasgow. Table 7th shows that there was an excess of deaths in Glasgow at all the ages specified in the Table under 30 years of age; and at all the ages specified above 30 years, there was an excess of deaths in Edinburgh, with the exception of the ages between 95 and 100, at which they were equal, and of one who died above 100 years of age in Glasgow. The preceding Tables of Mortality for Edinburgh and Leith for the five years commencing with the 1st January, 1835, shew that though there is a considerable difference in the rate of mortality of these towns from that of Glasgow during these five years, yet it appears that those years which were the most unhealthy at one place were the most unhealthy at the others. But in 1839, which was the most healthy of these five years in Edinburgh and Leith, there was an increase of deaths in Glasgow in that year over 1838, owing to a great mortality at the early ages.

**"Proportion of Deaths to the Population in 1839.**

The total deaths in Edinburgh, including Leith, were as .....	1 to 45,435 or 2.200
While in Glasgow they were as .....	1 to 36,146 or 2.766

Difference in favour of Edinburgh and Leith... 586

**Average Annual Mortality.**

Average annual mortality these five years in Glasgow (exclusive of still-born) was as .....	1 to 31,339 or 3.190
Do. in Edinburgh and Leith (do.) as .....	1 to 37,601 or 2.659

Difference in favour of Edinburgh and Leith... 531

The following Table exhibits at different ages the proportion which the Female Deaths bear to 1000 Male Deaths, during 1839, in Edinburgh:—

Ages.	Males and Females.	Proportion which the female deaths bear to 1000 male deaths.
Deaths under 5 years .....	Males .. 1000 Females .. 858.09	
Do. 5 and under 20 years .....	Males .. 1000 Females .. 856.35	
Do. 20 and under 50 years .....	Males .. 1000 Females .. 1006.65	
Do. 50 and upwards .....	Males .. 1000 Females .. 1371.91	
Do. at all ages .....	Males .. 1000 Females .. 1007.75	

\* As the sexes of the still-born children are not fully noted in all cases, and as the premature births are not fully recorded in the registers, the proportion of males and females cannot be shewn in the above Table.

"The above Table would be more valuable were these proportions shewn on the average amount of deaths for five years, as in the corresponding Table in the Glasgow Mortality Bill, which I am at present unable to give; but, by comparing the foregoing with the one referred to, a considerable difference will be observed in the relative proportions of male and female deaths at the different ages.

**"Diseases.**—The diseases in Table 7th are classified in the same manner as those in the Tables of the Mortality Bills for Glasgow, and as explained in the appendix of the one for 1839. It will be observed that the diseases which proved most fatal in Edinburgh in 1839 were, 'aged, catarrh, diseases of the head, of the heart, inflammation and nervous,' with those classed under the term 'miscellaneous.' All the others proved most fatal in Glasgow. The relative proportions which the deaths by the different diseases in the one city bore to those in the other are exhibited in the Table. The following is a comparison of the deaths by fever and eruptive fevers, at different ages, which took place in Edinburgh and Glasgow in the year 1839. It is to be regretted that the deaths by these diseases, on the average of five years, cannot at present be given for Edinburgh to compare with those given in the last mortality bill for Glasgow. The comparison of those for 1839, however, is complete. As to the column of 'diseases not ascertained,' these consist of such cases as are not easily discriminated; several of them being named in the registers 'inward complaint,' &c. It is obvious, therefore, that to whichever columns the numbers under this ought to be transferred, very few of them belong to the columns of fever and eruptive fevers, the characteristics of which are so strongly marked. There are some cases, however, upon the recording of which due attention has not been bestowed; yet the number of deaths caused by fever and eruptive fevers in Edinburgh and Glasgow in 1839 may be considered as very complete.

**"Fever.**—In Edinburgh, the number of deaths occasioned by fever was 9.27 per cent of the whole deaths; while in Glasgow they amounted only to 7.16 per cent of the whole deaths. Table 7th shows that the relation which the deaths by this disease bear to the whole population is, in Edinburgh, 0.197 per cent; and, in Glasgow, 0.198 per cent. In Edinburgh, of the whole deaths by fever, the number under five years of age was 15.06 per cent; under twenty years of age, 33.65 per cent; and above twenty years of age, 66.34 per cent. In Glasgow, the number under five years of age was 20.40 per cent; under twenty years of age, 46.19 per cent; and above twenty years of age, 53.80 per cent.

**"Proportion of Male and Female Deaths by Fever.**—In Edinburgh, the number of male and female deaths under twenty years of age, occasioned by fever, was in the proportion of 100 males to 87.50 females; and those above twenty years of age, as 100 males to 86.48 females. In Glasgow, the number of male and female deaths caused by fever, under twenty years of age, was in the proportion of 100 males to 111.01 females; and those above twenty years of age, as 100 males to 59.34 females.

**"Measles.**—In Edinburgh, of the whole deaths by measles, the number under five years of age was 91.37 per cent; under twenty years of age, 100 per cent; above twenty years, none. In Glasgow, the number under five years of age was 89.39 per cent; under twenty years of age, 99.61 per cent; and above twenty years of age, 0.38 per cent.

**"Scarlet Fever.**—In Edinburgh, of the whole deaths by scarlet fever, the number under five years of age was 54 per cent; under twenty years of age, 100 per cent; above twenty years of age, none. In Glasgow, the number under five years of age was 67.93 per cent; under twenty years of age, 100 per cent; above twenty years of age, none.

**"Small-pox.**—In Edinburgh, of the whole deaths by small-pox, the number under five years of age was 85.36 per cent; under twenty years of age, 97.56 per cent; above twenty years of age, 2.43 per cent. In Glasgow, the number under five years of age was 83.71 per cent; under twenty years of age, 94.08 per cent; above twenty years of age, 5.91 per cent.

**"Fever, and Eruptive Fevers.**—In Edinburgh, the number of deaths caused by these two groups, fever and eruptive fevers, was 18.87 per cent of the whole deaths by the fatal diseases. In Glasgow, the deaths by these two groups amounted to 26.44 per cent of the whole deaths by the fatal diseases. In Edinburgh, of the whole deaths by these two groups, fever and eruptive fevers, 50.55 per cent were cut off under five years of age; under twenty years of age, 67.24 per cent; above twenty years of age, 32.75 per cent. In Glasgow, the number of deaths by these two groups under five years of age, was 67.13 per cent; under twenty years of age, 84.07 per cent; and above twenty years of age, 15.92 per cent.

**"Bowel Complaint.**—In Glasgow, during the same year, there were 85.68 per cent of the whole who died by the diseases classed under the head of bowel complaints, cut off under two years of age; while in Edinburgh there appears to have been 83.33 per cent of those who died by this class of diseases, cut off under two years of age."

A lengthened and interesting discussion took place on the subject. All the members of the Section seemed to be aware of the vast importance of the registering of births, marriages, and deaths; and Mr. Chadwick, the Secretary to the Poor-Law Commissioners, detailed the successful working of the system in England. The discussion was maintained by Mr. C. R. Baird, Mr. Chadwick, Principal Macfarlan, Mr. Heywood, Sir Francis Mackenzie, and the Chairman.

#### PARIS LETTER.

Academy of Sciences, Oct. 27, 1840.

SITTING of October 19th.—M. Babinet read a memoir 'On the Discovery of a New Neutral Point in the Atmosphere when the Effects of the Polarisation of the Sun's Rays were almost Imperceptible.' M. Arago had previously shewn, that in the case of the rising or setting sun there was a neutral point about twenty or thirty degrees above the horizon, at a point opposite to the luminary; but M. Babinet had recently observed, by means of M. Savart's polariscope, that there was a neutral point about twenty degrees, just above the sun itself, when rising or setting. M. Arago had not had an occasion of verifying this observation.—M. Biot read a learned memoir 'On certain Data, calculated to serve as Foundations for Establishing the Bases of Chemical Mechanics.'—A paper by M. Liouville, 'On the Convergency of Mathematical Series,' was read to the Academy.—Mr. Milne Edwards presented to the Academy the third and concluding volume of his "Natural History of Crustaceous Animals." The first part of this volume contains the history of the amphipodi, isopodi, lamnodi, and trilobites; the second comprises

the branchiopodi, entomostracæ, crustaceous suckers, and xyphosuri. (This learned work, like all Mr. Milne Edwards's zoological productions, is very highly spoken of.)—M. Despierres communicated a memoir 'On certain new Meteorographical Instruments.' One was for indicating the variations of the electric state of the atmosphere during a single day, operating by means of a line traced with a continuous motion upon a cylinder which revolved once in twenty-four hours.

The "Gazette des Hôpitaux" contains a very important letter from M. Conerbe, of Verteuil in the Gironde, in which he states that the discovery of arsenic in all human bodies was originally made by him, and not by M. Orfila; and that the latter has acknowledged it. He also shews that a considerable quantity of arseniate of calcium exists in the bones; and, also, that the more a body becomes putrid, the more easily is the arsenic extracted from the fleshy and muscular parts of a body. He was one of the physicians who declared that M. Laffarge was not poisoned; and he now adduces the startling fact, which M. Orfila has admitted since the conclusion of the trial, that the peroxide of iron given to M. Laffarge as an antidote to the arsenic he was supposed to have taken, did itself contain arsenic at the time of its being purchased; and that all peroxide does so, more or less. He infers that M. Orfila's proceedings at Tulle, in the case of Madame Laffarge, were pure *charlatanerie*; and he shews that the conclusions of this chemist and the others, as to the arsenic found in M. Laffarge's body having been given him, are perfectly erroneous, the arsenic being no more than what is in every body naturally. M. Orfila has himself partially admitted the truth of these statements; and he is now exhibiting a series of experiments before the Academy of Medicine on the nature of empoisonments.

The Literary Society of Moudoir, in Lombardy, is about to erect a statue, by public subscription, to the memory of the eminent criminal lawyer Beccaria.

We learn, from Bordeaux, that chalk has just been found immediately underlying the sands of the Landes,—a fact contrary to what was usually supposed.

#### AUGUST AND NOVEMBER METEORS.

To the Editor of the Literary Gazette.

SIR,—The subject of November meteors becoming daily more interesting to the astronomical world, as further evidence of their periodicity is adduced, permit me to offer a few remarks on the probable cause of these phenomena.

During the last ten years the fall appears to have taken place on the nights of November 12th, and August 9th and 10th; yet it has frequently occurred that, in place of these meteors, a fine aurora borealis has been substituted; and, indeed, when they have been most numerous, the appearance of auroral lights at intervals, in different parts of the heavens, is attested by many observers. On Nov. 12th, 1837, a magnificent aurora borealis was witnessed nearly throughout the kingdom. In America they had not this phenomenon, but a grand display of shooting stars. During the nights of August 8th and 9th last, auroræ were seen at intervals, though the meteors did not appear in any considerable number.

One hypothesis advanced by a foreign astronomer has met with strenuous support among men of science. This philosopher supposed that

the meteors might belong to a nebulous body, revolving round the sun in 182½ days nearly, the earth, in its annual revolution, coming into proximity with it. In order to render this hypothesis consistent, we must suppose the existence of two nebulous bodies, one of which approaches us in August, the other in November, having an equal period of 182½ days.

We must bear in mind that the periodical meteors, or those so termed, differ from the "bolides" only in their number, and their preserving a fixed point of emanation. Astronomers do not suppose the existence of a nebulous body to produce every appearance of these meteors, as they happen in great numbers in windy weather about December. Are we then bound to admit the existence of even one only to produce the November display?

If the aurora borealis has any connexion with the periodical meteors, and it is not presuming to imagine such to be the case, the above hypothesis appears hardly reconcilable to the supposition.

My opinion has always been that they are magnetic or electrical phenomena, occurring synchronously with some unknown influence of the sun on terrestrial magnetism. The periodicity of the meteors may be owing entirely to solar action at that time of the year, though we know not at present in what way such action could be induced. Observation, however, may throw more light on the mysterious working of magneto-electricity on the surface of the earth and in the atmosphere. Until this influence is perfectly understood, we are not unjustified in upholding the hypothesis I have advanced, that the periodical meteors of August and November are produced by the action of the sun and moon on the magnetism or electrical equilibrium of the atmosphere, though the precise manner in which this action may operate cannot yet be known. The point of emanation and presence of the aurora during their appearance are decidedly favourable to such a theory.

—I have the honour to remain, Sir, your very obedient servant,

J. R. HIND.

#### FINE ARTS.

##### NEW PUBLICATIONS.

##### Findens' Royal Gallery of British Art. Part VI.

THIS number follows close upon the heels of No. I. of "Best Works of the Old Masters," a notice of which appeared very recently in the pages of the *Literary Gazette*; and we are still of opinion that the rivalry between the publications may be advantageous to both.

Messrs. Findens' present number contains "Deer Stalkers," engraved by Finden, after the painting by Edwin Landseer, R.A., from the picture in the possession of His Grace the Duke of Northumberland; "Lear and Cordelia," engraved by Richard Hatfield, after the painting of Gilbert Stuart Newton, R.A., from the picture in the possession of Lord Ashburton; and "Anne Page and Slender," engraved by F. Bacon, after the painting by Sir Augustus Wall Callcott, R.A. This last picture is in the possession of John Sheepshanks, Esq.

The uniform excellence in which this work has been executed, the present part included, is deserving of the highest commendation; whether considered as exhibiting the best examples of native talent in the engraving, or a sound judgment in the varied and tasteful selection from the productions of English painters.

The "Deer Stalkers," after the painting of Landseer, cannot fail to have its admirers, as a work of art in which fidelity in character and beauty of scenic representation are the concomitant features. Of the subject there may, and will, be a difference of opinion. The Nimrods of the day declare it to be an exploit—a successful stratagem; while persons of a temperament like that of the melancholy Jaques, or the sentimental Sterne, may be inclined to say,

"'Tis pitiful, 'tis wondrous pitiful."

How it came to be so, we know not; but the deer-stalker in the engraving, with his face nearly in full, is a very strong resemblance to the late James Northcote, a man as little given to field-sports as any we can imagine. The engraving by Mr. Finden is in the true spirit of the picture.

"Lear and Cordelia," from the painting of Newton, is a subject as touching and as full of pathos as can well be imagined, calling upon our sympathies in every point in which they can be affected. The anxious and ardent features of the kneeling Cordelia—the torpid and deathlike state of the storm-worn monarch—and the solicitous regard and attention expressed in the countenance of the physician, excite the deepest interest.

All which are borne out by one of the most brilliant, clear, and luminous engravings we ever remember to have seen.

"Anne Page and Slender," from the painting by Callcott, brings us into daylight, mirth, and festivity, and exhibits the comedy of art in some of its most striking features. In the figure of Slender we see the most imperturbable obstinacy united with the silliness of the idiot. This, with the half-laughing countenance of Anne Page, and the stupid wonder of Simple, complete the pictorial to its full effect. The accessories, also, are in perfect keeping with the lively scene. Nor is the varied character of the engraving, by Mr. F. Bacon, less an object of attraction, than an example of his brilliant talent.

*Minna Troil.* Engraved by George Doo, from the Original Picture by Samuel Drummond, A.R.A. Moon.

IN breadth, light and shade, and characteristic expression, we think this one of the artist's most successful productions; the melting softness of flesh was never more faithfully represented by the engraver than in the example before us, set off, as it is, by the equally beautiful and varied execution of the accessories. The touching sentiment connected with the character of Minna Troil will find an echo in the breast of all interested in the fate of those who encounter the perils of the deep.

*Bassanio and Portia.* Engraved by George Doo, after the Original Painting of the late G. S. Newton, R.A., in the possession of John Sheepshanks, Esq. Moon.

THE painting, which still lives in our remembrance, with all its brilliant effect of vivid colouring and characteristic expression, was exhibited a few years since at the Royal Academy; and we need hardly say that these qualities are most admirably borne out by the burin of Mr. Doo. The subject represents the scene where Bassanio receives the intelligence of Antonio's distressing situation; the painful feeling in the countenance of Bassanio is powerfully drawn, as well as the anxious solicitude of Portia reflected in the characters introduced in the background.

*Portrait of John Joseph Lawson.* Engraved by D. Lucas, after the Painting by James Sant. Moon.

A GRATED window and the interior of a prison, for the background of a picture, convey no very pleasant idea either of comfort or of tranquillity. Yet the features of the individual so situated suggest nothing like prison thoughts. On the contrary, the expression appears that of self-possession, perhaps that of self-gratulation; but our views of the print as a work of art are favourable, as a brilliant example of mezzotint engraving, and a fair specimen of portraiture.

### BIOGRAPHY.

N. A. VIGORS, ESQ.

MR. VIGORS, M.P. for the County of Carlow, died a few days ago, in the prime of life, at his house near the Regent's Park. At an early age he imbibed a taste for the science of zoology, and in conjunction with the late Sir Stamford Raffles, and one or two others, founded the Zoological Society of London, the fruitful parent of other institutions of the same nature in various parts of the United Kingdom. Until the establishment of the Zoological Society, the interesting study of zoology was almost neglected. Mr. Vigors officiated, for several years, as Secretary; but going into parliament, he found a seat there, and another at the board of the Zoological Society—incompatible! he, therefore, vacated the latter. He was a Radical in politics, and rarely spoke in the House of Commons; but being a business-man, he was very useful in committees.

### THE DRAMA.

*Covent Garden.*—On Thursday (late in the week for us) a *petite* comedy, called *Fashionable Arrivals*, was produced, and met with great success,—as much through the admirable manner in which it was acted, dressed, and produced, as from its own merits; it is, indeed, a light and pleasant little affair enough. It is from the pen of Mr. Mark Lemon.

*Haymarket.*—*The Love Chase* was revived on Tuesday, and gave Mrs. Stirling another opportunity of displaying her very varied and general abilities. She made a very charming *Constance*, though her mode of illustrating the character was more subdued than that of her popular predecessors, Mesdames Nisbett and Walter Lacy: she was, nevertheless, much applauded, and made a decided hit. Mrs. E. Yarnold, as *Lydia*, was another change in the cast; she played prettily. The play was exceedingly well received throughout, and announced for repetition by Mr. J. Webster, who played *True-worth*, a part in which there is not much to do, very effectively.

*Adelphi.*—*Laffarge; or, Self-Will in Woman*, about the production of which there has been a paper war (no skirmish), was brought out on Thursday, and with the most perfect success, before a very crowded house. We have only time to say, this week, that it is quite harmless, and a specimen of very superior acting; that of Mrs. Yates is perfection. Let us recommend our readers to go and see it.

*Olympio.*—On Wednesday "A Slight Mistake" was committed here, in producing a piece under the above title as "never acted." We think we remember it being played at the St. James's Theatre during Mr. Braham's management. It was followed by a very lively farce, called *A Last Day*, in which Mr. Roxby and Mr. Balls sustained the principal parts, and

were very amusing. The house was well attended.

### VARIETIES.

*Mr. Catlin's Gallery*, a pictorial history of the tribes of the Far West, is a wonderful instance of individual perseverance, zeal, industry, and skill; and the most complete illustration of a people and their customs ever collected and exhibited. It is well worthy repeated visits: this, however, we need not say to those who have once been there. We visited it, for the fifth or sixth time, on Monday evening; when Mr. Catlin, dressed as a Crow Chief, described his own, and several other, costumes on living figures; thus bringing more vividly to the minds of his audience the figure and bearing of the Indian warrior, woman, fop, &c. Whether for amusement or study, Mr. Catlin's Gallery is one of the most interesting of the present London sights.

*Colours used by the Artists of the Middle Ages for Painting on Glass.*—M. Vigné has published the following results of his experiments and inquiries on the composition of the colours of ancient stained glass:—

*General Fuse.*—Litharge or minium, 5; fine sand, 1; borax, from 5 to 15.

*Ochre Tint, or Yellow.*—Subsulphate of iron, 1; fuse, 5; oxide of zinc, 1.

*Dark Ochre Tint.*—Subsulphate of iron, slightly calcined, 4; oxide of zinc, 1; fuse, 4.5.

*Flesh Colour.*—Peroxide of red iron, obtained by calcination of the sulphate, 1; fuse, 2.

*Sanguine Red.*—Peroxide of iron, ditto, 1; fuse, 3.

*Violet Red.*—Oxide of iron, flesh colour, calcined, 1; fuse, 3.

*Light Brown.*—Subsulphate of iron, calcined, 1; black oxide of cobalt, 1.5; fuse, 6.

*Dark Brown.*—Oxide of iron by ammoniac, 1; oxide of zinc, 4; fuse, 4. By substituting for the zinc 1.5 of oxide of cobalt, the brown is converted into a black.

*Light Grey.*—Subsulphate of iron, 1.5; fuse, 4; oxide of zinc, 1; black oxide of cobalt, 1.2. This has to be fried and pulverised.

*Blue Grey.*—Fuse, 5; oxide of zinc, 2; oxide of cobalt, 1. This mixture has to be melted and run.

*Brown Black.*—Oxide of iron, 4.5; oxide of copper, 1; black oxide of cobalt, 1; fuse, 8; oxide of manganese, 2. This has to be well pounded and slightly roasted.

*Blue Black.*—Ditto ditto, with .5 of oxide of cobalt, and .5 of oxide of copper added.—*Paris Letter.*

### LITERARY NOVELTIES.

#### LIST OF NEW BOOKS.

The Keepsake, 1841, edited by Lady Blessington, 21s. boards; India Proofs, 52s. 6d. morocco. — *Legends of Venice*, Designs by Herbert, edited by T. Roscoe, 4to. 21s. bound.—*Portraits of the Children of the Nobility*, 3d series, edited by Mrs. Fairlie, royal 4to. 21s. bound.—*Book of Beauty*, 1841, edited by Lady Blessington, 21s. bound; India Proofs, 52s. 6d. morocco. — *Heath's Picturesque Annual: A History and Description of Belgium*, by T. Roscoe, 21s. boards, India proofs, 42s.—*A Winter in the West Indies*, by Joseph J. Gurney, 8vo. 5s.—*Scenes in Foreign Lands*, by Major E. Napier, 2 vols. post 8vo. 21s.—*The Siege of Florence, an Historical Romance*, by D. MacCarthy, 3 vols. post 8vo. 11. 11s. 6d.—*Rome, and the Early Christians*, 8vo. 1s. 10d.—*Nine Sermons on the Miracles*, by W. James, 12mo. 5s.—*Verbal Paraphrase of St. Paul's Epistle to the Romans*, by the Rev. E. Bosanquet, 8vo. 10s. 6d.—*Recreations in Physical Geography*, by R. M. Zornlin, fcap. 6s.—*The Churchman's Guide*; an Index of Sermons and Texts, by the Rev. J. Forster, 8vo. 7s.—*Garrick's Mode of Reading the Liturgy*, a New Edition, by R. Cull, 8vo. 5s. 6d.—*An Essay on the Church*, by the Rev. J. Jones, 8vo. 7s.—*Lectures on the Authenticity and Credibility of the New Testament*, by Bishop Marsh, 3d edition, 8vo. 8s.—*Peter Parley's Annual*, 1841, 5s.—*Fuller's Worthies of England*, with Continuation, by Nuttall, 3 vols. 8vo. 27s.—*Collyer on the Law of Partnership*, 2d edition, royal 8vo. 31s. 6d.—

Trifles from my Portfolio, by a Staff-Surgeon, 2 vols. 8vo. 20s.—*Life and Times of Montrose*, by Mark Napier, post 8vo. 12s.—*Dean Murray's History of the Irish Church*, 18mo. 3s. 6d.—*Dr. P. Buttmann's Larger Greek Grammar*, edited by Dr. C. Supf, 8vo. 13s. 6d.—*The Divine Economy of the Church*, by the Rev. J. Jebb, 12mo. 6s.—*An Index to Prohibited Books*, by Command of Pope Gregory XVI., by the Rev. J. Mendham, fcap. 4s. 6d.—*Library of Useful Knowledge: Farmers' Series; Husbandry*, Vol. III. 8vo. 10s.—*The Statutes at Large*, 4to. Vol. XV. Part II. 25s.—*The Friendship's Offering*, 1841, 12s.—*The Oriental Portfolio*; an Annual of Indian Scenery, 1841, 42s.—*Geraldine: a Tale of Conscience*, third edition, fcap. 6s.—*The Forget-Me-Not*, 1841, 12s.—*The Juvenile Album*, 1841, 4to. 10s.—*Scripture Gems; or, Book of the Cartoons*, by R. Cattermole, 8vo. 12s. morocco.—*Cairo, Petra, and Damascus*, in 1839, by John Kinnear, post 8vo. 9s. 6d.—*The Choephores of Eschylus*, with Notes, by the Rev. T. W. Peile, 8vo. 12s.—*Tracts for the People*; designed to Vindicate Religious and Christian Liberty, 12mo. 5s. 6d.—*Confessions of an Inquiring Spirit*, by S. T. Coleridge, fcap. 4s. 6d.—*Professor Smyth's Lectures on the French Revolution*, 2 vols. 8vo. 31s. 6d.—*The Clockmaker*; or Samuel Slick, third series, post 8vo. 10s. 6d.—*Rev. J. H. Newman's Sermons*, Vol. V. 8vo. 10s. 6d.—*Sixteen Sermons*, by the Rev. W. Jacobson, 12s. 6d.—*Chronicles of Life*, by Mrs. Baron C. Wilson, 3 vols. post 8vo. 31s. 6d.—*Family Library*, Vols. LXXIV. and LXXV.; *Narratives of Peril and Suffering*, fcap. 10s.—*Robert Macaire in England*, by G. W. M. Reynolds, 3 vols. post 8vo. 31s. 6d.—*Finden's Tableau*, 1841, 42s.—*Little Forget-Me-Not*, 1841, 2s. 6d.—*The City of the Magyar*; or, Hungary, &c. in 1839-40, by Miss Pardoe, 3 vols. post 8vo. 31s. 6d.—*Letters from under a Bridge*, and *Poems*, by N. P. Willis, 4to. 30s.—*Illustrated Commentary on the Bible*, Vol. II. post 8vo. 7s. 6d.

## ADVERTISEMENTS.

Connected with Literature and the Arts.

## PULPIT ELOQUENCE.

MR. RICHARD JONES has returned for the Season to his House, 14 Chapel Street, Grosvenor Place, Belgrave Square.

## SECOND GRAND INDIAN GALA, or

POW-WOW. — On Monday Evening, the 2d instant, at Eight o'clock, in Catlin's Rooms, in the Egyptian Hall, Piccadilly, Twenty Figures, in full and splendid Costumes, will join in the Frolicsome and equally with Bow, Spear, Lance, War-clubs, and Scalping Knives, giving the War-whoops, Yells, Signals, Songs, Dances, &c., and all fully explained in a Lecture given by Mr. Catlin.

In consequence of the great crowd on Monday evening last, extensive preparations have been made for the reception and amusement of the visitors, when the audience can all be comfortably seated.

Admission, One Shilling.

Just published, in a variety of fancy bindings, price 2s. 6d.

**FULCHER'S LADIES' MEMORANDUM BOOK AND POETICAL MISCELLANY** for 1841, embellished with several fine Engravings from Steel Plates. Besides the usual Rules Pages for Memoranda and Cash Accounts, to which a considerable Addition has been made this Year, the Calendar contains a Treatise on Domestic Greenhouses, explanatory of the Mode of Cultivating Plants and Flowers in Glass Cases, unobscured by Frost. The Poetical Miscellany consists of original Poems, written expressly for the Sunday Pocket Book, by James Montgomery, Bernard Barton, the Author of "Historical Reveries," P. S. Muller, Emma Bloodworth, &c. &c. Hebrew Melodies, Ninety new Enigmas and Charades, an Almanack, &c. "Fulcher's Ladies' Memorandum Book," with its pleasing poetry and miscellaneous contents, as usual greets the opening year. Bernard Barton is among its contributors, and has some companions not unworthy of his association. This is great praise for a provincial pocket-book, which is also well arranged for usefulness in other respects. — *Literary Gazette*, Nov. 1839. Published by Longman and Co.; Nately and Co. London; and sold by all Booksellers in Town and Country.

New ready, gratis,

**THE NEW LIBRARY TERMS.**  
On which Families and Book-Societies throughout Great Britain are supplied with the New Publications for Perusal, can now be obtained on application to Messrs. Saunders and Otley, Publishers, Conduit Street, Manchester Square.  
Monthly supplies in proportion to the number of Members forming each Society, are regularly forwarded; and to meet the increasing demand for New Works, the publishing resources of this extensive Establishment are added to the Library. Subscribers are furnished with the LIBRARY CIRCULAR, a Guide to the choice of New Books published Monthly.

## BOOKS IN THE PRESS.

## NEW WORK BY MISS PARDOE.

On the 1st of November will be published, in 2 vols. cloth, price 11. 11s. 6d. with Engravings,

## THE CITY OF THE MAGYAR; or, Hungary and her Institutions in 1839-40.

By MISS PARDOE,  
Author of "The City of the Sultan," "The Beauties of the Bosphorus," &c.  
London: George Virtue.

ANNUALS FOR 1841.  
UNDER THE INFLUENCE OF  
MR. CHARLES HEATH.

## THE BOOK OF BEAUTY.

Edited by the COUNTESS OF BLESSINGTON.  
The Engravings are Sixteen in Number, and highly finished by eminent Artists.

This Book contains Dr. Johnson's Portrait of Her Majesty.

The Picturesque Annual,  
Also containing Sixteen splendid Engravings.

Edited by Thomas Agnew, Esq.  
The Cautionary mode of binding has been applied by these experienced Binders, Wesley and Co. for the purpose of displaying the Plates in all their brilliancy and elegance, and to prevent them detaching, as in the old mode, whilst it enables the reader to enjoy the literary part with delightful ease, free from the stiffness so objectionable in these books when sewed.  
Bound with embossed Saxony, super-royal 8vo. 11. 1s.; India Proof, 8s. 12s. 6d.  
London: Longman, Orme, Brown, Green, and Longmans.

## NEW WORK BY MISS MARTINEAU.

Nearly ready, in 2 vols.

## THE HOUR AND THE MAN; a Historical Romance.

By HARRIET MARTINEAU.

In 3 vols. price 37s. boards.

Deerbrook; a Novel.

By Miss Martineau.

Edward Moxon, Dover Street.

## In a few days, price 10s. 6d. in boards, a Fifth Volume of

## PAROCHIAL SERMONS.

By the Rev. JOHN HENRY NEWMAN, B.D.  
Vicar of St. Mary the Virgin, Oxford; and Fellow of J. G., F., and J. Rivington, St. Paul's Churchyard, and Waterloo Place; and J. H. Parker, Oxford.

99s. Late published, Vols. I. to IV. new editions, 10s. 6d. each.

The New Number of

## THE METROPOLITAN

for November will contain, among others, the following

Original Articles:—

1. Sayings and Doings in the University of Oxford. By Miss H. R. Macdonald.
2. Songs of Spain. By Miss H. R. Macdonald.
3. History of the Jews. By M. Capetown.
4. Genius—Worship. By W. Thompson, B.A.
5. Italy. By an Exile.
6. The Goldsmith's Daughter: a Legend. By Mr. Valentine Bartholomew.
7. Lord Killick. By Abbott Lee.
8. The Last Caravan. By Major Calder Campbell.
9. Hugh Lloyd, the Warrior and Bard of Cambria. By Mrs. Crawford.
10. Adventures of a Gentleman in Search of an Estate. By the Author of "The Corsair's Bride," &c.
11. The Student's Hollopie.
12. Vittoria Cellomina.
13. The Mother's First Trial.
14. Tasteless Buildings in a beautiful Landscape.
15. Angling in Norway.

Reviews, Notices of New Books, &amp;c.

Saunders and Otley, Publishers, Conduit Street.

Agents—for Ireland, J. Cammings, Dublin; for Scotland, Bell and Bradfute, Edinburgh.

On the 2d of November will be published, price 7s. 6d. bound in cloth and lettered, post 8vo.

## THE ILLUSTRATED COMMENTARY

on the OLD and NEW TESTAMENTS, chiefly Explanatory of the Manners and Customs mentioned in the Sacred Scriptures; and also of the History, Geography, Natural History, and Antiquities; being a republication of the Notes of "The Pictorial Bible," of a size which will range with the authorized editions of the Sacred Text. With many Hundred Woodcuts from the best and most authentic Sources. Vol. II. Joshua—8 Kings.

To be completed in Five Volumes, to be published Monthly.

In 18mo. price 2*s.* in cloth boards, the 2d edition of  
**HENRY'S FIRST LATIN BOOK.**  
 \* \* \* The object of this work (which is founded on the principles of imitation and frequent repetition) is to enable the pupil to do Exercises from the first day of his beginning his Accidence.  
 By THOMAS KIRCHNER ARNOLD, M.A.  
 Rector of Lyndon, and late Fellow of Trinity College, Cambridge.  
 J., G., F., and J. Rivington, St. Paul's Churchyard, and Waterloo Place, Pall Mall; and Simpkin, Marshall, and Co.

In a pocket vol. price 4*s.* in cloth, and lettered,  
**THE CURATE'S MANUAL**, with References to the Nick and Dying. From the Latin of the Rev. JOHN STEWART, Vicar of 7 rim, in the Seventeenth Century. With Additions, original and selected.  
 By the Rev. KIRBY TRIMMER, A.B.  
 Curate of Stanhoe, Norfolk; formerly of St. Alban Hall, Oxford; and Author of "Conversations on the Thirty-nine Articles."  
 Rivingtons, St. Paul's Churchyard, and Waterloo Place.

Mr. Holden's Exposition of the Bible.  
 In 1 large vol. 18mo. price 1*l.* 8*s.* 6*d.* in boards,  
**THE CHRISTIAN EXPOSITOR; or, a Practical Guide to the Study of the Old Testament.**  
 Intended for the Use of general Readers, &c.  
 By the Rev. GEORGE HOLDEN, M.A.  
 Though many Expositions of the Bible, of great and deserved celebrity, exist in our language, a Commentary sufficiently short to be read by those who have not leisure to consult learned works, yet sufficiently comprehensive to serve as a guide to the study of the Sacred Scriptures, appears to be still wanting. To supply this deficiency is the design of the present work, in which it has been the aim and study of the author to embrace, in a condensed form, such information as will enable the general reader to ascertain the real meaning of the inspired writers.  
 Rivingtons, St. Paul's Churchyard, and Waterloo Place.

Of whom may be had, by the same Author,  
**The Christian Expositor of the New Testament.** 2d edition, revised and improved, 18mo. 1*l.*

The Holy Bible Chronologically Arranged.  
 Handsomely printed in 4 large vols. 8vo. price 3*l.* 6*s.* in boards, a new edition, with 24 marginal References, of  
**THE OLD and NEW TESTAMENT**, arranged in Historical and Chronological order, in such manner that the Book of Chapters, &c. &c. may be read as one connected History, in the very Words of the authorized Translation. With copious Notes and Indexes.  
 By the Rev. GEORGE TOWNSEND, M.A.  
 Prebendary of Durham.  
 Rivingtons, St. Paul's Churchyard, and Waterloo Place.

\* \* \* The Old and New Testament may be purchased separately, and the same Work, with short Notes, may be had in one large volume, price 1*l.* 4*s.* in boards.

In 12mo. price 2*s.* 6*d.* cloth and lettered,  
**THE ITALIAN ANALYST; or, the Essentials of Italian Grammar, and their Application in Parsing.**  
 By the Rev. HENRY HAMILTON ARNOLD, B.A.  
 Rivingtons, St. Paul's Churchyard, and Waterloo Place.

In small 8vo. price 7*s.* boards,  
**THE CHURCH OF THE FATHERS.**  
 (Reprinted from the "British Magazine," with Additions.)  
 By the Rev. JOHN HENRY NEWMAN, M.A.  
 Vicar of St. Mary the Virgin's, Oxford; and Fellow of Oriel College.  
 Rivingtons, St. Paul's Churchyard, and Waterloo Place.

**COMPLETE IN SIX VOLUMES.**  
 Price 8*s.* in cloth, lettered, the Sixth and Last Volume of  
**WILSON'S TALES of the BORDERS**  
 and of SCOTLAND.  
 "The most amusing collection of tales extant."—*Dundee Courier*.

\* \* \* These tales are intensely interesting.—*Manchester Advertiser*.  
 They are of a very superior order, and form one of the most delightful publications of the day.—*Edinburgh News*.  
 John Sutherland, Edinburgh; R. Greenbridge, London; and John Cumming, Dublin.

Of whom may be had,  
 A Re-issue of the above Work, in Weekly Numbers and Monthly Parts.

**DE FOE'S HISTORY OF APPARITIONS.**  
 In 1 vol. duodecimo, price 5*s.* cloth,  
**THE SECRETS of the INVISIBLE WORLD DISCLOSED; or, a Universal History of Apparitions, Sacred and Profane.**  
 Forming Vol. XIII. of De Foe's Works.  
 N.B. A Volume Monthly, until the Work is completed in 12 Vols.  
 Oxford: Printed for Thomas Tegg, Cheapside, London; and sold by all other Booksellers.

**ROBERT MACAIRE IN ENGLAND.**  
 In 3 vols. post 8vo. embellished with Eighteen Inimitable Illustrations by Phil.  
**ROBERT MACAIRE IN ENGLAND; a Tale.**  
 By GEORGE W. M. REYNOLDS.  
 London: Published by Thomas Tegg, 73 Cheapside; and may be read at all Circulating Libraries in the United Kingdom.

**MARY HOWITT'S TALES FOR THE PEOPLE and THEIR CHILDREN.**  
 In 1 handsome pocket vol. price 2*s.* 6*d.* bound,  
**SOWING and REAPING; or, What will come of it?** Forming Part of a Series,  
 By MARY HOWITT,  
 Entitled "Tales for the People and their Children."  
 By the same Author, and sold separately,  
**Strive and Thrive; a Tale; also, Hope on!**

 T. and W. Boone, New Bond Street; and Oliver and Boyd, Edinburgh.

**VAN BUTCHELL ON FISTULA, &c.**  
 4th edition, in 8vo. cloth boards, price 7*s.* 6*d.* enlarged,  
**FACTS and OBSERVATIONS** relative to a Successful Mode of treating Piles, Fistula, Hemorrhoidal Excrescences, Tumours, and Strictures, without Cutting or Confinement: illustrated with numerous Cases. Being a Familiar Exposition of the Practice of Mr. S. J. Van Butchell, Surgeon Accoucheur.  
 "This volume presents to us a number of illustrations of his singular success under circumstances that would have induced despair in any professor of less mastery, or less accustomed to accomplish cures where cures seemed impossible. The statements here made are most convincing, and place beyond doubt the superiority of the treatment to which they refer."—*Court Journal*.  
 Published by H. Renshaw; Sold also by the Author, No. 16 Percy Street, Bedford Square.

18th edition, price 9*s.*; 11*s.* 1*s.* of  
**THE WOMEN of ENGLAND: their Social Duties and Domestic Habits.**  
 By Mrs. Ellis.  
 "If we could have our own way, every family should order a copy of 'The Women of England.' Husbands, especially young husbands, should buy it for their wives; fathers, for their daughters; brothers, for their sisters."—*Methodist Mag.*

# MR. COLBURN'S NEW PUBLICATIONS.

## NOW READY.

### I. SCENES AND SPORTS IN FOREIGN LANDS.

Illustrated with a Series of Drawings taken from Nature.  
By Major E. NAPIER, 46th Regt.  
2 vols. small 8vo. 21s. bound.

### II. THE SIEGE OF FLORENCE; AN HISTORICAL ROMANCE.

By DANIEL MACARTHY, Esq. 3 vols.

### III. NARRATIVE OF THE LATE WAR IN AFGHANISTAN.

By Capt. HENRY HAVELOCK,  
Aide-de-Camp to Major-General Sir Willoughby Cotton, G.C.B. and K.C.H. commanding  
the Bengal Forces.  
2d edition, in 2 vols. post 8vo. price 21s. bound, with a complete Map of the Seat of War.  
"This work furnishes by far the most comprehensive as well as the most interesting account  
the public has yet received of the late brilliant war in Afghanistan."—*New Monthly*.

### IV. THE HISTORY OF A FLIRT. RELATED BY HERSELF. 3 vols. post 8vo.

"Among the best novels of its kind for many years given to the world by the English  
press."—*Athenæum*.

### V. THE NEW VOLUME OF SIR E. L. BULWER'S WORKS FOR NOVEMBER, CONTAINING PELHAM; OR, THE ADVENTURES OF A GENTLEMAN.

Illustrated uniformly with the preceding Volumes.

### VI. THE ART OF NEEDLEWORK, FROM THE EARLIEST AGES, WITH NOTICES OF THE ANCIENT HISTORICAL TAPESTRIES. Edited by the Right Honourable the COUNTESS OF WILTON.

2d edition, in 1 vol. post 8vo. 10s. 6d. bound.  
"An admirable volume, and should be possessed by every lady."—*Times*.

### VII. THE DREAM, AND OTHER POEMS. By the Hon. MRS. NORTON.

1 vol. 8vo. with fine Portrait of the Author, after a Drawing by E. Landseer, R.A.  
12s. bound.

"A very beautiful poem. This lady is the Byron of our modern poetesses; she has very much  
of that intense personal passion by which Byron's poetry is distinguished from the larger grasp  
and deeper communion with man and nature of Wordsworth. She has also Byron's beautiful intervals  
of tenderness, his strong practical thought, and his forceful expression. It is not an artificial  
imitation, but a natural parallel; and we may add that it is this, her latest production, which espe-  
cially induces, and seems to us to justify our criticism."—*Quarterly Review*.

### VIII. A YEAR AMONG THE CIRCASSIANS. By J. A. LONGWORTH, Esq.

2 vols. post 8vo. with Illustrations, 21s. bound.  
"Incomparably the most valuable account of Circassia that has yet appeared."—*Court Journal*.

### IX. STANDARD NOVELS FOR SIX SHILLINGS EACH. Now ready, complete in 1 vol. with Portrait of the Author and Vignette, price 6s. bound, THE CHELSEA PENSIONERS. By the Author of "The Subaltern."

Forming the New Volume of  
COLBURN'S MODERN STANDARD NOVELISTS;  
A select Collection of the best modern Works of Fiction, which cannot be procured in  
any other Collection.

HENRY COLBURN, PUBLISHER, 13 GREAT MARLBOROUGH STREET.

\*. \* ORDERS RECEIVED BY ALL BOOKSELLERS.

## JUST READY.

### I. THE LIFE AND CORRESPONDENCE OF L. E. L.

By LAMAN BLANCHARD, Esq.  
3 vols. post 8vo. with Portrait.

The materials for this work are derived exclusively from authentic sources: from her own  
notes and communications; from the statements of her nearest relatives; from her long and con-  
tinued correspondence with most intimate friends, confided for the purpose; and from their recol-  
lections of personal intimacy with her. Every interesting particular connected with her literary  
life will be selected from a mass of accurate information, to which no one could have had access  
but the friend whom she had solicited to become her literary executor.

### II. THE NAVAL SURGEON. By the Author of "Cavendish," "Gentleman Jack," &c. 3 vols.

### III. POPULAR TALES OF ENGLAND.

First Series:—LANCASHIRE.  
By JOHN ROBY, Esq. M.P. F.R.S.L.  
3 vols. post 8vo. with numerous Engravings on Wood.

### IV. MEMOIRS OF BEETHOVEN. By his Friend, A. SCHINDLER. Edited, with Notes, &c. by IGNACE MOSCHELES, Esq. 2 vols. post 8vo. with Portrait, &c.

### V. THE CONSPIRATORS; OR, THE ROMANCE OF MILITARY LIFE. By EDWARD QUILLINAN, Esq. 3 vols. post 8vo.

### VI. LETTERS ILLUSTRATIVE OF THE REIGN OF WILLIAM III. ADDRESSED TO THE DUKE OF SHREWSBURY. By JAMES VERNON, Esq. Secretary of State. Edited, with Introductions and Notes, by G. P. R. JAMES, Esq. Author of the "Memoirs of the Court of Louis XIV." "Richelieu," &c. 3 vols. 8vo. with Portrait, 38s. bound.

### REVIEWS OF NEW BOOKS.

*The Clock Maker; or, the Sayings and Doings of Samuel Slick of Slickville.* Third Series. 12mo. pp. 309. London, 1840. Bentley.

ORIGINAL and pithy, it is always refreshing to fall in with the inimitable Clock-maker of Slickville. His mixture of sound sense with genuine humour; his fund of information and peculiar way of putting it on record; his fun and his force—the fun being part and portion of that force—are at the same time qualities so entertaining and instructive, that we know not in the end whether to be better pleased with the intelligence we have acquired, or the amusement we have received.

In this new volume, the author, accompanied by Mr. Slick, sets out on his journey for England; and, after discussing American questions incident or non-incident to their route, finally leaves off with their embarkation at New York in the Great Western, Sam having previously been appointed a government *attaché* by the President Van Buren, in order to facilitate his introduction to our highest society, and enable him to form and promulgate a just opinion of English manners. When his account of us appears, it will surely be a treat to see it. Meanwhile we revert to the present narrative of his transatlantic Sayings and Doings. The starting of the travellers for Halifax is a “rael” bit of Slickism:—

“On the following morning, when the little light travelling-wagon was driven round from the coach-yard, I was delighted to see that the Clockmaker had brought his favourite horse, ‘Old Clay,’ with him. Come, step in, squire, said he, as he held the reins; ‘Old Clay’ is a-pawing and a-chawing like mad; he wants to shew you the way to Windsor, and he is jist the boy that can do it. Hold up your head, my old gi-raffe, said he, and make the folks a bow; it’s the last time you will ever see them in all your born days: and now off with you as if you was in rael wide-awake airnest, and turn out your toes pretty. Never stop for them idle critturs that stand starin’ in the road there, as if they never seed a horse afore, but go right over them like wink, my old snort, for you’ll be to Conne’ticut afore they can wake up the crowner and summon a jury, I know. There’s no occasion to hurry tho’ at that rate, or you’ll set my axle a-fire. There, that will do now, jist fourteen miles an hour. I don’t calculate to drive faster on a journey, squire, for it sweats him, and then you have to dry him afterwards afore you water him, so there is nothing gained by it. Ain’t he a horrid handsome horse, a most endurin’ quickster, a rael salt, that’s all? He is the prettiest piece of flesh and bone ever bound up in horsehide. What an eye he has!—you might hang your hat on it. And then his nostrils! Lord, they open like the mouth of a speakin’ trumpet. He can pick up miles on his feet, and throw ‘em behind him faster than a steam doctor a-racin’ off with another man’s wife. There now, squire, ain’t that magnificent? you can hear him, but can’t see him; he goes like a bullet out of a rifle, when its dander is up. Ain’t he a whole team that, and a horse to spare? Absquotilate it in style, you old skunk,

from a squerrel’s jump to the eend of the chapter, and shew the gentlemen what you can do. Anybody could see he ain’t a blue-nose, can’t they? for, cuss ‘em, they don’t know how to begin to go. Trot, walk, or gallop, is all the same to him, like talkin’, drinkin’, or fightin’ to a human. Lord, I have a great mind to take him to England, jist for the fun of the thing, for I don’t know myself what he can do. When he has done his best, there is always a mile an hour more in him to spare: there is, upon my soul. But it takes a man to mount him. Only lookin’ at him goin’ makes your head turn round like grindin’ coffee:—what would ridin’ him do? And now, squire, here goes for Slickville, Onion county, state of Conne’ticut, United States of America. Here’s for home.”

During their first ride at this rapid rate, the Clockmaker, nevertheless, finds time and opportunity to relate the particulars of his only exhibition as a Slickville legislator; and the caricature is not only so laughable in itself, but so applicable to many other pseudo-orators on both sides of the water, that we copy it with much pleasure into our page. After his election, he goes on to say:—

“Dear, dear, I shall never forget the day I was elected; I felt two inches taller, and about a little the biggest man in all Slickville. I knew so much was expected of me I couldn’t sleep a-tryin’ to make speeches; and when I was in the shop I spiled half my work by not havin’ my mind on it. Save your country, says one; save it from ruin; cut down salaries.—I intend to, says I. Watch the officials, says another; they are the biggest rogues we have. It don’t convene with liberty that public sarvants should be the masters of the public.—I quite concur with you, says I. Reduce lawyers’ fees, says some; they are a-eatin’ up of the country like locusts.—Jist so, said I. A bounty on wheat, says the farmer, for your life. Would you tax the mechanic to enrich the agriculturist? says the manufacturer. Make a law agin’ thistles, says one; a regulator about temperance, says another: we have a right to drink if we please, says a third. Don’t legislate too much, says a fourth—it’s the curse of the state; and so on without eend. I was fairly bothered, for no two thought alike, and there was no pleasin’ nobody. Then every man that voted for me wanted some favour or another, and there was no bottom to the obligation. I was most squashed to death with the weight of my cares, they was so heavy. At last the great day came, and the governor, and senate, and representatives, all walked in procession, and the artillery fired, and the band of the caravan of wild beasts was hired to play for us, and we organised in due form, and the governor’s message was read. I must say that day was the happiest one of my life. I felt full of dignity and honour, and was filled with visions of glory to come. Well, says I to myself, the great game is now to be played in rael airnist, and no mistake: what card shall I play? The presidential chair and the highest posts is open to me in common with other citizens. What is to prevent me a-comin’ in by honours, or, if I have good luck, by the odd

trick. What shall I lead off with? I laid awake all night considerin’ of it, a-rollin’ and a-tossin’ over, like cramp in the stomach, not knowin’ what to do: at last I got an iden. Extension of suffrage, says I, is the card I’ll play. That will take the masses, and masses is power, for majorities rules. At that time, squire, we had the forty-shilling freehold qualification, and it extended no farther; so I went for universal suffrage; for, thinks I, if I can carry that, I can go for governor first, on the strength of the new votes, and president afterwards; and it did seem plausible enough, too, that’s a fact. To all appearance it was the best card in the pack. So out I jumps from bed, a-walkin’ up and down the room in my shirt tail, a-workin’ away at my speech like anything, and dreadful hard work it was, too; for it is easier to forge iron any time than a speech, especially if you ain’t broughten up to the business. I had to go over it and over it ever so often, for every now and then I’d stick fast, get bothered, and forget where I was, and have to begin again; but when day was e’en about breakin’, I was jist drawin’ to a close, and had nearly scored and rough-hew’d it out, when all of a sudden I run agin’ the bed-post in the dark; and nearly knocked my brains out. Well, next night I worked at it again, only I left the candle burnin’, so as not to be a stumblin’ up agin’ things that way, and the third night I got it all finished off complete; but I got a shockin’ cold in my head, a-walkin’ about naked so, and felt as weak as a child for want of sleep. I was awful puzzled to fix on what to do on account of that plaguy cold. I didn’t know whether to wait till it got better, or strike while the iron was hot and hissin’, for I warnt sure sume o’ the speech wouldn’t leak out, or the whole get flat if I kept it in too long; so as soon as the house opened, I makes a plunge right into it; for what must be, must be, and it’s no use a considerin’. So I ups and says, Mr. Speaker, says I (Lord, how thick my tongue felt; it seemed to grow too thick for my mouth, like the clapper of an old horse,) let me perpound this resolution, sir, said I; all men are free and equal. No one doubts it, Mr. Slick, said an old member: no one denies that; it’s a truism. I didn’t somehow expect that interruption; it kinder put me out, and I never got a-goin’ altogether right agin afterwards, for I lost my temper; and when a man ain’t cool, he might as well hang up his fiddle, that’s a fact. Have I freedom of speech, sir, said I, or have I not? or is that last rag of liberty torn from the mast of the constitution too? I stand stock still a-waitin’ for your answer, sir. Oh, sartain, said he, sartain; you may talk for ever, if you like: go on, sir; only no man doubts your proposition. It’s a lie, sir, said I, it’s a lie writ.—Order! order! chair! chair! says some. Knock him down! turn him out! where did you larn manners? says others. Hear me out, says I, will you? and don’t be so everlastin’ fast: what’s the use of jumpin’ afore you come to the fence. It’s a lie written on the face of the constitution. Oh, ah! says they, is that it? Yes, says I, it is, and contradict it if you darst. We are not free;

we are slaves: one half of us is tyrants, — unremorseless, onfeelin', overbearin' tyrants, and vile usurpers; and the other half slaves, — abject, miserable, degraded slaves. The first argument I advance, sir, is this — and the cold in my nose began to tickle, tickle, tickle, till I couldn't hold in no longer, and I let go a sneeze that almost broke the winders out. Oh, Lord! what a haw! haw! they sot up. The first argument is this, sir; and off went both barrels of my nose agin like thunder: it fairly raised the dust from the floor in a cloud, like a young whirlwind in the street afore rain. It made all spin agin. Why, he is a very ring-tail roarer, says the members; a regular sneezer: and they shouted and roared like anything. I thought I should a-died for shame one minit, and the next I felt so coonish I had half a mind to fly at the Speaker and knock him down. I didn't jist cleverly know what to do, but at last I went on. Did the best blood of the land flow for forty shillings? Was Bunker Hill fought out to loosen British chains, merely to rivet American ones? Was it for this the people died covered with gore and glory, on the bed of honour? Was it the forty shillings alone that fought the revolution or the Polls? I am for the Polls. Taxation and representation should go hand in hand, and freedom and equality likewise also. How dare you tax the Polls without their consent? Suppose they was to go for to tax you without your consent; why who would be right or who wrong then? Can two wrongs make a right? It is much of a muchness, sir, — six of one, and half-a-dozen of the other. What's that feller talkin' about? says a member. A vote to help the Poles agin' Russia, says the other: what a cussed fool he is! It put me quite out, that, and joggled me so I couldn't make another line straight. I couldn't see the Speaker no longer, for my eyes watered as if I had been a-stringin' inions for a week, and I had to keep blowin' my nose the whole blessed time, for the cold in it corked it up as tight as a bottle. Who calls them fools? says I: who dares insult free citizens because they are not forty shillings? You couldn't treat them vus if they was nasty, dirty, dispisable niggers; and yet you boast your glorious constitution. Will any member answer me this? Have they blood in their veins? — and if they have, it must be free blood; and if free, it must boil. (Tickle, tickle, goes my boscis agin, and I had to stop to sarch my pocket for my nose-rag.) The honourable gentleman, says some feller or another, for most on 'em were strangers to me, means a blood puddin', I suppose. Ah! I thought I should have gone ravin', distracted mad. I knew I was talkin' nonsense, that I had run off the tracks with all steam on, and was a-ploughing thro' the mud in the fields like any thing. Says I, I'll have your blood, you scoundrel, if you dare to say that agin, see if I don't, so there now! Oh dear, such shoutin', and roarin', and clappin' of hands I never heerd: my head run round like a spinnin' wheel; it was all burr, burr, burr, buzz, buzz, buzz. I bit in my breath to keep cool; I felt I was on the edge of a wharf, and only one step more was over head and ears chewallop in the water. Sam, says I to myself, be a man; be cool — take it easy: so I sot off agin, but I was so confused I got into my other speech on agricultur' that I had larned by heart, and mixed the two together all in a ravel. 'Thistles, says I, is the bane of all good husbandry. Extriptate them from the land; they are usurpin' the places of grain, and all Slickville will be filled with Polls. If they have no voice in this assembly, how can you expect them to obey the laws they never made?

Compel folks to cut them down in the full of the moon, and they'll all die; I have tried it myself with universal suffrage and the ballot. Well, artillery is nothin' but a popgun to the noise the members now made, — was an airthquake tipped with thunder and lightning. I never heerd nothing like it. I felt I was crazy; I wished I was dead a'most, or could sink through the floor into the middle of the sea, or any where but where I was. At last cousin Woodberry took pity on me, and came over to where I was, and said, Sam, said he, set down, that's a good feller; you don't know what you are a-doin' of; you are makin' an ass of yourself. But I didn't hear him. Confound you! said he, you look mean enough to put the sun into eclipse; and he laid hold of the skirts of my coat, and tried to pull me down; but instead of that he pulled 'em right off, and made an awful show of me. That sot me off agin, quite ravin' as bad as ever. I won't be put down, says I, Mr. Speaker; I fight for liberty and the Polls: I stand agin' the forty shillings. Unhand me, you slave! said I; touch me not, or I'll sacrifice you on the altar of my country; and with that I ups fist and knocks Woodberry over as flat as a pancake, and bolts right out of the hall. But I was so blinded with the cold in my head and rage together, I couldn't see no more nor a bat, and I pitched into several members in the way out, and 'most broke their necks and my own too. It was the first and the last of my speech-making. I went by the name, for years afterwards, in our town, of 'Free-and-equal Slick.' I wish I could wipe out that page of my follies from my memory, I tell you; but it's a caution to them that navigate in politicks, that's a fact. Nothin' on this side of the water makes so big a fool of a man, squire, he continued, as goin' to the house of representatives without bein' fit for it. Them that hante jist got the right weight of ballast are upst in no time, and turned bottom upwards afore they know where they be. Them that are a little vain by natur' get so puffed up and so consaited, they become nothin' but laughin' stocks to all the world, most ridiculous fools; while them whose principles ain't well anchored in good holdin'-ground, let the rogue peep out o' their professions plainer than they are a-thinkin' on. The skin of the beast will shew through, like an Irishman's elbow, though he has three coats on. But that ain't the worst of it neether. A man is apt to become bankrupt in business, as well as in character, by it. Doin' big and talkin' big for three months in the year, and puffin' each other up till they are ready to burst with their importance, don't convene with sellin' tape by the yard, or loadin' on carts, when they return home to their business. In short, squire, a country ought to be a rich country, with larned men in it, and men o' property to represent it, or else assembly work is nothin' but high life below stairs, arter all. I could point you out legislatures on this here continent where the speakin' is all kitchen talk, all strut, brag, and vulgar impudence. It's enough to make a cat sick to hear fellers talk of independence who are mortgaged over head and ears in debt, or to listen to chaps jawin' about public virtue, temperance, education, and what not all day, who spend the night in a back room of a market tavern with the key turned, drinkin' hail-storm and bad rum, or playin' sicken penny loo. If mankind only knew what folks they were, and how they helped fools themselves to fool them, there would be some hope of them, for they would have learned the first lesson of wisdom. But to sum-totalise my

story: the next time I went to poor old minister's arter that, says he, Sam, says he, they tell me you broke down the other day in the house of representatives, and made a proper gag of yourself. I am very sorry for you, very sorry indeed; but it is no use now a-cryin' over spilt milk. What can't be cured must be endured, I do suppose; but I do wish with all my heart and soul you had a-taken my advice and left politicks alone. — Don't mention it, minister, said I; I am ashamed to death of myself, and shall leave Slickville till it's blowed over and forgot: I can't bear to hear of it; it fairly makes me sick. It was a great card I had tho', if I had only played it right, says I, a very great card indeed. In fact, it was more than a card, — it was high, low, Jack, and the game. — What was it, said he, that was worth all that are nonsense? — Universal suffrage, says I. — Sam, said he (and I know'd I was in for a lectur', for he knit his brow, and looked in rael right down ainst), you don't know what you are a-talkin' about. Do you know what universal suffrage means? — To be sure I do, says I; it's every man havin' a vote and a voice in makin' those laws that is to govern him; and it comports with reason, and stands to common sense. — Well, says he, what's all that when it's fried? why, it amounts to this, and nothin' more nor less: Now men of property and character make laws to govern rogues and vagabonds, but by your beautiful scheme of universal suffrage, rogues and vagabonds will make laws to govern men of property and character. It is revarsin' the order of things: it is worse than nonsense; it is downright madness. We are fast approaching this state without your aid, Sam, I can tell you; and when we do arrive at it we shall be an object for the finger of scorn to point at from Europe. We shall then have wound up the fearful tragedy of our revolution with as precious a farce as folly and licentious ever produced. — Minister, says I, I don't know how it is, but you have such a short-hand way of puttin' things, that there is no contradictin' of you. You jist squeeze all the argument up in a hall, as easy as dough, and stop a feller's mouth with it. How the plague is it that you seem always right? — Because I never play a card, Sam. I never consider what is expedient, but what is right; never study what will tickle the ears of people, but what will promote their welfare. You would have been all straight, too, if you had only looked to the right and wrong of the measure; but you looked to popularity, and that sot you to playin' of a card. Now the upshot of this popular gambling, or card-playing, is patriotism; and mark my words, Sam, mark my words, my boy, for I am an old man now, and have read the human heart well, — in ninety-nine cases out of a hundred, patriotism is the trump card of a scoundrel."

This is a fair specimen of the whole of this very clever volume, and we think justifies our opinion that the drollery of the author is a powerful auxiliary to his strong sense: with him the ridiculous is not the opposed test of reasoning, but its able ally.

It is beyond our limits to illustrate this by other extracts of similar length; but we must copy a few morsels out of the several subjects, just to shew how the clock strikes. [By the by, did Mr. Haliburton's *nom de guerre* suggest Mr. Dickens's title of "Humphrey's Clock?"] After the foregoing chapter, "Playing a Card," we have an excellent one on the wisdom gathered from being "Behind the Scenes;" and the "Black Brother," "The Great Unknown,"

and "Snubbing a Snob," are all capital in their various ways;—the first, touching on American brotherhood in sectarianism; the second, an English opposition party picking the brains of a Yankee visitor; and the last, on putting down a greenhorn in Slick's best style. Chapter VII. is entitled "Patriotism," and, like most of the rest, enlivened by a tale. A patriot of the Maine has just concluded an interested job, and told Sam of it, ends "'Dulce est pro patria mori.' And then he bust out a-larin', and staggered right over to the sophy, and laid down and haw-hawed like thunder. Well, Slick, said he, when he came too, what darned fools mankind are, to be so easily gulled by that are word patriotism! ain't they? It fairly beats all, don't it?—Now, strangers, said the Clockmaker, that's pretty much the case with delegations. As long as them missions are profitable things, delegates will be as plenty, and grievances as thick, as hops. If I was the minister I would receive them folks very civilly, and attend to their business if they had any, and was recommended by the governor: but I never would encourage agitation, and hold out a premium for it, by rewardin' agitators themselves with appointments. A trade won't be followed long that ain't a profitable one, that's a fact. I'll tell you a story." The story is of his being shewn the headless corpses of the two Shearers in the vault of St. Michan's Church, Dublin,—a disgraceful show it must have been,—where, from the dry nature of the soil, the bodies do not decay. As this was only two years ago, the shameful sight may yet be visible for a fee, as many others are in Great Britain, which ought to be sacred from greedy officials and idle curiosity. But we pass to our next little sketch of love in a cottage. They are travelling in a retired country, and Mr. Slick suddenly reined up his horse:—

"There, said he, there is a pictur' for you, squire. Now, that's what minister would call love in a cottage, or rural felicity, for he was fond of fine names was the old man. A neat and pretty little cottage stood before us as we emerged from a wood, having an air of comfort about it not often found in the forest, where the necessities of life demand and engross all the attention of the settler. Look at that crittur, said he, Bill Dill Mill. There he sets on the gate, with his go-to-meetin' clothes on, a-doing of nothing, with a pocket full of potatoes, cuttin' them up into small pieces with his jackknife, and teachin' a pig to jump up and catch 'em in his mouth. It's the schoolmaster to home, that. And there sets his young wife a-balancin' of herself on the top rail of the fence opposite, and a-swingin' her foot backward and forrerd, and a-watchin' of him. Ain't she a heavenly splicee that? By Jacob's spotted cattle what an ankle she has! Jist look! a rael corn-fed heifer that, ain't she? She is so plump she'd shed rain like a duck. Them Bluenoses do beat all in galls, I must say, for they raise some desperate handsome ones. But then there is nothin' in that crittur. She is nothin' but wax-work—no life there; and he looks tired of his bargain already,—what you call fairly onswaggled. Now, don't speak loud, for if she sees us she'll cut and run like a weasel. She has got her hair all covered over with paper-curls, and stuck thro' with pins, like a porcupine's back. She's for a ten-squall to-night, and nothin' vexes women like bein' taken of a nonplush this way by strangers. That's matrimony, squire, and nothin' to do; a honeymoon in the woods, or young love grow'd ten days old. Oh, dear! if it was me,

I should yawn so afore a week; I should be skeered lest my wife should jump down my throat. To be left alone that way idle, with a wife that has nothin' to do and nothin' to say, if she was as pretty as an angel, would drive me melancholy mad. I should either get up a quarrel for vanity sake, or go hang myself to get out of the scrape. A tame, vacant, doll-faced, idle gall! O Lord! what a fate for a man who knows what's what, and is up to snuff! Who the plague can live on sugar-candy? I am sure I couldn't. Nothin' does for me like honey; arter a while I get to hate it like sin; the very sight of it is enough for me. Vinegar ain't half so bad; for that stimulates, and you can't take more nor enough of it if you would. Sense is better nor looks any time; but when sense and looks goes together, why then a woman is worth havin', that's a fact. But the best of the joke is, that crittur Bill Dill Mill has found out he 'knows too much,' and is most frettin' himself to death about it. He is actilly pinin' away so, that it will soon take two such men put together to make a shadow; and this I will say, that he is the first feller ever I met that actilly was 'too knowin' by half.' But time progresses, and so must we, I guess."

Sam bamboozles a "ginerall" in the Maine, and his description of their concluding the bargain when in bed together (for such is common in American travelling) affords a strange idea of customs:—

"Well, arter walkin' about a trifle from the house, for a while, and talkin' about indifferent subjects, we took just a dust of rael good mint julip, and turned into bed.—Says he, Slick, excuse me, but I must turn my back on you, for, as I chews a good deal, I'd have to spit across you in the night, which ain't very genteel, so I can't lay spoonbill fashion.—Now for the spec'—I seed his curosity was up, so not to appear in a hurry, I said, Ginerall, said I, nothin' but bisnes would ever make me sleep with a man. I got frightened out of a year's growth once, by goin' to bed with a Britisher. It was second or third stage out of Buffalo, Canady way. When I arrived it was late to night, and I had to dig thro' the woods considerable sharp to get there at all. The house was full, and every bed had two in it, all 'xcept one, and that an Englishman had, who carried on, and swore so 'bout sleepin' two in a bed, that they gave him one all to himself, more to save the bother of havin' a quarrel with him than out of any love for him; for them English are the devil when travellin', they give so much trouble, and do what you will are never satisfied.—Exactly, said the Ginerall, most commonly their manners are rude, overbearin', and tyrannical. They want their flints fixed for 'em, as we did last war; but, fire and tow! let's have your spec' afore we get a-noddin'; I shall go for it soon, for I am considerable sleepy, I tell you.—Well, says I, so they jist told me to take up with the Englishman, and I undressed in two-twos, outs with the candle, and into bed in no time. The crittur was a-lyin' with his back to me, a-snorin' like a bull, and more nor once I had a-mind to wake him, so that we might have a fair start for it; but then, I thought it would only eend in a fight, so I let him be. But jist as I was a-droppin' off to sleep, the crittur fell too and kicked like a jackass. Lord, I thought he would have kicked me out of bed, or broke my leg, he kicked so like all possessed. Thinks I to myself, what on airth shall I do? shall I give him a slockdoler under the ear, and wake him up, or shall I turn to and kick him

in return agin? I didn't actilly know what to do; at last I gets upon my knees, gist lays hold of him by the shoulders and turned him over, with his face to me, and his back to the outside of the bed. Now, says I, kick away till you are tired, will you, my hearty, and you won't hurt nothin' but the wall. Well, if he didn't anore and kick away in great style, it's a pity; but as he didn't touch me no more, I dropped off a-sleep, and left him a-batterin' away at the wall with his heels like a paviour's rammer. In the mornin' he was quiet enough; but oh, such an ugly, ungainly-lookin' beast, I never seed. He had his mouth wide open, a-showin' of his snags of teeth like a hoes when he sneezes, and there was dry froth on his nose and lips from snortin' so. His eyes was open too (for some men sleep with their peepers open, like the Dutch overseer of the niggers with the glass eye, in the sugar-house), and they stared like the eyes of an owl, and had jist sich a glassy, filmy, onmeanin' look. His hands, like most Britishers, was as white as chalk, but the nails was blue, and so was his lips. The nostrils were pinched in, and his nose looked pointed, altogether he was a perfect pictur' of an ugly man. Hullo, shipmate, says I, how's your heels this mornin'? I guess you must have hurt 'em agin' that are wall last night, for you kicked like all vengeance; but he was as sound as a top. With that, I throw'd down the clothes on my side, and was a-gittin' out of bed, when one leg touched him, and his skin was so cold and so clammy; I turned round and took another survey of him, and then put my ear close to his mouth, and I hope I may be shot if he warn't as dead as a herring. He was I swear. It was an apperplexity fit he had, that made him kick so, like mad. It made me quite sick; I didn't get that crittur's ugly mug out of my thoughts for one while, I know. It was horrid now, warn't it?—Well, fire and tow! it was horrid, that's a fact, said the Ginerall, and if your bed-fellers are apt to be so confounded unlucky, I must say I'm 'most afeard to go to bed with you. I don't like to hear about them things at night, they kinder skeer away sleep and set me a-dreamin'; let's hear about your Nova Scotia estate: what is it like?—We had a crowner's inquest on the body, says I, and the crowner, who was a bit of a wag, returned a vardict, 'Died of fright, a-sleepin' along with a Yankee.' He did, upon my soul. Fact, I assure you.—Who the plague cares, says Corncomb, what the great, fat, porter-drinkin' hog died of; do, for gracious' sake, let him be! Did you say your land was in Nova Scotia or New Brunswick? Come, gin' over soolin', that's a good feller.—I seed he was very anxious to hear about the bond, so to tease him and pique him, says I, I had another curious adventure once with a man in bed.—What a devil of a long-winded feller you be, Slick, says he; why don't you come to the pinte at once? if you want advice, ax it; if not, let's go to sleep, for your stories are diamal. Fire and tow! I shall see that dead man in a night-mare yet.—Well, says I, this one will make you larf, anyhow, for it took a different turn from t'other one altogether. When I fust went out in the clock line, up Huron way, I used to be subject to the cramp, violent fits of the cramp, and nothin' a'most gave me relief but holdin' up a roll of stick brimstone in my hand, and I used to place it every night under the pillar of my bed to have it handy. Well, one night (and most sincerely cold it was too) I was a-bed along with Plato Frisk, a jumpin' Quaker, a terrible, cross-grained, cantankersome crittur

as ever I seed. He had a beard like a goat, it hung down to his waist a'most, and he had the power of raisin' it up with his chin, and whiakin' it as an ondocted crittur does its tail. A switch of it across your face was as bad as a blow from a bunch of stingin' nettles; it made it smart agin, like all wrath. It was a caution to look at. His nose was long, thin, and rounded, like the shape of a reapi'n'-hook, and his eyes as black and small as a weasel's; they looked like two burnt holes in a blanket, they was so deep. He actilly was an awful-lookin' crittur, as shaggy as a two-year old, and jist about as ontamed too. Well, I woke up in the night half dead with the cramp, and screamin' like mad, and I jist out fin and felt for the brimstone, and I no sooner seized it than Frisk he roared like a bull too, and folks came runnin' and troopin' in from the other room, to see what on airth all the hubbub was about; and I hope I may die this blessed minit if I hadn't got him by the nose in mistake for the brimstone (a'most an endless one it was too), and was a-squeezin' away and a-hangin' on it like grim Death to a dead nigger. It made me larf so, when the lights come in and I cured the ugly faces the goney made, that it iised the cramp, hang me if it didn't. Well, the General, he haw-hawed right out, like thunder. —Why, Slick, said he, what a droll feller you be! that was a mistake done a-purpose, I know it was, for you was always full of the devil when a boy; but for gracious's sake let my nose alone, at any rate, for I hante much to spare, I tell you. Upon my word you ain't over safe to sleep with, are you? But, fire and tow! let's go to land, as the feller said when the boat upset, let's get to land. Let's have business first, and jokes arterwards.—Well, there is reason even in roasin' an egg. I know'd I might push this too far, and that it was time to stop afore he smelt a rat. So I jist began at the beginnin', by tellin' him the land warn't for sale at no rate, but for a company, in shares, to be called 'Chester Lakes Mill Company,' and to be incorporated, like other companies, so that they needn't pay their debts if they hadn't a mind to. Then I laid out afore him how grand the water powers was, and what noble timber there was all around on the queen's land that was to be had for takin', and the great lakes for raftin' of it, and Windsor river for shippin' of it, and Mahone Bay on t'other side for exportin' of it, and so on, and then offer'd him a bonus of four hundred dollars, and a commission of ten per cent to sell shares. All the time I was a talkin' of this, I heard old 'fire and tow' a-workin' of the weed in great style, and when I got this far, he put out his hand and felt onder the pillar for his bacca. I seed he was a-beginnin' to nibble at the bait, and that he was fairly on the scent, and I calculated I should have him afore long, if nothin' didn't skeer him. Says he, why not sell out and out and have done with it? I think I could shew you how to put it off.—Sell it, says I, catch me a-sellin' of it! why it's ontit for sale.—Onfit! says he; how so? I thought you said it was particular jam.—So it is, says I, and that's the reason it's ontit; it's the rael right down thing itself.—You know best, says he, but if I was to presume to offer an opinion to a man o' your judgment, I should say, sell. Companies is cumbrous, full of liabilities, and troublesome. Sales is short and snug, and they eend the business, so you can turn the money quick, and are ready for a fresh start.—Exactly, says I, when it's a bam sell by all means; but when it's got a bottom, my rule is to hold on.—Says

he, look here, Slick.—What on airth is the use of lookin' says I, for it's as dark as Egypt; I can't see if I do look.—Fire and tow! said he, listen, if you can, for you are like a sheep's head, all jaw. I'll give you two thousand dollars at a word, for your bargain; what do you say now, go or no go? Say the word, bargain or no bargain!—I'll give you an answer in the mornin', general, says I. I don't want to part with it, and I must sleep upon it. The fact is, selling shares to a company would bring more nor twice that are sum. Let me cipher over it a little, for I have got hold of a rael pitikilar smart chance, and the right eend of the rope too, and if I am too greedy to turn it at once, I know I shall repent it to my dying day.—No, said he, I like a man to be up to the notch, and stand to his licklog; salt or no salt, say the word, or it's no offer.—Dear, dear, said I, you put the leak into every one, a'most, General; other men beat the bush, but you catch the bird; say ninety cents more, for I have made a vow I wouldn't look at two thousand dollars, and it's yourn.—Fire and tow! then, done, said he, and now I'll shew you how I do business; and with that he jumps out of bed and lights a lucifer, and openin' of his desk, says he, Write you a short assignment of that bond, Slick, and I will write the cheque; and in less than twenty minutes the bond was in his trunk, the cheque in my portmanteau, and we was both in bed agin, back to back, as sociable as you please.

Sam is fine on cemeteries: *ex.gr.* he asks his companion to see Mount Auburn in Boston, and proceeds:—

"Lord, the French may crack and boast as much as they please about their 'Pair o' Shaise,' but it's no touch to it. Why, I never was so disappointed in anything in all my life, since I was brought up, as that are Paris buryin' ground. It looks for all the world like an old ruined town, where the houses are all gone, and the porches, and steps, and dog-kennels, are left. It hante no interest in it at all, except the names o' them that's buried there; but Mount Auburn is worth seein' for itself. It's actilly like pleasure ground, it's laid out so pretty, and is the grandest place for courtin' in I know on, it's so romantic. Many a woman that's lost one husband there has found another in the same place. A widower has a fine chance of seein' widders there; and then nobody ever suspects them of courtin', bein' that they are both in black, but takes 'em for mourners, and don't intrude on 'em out of pity. I'll go a bet of a hundred dollars the women invented that place, for they beat all natur' for contrivances, so they do. Yes, squire, if you have a mind for a rich young widder, clap a crape weeper on your hat, and a white nose-rag in your hand, and go to Mount Auburn, and you'll see some heavenly splices there, I tell you, in some o' them are shady walks, that will put all the dead in creation out of your head a'most. Them saller-lookin', garlick-eatin' French heifers, you see to 'Pair o' Shays,' may have better top gear, and better riggin' in general than our gulls, and so they had ought, seein' that they think of nothin' else but dress; but can they shew such lips, and cheeks, and complexions, that's all, or such clinker-built models? No, not them, nor any other women of any other nation in the univarsal world. If they can, it's some place that's not discovered yet, that's all I can say; and you must go a leetle farther than the eend of the airth to find them, for they ain't this side of it. You must

see Mount Auburn to-morrow, squire, that's a fact; but then, leave your heart to home, to the Tremont, as folks do their watches when they go to the theatre to London, or you will lose it as sure as you are born."

With this we are compelled to be content for the present, but must have another gossip with our esteemed friend the Clockmaker.

*Forget-me-Not* for 1841. Edited by F. Shoberl. 18mo. pp. 354. London. Ackermann and Co.

Of late our pages have been crammed with science, at which many of our lighter readers turned up their little noses; but now they may have their enjoyment and revenge, for this is the abundant ephemeral time of publication, and we shall only rejoice if our scientific readers do not in turn turn up their learned noses at the flood of Annual glitter which pours in upon the gayer world. Be that as it may, even with the idea of the two stools before us, we can be but the creatures of circumstances, and reflect the form and pressure of the age as its real images rise to the view.

*Forget-me-Not*, an old and established favourite, comes forth with its due amount of art, and variety of prose and verse. In the former, "Phoebe May's Dream," by Parris, engraved by E. Scriven; "The King's Banner-bearer," by Cattermole, engraved by L. Stocks; and "The Wife of Raleigh," painted and engraved by J. Penstone, are the best; the other seven either not being such good designs, or not so well executed by the burin. Among the contributors, Mrs. Sigourney, Lady Blessington, Miss A. Strickland, Miss M. A. Browne, Miss Pardos, Miss Lawrance, Charles Swain, Richard Johns, Dr. Mackenzie, E. Howard, Laman Blanchard, and G. P. R. James, are the most known to fame, and successful in adorning this volume. In our choice of quotation, however, we must be guided by limits, and the wish to be as various as we can; and under these impressions we pitch upon Lieut. John's original tale of Cornwall, which is simply and well told; and a poem upon Love by Miss E. Scaife, as brief as *true* love itself.

"Since the days of Darby and Joan, never could there have been a nicer couple than Mr. and Mrs. Poltwinny. Many are paired, but these were matched; and, if not born for each other, the wonder would be why they came into this world at all: yet in their relative positions well did they fulfil the apparent purpose of their being; helpmates and copartners, changeless amid change, pursuing in harmony the even tenor of their way. But, once upon a time, Mr. Poltwinny, in an evil moment, nearly destroyed this fair fabric of tranquil happiness by a single inconsiderate act—we had almost said youthful indiscretion—though, as few remembered Mr. and Mrs. Poltwinny to have been young, it is probable the old gentleman had sown his wild oats ere our tale commences. The ancient pair lived on a comfortable annuity, which supplied all the wants, and afforded many of the superfluities of life. They dwelt in their own cottage, redeemed of the land-tax, and too small to come under other assessments; even the parson did not get a tenth apple or gooseberry out of their garden, since Mr. Poltwinny not being a horticulturist, its arrangements were always at 'sixes and sevens.' Could the old people have been more happy? for, to crown all, their lot was cast in a temperate climate, in a respectable neighbourhood, and in a county remarkable for longevity. Yet, though the inhabitants of that part of the world did live a long time, now and then it

would happen that a neighbour died; and, on one occasion, which falls in our province to mention, Death most impertinently took unto himself, and to the churchyard of Chatterton, a very wealthy man, who, among other bequests, willed 'To his kind and quiet neighbours, Sarah and Peter Poltwinny, the estate called St. Ernst.' Now the reader may perhaps be envying our old friends this piece of good fortune; but, though the property was well let, and worth a full hundred a-year, we doubt not it would have been much better for Mr. and Mrs. Poltwinny had any covetous person possessed it rather than themselves. That hitherto harmonious couple found the apple of discord in the said little farm of St. Ernst. Mr. Poltwinny wanted to go and see it without delay, while Mrs. Poltwinny, who never went farther than the bowling-green, 'for a bit of a turn in the evening,' thought there need be no hurry in the matter. 'To be sure, they would go some time or other, that is to say, when there was a *fitty* and proper day; but she couldn't abide to be fussed; and Mr. P. was always a nag, nag, nag, about going; and it hurt her more than any body could tell.' Thus would the old lady pour the secret of her sorrows into the eagerly listening ears of the gentle gossips of the town, who—sympathising creatures!—would lift their open palms to the level of their chins in commiseration; and wisely did they shake their heads as they declared 'men would be men,' and that 'poor women had a great deal to put up with,' till Mrs. Poltwinny actually believed herself the most injured wife in the parish. We are strong advocates for married ladies having their own way, but then we would suggest the propriety of their conceding a proportionate freedom of action to their husbands, ere they take on themselves this privilege. As this is a true history, it must be confessed Mrs. Poltwinny might have regarded her ancient helpmate's anxiety to inspect his landed property with a little more forbearance; more particularly, as the prospect of the jaunt had its gratification even to her. Yes, often would she put forth the luckless proposition, 'Now, Mr. Poltwinny, let's talk about going to St. Ernst, just for a bit of a cosey chat;' with this prelude commencing that communion of soul which usually followed their two-o'clock meal. It was then that, seated on either side the fireplace, and gravely arguing the St. Ernst question, the old people would prose each other to sleep after dinner, if Mr. Poltwinny's perverseness in trying to fix a day for the excursion did not produce a squabble requiring the best part of the afternoon to make up. We will, so far as our feeble pen enables us, give to the reader one of these discussions: sad to say, it was the last that the journey to St. Ernst afforded them; the subject ever afterwards possessing too painful reminiscences to be idly renewed. It was a gala day at Chatterton. May had not, at the period of which we write, become a cold, blowing, wintry month, and it was appropriately ushered in with festivities. Our scene is laid in rather a primitive part of old England. On this occasion there was much merriment without much intemperance, and the joyous dance was not confined within the walls of the dwellings, but took its course along the streets. Music hailed the dawn, and carolled through the day. Even the parish-headle forgot to be churlish. Yet all this merry-making had but little effect on Mr. and Mrs. Poltwinny. They had passed the age for such uproarious mirth; added to which, the debates occasioned by the possession of the St. Ernst estate had gone far to absorb

every minor interest. The dinner had been removed by the maiden who took charge of the Poltwinny household department, when the old gentleman suddenly remarked, 'I wonder, Mrs. Poltwinny, if we ever shall get to St. Ernst?' The patient partner of the impatient querist, for this was evidently a leading question in disguise, did not accustom herself to take offence at an early stage of the conversation; so she quietly replied, 'I am sure I have not the least objection to going—you can't say I ever refused to go, Mr. Poltwinny—now can ee?' 'No, my dear,' coaxingly rejoined the old man, 'you never did: and I should like to see the farm some fine afternoon. It's barely three miles off, and if ee don't care to walk, why the cost of a car there and back will be only five shillings; and we can take our own tea and sugar and a seedy cake, and Farmer Freeman will boil the kettle for us—' and here the speaker paused for breath, having, in eagerness to gain his heart's fondest wish, expended more of that commodity than so short an harangue warranted. 'Mr. Poltwinny, I told ee before, and I tell ee now, that I have no objection,' gravely responded the old lady. 'Thank ee, my dear, thank ee. Why, please sure, I have set my mind upon going, and don't ee know that we've had the place nine months come Midsummer? When shall it be, then, Mrs. Poltwinny? suppose we say to-morrow.' 'How can ee be so foolish, Mr. Poltwinny!' snappishly returned his helpmate, for they had now arrived at the point dangerous of their discourse. 'How can ee be so foolish! don't ee know that to-morrow's washing-day?' 'Well, well, my dear, then say Wednesday?' 'Oh! bless my heart! Mr. Poltwinny, what can have come to ee? Wednesday the maiden will be drying and folding, and you know I do always help her.' 'Never mind, then, Mrs. Poltwinny, suppose we name Thursday?' 'Dear! dear! why the man must be a born fool! what can make ee forget the ironing? It's enough to tire the patience of a tender lamb. I wish ee'd go without me, please sure, I do; like a tearing, gallivanting man as ee are!' Here the ancient dame gave symptoms of a cry, though her insinuations respecting the infidelity of her spouse were most unjust. In the memory of the oldest inhabitant of Chatterton, never had there been a continuous separation for more than an hour between Mr. and Mrs. Poltwinny; nor had it ever entered into the old gentleman's head, till then, that it was possible for him to go to St. Ernst by himself. 'Mrs. Poltwinny, don't cry—'tis very foolish to cry for such a trifle—what a fuss ee do make about it!' Thus saying, with a look of peculiar sagacity, Peter Poltwinny went to the cupboard and brought out a bottle. 'We'll have another glass, Mrs. Poltwinny, as 'tis holiday time, and drop the subject.' The old lady said nothing, which was a good sign—she had another glass and was comforted. There happened to be an interregnum of repose in the town; the maiden 'had liberty' for the evening; she had set the 'tea-things' and gone out, leaving the kettle in charge of her master and mistress, who, glad of an excuse for a fire, agreed that they might as well burn the coals in the parlour as in the kitchen. It is now necessary that the reader should be introduced, with all imaginable perspicuity, to the Poltwinny *salle à manger*. It was a snug little apartment, twelve feet by ten, warmly carpeted; four high-backed chairs of black wood stood sentry against the dark wainscoting, and a mushroom-shaped table bore on its glossy

mahogany the aforesaid 'tea-things.' The most affecting portions of the history of the prodigal son had suggested subjects for three prints over the mantel-piece; beneath which, prostrate before the fender, was a worsted tiger, on a green field of the same material, surrounded by a coffee-coloured fringe; the whole being the work of Mrs. Poltwinny's industrious hands. That beast of prey was an awful-looking animal, much resembling a yellow donkey, streaked and spotted with black, the hoofs being removed and giving place to long claws, much too terrific to gaze upon, had they not, by their form and colour, called to our recollection sundry branches of young carrots. Mrs. Poltwinny was not a nervous woman, yet surely nothing but custom, and the fact of the appalling monster being the creation of her own fancy, could have reconciled her to slumber, as she was then doing, like Tippoo Sahib, with a tiger's head for a footstool. This brings us to the arm-chair on either side of the fireplace. In one of these reclined Mrs. Poltwinny, a sharp-faced little dame, whose wizened cheeks, wearing a ruddy tinge, reminded you of winter apples kept long in store. Round her head was the close quilling of a high cap, decorated with pink bows, which confined a smart front of auburn curls, made from her own hair, as she positively declared, though when cut off was never stated—the only affectation our ancient friend sported being a dislike to confess herself grey. A long-waisted, plum-coloured, silk gown, crossed by a tightly-pinned shawl, snow-white stockings, and somewhat high-heeled slippers, completed the costume of the sleeper. And now, disregarding the syren voice of the tea-kettle, which was beginning to sing, and merely mentioning, *en passant*, that it was shining in all the radiance of bright copper, we will take a glance at the opposite chair and introduce Peter Poltwinny to the reader. The old gentleman was of opinion that he was about the middle height; but this is an altitude so few confess they are below, that we are not at all surprised he had taken the medium at five feet two, for such was he in his shoes. Still, if Mr. Poltwinny did not carry a high head among the children of men, he certainly bore a very long one, which many think far better. He had a long nose too, and a long chin, and these seemed bent in eternal consultation as to the width of his mouth, while his lengthly ears stood out as if listening to the debate. All these features were set in rather a cadaverous complexion, and formed the capital of a long body. Where, then, was the short-coming in Mr. Poltwinny's stature? the reader will naturally ask. It was in his legs. Though, so far as form went, straight and proper to look at; they appeared never to have arrived at their proper growth; and, cased as these extremities generally were in leather inexpressibles, blue hose, and buckled shoes, they seemed rather the appendages of a charity boy, than belonging to so matured and respectable an individual as our hero. Yes, Mr. Poltwinny is our hero. Without further preface we announce this important fact, ere we recommence the action of this domestic drama. Silly and cautiously was he glancing at his sleeping partner with his little grey eyes, for Peter Poltwinny had not yielded to the influence of the drowsy god. There was a speculation in those orbs most unwonted. Uprose that old man with stealthy caution. It was a period of fearful excitement. We would fain pause in our narrative; but the daring act of that cruel husband must be revealed. We have witnessed

many scenes of overpowering interest in certain melodramas that, however faintly, may in some degree approach the reality of this moment. How breathless is the effect when a deed of import is to be done, while a principal character in the piece slumbers! With what care will the lady or gentleman doing the waking business of the scene appear to ascertain that the recumbent party actually sleeps — no fox's sleep, but a *bonâ fide* sound nap! So completely absorbed have we been during such a passage in the enthralling drama, that we have longed for an expressive snore to assure us of this fact. Return we now to the Poltwinnies. The old man had approached the sleeping dame with noiseless foot. His hand was uplifted to reach his hat from a small side-table near her, when Mrs. Poltwinnny's nose gave utterance to that melody peculiar to slumber, and this drove Mr. Poltwinnny back to his chair. In a moment he recovered himself sufficiently to draw comfort, rather than affright, from a sound which now at intervals testified that his unsuspecting wife actually slept. He gained his hat.—He cautiously approached the door.—He opened it—and, desperate man! in another instant he was on his way to St. Ernst. The scene of this domestic perfidy was on the outskirts of the town, and Mr. Poltwinnny traversed divers bystreets with hasty steps, it being then past four o'clock, and the goal of his desires lying nearly three miles on the other side of Chatterton. Whatever other errors he may have committed, we feel assured that the old gentleman never contemplated the awful wickedness of remaining out after nightfall. Leaving him to pursue his way, we will return to his respectable and injured spouse, who continued tranquilly unconscious of the cruel treachery of her husband. Little did she dream that her unfortunate petulance in calling Mr. Poltwinnny a 'tearing, gallivanting man,' and desiring him to 'go to St. Ernst by himself,' had literally put this daring idea into his head; and, alas! so quick is the growth of evil, it might not be impossible that the once staid and proper elderly gentleman would, in the end, deserve the character she had so heedlessly assigned him. Brightly the fire burnt, loudly the kettle sang, and soundly did Mrs. Poltwinnny sleep. How many unwittingly slumber over a mine, remarks the moralist who would expatiate on the instability of all sublunary affairs, and finds in gunpowder the most powerful simile for his purpose. Now Mrs. Poltwinnny was actually, as well as figuratively, sleeping over a mine; but it was a mine not likely to blow her into the air; no, rather to precipitate her full fifty fathom deep into the bowels of the earth. Since the days of those first of travelling tinmen, the Phœnicians, that part of England of which we write has been a mining district. We are not composing a treatise on the stannary laws, but we must observe that a custom existed formerly which has occasioned no small surprise of late years. We refer to the practice of passing balks of timber across the mouth of a disused shaft of a mine, which, though they might have prevented the then rising generation from an untimely descent, have had the dangerous effect of obliterating all marks of such a chasm from the surface, by the collection of earthy and vegetable matter, till the very site has been frequently forgotten. Yes, thus may the enterprising building speculator, in planting his ten-pound freeholds on this soil, find that he is on the verge of a burrow which the Reform-bill never contemplated. Reader, Mrs. Poltwinnny's feet were on the tiger's head; the tiger reposed on

the hearth; but the shaft of a mine, which just came within the limits of the shallow foundation of the cottage, was beneath that hearth-stone. We know not if the primitive earth about the old-fashioned town of Chatterton trembled at Mr. Poltwinnny's audacity, or whether a portion of the timbers covering the chasm had decayed, but it is certain that Mrs. Poltwinnny was aroused from her slumber by a sound which to her sleeping ears strongly resembled thunder; and the old lady, when she opened her eyes, gazed into an abyss some hundred feet deep. Down—down had gone the hearth-stone. Down—down had gone fender and fire-irons. The tiger hung suspended, as if unwilling to proceed farther into an unknown country; and Mr. Poltwinnny's chair had one leg in the grave. Let any elderly gentleman imagine the alarming position in which Mrs. Poltwinnny was placed at this moment. The distracted old lady gave a shriek which would have been appalling, only nobody heard her. She did not dare to stir, for she felt tottering for a fall; so all she could do was to scream, and even the shaking of her voice threatened to precipitate her into the pit. It must not be supposed that our heroine's distress was all selfish. No;—verily believing that her respected husband had fallen a victim to that 'fatal shaft,' loud was the lament she raised over his sudden departure. A shower of burning ashes now fell from the grate; and she fancied, as they descended, that she heard a faint groan. 'Mr. Poltwinnny! Mr. Poltwinnny!' cried the agonised wife, 'speak—are ee down there?' No answer was vouchsafed, seeing that Mr. Poltwinnny was gone to St. Ernst. Already a widow in imagination, alas! there was no one to condole with her. The kettle sang away as if nothing had happened, but glad are we to say that this unfeeling domestic rebel to a good mistress soon met with the fate it so richly deserved. Oppressed by the heat, and ultimately boiling over, it slipped from a high coal on which it was poised, lost its equilibrium, pitched on the tiger's back, and thence bounded into the ebon darkness beneath. It was immediately followed by the royal animal, thus bathed in hot water; and doubtless there was a fearful settlement in the depths of that mine. Lucky for Mr. Poltwinnny that he was not 'down there' to superintend it. Strange it may appear that our ancient friend did not manage to push aside her chair, and escape from her fearful and inactive position, since no portion of the floor had descended with the hearth-stone; but it must be remembered that the good lady, like the philosopher of old, wanted the fulcrum for her lever. Her feet dangled over the shaft, nor could she slide out of her seat, which, being formed on an easy principle, walled her in on every side. No; all that Mrs. Poltwinnny could do was most conscientiously performed—she screamed till she could scream no longer; and then employed herself, as she imagined, in looking after Mr. Poltwinnny; an occupation which, in another sense, had been the whole business of her life. Nearly two hours had elapsed in this unpleasant predicament, when the sound of fiddles, drums, and fifes, arose in the distance: thus the prisoner hoped that succour was hand, nor was the hope fallacious. Having so far relieved the reader's anxiety respecting the worthy dame, we will follow Mr. Poltwinnny to St. Ernst, whither he travelled as fast as his little legs could carry him. The farmer, his tenant, happened to be opportunely at home. They went into the farmyard and the fields, they looked into the cowsheds and

the pigsties, indeed over the whole property and premises. The landlord was so delighted that he promised Farmer Freeman a new thatch to his barn; and Farmer Freeman, out of respect to the generous proprietor, opened a bottle of very curious old rum to ratify the agreement; concluding his attentions by driving Peter Poltwinnny back to Chatterton in his taxed cart. For the honour of human nature, it must not be supposed that the runaway husband indulged in all these pleasures without some small prickings of conscience, to say nothing of sundry apprehensions that Mrs. Poltwinnny would never forgive him. He had tried to comfort himself in the belief that, as she usually slept long of an afternoon, her anxiety about him would be of short duration; but then, again, he recollected that, having foolishly left the kettle on the fire, it might boil over, and disturb her. Poor Mr. Poltwinnny! could he but have guessed where that kettle then was! These distressing thoughts, however, had subsided under the influence of two or three glasses of punch; and when the farmer set the worthy proprietor down at the entrance of the town, the happy little gentleman started for his house, certainly in a state of much bewildered excitement, but still with thorough enjoyment of spirit. The thirst of his soul was slaked; had he not been to St. Ernst? Thus he pursued his course with great hilarity. The town was all harmony; music was playing; men and women were dancing; and why should he alone be unhappy? About the length of a street from his own cottage, Mr. Poltwinnny fell in with a string of youths and maidens, preceded by musicians, who, according to the custom of the town on that particular day, were performing most vigorously a kind of continuous figure, which enabled the dancers to progress through all the principal thoroughfares. What demon tempted Mr. Poltwinnny we know not, unless it might have been that spirit of Obi which is a native of our Western Indies, *videlicet*, rum; but true it is, though strange to say, he got entangled in the mazy dance, and this when he was not far from his own house, beneath the windows of his wife's most intimate acquaintance, Miss Weeks, an amiable spinster of fifty-three, whose only weakness was an excess of sympathetic friendship. With virtuous horror the antiquated maiden beheld the husband of her friend poussetting it with half-a-dozen damsels at once, as the merry-makers crowded round him, and the music poured forth its loudest strain. For Miss Weeks to slip on her bonnet and shawl, and dash out of her back-door, was but the work of a moment. 'A scandalous, audacious old fellow! but I'll tell his wife of un!' and, so saying, by a short cut the sympathising neighbour reached her destination, and, without the ceremony of knocking, ran into the little parlour where we just now left poor Mrs. Poltwinnny on the very brink of destruction. 'Where's your husband, my dear?' cried Miss Weeks, ere her hurried glance had quite taken in the peculiar position of her unhappy friend. Now the querist had fully assured herself that the old gentleman was dancing through the streets; but then it was proper to ascertain under what false pretences he had gone abroad. With a burst of joyful tears at the arrival of help, Mrs. Poltwinnny, still seated in her armchair like an affrighted tenant of an up-and-down at a fair, pointed to the chasm before her, and sobbed out, 'Pull me back! pull me back! he's tumbled down there!' To have found a friend in so extraordinary a dilemma, we might suppose would have changed the current of the

sternest thoughts; but no—a duty was to be performed; 'Miss Weeks would shew Mrs. Poltwinny what kind of a man her husband was:' so, reserving all questions as to the scene before her, the indignant virgin exclaimed, 'Down there, my dear woman! he's dancing the streets with the maidens;' and, whirling the chair round with much dexterity, she raised the injured wife on *terra firma*, and hurried her to the bay-window. 'Look at un, look at un!' said Miss Weeks. 'How did ee get such a hole in the floor, my dear? Look at the audacious old fellow! I would not live with un after this—that I wouldn't! What made ee think he was down in the pit, my dear soul? Why, the mercy is you didn't go in yourself.' Thus questioned and ejaculated this invaluable neighbour, while poor Mrs. Poltwinny was staring with distended eyes at her husband 'dancing with the maidens.' The little man at length extricated himself from the merry group, and, catching a glance of his wife, together with the fair counsellor at her right hand, he approached the door with that down-cast expression of visage and unobtrusive demeanour which have been classically said to remind one of a dog that has burnt his tail. 'Where have ee been, you cruel thing you? a'n't ee ashamed of yourself? Oh, the fright I've had about ee!' cried Mrs. Poltwinny to the truant as he entered. The old man was aghast, for he knew that the truth must come out one time or another. He looked at his wife, and then at Miss Weeks, and then at his wife again, while his small legs trembled under him. 'I've been to St. Ernst,' said Mr. Poltwinny. Mrs. Poltwinny had borne up wonderfully the whole of that afternoon; she had believed her husband entombed alive; she had herself been in imminent peril; and, when rescued from this, she had beheld the partner of her bosom, whom she had mourned as dead, wantonly dancing with maidens of low degree: all this she had supported like a heroine, but human nature could not stand such a climax to the distresses of the day: Mr. Poltwinny said he had been to St. Ernst, and Mrs. Poltwinny swooned! It was many a long month ere the harmony of the Poltwinnies was restored; and it is supposed that the reconciliation of the old couple would never have been effected had they not removed from the neighbourhood of which Miss Weeks formed so distinguished an ornament, in consequence of the breaking-up of their domestic hearth; but never again did Mr. and Mrs. Poltwinny talk of 'going to St. Ernst.'"

"Love."

And is it all a dream—a dream?  
Is love indeed a dream?  
Are all love's bright imaginings  
Like sunlight on the stream?  
Is there no truth—no lasting truth—  
To hallow future years,  
In all love's thousand fervent vows,  
Its mingled smiles and tears?  
Is there no steadfastness in love—  
No ever-during might?  
O, is it all a dream—a dream,  
A falling star of night?  
Tell not of love! It is a dream:  
It is indeed a dream!  
Tell not of love! It is indeed  
A sunlight on the stream!  
Tell not of love! It owns no god,  
No truth, no durling might;  
Tell not of love! the child of change,  
Whose breath can bless and blight.  
Tell not of love! It cannot last,  
Though seeming from above;  
Tell not of love! It is a dream:  
Tell not of Earthly love!"

*Friendship's Offering; and Winter's Wreath: a Christmas and New Year's Present for* 1841. 18mo. pp. 384. London, Smith, Elder, and Co.

FRIENDSHIP'S offerings ought to be much the same, year after year for many a year; and if they are not often so in the intercourse of life, it is at least a merit of consistency that they are pretty nearly so in this now eighteen-year-old miscellany. The success it has acquired it deserves to retain; for we find its poetry, its prose, and its embellishments, so little different from former periods, that we could offer no objection to giving or taking 1835 for 1839, or 1840 for 1841, or, handy-dandy, any one Christmas for any other of its Christmas publications. Such being the case, we have only to glance our eye over the contents and select a few specimens of the finer features as illustrations of the whole.

A preface presents the usual editorial gratulations, and the Annual opens with "Claude Rovani," an Italian prose tale by "the Hon. Mrs. Erskine Norton." Another "Hon." lady, Mrs. Lambert, supplies a Sicilian story of like stamp; and Etty, the R.A., lends his name to a few reflections of no general interest. "The Collegian of Coimbra," a Portuguese tale by Mr. W. H. Harrison, fills about thirty pages; and an Eastern legend by Mr. J. A. St. John, nearly as many. Allan Cunningham we are glad to see again in print, like himself, with a Scotch piece of the Covenanted time; and Dr. W. C. Taylor, with "The Tomb of Solomon," a well-done Jewish legend. The rest of the *proses* are by Agnes Strickland, Eden Lowther, Mrs. Ellis, anonymous contributors, and the author of "The Provost of Bruges," whose pen draws a descriptive and pathetic picture of the destruction of some of the last of the Egyptian Mamelouks. From none of these can we conveniently make any extracts; and we must, therefore, look from them to the more brief poetical interspersions.

"The Happy Valley," by Thomas Miller, though partially cramped by being written to illustrate an engraving, is, in our opinion, by far the *happiest* of these; the single epithet which commences the third stanza, "The golden-belted bees," proclaims the poet of nature. But we give the composition entire:—

"It was a valley filled with sweetest sounds,  
A languid music haunted everywhere,—  
Like those with which a summer-ewe abounds,  
From rustling corn, and song-birds calling clear,  
Down sloping uplands, which some wood surrounds,  
With tinkling rills just heard, but not too near;  
Or lowing cattle on the distant plain,  
And swing of far-off bells, now caught, then lost again.

It seemed like Eden's angel-peopled vale,  
So bright the sky, so soft the streams did flow;  
Such tones came riding on the musk-winged gale,  
The very air seemed sleepily to blow,  
And choicest flowers enamelled every dale,  
Flushed with the richest sunlight's rosy glow:  
It was a valley drowsy with delight,  
Such fragrance floated round, such beauty dimmed the sight.

The golden-belted bees hummed in the air,  
The tall silk grasses bent and waved along;  
The trees slept in the steeping sunbeams' glare,  
The dreamy river chimed its undersong,  
And took its own free course without a care:  
Amid the boughs did lute-tongued songsters throng,  
Until the valley throbb'd beneath their lays,  
And echo echo chased, through many a leafy maze.  
And shapes were there, like spirits of the flowers,  
Sent down to see the Summer-beauties dress,  
And feed their fragrant mouths with silver showers;  
Their eyes peeped out from many a green recess,  
And their fair forms made light the thick-set bowers;  
The very flowers seemed eager to caress  
Such living sisters; and the boughs, long-leaved,  
Clustered to catch the sighs their pearl-flush'd bosoms heaved.

One through her long loose hair was backward peeping,  
Or throwing, with raised arm, the locks aside;  
Another high a pile of flowers was heaping,  
Or looking love a-sance, and, when desisted,

Her coy glance on the bedded greensward keeping;

She pulled the flowers to pieces as she sighed,—  
Then blushed like timid day-break when the dawn  
Looks crimson on the night, and then again's withdrawn.

One, with her warm and milk-white arms outspread,

On tip-toe tripped along a sun-lit glade;

Half turned the matchless sculpture of her head,

And half shook down her silken circling braid;

Her back-blown scarf an arched rainbow made,

She seemed to float on air, so light she sped;

Skimming the wavy flowers, as she passed by,  
With fair and prattling feet, like clouds along the sky.

One sat alone within a shady nook,

With wild-wood songs the lazy hours beguiling;

Or looking at her shadow in the brook,

Trying to frown, then at the effort smiling—  
Her laughing eyes mocked every serious look;

'Twas as if Love stood at himself reviling:  
She threw in flowers, and watched them float away,  
Then at her beauty looked, then sang a sweeter lay.

Others on beds of roses lay reclined,

The regal flowers athwart their full lips thrown,  
And in one fragrance both their sweets combined,  
As if they on the self-same stem had grown,  
So close were rose and lip together twined.

A double flower that from one bud had blown,  
Till none could tell, so closely were they blended,  
Where swelled the curving lip, or where the rose-bloom ended.

One, half-asleep, crushing the twined flowers,

Upon a velvet slope like Dian lay;

Still as a lark that mid the daisies cowers:

Her looped-up tunic tossed in disarray,  
Shewed rounded limbs too fair for earthly bowers;

They looked like roses on a cloudy day;  
The warm white dugh amid the colder green;

The flowers too ruffled a couch that lovely shape to screen.  
Some lay like Thetis' nymphs along the shore,  
With ocean-pearl combing their golden locks,  
And singing to the waves for evermore;

Sinking like flowers at eve beside the rocks,  
If but a sound above the muffled roar

Of the low waves was heard. In little flocks,  
Others went trooping through the wooded alleys,  
Their kirtles glancing white, like streams in sunny valleys.

They were such forms as, imaged in the night,  
Sail in our dreams across the heaven's steep blue;

When the closed lid sees visions streaming bright,  
Too beautiful to meet the naked view;  
Like faces formed in clouds of silver light.

Women they were! such as the angels knew—  
Such as the Mammoth looked on, ere he fled,  
Scared by the lovers' wings, that streamed in sunset red."

From J. R., of Christ's Church, Oxford,\*  
we have some spirited poems, including the  
third part and conclusion of the "Broken  
Chain." There are fewer of this young aspirant's peculiarities in these compositions; and as he seems to bestow more thought and pains on what he does, instead of running wild after words and imperfect similes,† we trust yet to see an original prediction of the realisation of his powers fulfilled. Meanwhile, a rival University man is proclaimed in T. E. Hankinson, M.A., of Cambridge, who celebrates the burning of the Royal Exchange in some pleasant lines, though not so playful as they assume. They resemble, at a distance, the "Rejected Address" imitation of Sir W. Scott; but, sooth to say, we cannot consider the Royal Exchange so fortunate in this celebration of its fiery fate as to be redeemed from the curse implied by the last tune its evening bells performed,—

"There's nae luck about the house,  
There's nae luck ava;  
There's little pleasure in the house," &c.

"The Phantom Fact" (anonymous) is an agreeable trifle; and "The Heir of Dunrea," by the author of the "Provost of Bruges," is a sad and terrible ballad; but we will conclude (none of the others possessing any remarkable merit, and some of them being very namby-pamby) with one of Mr. T. K. Hervey's natural and touching songs:—

"Homes and Graves.  
How beautiful a world were ours,  
But for the pale and shadowy One

"The Phantom Fact" (anonymous) is an agreeable trifle; and "The Heir of Dunrea," by the author of the "Provost of Bruges," is a sad and terrible ballad; but we will conclude (none of the others possessing any remarkable merit, and some of them being very namby-pamby) with one of Mr. T. K. Hervey's natural and touching songs:—

"Homes and Graves.  
How beautiful a world were ours,  
But for the pale and shadowy One

\* He styles the bees "music winged," page 312, which is a good phrase; but neither so fine nor so original as Mr. Miller's—*Ed. L. G.*

† Such as even yet, at page 316,—

"And waved its dark and drifted plume  
Like *fire* that haunt the unholy tomb."

That treadeth on its pleasant flowers,  
And stalketh in its sun!  
Glad childhood needs the lore of time  
To shew the phantom overhead;—  
But where the breast, before its prime,  
That carrieth not its dead,—  
The moon that looketh on whose home  
In all its circuit sees no tomb?

It was an ancient tyrant's thought  
To link the living with the dead;—  
Some secret of his soul had taught  
That lesson dark and dread!  
And, oh! we bear about us, still,  
The dreary moral of his art,—  
Some form that lieth, pale and chill,  
Upon each living heart,  
Tied to the memory, till a wave  
Shall lay them in one common grave!

To boyhood hope, to manhood fears!  
Alas!—alas! that each bright home  
Should be a nursing-place of tears,  
A cradle for the tomb!  
If childhood seeth all things loved  
Where home's unshadowy shadows wave,  
The old man's treasure hath removed,  
He looketh to the grave!—  
For grave and home lie sadly blent,  
Wherever spreads yon firmament.

A few short years—and then, the boy  
Shall miss, beside the household hearth,  
Some treasure from his store of joy,  
To find it not on earth;—  
A shade within its saddened walls  
Shall sit, in some beloved's room,  
And one dear name, he vainly calls,  
Be written on a tomb,—  
And he have learnt, from all beneath,  
His first, dread, bitter taste of death!

And years glide on, till manhood's come;  
And where the young, glad faces were,  
Perchance the once bright, happy home  
Hath many a vacant chair;—  
A darkness from the churchyard shed,  
Hath fallen on each familiar room,  
And much of all home's light hath fled,  
To smoulder in the tomb,—  
And household gifts that memory saves  
But help to count the household graves.

Then, homes and graves the heart divide,  
As they divide the outer world;  
But drearier days must yet betide,  
Ere sorrow's wings be furled;  
When more within the churchyard lie  
Than sit and sadly smile at home,  
Till home, unto the old man's eye,  
Itself appears a tomb;  
And his tired spirit asks the grave  
For all the home it longs to have!

It shall be so,—it shall be so!  
Go, bravely trusting—trusting on;  
Bear up a few short years—and, lo!  
The grave and home are one!—  
And then, the bright ones gone before,  
Within another, happier home,  
Are waiting, fonder than before,  
Until the old man come—  
A home where but the life-trees wave:  
Like childhood's—It hath not a grave!"

There are ten engravings, of moderate interest and merit.

MISS STRICKLAND'S LIVES OF THE  
QUEENS OF ENGLAND.  
[Second notice: conclusion.]

FROM the life of Katherine we quote a few passages. In her honeymoon, spent amid sieges, battles, and carnage, we are told:—

"After the tragedy of Montreuil, the united courts removed to Corbeil, where Queen Katherine was joined by her sister-in-law, Margaret, duchess of Clarence, and many noble ladies, who had come from England to pay their duty to the bride of King Henry. She was with her mother and King Charles at the camp before Melun. 'But, indeed,' says Monstrelet, 'it was a sorry sight to see the King of France bereft of all his usual state and pomp. They resided, with many ladies and damsels, about a month, in a house King Henry had had built for them near his tents, and at a distance from the town, that the roar of the cannon might not startle King Charles. Every day at sunrise,' continues the Burgundian, 'and at nightfall ten clarions, and divers other instruments, were ordered by King Henry to play for an hour most melodiously be-

fore the door of the King of France.' The malady of the unhappy father of Katherine was soothed by music. This was evidently the military band of Henry V., the first which is distinctly mentioned in chronicles. Henry was himself a performer on the harp from an early age. He likewise was a composer, delighting in church harmony, which he used to practise on the organ. That he found similar tastes in his royal bride is evident from an item in the *Issue Rolls*, whereby it appears he sent to England for new harps for Katherine and himself, in the October succeeding his wedding. 'By the hands of William Menston was paid 8*l.* 13*s.* 4*d.* for two new harps, purchased for King Henry and Queen Katherine.' If the reader is anxious to know who was the best harp-maker in London at this period, complete satisfaction can be given; for a previous document mentions another harp sent to Henry in France, 'purchased of John Bore, harp-maker, London; together with several dozen harpichords and a harpcase.'"

The death of her valiant husband is thus related:—

"In the castle of Vincennes, near Paris, which has so often been the theatre of the destinies of France, Katherine and her mother attended the last hours of Henry V. He made a very penitential end, but was so little conscious of his blood-guiltiness, that when his confessor was reading the seven psalms in the service for the dying, he stopped him when he came to the verse, 'Build thou the walls of Jerusalem,' with an earnest protestation, 'That when he had completed his conquests in Europe, he always intended to undertake a crusade.' When he had arranged his affairs, he asked his physicians, 'how long he had to live?' One of them replied on his knees, 'That without a miracle he could not survive two hours at the most.' 'Comfort my dear wife,' he said to the Duke of Bedford, 'the most afflicted creature living.' In a will he made on his death-bed, he leaves Katherine a gold sceptre. Henry expired on the 31st of August, 1422. Henry was a learned prince, but he had the bad habit of borrowing books and never returning them. After his death a petition was sent to the regency by the Lady Westmorland, his relative, praying that her 'Chronicles of Jerusalem,' and the 'Expedition of Godfrey of Boulogne,' borrowed of her by the late king, might be returned. The Prior of Christchurch, likewise, sent in a most pitiful complaint, that he had lent to his dear lord King Henry the works of St. Gregory, who had never restored them to him their rightful owner."

The interruption here recorded, touching the crusade to restore Jerusalem, was no death-bed or momentary thought. Henry seriously entertained, during the most anxious and busy periods of his life, and, as appears from a paper in the "*Transactions of the Royal Society of Literature*," actually sent out an expedition to survey the coast of Syria, that he might choose the best part for landing with his forces.

Miss Strickland throws considerable doubts on the marriage between Katherine and Owen Tudor: but before we quote a portion of her argument, we may just take a passing notice of her baby boy, the infant Henry VI., whom she would have born at Windsor, in spite of all the prophecies of mishap to be attendant thereon, and the express prohibition of her husband on his departure for the French war.\* In such matters women will run counter to the best ad-

vice, and hence, ill condition or ill luck to their children, as was the case with the unfortunate Henry, unpropitiously of Windsor.\*—

"Our warlike barons were not a little embarrassed by the mutations of this world, which had snatched from them a leader of singular energies both as monarch and warrior, and, placing a little babe at their head, made them directors of a nursery. The chivalric Earl of Warwick had the guardianship of the king's person at a very early age,—a fact illustrated by a beautiful contemporary drawing in the pictorial history of the earl. He is represented holding the king, a most lovely infant of fourteen months old, in his arms, while he is shewing him to the peers in parliament. One of the lords is presenting the infant monarch with the orb. The royal babe is curiously surveying it, and, with an arch look, gently placing one dimpled hand upon the symbol of sovereignty, seems doubtful whether it is to be treated with reverence, or chucked, like a common ball, into the midst of the august assembly. Another representation of the Earl of Warwick gives us an idea of the costume of royal infants in the middle ages; for the limners of that age drew what they saw worn, and invented nothing. Warwick is delineated in the Rous Roll, holding his royal charge on his arm: the babe is about eighteen months old; he is attired in a little crimson velvet gown, and has on his head a velvet cap turned up with a miniature crown; moreover, he holds a toy sceptre in his baby hand, which he looks much inclined to whisk about the head of the stout earl, who is so amiably performing the office of a nursery-maid. It is to be presumed that the earl carried the little king on all state occasions; while his governess, Dame Alice Boteler, and his nurse, Joan Astley, had possession of him in his hours of retirement. In a very naively worded document, the privy council, writing as if the king were giving his directions to his governess himself, requests Dame Alice 'from time to time reasonably to chastise us, as the case may require, without being held accountable or molested for the same at any future time. The well-beloved Dame Alice, being a very wise and expert person, is to teach courtesy, and nurture (good manners), and many things convenient for our royal person to learn.' After these arrangements were effected, Katherine the Fair retires behind a cloud so mysterious, that for thirteen years of her life we have no public document which tells of her actions, and the biographer is forced to wander in search of particulars into the pleasant but uncertain regions of tradition and private anecdote."

\* From another passage in Miss Strickland's volume, she does not seem to have very clear or matronly ideas on the subject of child-bearing; for she says in the life of Richard's queen Anne, when telling of the birth of the Duchess of Clarence's first child, when she died with her husband and father from the defeat of Edgecote:—

"On the voyage they encountered the young Earl of Rivers, with the Yorkist fleet, who gave their ships battle, and took 11 excepting the vessel containing the Neville family. While this ship was flying from the victorious enemy, a dreadful tempest arose, and the ladies on board were afflicted at once with terror of wreck and the oppression of sea-sickness. To add to their troubles, the Duchess of Clarence was taken in labour with her first child. In the midst of this accumulation of disasters, the tempest-tossed bark made the offing of Calais; but in spite of the distress on board, Vaclere, whom Warwick had left as his lieutenant, held out the town against him, and would not permit the ladies to land; he, however, sent two flagons of wine on board for the Duchess of Clarence, with a private message, assuring Warwick that the refusal arose from the townspeople, and advising him to make some other port in France. The Duchess of Clarence soon after gave birth, on board ship, to the babe who had chosen so inopportune a time for his entrance into a troublesome world; and the whole family landed safely at Dieppe, the beginning of May 1470."

\* The hero of Agincourt was certainly as deeply tinctured with superstition, and as much under priestly influence, as any iron-clad warrior of his age.—*Ed. L.G.*

Into these our author plunges, and, as we have remarked, is very dubious as to the precise nature of the connexion between the widowed queen and Owen Tudor. One thing is very evident, that their descendant, Henry VII., had every reason and every disposition to falsify and destroy any evidence against them, as it must have proved his illegitimacy. Katherine died at the age of thirty-five, just after the birth of a daughter, who lived but a few days, the children to whom she had previously given birth in secret being taken from her by the order of the council; and, "while languishing between life and death, Katherine made her will in terms which fully denote the deep depression of her spirits:— 'The last will of Queen Katherine made unto our sovereign lord, her son, upon her departing out of this world. Right high and mighty prince, and my full doubted lord, and full entirely beloved son, in due humble wise, with full hearty natural blessing I commend me to your highness. To the which please to be certified, that before the silent and fearful conclusion of this long grievous malady, in the which I have been long, and yet am, troubled and vexed by the visitation of God (to whom be thanking and land in all his gifts!), I purpose, by the grace of God, and under your succour, protection, and comfort (in whom only, among all other earthly, stands all my trust), to ordain and dispose of my testament both for my soul and my body. And I trust fully, and am right sure, that, among all creatures earthly, ye best may and will best tender and favour my will in ordaining for my soul and body, in seeing that my debts be paid and my servants guerdoned, and in tender and favourable fulfilling of mine intent. Wherefore, tenderly I beseech you at the reverence of God, and upon my full hearty blessing, that to my perpetual comfort and health of soul and body, of your abundant and special grace (in full remedy of all means that in any wise may ammentise or deface the effect of my last purpose and intent), grant at my humble prayer and request to be my executor; and to depute and assign such persons to be under you of your servants, or of mine, or of both, as it shall like you to chuse them, which I remit fully to your disposition and election. Beseeching you, also, at the reverence of our Lord God, and the full entire blessing of me your mother, that this done, ye tenderly and benignly grant my supplication and request contained particularly in the articles ensuing. And if tender audience and favourable assent shall be given by so benign and merciful a lord and son to such a mother, being in (at) so piteous point of so grievous a malady, I remit to your full, high, wise, and noble discretion, and to the conscience of every creature that knoweth the laws of God and of nature; and if the mother should have more favour than a strange person, I remit (refer or appeal) to the same.' From the perusal of this solemn exhortation, a conclusion would naturally be drawn, that it was the preface to the earnest request of Katherine for mercy to her husband, and nurture for her motherless infants. Yet the articles or items which follow contain not the slightest allusion to them. All her anxiety seems to be centred, firstly, in the payment of her creditors, without which she seems convinced that her soul will never get free; secondly, in obtaining many prayers and masses for her soul; and, thirdly, in payments being made and rewards being given to her servants. If Katherine, by this mysterious document, really made any provision for her helpless family, it is all comprised in the dark

hints to her son of acting 'according to his noble discretion and her interest;' which intention, perhaps, had been confided to the young king in some interview previous to her imprisonment. There is no enumeration of property in the items that follow, excepting the portion of income due at the day of her departing. She declares that her soul 'shall pass as naked, as desolate, and as willing to be scourged, as the poorest soul God ever formed.' This piteous exhortation to her son is written, or dictated, a few hours before her death, yet, even at her last gasp, she evidently dared not break regal etiquette so far as to name to her son her plebeian lord or her young children. Whilst this pathetic document was in course of preparation, the dying queen received a token of remembrance from her son, King Henry, on new year's day, consisting of a tablet of gold, weighing thirteen ounces, on which was a crucifix set with pearls and sapphires; it was bought of John Pottesby, goldsmith, and was sent to Katherine at Bermondsey. To use the poor queen's own pathetic words, 'the silent and fearful conclusion of her long, grievous malady,' took place on the 3d of January, 1437. When the news was brought to the young sovereign of his mother's death, he was on his throne presiding in parliament. Power was given to the poor queen's two persecutors, the Cardinal of Winchester, and Humphrey, Duke of Gloucester, to perform the office of executors. Katherine was buried with all the pomp usual to her high station. On the 18th of February, 1437, her body was removed to the church of her patroness, St. Katherine by the Tower, where it lay in state; it then rested at St. Paul's, and was finally honourably buried in Our Lady's Chapel at Westminster Abbey. Henry VI. piously erected an altar-tomb to her memory, on which was engraved the following epitaph, preserved in the pages of William of Worcester:—

'From this world, adverse death has reft queen Katherine! Noble was her soul whose clay this tomb encloses. From the French king derived. Wife and mother To our Henries Fifth and Sixth:—as maid and widow, A perfect flower of modesty esteemed. Here, happy England, brought she forth thy king! Now reigning; without whose birth brief had been the joy Of this delightful realm; a pleasant land which teems With people kind—true followers of the faith; Blessed both by heaven and earth the realm appears; What earth brings forth heaven worthily endows. In the fourteen hundred thirty-seventh year This queen's life ended; beyond the starry sphere Her soul received, for aye reigns gloriously.'

This original epitaph has hitherto escaped all modern historians; but it is very probable that its assertion that Katherine died a widow, and not a wife, led to the demolition of the tomb under the reign of her grandson."

The life of Margaret of Anjou is the longest in the volume, and very carefully and spiritedly written; for, be it known, Miss Strickland is a stout Lancastrian. But what are the politics and struggles of those days to us?—nothing; and so we conclude with an extract from the history of Elizabeth Woodville, the queen of the gallant and luxurious Edward IV. Whilst yet a maid of honour to Queen Margaret, "she captured the heart of a brave knight, Sir Hugh Johnes, a great favourite of Richard, duke of York. Sir Hugh had nothing in the world wherewithal to endow the fair Woodville, but a sword whose temper had been proved in many a battle in France; he was, moreover, a timid wooer, and very impolitically deputed others to make to the beautiful maid of honour the declaration of love which he wanted courage to speak himself. Richard, duke of York, was protector of England when

he thus, in regal style,\* recommended his landless vassal to the love of her who was one day to share the diadem of his heir:—

"To Dame Elizabeth Woodville.

"Right trusty and well-beloved, we greet you well,—For as much as we are credibly informed that our right hearty and well-beloved knight, Sir Hugh John, for the great womanhood and gentleness approved and known in your person—ye being sole (single) and to be married—his heart wholly have; wherewith we are right well pleased. How it be of your disposition towards him in that behalf, as yet is to us unknown. We, therefore, as for the faith true and good lordship we owe unto him at this time (and so will continue), we desire and heartily pray ye will on your part be to him well willed to the performing of this our writing and his desire. Wherein ye shall do not only to our pleasure, but we doubt not to your own great weal and worship in time to come; certifying, that if ye fulfil our intent in this matter, we will and shall be to him and you such lord as shall be to both your great weal and worship, by the grace of God, who precede and guide you in all heavenly felicity and welfare.

"Written by RICHARD, duke of York.'

Even if Elizabeth's heart had responded to this earnest appeal of her lover's princely master, yet she was too slenderly gifted by fortune to venture on a mere love-match. She probably demurred on this point, and avoided returning a decisive answer, for her delay elicited a second letter on the subject of Sir Hugh's great love and affection. This time it was from the pen of the famous Richard Neville, earl of Warwick. This letter is not written as if by a stranger to a stranger, though, at the same time, by his promises of 'good lordship' (patronage) to Elizabeth and her lover, it is very evident he considers himself as the superior of both.

"To Dame Elizabeth Woodville.

"Worshipful and well-beloved,—I greet you well, and for as much my right well-beloved Sir Hugh John, knight (which now late was with you unto his full great joy and had great cheer, as he saith, whereof I thank you), hath informed me how that he hath for the great love and affection that he hath unto your person, as well for the great sadness (seriousness) and wisdom that he hath found and proved in you at that time, as for your great and praised beauty and womanly demeaning, he desireth with all haste to do you worship by way of marriage, before any other creature living, as he saith. I (considering his said desire, and the great worship that he had which was made knight at Jerusalem, and after his coming home, for the great wisdom and manhood that he was renowned of, was made knight-marshal of France, and, after, knight-marshal of England unto his great worship; with other his great and many virtues and desert, and also the good and notable service that he hath done and daily doth to me.) write unto you at this time, and pray you effectually that ye will the rather (at this my request and prayer) to condescend and apply you unto his said lawful and honest desire, wherein ye shall not only purvey (provide) right notably for yourself unto your weal and worship (profit and honour) in time to come, as I hereby trust, but also cause me to shew unto you such good lordship (patronage)

\* Bib. Reg. 17, b. xlviii. fol. 164, vol. 165. &c. This and the following letters, which are not yet named in the catalogue of the British Museum, were discovered by the indefatigable research of Mr. Halliwell, and with great liberality communicated to the author. Their biographical value every one will perceive."

as ye, by reason of it, shall hold you content and pleased, with the grace of God; which everlastingly have you in his bliss, protection, and governance.

“Written by the EARL OF WARWICK.”

No one can read this epistle without the conviction that the great Earl of Warwick had some ambition to become a match-maker as well as a king-maker. Nevertheless, Sir Hugh met with the usual fate of a lover who has not the spirit to speak for himself, and deputed his wooing to the agency of friends—he was rejected by the fair Elizabeth. He married a nameless damsel, and in course of time died possessor of a single manor. A far different destiny was reserved for the lady of his love. In the absence of dates there is much internal evidence which proves the foregoing letters to have been written after the year 1451, for Sir Hugh Johnes was evidently serving in France till that year. Elizabeth must have been twenty-one in 1452; she was then, as Richard of York says, ‘sole and to be married;’ that is, she was single and disengaged. And this time proved a remarkable crisis of her life, when in her maiden beauty she was eagerly wooed by the vowed partisans of the ‘pale and of the purple rose.’ Some worldly considerations, besides her duty to her royal mistress, Queen Margaret, seem to have led Elizabeth to reject the Yorkist partisan, Sir Hugh Johnes, and accept the hand of the heir of the illustrious and wealthy lordship of Ferrers of Groby, a cavalier firmly attached to the house of Lancaster.”

She was his widow when she caught the heart of Edward, and the rest of her chequered life is well known.

In conclusion, Miss Strickland has so well acquitted herself that we look with assured anticipations of instruction and pleasure to the sequel of her very justly popular design.

#### BUNN'S STAGE. [Concluding notice.]

THE Queen's visit to Van Amburgh and his beasts is a royal scene, both human and lionly, too cleverly described to be omitted:—

“Immediately on the queen's return from Brighton, her majesty honoured Drury Lane Theatre with her presence: this was on January 10. On the following Thursday, January 17, a similar mark of honour was conferred on this establishment; and on the ensuing Thursday, January 24, the same flattering distinction was shewn. On this latter evening, pursuant to arrangements which had been made for the purpose, our gracious mistress condescended to cross the stage of the theatre for the purpose of seeing the animals, in their more excited and savage state, during the operation of feeding them. It is almost unnecessary to observe that this gratifying scene took place after the departure of the audience, and that every possible caution was adopted for the comparative comfort and seclusion of the royal visitor, which the resources of the theatre permitted, such as enclosing the entrances with crimson draperies, and carpeting the stairs; not merely to shut out the draught of the night air, but to exclude the prying gaze of the many stragglers who remained behind, in hopes of bearing testimony to so unprecedented a compliment paid to the theatre. The animals had been kept purposely without food for six-and-thirty hours, strong symptoms of which had become manifest during Mr. Van Amburgh's performance, by the lion and the panther having simultaneously attacked the lamb on its being placed in their den; and they would have evi-

dently made but a mouthful apiece of it, had not their almost superhuman master literally lashed them into the most abject and crouching submission. The first portion of food thrown amongst them, seized by the lion as a matter of priority, was enough to convince any sceptic of the fearful savageness of their nature, when out of the control of the one hand whose authority they acknowledged. The rolling of the tiger's eye, while he was devouring the massive lump of meat and bone, clutched between his fore paws, seemed to possess the brilliancy as well as the rapidity of lightning; and was only diverted by a tremendous and sudden spring of the lion, who, having demolished his own portion, seized upon what was left of his ferocious neighbour's fare. The dash against the sides of the den sounded like the felling of huge trees, and was enough by its force and fury to shake the strongest nerves; but it was a positive fact, that while the boldest of the hearts in the royal suite speedily retreated at this unexpected plunge of the forest monarch, the youthful queen never moved either face or foot, but with look undiverted, and still more deeply riveted, continued to gaze on the novel and moving spectacle. Her majesty's inquiries were not those of a youthful mind, merely intent upon ordinary and unmeaning questions, but bespoke a scrutiny of mind little to be expected in one of such tender years. It was not to be expected that a circumstance, so altogether without precedent, as the ruler of this vast realm condescending to pay a personal visit to the stage itself, could escape the observations of those malicious partisans, the sole object of whose life is to carp and cavil at the actions of their equals, and who naturally lie in ambush for an opportunity of attacking their superiors; and the more exalted in rank, the better for the purposes of such people. This visit of their sovereign,—this unbending from the cares of state, and indulging in the recreations most suitable to the earlier years of life, when the mind is thirsting for every kind of information, and naturally preferring to mingle the *utile et dulce*, this harmless entertainment was to be questioned, because the queen was in the case, while every one of her subjects was at full liberty to enjoy it. Pretty sophistry this! because destiny has placed a crown upon your brow, that you are to be debarred from every pursuit of pleasure in which people with not a crown in their pockets are bent upon participating! It is a wonder such logicians admit the propriety of their sovereign even walking or talking, or, except as a mark of especial favour, partaking of any repast beyond ‘the camelion's dish;’ and, deeming royalty to be a mere state cipher, that they do not require its members to be kept under glass globes, or wrapped up in silver paper. To my way of thinking and feeling, a more beautiful or truly interesting sight could not be devised, than to behold this young and lovely creature emerging from the trammels of state which must of necessity confine her so much, and seeking relief in those diversions which instruct and amuse at the same time; and none but a fool will withhold the award of both these qualifications from Mr. Van Amburgh's surpassing exhibition.”

What a pity Mr. Bunn is not a Cabinet minister at least, if not Prime! The following account of an *imperium in imperio* in theatrical affairs may be a novelty to most readers:—

“It is not unknown (says Mr. Bunn, on whose truth the account rests) to the public generally, but especially to persons of ton, that several fashionable librarians at the west end

of the metropolis are extensive speculators in theatres. The principal parties are Messrs. Andrews, Sams, Mitchell, Ebers, and Hookham. The three first are large dealers, the two first the largest, and considered to be the wealthiest and most important. This may appear very strange to the uninitiated, who may not be able to understand what one man can have to do with another man's business, and, above all, with such an exclusive kind of business as all theatrical business must be: but they may depend upon it there is barely one of the gentlemen herein named, who would not rather give up the proceeds of his own calling, than resign all connexion with mine. There is a class of people in this town (as elicited in the recited conversation of a lady of rank with Charles Kean) who affect not to know where a theatre is, unless they obtain their information ‘at the library;’ and having obtained it, would not even drive, much less walk, there, although it should be considerably nearer their own houses than the said library. There are more reasons than one for this assumed affectation; but the principal reason after all is, that if they take their boxes at the office of the theatres, they must exhibit their purses; but if they go to Bend Street, or to the corner of St. James's Street, their names get into the books of ‘the manager and the librarian at the same time. CREDIT, credit is the great consideration with this part of the community. Putting your hand in your own ‘till’ is with them a serious matter; but putting it in the till of other people is not of the slightest consequence; and there are few of this genus who would not much rather promise to pay a librarian five or six guineas for a box, than actually pay a manager half that sum for one. With some of them the said amount—whole or half, no matter—is vital during the season, for all the necessary amusements of town; and at the end of the season they make a point of bolting out of it: with others, fashion, carelessness, habitude, convenience, all combine to make it more agreeable to put their hands in their pockets but once a-year, and then they do not at all object to pay pretty good interest for so doing. There is a particular set (pretty well known to the librarians by this time, or they ought to be), who, not at all objecting to a *little* bit of fleecing, think it may be as well done occasionally with an opera-box as with a dice-box, there being plenty of ‘play’ in both. To supply, therefore, the wants and wishes, to consult the laziness and the lounging, and now and then, the depravity of the *beau monde*, these gentlemen have become the principal managers of the principal London theatres. Nor is it by the accommodation they render to the world of fashion alone that their state has become so important; it is by the assistance they have rendered, and at all times do render, the manager, as well as his patrons, that they have ‘grown so great.’ Their vast speculations in the Opera House are almost as well known as the Opera House itself; and they are, comparatively speaking, as extensive dealers in the property of minor establishments. The immense sums vested by them annually in Her Majesty's Theatre have become so public, through the notoriety of Messrs. Chambers' affairs, that no delicacy whatever could be charged against me were I to enter upon the subject, and to allege that the funds and securities of some two or three of the librarians herein cited have been the sole means of there being latterly an Italian Opera in London. \* \* \*

reader will be inquiring, probably, what all this has to do with the 7th March, 1839: he shall know. Messrs. Andrews and Sams having been some time at variance upon points of business (upon which I have nothing, and wish to have nothing to advance), perceived at last, like very prudent men, that their hostility was prejudicial to their respective interests, and extremely beneficial to the interests of other people. It was, therefore, suggested by many well-wishers of both, that a reconciliation should be effected between them, which was accordingly done; and, with the view of completing a matter so auspiciously begun, Mr. Sams invited the principal librarians and the principal managers they dealt with (Laporte and myself), to a dinner on the day in question. I have long been intimate with both these gentlemen—with Mr. Andrews probably most so; and while in Mr. Sams I have invariably found good faith in dealing, and good fellowship out of it, I need scarcely add that the name of Mr. Andrews is a passport wherever liberality in business, and all the distinguishing qualities of human nature, are to be found. It was gratifying to me, therefore, to assist at so agreeable a ceremony as the reunion of (what Mr. Lover has written so delightfully, and Michael Blood warbles so delightfully)—

‘Hearts that had been long estranged,  
And friends that had grown cold!’

We sat down to the dinner-table, at one end of which was Mr. Sams, and at the other Mr. Andrews, and between them were to be found what the ‘Morning Post’ calls ‘all the delicacies of the season;’ and while it was pleasant to see the attention paid by each to those they were surrounded by, it was still pleasanter to see the marked attentions they paid each other. *Mister Andrews* and *Mister Sams*, emphasised with an extra degree of ‘French polish,’ resounded through the room with the demolition of every mouthful; but while all this denoted the display and the acceptance of hospitality, it seemed to me to be mixed up with a prodigious quantity of reserve, to which the following exquisite passage may be well applied:—

‘*Brutus*. How he received you, let me be resolved.  
*Lucilius*. With courtesy, and with respect enough;  
But not with such familiar instances  
As he hath used of old!  
*Brutus*. Thou hast described  
A hot friend cooling: ever note, *Lucilius*.  
When love begins to sicken and decay,  
It useth an enforced ceremony!’

Such seemed to me to be the case on the present occasion, and however one might regret any difference, or rejoice at any arrangement of it, one could not help an inward sinner at the *modus operandi*. At a moment when it was palpable that outward form and inward feeling were still a little at variance, the following view of the case was taken in short-hand by a party present on the occasion:—

Reconciliation Dinner,  
Given by Mr. Sams to Mr. Andrews, March 7, 1839.  
‘*Mr. Sams*. Mister Andrews, I can strongly  
Recommend this carrot soup!’  
*Mr. Andrews*. ‘Pins’ of late have gone so wrongly,  
I fear appetite will droop.  
*Mr. Andrews*. But, Mister Sams, permit me—  
These smells, sir, are not bad!  
*Mr. Sams*. To a little you have hit me,  
If some turbot you will add.  
*Mr. Sams*. Mister Andrews, try the mutton,  
Why, to kill it was a grief!  
*Mr. Andrews*. I for once would turn a glutton,  
Had it been a round of beef!  
*Mr. Andrews*. But Mister Sams, allow me,  
Do try this nice *ragoût*!’  
*Mr. Sams*. (Aside.) The fellow thinks to cow me—  
Well, I don’t care if I do!  
*Mr. Sams*. Mister Andrews, now suppose we  
Mar no more each other’s wealth!  
*Mr. Andrews*. And, Mister Sams, propose we  
Each other’s better health!

‘*Mr. Sams*. Mister Andrews, here’s to you, sir!  
(Then aside.) It has gone off pretty well!’  
*Mr. Andrews*. Mister Sams, let none abuse, sir—  
(Then aside.) Mister Sams may go to h—ll!’

This will afford a taste of Mr. Bunn’s poetical talent, which an epistle in verse of some dozen stanzas (pages 215, &c.) and other little pieces, shew to be, on occasion, ready and playful enough. These; and many slight points in the prose, evince a fund of good-humour at the bottom of his disappointments and resentments; and begets a sort of liking, notwithstanding the ruffling, rattling, unprincipled impudence of the rest. The vulgarity of printing his oaths, just as if he were in conversation with some of his fashionable friends and patrons, is an instance of want of taste which we could not have expected from a person so hand-and-glove with belted knights, dukes, lords, “and a’ that.” Still as every one must be interested in the hero of a three-volume book (and we should not wonder to see three more), we must not close without a final glimpse at him reflected from his own glass:—

“The mere question of self (says he, aware of the anxiety that must be felt about him) is very easily disposed of.—If it depended merely upon self; for my ambition would have been just as well satisfied, and my pocket much more satisfied, had I remained, as I intend *pro futuro* to remain, a paid, and not a paying, manager. [A very bad one he was.] I should then have avoided all the cares, all the obloquy, all the indignities, all the privations, all the misrepresentations, and all the mortifications, which *wait upon power*, be it wielded never so considerably. I should have avoided the inevitable consequence to any manager of the patent theatres—who has neither ingots nor acres to melt—of being dragged, however full of honesty and good intention, before a legal tribunal for public examination, where, however flattering and triumphant may be the scrutiny into character, the feelings of humiliation and degradation (temporary though they be), are barely durable, and only become so by the consciousness of rectitude, and a determination of purpose to appear that you are what you would seem. Being one of moderate desires, I should have amassed by this time as much as would have gone a considerable way towards the comforts of advancing years, which so many by my exertions have, during the period of their being made, actually done; and thus have had, what every man is entitled to, the emoluments arising from his own labour. The duties of management came upon me by desire, by advantage, by study, by travel, by fate if you will, but the responsibilities of it by *circumstance*. To fulfil the promise made to my predecessor, and to maintain the position in which I then stood before the public, was that circumstance: and when those responsibilities were once upon my shoulders, I had to make every exertion which industry, ingenuity, or expediency, could devise, where I had no other backers but them to assist me. When once involved in an enterprise of this nature, there is a prospect, always believed to be within your reach, which induces you to persevere; and the excitements of a theatrical life, while they are the most delusive, are, at the same time, the most alluring imaginable. Had I possessed those beneficial means which should be at the disposal of a manager of such enormous buildings, that prospect might yet have been realised; but the first grand consideration, without which all others are unavailing, was wanting—capital!”

Well! industry, honesty, integrity, good

manners, joined with oblivion of the past, may yet do much. Try.

#### MISCELLANEOUS.

*The Book of Family Crests*. 2 vols. 12mo. 1840. London, Washbourne; Edinburgh, Fraser and Crawford; Dublin, Machen and Co.

This is the second edition of a most useful book of reference, and is in many respects greatly improved. Some crests have been added, as well as a dictionary of the mottoes; and the volume containing the plates having been bound with the India-rubber back, may be opened perfectly flat at any particular page. This is a great advantage, and one which will undoubtedly be made serviceable to all works of this kind, where the plates are very numerous.

*The Naturalist's Library: Entomology*. Vol. I. 1840. Edinburgh, Lizars; London, Highley.

THE new volume of Sir W. Jardine's *Naturalist's Library* contains an “Introduction to Entomology” by Mr. J. Duncan, in addition to memoirs of Swammerdam and De Geer, and is beautifully embellished with thirty-seven coloured plates.

*Usborne's Guide to Egypt and the Levant*. London, 1840. Cradock and Co.

WHEN our differences respecting the Pacha are arranged, as doubtless they speedily will be, hundreds will avail themselves of the more rapid transit to India overland; and to these travellers this little volume will be an invaluable companion.

*The Principles of Botany: Structural, Functional, and Systematic: Condensed and immediately Adapted to the Students of Medicine*. By W. H. Willshire, M.D. Edin. Pp. 232. (London, Highley.)—A very concise, clear, and excellent volume; quite sufficient for the purpose indicated in the title-page.

*Memoirs of the Contest in Spain*. By Sir De Lacy Evans, M.P. 8vo. pp. 151. (London, Ridgway.) Spain under Charles II.; or, Extracts from the Correspondence of the Hon. Alexander Stanhope, British Minister at Madrid, 1680-93. From the Originals at Chiswick. 8vo. pp. 173. (London, Murray.)—The last of these publications shews the misrule and corruption which, a century and a half ago, paved the way for the decline and desolation to which the first of them bears testimony in our own day. The two together are well worth the perusal and study of those who desire to be acquainted with Spanish history.

*A Practical Discourse of Religious Assemblies*. By Dr. Sherlock. Pp. 233. (London, Burns.)—A new and excellent edition of Dr. Sherlock's admired and valuable work on public worship, edited by the Rev. Henry Melvill, and with a preface worthy of his clerical reputation.

*Guide to Madeira*. By W. W. Cooper. Pp. 116. (London, Smith, Elder, and Co.)—A nice little book for the visitors to this salutary isle; where they will see some beautiful scenery, and may drink some excellent wine.

#### ARTS AND SCIENCES.

##### GEOLOGY.

THE most memorable matter elicited by the late meeting of the British Association at Glasgow is the new geological theory respecting the agency of ice in the formation of the upper crust of the earth we now inhabit, by M. Agassiz. His paper on the subject was the only business brought forward at the first meeting for the season of the Geological Society of London, on Wednesday\* last; and it is likely to occupy their attention, not merely at the next meeting, but often thereafter. As the Reports of the proceedings will, however, be given as usual in our columns, we, at present, wish merely to state a few particulars of interest to the inquiry, and not alluded to on this occasion.

\* THE meeting was fully attended, and the company included many persons of rank, members of parliament, and men of learning and eminence in every profession and branch of science, as well as nearly all the leading geologists of the day.—Ed. L. G.

After hearing M. Agassiz's account of the strong confirmation his opinions had received by examining Ben Nevis, the parallel roads of Glenroy, &c. as mentioned in a previous *Lit. Gaz.* (see No. 1239), we had a future opportunity of knowing that equally strong, if not stronger, corroboration of their truth had been derived from the hills in the neighbourhood of Edinburgh, as well as in the north of Ireland, where all the traces on which M. Agassiz relies for the proof of his theory are legibly and indelibly impressed. Near Edinburgh, the Calton Hill, the Corstorphin Hills, and Blackmore Hill (by the Pentlands), were inspected by this distinguished individual, accompanied by one of the highest authorities of the age in geology and natural history (Professor Jameson), and other able northern philosophers. Professor Jameson guided M. Agassiz to sites remarkable in the pursuits of geological information; places to which he had for years directed the attention of his collegiate classes, and some of which had been pointed out as most deserving of investigation by Sir James Hall and others. The result was, that M. Agassiz, in all these places, clearly shewed the presence of the striated lines, furrows, &c. &c. which attended the movements of the glaciers of Switzerland, and demonstrate that an immense extent of the Arctic and temperate circles lay long under the dominion of ice before the last great change was effected in their condition, and they became the earth, such as it is, on which we exist at the present hour. The phenomena could not be explained by any other means; either by the agency of atmosphere, or water, or fire, or by all combined. As the *moraines* are embanked deposits round the icy glaciers, so are these marks on rocks the effects of their passage over them. In the three instances we have specified, they are all of igneous formation—trap; the Corstorphin being clink, and the Calton, porphyry. Yet each bears the same appearance, and give like testimony to the one cause by which these appearances could be produced. The sensation created by this discovery (and by further proofs in the north of England) is very great; and we may safely predict that no future views in geology will ever be taken without the agency of ice making a much more important figure than it has hitherto done in accounting for the condition of our globe's external surface.

We may notice (from "Jameson's Philosophical Magazine") that M. Lenoir has found the same indications in the Vosges; and that we understand it is M. Agassiz's belief that the traces of the world's having been covered with ice may be demonstrated from the north pole as far as Mount Lebanon, and all parallel latitudes!!

**Fossil Remains.**—Whilst in Edinburgh, M. Agassiz had an opportunity of examining the fossil remains in the College Museum (which, as well as the rocks to which we have referred, we also followed him in seeing, and can therefore vouch for our facts), and at once put his hand upon two entirely new genera and eight species of the *Pterichthys*, or winged fish. Unlike the specimen exhibited at Glasgow, which resembled a butterfly, these are like beetles, with the wings of the flying-fish. The one genus is broader than the other: the length of each, between two and three inches. Here we have a most interesting addition to the *Fauna* of an elder world—the world before man was created; and as these wonderful resuscitations go on, we doubt not but that the *fifteen hundred extinct animals* already possessed by this indefatigable and enlightened geologist will soon be augmented to double that number.

Such are among the fruits of the British Association!

#### LINNEAN SOCIETY.

MR. FORSTER in the chair.—This was the first meeting of the session 1840-41. A great number of donations made to the Society during the recess were announced. Amongst them were the Transactions of many scientific societies, and the conclusion of Rüppell's celebrated work on the vertebrated animals of Abyssinia. The conclusions of two splendid works, viz. Sibthorpe's "Flora Græca," and the "Flora Londoniensis," purchased by the Society, were placed on the table.—Mr. W. Taylor exhibited samples of the oil obtained from the seeds of *Madia sativa*, and of the oil and other products of the common sunflower; these products in part are:—1. Hemp from the stalks—good for canvass bags, packthread, &c. 2. Paper made from the head after the expression of the seed. 3. Syrup for medicinal purposes. 4. A yellow dye from the petals and blossoms: this dye stands the test of acids and alkalis. 5. Oil cake—capital food for cattle. 6. Oil, which is superior to any other now in use, for lubricating machinery and for burning in lamps. 7. Potash. 8. Gum resin, or balsam, &c. &c.—Mr. Gould exhibited drawings of some of the animals, &c. found by him in New Holland.—Read, 'A Note on the Bokhara Clover, *Melilotus Ruthenica*,' by Mr. W. Taylor. The object of the paper was to give an account of the fibre as fodder, and as a substitute for hemp: the latter appears to be exceedingly tough and firm. Specimens were exhibited.—Read, also, a paper, being descriptions of several Indian insects, chiefly from Assam, hitherto undescribed, by the Rev. F. W. Hope. The paper was illustrated by beautiful drawings of the insects, executed by Mr. Westwood. Several new fellows were proposed.

#### ENTOMOLOGICAL SOCIETY.

AUGUST 3, 1840. The Rev. F. W. Hope, F.R.S. President, in the chair.—Donations of numerous entomological works were announced from Professors Burmeister, Dahlborn, and other authors.—Various new and beautiful exotic species of insects were exhibited by the Rev. F. W. Hope and Mr. A. White, belonging to the rare genera *Chiasognathus*, *Trochodens*, *Labidus*, *Pelecinus*, &c. Mr. Westwood noticed a peculiarity in the economy of the small brown garden ant; vast numbers of the empty cocoons of which he had observed on the leaves of a nectarine tree, at a considerable height from the ground.—The memoirs read were, 1. 'On a New Species of *Dynastes*, and some other exotic *Coleoptera*,' by the President. 2. 'Observations on *Typhlopone*, a genus of Blind Ants,' by J. O. Westwood, F.L.S. 3. 'Remarks on the Vesicant Powers of two Indian Species of *Cantharida*,' by Alexander Burn, Esq. As these two species are exceedingly abundant, and as powerful stimulants as the common blister-fly, it was suggested that they might become a valuable article of commerce, which would render it unnecessary to resort to Spain for our supply of blister-flies.—Mr. Newport also stated, that he had ascertained by experiment that the common English *Meloe Proscarabæus* is highly diuretic.

September 7. Thomas Marshall, Esq. in the chair.—Various donations of entomological works from the Natural History Society of Boston, Professors Gennar, T. H. Harris, and others, were announced, as well as a collection of New Holland insects from Mr. Bowerbank.—Mr. Smith exhibited specimens

of *Miscus campestris* and *Ammophila vulgaris*, which he was convinced were varieties of the same insect. Also, a new British species of *Nomada*, and other bees.—Mr. Walton also exhibited three new British species of *Magdalis*.

October 5.—J. Walton, Esq. V.P. in the chair.—Mr. Sells exhibited a series of specimens illustrating the natural history of various insects, especially that of *Chlorops pumilionis*; a small fly, the larva of which feeds in the stems of wheat, and which had done great damage by destroying many acres of rye near Kingston.—Various illustrations of the economy of other insects were exhibited by Messrs. Inghen, Westwood, and Smith.—Mr. Stephens mentioned a remarkable instance of the autumnal disease of flies, having observed hundreds of specimens of a particular species (*Cheilosia gracilis*) dead upon the blades of *Sesleria caerulea*.—Mr. Westwood exhibited drawings of the veins of the wings of several genera of British butterflies, which had afforded a satisfactory character for the determination of such genera, and read the commencement of a paper entitled 'Observations on the Linnean Species of *Staphylinida*.'

#### PARIS LETTER.

Academy of Sciences, Nov. 3, 1840.

SITTING of October 26.—M. Cauchy brought up a report on a new steam-engine, and a new steamboat, invented by M. Jouffroy. The commissioners had witnessed experiments performed only on a small model six feet long, and therefore could not estimate the practical results of the invention on a larger scale. They, however, anticipated great economy, both of fuel and power, from it. Messrs. Arago, Biot, Thenard, and others, recommended that the experiments should be made on a large scale, and the report was ordered to be amended.—M. Isidore Geoffroy de St. Hilaire presented a work, in which he had collected several essays already published by him, as well as some new ones, on the distribution of animals over the surface of the globe.

The Academy proceeded to ballot for a corresponding member in the Section of Medicine and Surgery. The names proposed were those of M. Lallemand, of Montpellier; Sir Benjamin Brodie, of London; M. Gnyon, of Algiers; and M. Dieffenbach, of Berlin. The choice of the Academy fell on the first of these candidates.

**Sub-cutaneous Section of the Ocular Muscles.**—A memoir was read by Professor Jules Guérin, 'On the Sub-cutaneous Section of the Muscles of the Eye for the Cure of Strabismus (squinting).' He stated that he had been desirous of avoiding the inflammation, suppuration, and other consequences of the external cutting, and had already operated successfully in two cases according to the method he proceeded to describe. The subject was placed in a horizontal position, and the head fixed. The eyelids having been separated, the globe of the eye was drawn forward, and a little to one side, by means of a proper instrument; and a small convex instrument, convex on its cutting edge, and doubly curved in the handle, was then introduced perpendicularly, at the internal or external corner of the eye, according to the muscle to be divided. The blade of the instrument having been allowed to penetrate to the whole of its depth, about fifteen millimetres, or a little more than half an inch, it was raised horizontally, by making it slide between the globe of the eye and the surface of the muscle. The convex cutting side of the instrument was

then presented to the surface of the muscle, and was made to divide it from within to without, or from the globe of the eye to the side of the orbit. The globe of the eye having been drawn forward and to one side, that is to say, in the direction of the muscle that is to be divided, produces tension of the latter, and facilitates the action of the cutting instrument. The division of the muscle is attended with a cracking noise, the feeling of a resistance overcome on the part of the patient, and a small movement of the globe of the eye in the direction of the traction. The instrument is then withdrawn by the small aperture through which it was made to enter, and no appearance of a scar remains. The section of the muscle is proved to have been effected by the rotation of the eye being much facilitated, and by the diminished motion of the eye in the direction which the divided muscle used to draw it into. The operation lasted in each of the cases specified by M. Guérin less than one minute.

M. Kuhn mentioned to the Academy that he had been making some interesting experiments on the contractibility of muscles by heat, as applied to cases of partial muscular distortion. He had, among other cases, produced strabismus of the eye of a corpse by this method.

**Academy of Inscriptions and Belles Lettres.**—Sitting of October 30. M. Hase presented a report upon an inscription lately discovered at Constantinople by Captain Cazzette of the Engineers, attached to the Scientific Commission for the exploration of Algeria. According to the explanations of the learned philologist, this inscription appears to be of the time of the Byzantine dominion in Africa.—M. Guérard communicated the impression of a coin discovered at Bordeaux, and supposed to be of the Merovingian kings. He observed that, if so, this would be the first instance of a Merovingian *triens* bearing the full face of a king, an arrangement which is on the contrary the ordinary one in all Visigothic coins. This gentleman also communicated a funeral inscription of a young female belonging to the Gaulish tribe of the *BITURIGES VIVISCI*, whose name is written in various ways by classic authors.—M. Letronne commenced an highly interesting paper 'On the Ancient Porphyry and Granite Quarries of Upper Egypt.' After rectifying several errors committed by Visconti in the explanation of passages of Pliny, Aristides, Eusebius, and Julius Capitolinus, relative to the real situation of these quarries, and to the mode of working them by convicts; the learned critic adverted to two Greek inscriptions copied in the Eastern Desert of Egypt, from temples of porphyry and red granite, built at Gebel Fatscherh and Gebel Dokhan, by Epaphroditos Sigerianos, a freedman of the Emperor Adrian. These two inscriptions were discovered in 1823 by Messrs. Wilkinson and Burton, who proved that the Gebel Dokhan was anciently called the *Mons Claudianus*. M. Letronne pointed out several peculiarities of these inscriptions, as tending to resolve various difficulties in the deciphering of similar monumental records.

Southey's "Roderick" has been translated into Latin verse by Signor G. B. Martelli of Orta.

#### LITERARY AND LEARNED. UNIVERSITY INTELLIGENCE.

OXFORD, October 29.—The following degrees were conferred:—

*Doctor in Civil Law*.—H. K. Seymer, late Fellow of All Souls' College, Grand Comptroller.  
*Bachelor in Divinity*.—Rev. C. Taylor, Brasenose College, Prebendary of Hereford Cathedral.

*Bachelor in Civil Law, by Commutation*.—R. C. Sewell, Fellow of Magdalen College.

*Masters of Arts*.—J. Simmon, Rev. R. J. F. Thomas, Christ Church; Rev. D. Roberts, Jesus College; Rev. G. H. Cotton, Worcester College; E. Gordon, Oriel College.

*Bachelors of Arts*.—J. F. Reeve, Wadham College, Grand Comptroller; L. H. Palmer, Christ Church; J. Bostock, Brasenose College; H. W. Guy, Exeter College; G. W. Garrow, J. Barber, W. Toms, Worcester College.

#### ECLECTIC SOCIETY.

At a meeting of this Society, held on Tuesday, Oct. 27th, C. E. Jenkins, Esq. V.P. in the chair, several new members were elected.—A letter was read from the Marquess of Normanby, conveying the Queen's gracious permission to bear her majesty's likeness, or effigy, on the obverse of the Society's medals.—Mr. Thomas Beale read his paper 'On the Propriety of forming a Committee for the Purpose of extending Medical Relief to the Inhabitants of the Polynesian Islands.' Mr. Beale depicted in glowing colours the pristine happiness of the amiable inhabitants of the South Seas,—the innocence and simplicity of their manners,—and, reversing the picture, shewed (the result of his personal observation) their present miserable and degraded state, and placed before the meeting the appalling fact that a proportion of these poor people, amounting in some instances to ninety-eight per cent of the whole population, were afflicted with diseases imparted to them by the vices of the Europeans; and for which diseases, *be it ever remembered*, unassisted nature knows no means of cure. Mr. B. appealed no less to the justice than to the charity of his auditors, to stand forth on behalf of those suffering nations, and provide a remedy for the afflictions which they have endured from European intercourse. He then proceeded to shew how this desirable object might be effected, viz. by the sending out a properly organised medical mission of scientific young men, which should, on the one hand, cure and teach the natives to cure their own diseases, and, on the other, under the direction of the various learned bodies, make such observations as would greatly enlarge our knowledge of that interesting portion of the globe, and also by collecting specimens in every branch of natural history, form a museum, which, by its value and exhibition, might materially lessen, if not entirely defray, the expense of the mission. It was resolved that a committee be formed, consisting of the Council of the Society, with such other members thereof as are of the medical profession, with power to add to their number; that Mr. Beale, from his practical knowledge of the subject, and the long and careful attention he has paid to it, be constituted the chairman of the said committee.—The meeting adjourned.

#### LITERARY AND SCIENTIFIC MEETINGS FOR THE ENSUING WEEK.

*Monday*.—Geographical, 9 P.M.  
*Tuesday*.—Medical and Chirurgical, 8½ P.M.; Zoological, 8½ P.M.; Society of Arts (Illustration), 8 P.M.  
*Wednesday*.—Society of Arts, 7½ P.M.; Medico-Botanical, 8 P.M.  
*Thursday*.—Royal Society, 8½ P.M.; Antiquaries, 8 P.M.; Royal Society of Literature, 4 P.M.  
*Friday*.—Astronomical, 8 P.M.; Botanical, 8 P.M.  
*Saturday*.—Asiatic, 2 P.M.; Guy's Hospital Physical Society, 8 P.M.

#### SKETCHES.

##### JEAN DE LAUNEVILLE.

In September 1831, an execution took place at Dijon, which was attended with the most horrible and appalling circumstances.

Jean de Launeville, the unfortunate wretch who had forfeited his life by the murder of a fellow-creature in the Revolution of 1830, was

quietly playing at *écarté* with a fellow-prisoner, when the door of their cell was opened, and presented to their view a couple of gendarmes, one of which informed De Launeville that he was to die in two hours. The announcement made him shudder from head to foot, because for the previous eight months he had been forgotten. This had made the unhappy man cease to think of the possibility of dying,—but he was now shaved—his hair cut close—he was handcuffed, and was consigned to the confessor. He was then committed to the care of four gendarmes, who conducted him to the fatal scaffold. When the procession had reached the place of execution, the executioner received the prisoner from the hands of the priest—he was bound to a plank—turned down to the horizontal position—and the axe fell! The ponderous triangle of iron moved with some opposition—fell sluggishly in its grooves upon the neck of the culprit, and only wounded without killing him. The wretched creature shrieked so hideously that it pierced the heart of every bystander. The executioner raised the axe again, and let it fall a second time, when it again refused to complete his deadly purpose. The convict's shrieks were more frightful, and the crowd became clamorous. The executioner drew up the hatchet again, but there was not any better result. The third incision caused a stream of blood to rush from the nape of the wretch's neck, but did not sever the head. The knife was drawn up, and suffered to fall five times; five wounds did the sufferer receive; five times did the condemned utter the most agonising cries, at the same time exclaiming "Mercy! mercy!" The multitude, exasperated at the sight of this hideous drama, began hurling stones at the executioner. The executioner leaped from the scaffold of the guillotine, and concealed himself beneath it, protected by the horses of the gendarmes. But here the frightful tragedy did not finish. The convict, discovering that he was left alone upon the scaffold, had risen from the plank; and there—a horrible sight!—with his head half severed, hanging over one shoulder dripping with gore, he implored the affrighted crowd to hasten to release him. The crowd, full of compassion, were upon the point of forcing their way through the ranks of the gendarmes to render assistance to the half-butchered convict; but at that moment one of the executioner's *employés*, a young man about twenty, mounted the scaffold, and told the sufferer to turn himself round while he untied him, and, taking advantage of the posture of the dying man, who yielded without discredit, jumped upon his back, and began to cut through with a butcher's knife all that remained of the convict's neck which the guillotine had left unaccomplished.

E. W.

#### ORIGINAL POETRY.

##### BRITISH ASSOCIATION.

[Last year, "The Expedition to Dudley by Water" supplied a light offset to the dryness of our report of the British Association Meeting at Birmingham; and we hope the following, by the same hand, may do as much for that of Glasgow.—Ed. L. G.]

##### THE DREDGING SONG.

By a Member of the Dredging Committee of Section D.

HURRAH for the dredge, with its iron edge,  
And its mystical triangle,  
And its hid net with meshes set,  
Odd fishes to entangle!  
The ship may rove through the waves above,  
Mild scenes exciting wonder;  
But braver sights the dredge delights  
As it rovethe waters under!

##### Chorus.

Then a dredging we will go, wise boys!  
Then a dredging we will go!

Down in the deep, where the mermen sleep,  
Our gallant dredge is sinking;  
Each finny shape in a precious scrape  
Will find itself in a twinkling!  
They may twirl and twist, and writhe as they wist,  
And break themselves into Sections;  
But up they all, at the dredge's call,  
Must come to fill collections!  
Then a dredging we will go, wise boys!  
Then a dredging we will go!

The creatures strange the sea that range,  
Though mighty in their stations,  
To the dredge must yield the briny field  
Of their loves and depredations:  
The crab so bold, like a knight of old,  
In scaly armour plated;  
And the slimy snail with a shell on his tail,  
And the star-fish radiated!  
Then a dredging we will go, wise boys!  
Then a dredging we will go!

Were I a fish (though I've no wish  
For a tail—the more's the pity!)  
I'd anathematise the prying eyes  
Of that terrible Dredging Committee;  
No fish am I, but high and dry  
Mid dredgers take my station,  
A-cotching the fishes, all at the wishes  
Of the British Association!  
Then a dredging we will go, wise boys!  
Then a dredging we will go!

### THE DRAMA.

**Adelphi.**—We last week noticed the production of *Laffarge*; or, *Self-will in Woman*, and stated that those who expected a minute version of the late trial in Paris had been disappointed. Indeed *Laffarge*, under any other title, would not have been subjected to any nonsensical letters about the morality of producing a play upon criminal events still under the consideration of a court of law. The piece is one of a particular class—a class which has gained the appropriate title of “Adelphi domestic drama,” and is one of the best of the order, nearly, if not quite, equal to the *Wreck Ashore* and *Victorine*. Of the acting it is almost impossible to speak too highly. Mrs. Yates's impersonation of the infatuated *Maria Capelle* is one of the most beautiful and affecting of her numerous beautiful and affecting characters; she is, indeed, seen to advantage in parts like this, full of passionate bursts and truthful appeals, in both of which she is equally natural. The characters of *Laffarge* and *Maria's* lover are sustained with great ability by Messrs. H. Hall and Lyon; and a lighter underplot, quizzing *la jeune France*, in which Messrs. Yates and Paul Bedford play a couple of gamins, is a droll and capital relief to the more sombre current of the play. We cannot conclude without mentioning Mr. Wright, as a fair *limonadière*, in which he dances a burlesque of the Cracoviennne, which is nightly greeted with shouts of laughter and an unanimous encore.

**Olympic.**—A rapid succession of light pieces are rewarding Mr. Butler's judicious management by filling the theatre. *Some Roman Ladies* made their appearance last night, and were very kindly received; these, with *A Last Day*, *English Etiquette*, &c. &c. afford a very agreeable evening's amusement.

**Promenade Concerts.**—These delightful entertainments now form a decided feature at our theatres, though they should more properly come under the head of music than drama; still we would rather see even our national theatres devoted to good music than have them turned into stables for wild-beasts and other animals. Drury Lane, with its fine band, is the most attractive resort; and the continual changes in the selection of the music and the solo performers, draw the same audiences night after night. During the present week fine pieces have been played by König on the cornet-à-pistons, Dantonet on the trombone, and others; but the feature of the week has

been the production of Matthew Lock's splendid music to *Macbeth*, which was given in the most perfect style, and the great execution of the various artists gave it all the semblance of a dramatic performance. Mr. Eliason has fairly shewn, by bringing forward this masterly composition, that his promise to give the public some of our own English music was not a vain boast; and, performed as it was on Thursday evening, there is little in foreign composition that is to be compared with it. Novelties are continually added to the entertainments at the *English Opera* and the *Princess's*, both of which theatres have their fair share of patronage.

### VARIETIES.

**Sir Anthony Carlisle, Knt.**—This eminent surgeon died at his residence at Laugham Place, on Monday last, in his seventy-third year. His numerous publications on anatomy, physiology, and natural history, and the distinguished station he has so long occupied in his profession, entitle his memory to a more detailed record in our Journal than we are at present able to allot to it. In social intercourse, Sir Anthony was agreeable and instructive; with the manners of a gentleman, and the intelligence of a highly cultivated mind.

**Royal Artillery Institution, Woolwich.**—A new institution has just been formed among the officers of the regiment stationed at Woolwich, under the above title. A building has been completed on the Common, near the Repository, containing lecture-rooms, library, and an observatory, where meteorological and astronomical observations will be regularly taken. The management of it is intrusted to the care of Mr. Davies, of the Royal Military Academy.

**Earthquake at Comrie.**—One of these very frequent visitations was experienced on the 26th ult., being the third within a month. The Scotch newspapers, noticing the effects upon the philosophical instruments employed to mark its character and direction, state that they indicate the seat, or focus, of the disturbance to be two miles in depth, and under the Hill of Cluan.

**Volcano.**—A great eruption of the volcano called Gontoor, in Batavia, took place on the 22d of May, and several successive days. The result has been a vast enlargement of the crater, and to convert the mountain, previously covered half-way up with vegetation, into one mass of blackened and arid rocks.

**New Comet.**—On the evening of the 26th ultimo Dr. Brensacker, at Berlin, discovered a telescopic comet near the star 47 *Draconis*; and again on the following evening, but not long enough to enable him to ascertain its course.

**Improvement in Calico-Printing.**—A Mr. Chassuis has invented, and Mr. Beard, of London, patented, an improvement of M. Perrott's (of Rouen) invention for printing two or three colours at once on calico; by which, it is stated, that eight colours may be so produced, and some saving of expense be attained.

**Produce of Cotton in the U.S.**—For the year ending 30th September, 1840, it appears from official returns that a great increase of the growth of cotton had taken place in America. The total crop for 1840 was 3,177,835 bales; being an addition of 817,303 bales upon the preceding year. Of these England had taken 1,246,971 bales; France, 447,465; and the north of Europe, 103,232; the remaining 78,615 being consumed by various other foreign ports.

### LITERARY NOVELTIES.

In the Press.

The Letters of James Vernon, Esq. addressed to the Duke of Shrewsbury, illustrative of the Reign of William III. Edited by G. P. R. James, Esq. with Introductions and Notes.—Mr. Roby's Popular Traditions of England, the First Series: Lancashire.—The Naval Surgeon. By the Author of “Cavendish.”—Sir T. Dick Lauder's Legendary Tales of the Highlands, a Sequel to his “Highland Rambles,” to be illustrated by Phil.—The Conspirators; or, the Romance of Military Life. By Edward Quillinan, Esq.—The Third Volume of Lady Blessington's *Idler in Italy*.—The Memoirs of Beethoven. Edited by Moschelles.—Mr. Serle's new Historical Romance, Joan of Arc.—A Monograph. By S. Gower.—Tendrill's *Cherished*; or, Home Sketches. By E. B.—Sermons on the Seven Churches of Asia, &c. By the late Rev. T. N. Carr.—The Fortress; an Historical Tale.

### LIST OF NEW BOOKS.

Dr. Paley's *Horn Pauline* illustrated in a Continuous History of St. Paul, by J. Tate. Canon of St. Paul's, 8vo. 13s.—*Corn-Law Repealing Fallacies and Inconsistencies*, by G. C. Holland, M.D. 8vo. 7s.—*The Science of Vision*, or, Universal Perspective, by A. Parsey, royal 8vo. 12s.—Poems by the late John Bethune, with a Sketch of the Author's Life, f.cup. 4s.—Second Annual Report of the Registrar-General, 8vo. 4s.—*The Mabington*, Part III. by Lady Charlotte Guest, royal 8vo. 8s.—W. Barnes's *Arithmetical and Commercial Dictionary*, 12mo. 1s. 6d.—W. Barnes's *Investigation of the Laws of Case in Language*, 12mo. 2s. 6d.—*The Genius*, and other Poems, by W. Harper, 12mo. 2s. 6d.—*Practical Treatise on the Bilious Remittent Fever*, by W. Arnold, M.D., 8vo. 10s.—Dr. Williams on the Lungs, 4th edition, 8vo. 10s. 6d.—Walpole's Correspondence, Vol. VI., 8vo. 14s.—*Statutes*, 8vo. 3s. and 4 Victoria, 22s.—*A Love-Gift for 1841*, royal 32mo. 2s. 6d.—J. T. Pratt's *Statutes* (32 and 4 Victoria), relating to Justice of Peace, 8vo. 7s.—*Engelmann's Library*, Vol. V.: Palmer's Ecclesiastical History, new edition, f.cup. 4s. 6d.—W. Hughes on the Sale and Conveyance of Real Property, 2 vols. 12mo. 91s.—*Leaves of Knowledge for the Young*, square, 2s. 6d.—*The Gift of Friendship*, by Mrs. Sherwood, 18mo. 4s. 6d.—*Peter Parley's Book of Poetry*, square, 2s.—*History of Scotland*, by Miss Julia Corner, 12mo. 2s. 6d.—Rev. W. Wilson's *Seven Sermons on the Sacraments*, 12mo. 5s.—*The Fortress*; an Historical Tale, 3 vols. post 8vo. 31s. 6d.—A Present from Germany; translated from the German by E. Perry, 16mo. 3s. 6d.—*Tyler's Legal Hand-Book*: Willis, 18mo. 2s.—*Dr. Weatherhead's History of Syphilis*, 12mo. 6s.—*The Transfiguration*; an Exposition of Matt. xvi. 1-4, by the Rev. D. Bagot, 32mo. 1s. 6d.—*The Excitement*, 1841, 18mo. 4s.—*Lexicon Herodoteum*, by Schweighaeuser, 8vo. 14s.—*Bellenberg's New Conversations* in French, English, and German, 13mo. 12s.—*Zadkiel's Grammar of Astrology*, second edition, 12mo. 5s.—*Illustrations of the Shop-Fronts of London*, by N. Whitlock, 12s.; or, coloured, 10s.—*The Friendship's Gift*, royal 32mo. 5s.—*Memory's Token*, 32mo. 1s. 6d.—*A Bridal Token*, 32mo. 1s. 6d.—*A Birthday Token*, 32mo. 1s. 6d.—*Adcock's Engineer's Pocket-Book*, 1841, 6s.—*Introduction to the Evidences of the Christian Religion*, f.cup. 6s.—*Valpy's Greek Testament*, new edition, 3 vols. 8vo. 21s.—*Edinburgh Lectures on Non-Intrusion*, 12mo. 3s. 6d.—*Dr. Grey's Memoria Technica*, by J. H. Todd, new edition, 18mo. 3s. 6d.—*Recollections of the Lakes*, and other Poems, by the Author of “*The Moral of Flowers*,” f.cup. 7s.—*Irish Life in the Castle, the Court, and the Country*, 3 vols. post 8vo. 11s. 11s. 6d.

### METEOROLOGICAL JOURNAL, 1840.

October.	Thermometer.	Barometer.
Thursday ... 29	From 37 to 47	29.29 to 29.32
Friday ... 30	... 32 ... 51	29.44 .. 29.40
Saturday ... 31	... 36 .. 51	29.50 .. 29.53
November.		
Sunday ... 1	... 33 .. 53	29.58 .. 29.36

Tuesday ... 3	... 44 .. 55	29.49 .. 29.30
Wednesday 4	... 43 .. 53	29.21 .. 29.32

Wind, south-east on the 29th ult., and three following days; the 2d inst., south in the morning, and south-east in the afternoon and evening; north-east on the 3d; south, and south-west, on the 4th.

On the 29th, cloudy, with frequent showers; the 30th, morning overcast, otherwise clear; the 31st ult., generally clear; the 1st inst., a general cloud, rain in the evening; the 2d, clear, except the morning, rain, with boisterous wind; the 3d, generally cloudy; the 4th, morning cloudy, with rain, otherwise clear.

Rain fallen, .405 of an inch.

**November Meteors.**—We have to remind our readers that the next periodic fall of these phenomena may be expected to take place from the 11th to the 15th of the present month.

Edmonton.

CHARLES HENRY ADAMS.

### TO CORRESPONDENTS.

The first numbers of several new and interesting periodical publications are reserved for notice in our next.

Our literary arrears, in every respect, shall be brought up with a wet sail; though if there had been much of importance in that way during the last two months we would have found room for it, as well as for the mass of various science which has occupied our columns. “Puff,” “Penelope,” “No Doubt,” “Et Cetera,” to be seen to.

## ADVERTISEMENT.

Connected with Literature and the Arts.

**FRONT of the NEW ROYAL EXCHANGE.**—The Stationers' Sheet Almanack for the ensuing Year will be embellished by a beautiful View of the South-west Front of the Royal Exchange, about to be constructed by William Tite, Esq. F.R.S. This Almanack, price 3s. will contain the usual variety of Commercial and Metropolitan information.  
London: Printed for the Company of Stationers, and sold by George Greenhill, at their Hall, Ludgate Street.  
\*\* A few Proofs of this interesting Plate may be obtained of any Bookseller or Stationer, price 3s. each, on large paper.

## BOOKS IN THE PRESS.

NEW WORK BY MISS MARTINEAU.

Nearly ready, in 3 vols.

**THE HOUR and the MAN; a Historical Romance.**

By HARRIET MARTINEAU.

In 3 vols. price 7s. boards.

Deerbrook; a Novel.

By Miss Martineau.

Edward Moxon, Dover Street.

Preparing for publication.

**PRINCIPLES of OPHTHALMOLOGY;** being the Introductory Part of a Course of Lectures on Diseases of the Eye.

By JAMES HUNTER, M.D.

Surgeon to the Eye Dispensary of Edinburgh.  
Longman and Co. London; and Ising and Forbes, Edinburgh.

(If whom also may be had, by the same Author, price 8s. 6d.)

**On the Influence of Artificial Light on the Eye, and the Prevention of its Injurious Action.**

13 Great Marlborough Street, Nov. 7.

**MR. COLBURN** will publish immediately the following NEW WORKS:—

I. Popular Traditions of England.

First Series—Lancashire.

By John Kelly, Esq. M.P. F.R.S.L. &c.

3 vols. post 8vo. with numerous Engravings on Wood.

County, on Saturday, November 7th, 1840.

Agents for New York—Wiley and Putnam, 101 Broadway.

## REVIEWS OF NEW BOOKS.

*Ireland, its Scenery, Character, &c.* By Mr. and Mrs. S. C. Hall. Illustrated by Distinguished Artists. Part I. large 8vo. pp. 48. 1840. London: How and Parsons. Dublin: Curry, jun. and Co.

It would neither be fair nor candid to deliver a critical opinion upon the first part of a work like this—for if adverse it might justly be arraigned for want of sufficient data, and if favourable, it would not have the public weight to which a more mature judgment might be entitled. We shall, therefore, offer only a few cursory remarks on the commencement of *Ireland*; taking it for granted that the reputation of Mrs. Hall in the treatment of Irish subjects may be deemed a guarantee for much to interest us in the present case.

It is stated that the publication is the result of five tours made within the last fifteen years—a sufficient length of time and observation to afford grounds for comparison; and that it is divided into counties for the sake of the clearer arrangement of the materials collected. The embellishments are of a high order, and the woodcuts interspersed with the text, very characteristic.

After pointing out the extreme importance to the intercourse between England and Ireland of steam navigation, and declaring against the repeal agitation as calculated, as far as it goes, to neutralise and defeat its beneficial effects; we rejoice to see it stated that the improvement of Ireland within the last two years is of the most marked and gratifying description. Of this we are convinced from other sources of unquestionable information; and it is a happy thought to indulge in, in spite of every impediment which may be thrown in the way of continuous and farther progress. Mr. and Mrs. Hall attribute the change, in great measure, to the establishment of temperance societies, and give an interesting account of them and Father Mathew, to which we shall turn after disposing of a few preliminaries.

Landing at Cork, the multitude and importunities of aqualid and disgusting beggars seem not to be in the least diminished; and we are told some amusing anecdotes of their ready wit as well as some pathetic stories of their sufferings. In touching up the latter (and on other occasions) we may be permitted to remark that there appears to be a little too much of the ornate which belongs to fiction—for this is to be a real and actual picture of Ireland, to inform the British people; not a book of the picturesque, nor of affecting and beautified tales, however charmingly written and wrought up. With regard to the *comique*, we copy the annexed:—

“A beggar, on receiving a refusal from a poor-law commissioner, addressed him with ‘Ah, then; it’s little business you’d have only for the likes of us.’ Another, vainly soliciting charity from a gentleman with red hair, thrust forward her child, with ‘And won’t ye give a ha’penny to the little boy?—sure he’s foxy like yer honour.’ ‘You’ve lost all your teeth,’ was said to one of them.—‘Time for me to lose ’em when I’d nothing for ’em to do,’ was the

reply. Some time ago, we were travelling in a stage-coach, and at Nias, where it has been said, ‘the native beggars double the population of the town,’ a person inside told a troublesome and persevering applicant, very coarsely, to go to —. The woman turned up her eyes, and said, with inimitable humour, ‘Ah, then it’s a long journey yer honour’s sending us; may be yer honour ’ll give us something to pay our expenses.’ We saw, in Waterford, a gentleman angrily repulse a beggar, with a call to his servant to shut the door; and an odd soliloquy followed: the woman half murmured and half hissed, ‘Shut the door; and that’s it, is it? Oh, then, that’s what I’ll be saying to you when ye want to pass through the gate of heaven. It’s then I’ll be saying to St. Peter, shut the door, St. Peter, says I, to a dirty nagur, that ’ud disgrace the place intirely, says I; and ye’ll be axing me to let ye in; the never a fut, says I.—Shut the door, says I; Shut the door! Ould go-by-the-ground (the person who had excited her wrath was of diminutive stature), what ’ll ye say then?’ ‘May the spotted fever split ye in four halves!’ was a curse uttered by a beggar who had been rejected somewhat roughly. ‘Foxy-head, foxy-head,’ was called out by one as a reproach to another; ‘That ye may never see the Dyer!’ was the instant answer.”

There is a good antiquarian account of Cork, and of the curious legend of the wren, “the king of all birds,” with a capital illustration by MacIise. And now we come to the wonders performed by the introduction of temperate habits, and the disuse of that bane to Scotland as well as Ireland—whisky (not surpassed in moral and social evil by the gin of London). Listen!—

“All attempts to check the progress of intemperance were fruitless; it had long been customary, indeed, to take oaths to abstain from drink for a season, but, if kept, they produced no permanent good; and the tricks and shifts to evade them were generally successful. We recollect a man swearing he would not drink for a month—he soaked bread in spirits and ate it; another, who swore he would not touch liquor while he stood ‘on earth,’ got drunk amid the branches of a tree; another, who vowed not to touch a drop ‘in doors or out,’ strode across his threshold, placing one leg inside and the other outside: and so, persuading himself he did not break his oath, drank until he fell; another who bound himself not to ‘touch liquor in the parish,’ brought a sod of turf from a distance, and placed his feet upon it when he resolved to drink. We knew one who was kept sober thus: he was always willing to take an oath against whisky for six weeks, but no longer; his master invariably watched the day on which ‘his time’ expired, and compelled him to repeat his oath; which he would readily do after swallowing two glasses. To make the Irish abstain, even to a moderate extent, was, therefore, considered a hopeless task; and he would have been a visionary indeed who foretold a time when a drunken Irishman would be a far greater rarity than a sober one. The frightful nature and extent of the evil had long been fully understood, and exertions had

been made to lessen it. On the 20th of August, 1829, the Rev. George Carr, a clergyman of the Established Church, a near and dear connexion of our own, established the first temperance society of Ireland in the town of New Ross. He had read some American newspapers which contained encouraging accounts of the progress the principle was making in the New World—we quote his own words—and saw at once ‘that there was no country where it was so much needed as Ireland; not only as removing the national stain of drunkenness, but, by its operations, raising a platform on which all parties could meet without compromise of, or interference with, their respective principles, either political or religious.’ Having been called upon to attend a meeting of the Bible Society, at a Quakers’ meeting-house, he took occasion to request that his auditors would remain in order to hear what he had to say on the subject of temperance. They heard him, were satisfied with his arguments, adopted his plans, and the work was at once commenced. For several years, however, but little way was made; the advocates of temperance were exposed to contempt and laughter as idle dreamers; a coffee tent, which they erected at fairs, was an object of ridicule; and although they had not abandoned hope, their efforts were comparatively fruitless, and the most sanguine among them indulged in no idea of large success. Shortly afterwards, a temperance society was formed in Cork; the example of New Ross having, by the way, been followed in many other towns. Among its leading members were the Rev. Nicholas Dunscombe, Mr. William Martin, a Quaker, and two tradesmen, Mr. Olden, a slater, and Mr. Connell, a tailor; they conceived the idea of consigning the important task into the hands of the Rev. Mr. Mathew, then highly popular in the city, and so liberal in his opinions as to be respected by all classes. He met these gentlemen, seriously pondered over their plans and the probabilities of succeeding, and, ultimately, though not immediately, joined them—‘hand and heart.’ The road had thus been to some extent opened for him; and it is unquestionable that the gradual, although limited improvement which had taken place in the character of the peasantry, had greatly facilitated his progress. Notions of thrift, an appreciation of comforts easy of attainment, and a conviction that a skilful application of industry might double the produce of the poor man’s ‘bit of land,’ had been taught them by causes to which we have already referred, and had made them willing rather than averse listeners. The comparative dearth of topics for agitation, too, had left their minds at leisure to receive lessons, to which, a few years ago, they would have paid no attention. On the 10th of April, 1838, ‘The Cork Total Abstinence Society’ was formed. It is certain that Mr. Mathew never for a moment anticipated the wonderful results that were to follow its establishment; and probably was as much astonished as any person in the kingdom, when he found not only thousands but millions entering into a compact with him ‘to abstain from the use of all intoxicating drinks’—and keeping it. His Cork society

was joined by members from very distant parts—from the mountains of Kerry, from the wild sea cliffs of Clare, from the banks of the Shannon, and from places still farther off; until at length he formed the resolution of dedicating his whole time, and devoting his entire energies, to attain the great object he now knew to be within his reach. He has travelled through nearly every district of Ireland; held meetings in nearly every town; and on the 10th October, 1840, his list of members contained upwards of two millions, five hundred and thirty thousand names. Previous to our latest visit to Ireland, we had entertained, in common with many others, strong doubts—first, as to the actual extent of the reformation; next, as to the likelihood of its durability; and next, as to whether some latent danger might not lurk under a change so sudden—so unaccountable by any ordinary rules—and so opposed to the character and constitution of the Irish people. As in our case these doubts have been entirely dispelled, it is our duty to labour to remove them from the minds of those of our readers by whom they may still be entertained. In reference to the extent to which sobriety has spread, it will be almost sufficient to state that during our recent stay in Ireland, from the 10th of June to the 6th of September, 1840, we saw but six persons intoxicated; and that for the first thirty days we had not encountered one. In the course of that month we had travelled from Cork to Killarney, round the coast; returning by the inland route; not along mail-coach roads, but on a 'jaunting car,' through byways as well as highways; visiting small villages and populous towns; driving through fairs; attending wakes and funerals (returning from one of which, between Glengarriff and Kenmare, at nightfall, we met at least a hundred substantial farmers, mounted); in short, wherever crowds were assembled, and we considered it likely we might gather information as to the state of the country and the character of its people. We repeat, we did not meet a single individual who appeared to have tasted spirits; and we do not hesitate to express our conviction, that two years ago, in the same places and during the same time, we should have encountered many thousand drunken men. From first to last we employed, perhaps, fifty car-drivers: we never found one to accept a drink; the boatmen at Killarney, proverbial for drunkenness, insubordination, and recklessness of life, declined the whisky we had taken with us for the bugle-player, who was not 'pledged,' and after hours of hard labour, dipped a can into the lake, and refreshed themselves from its waters: it was amusing as well as gratifying to hear their new reading of the address to the famous echo;—'Paddy Blake, plase yer honour, the gentleman promises ye some coffee whin ye get home;' and on the Blackwater, a muddy river, as its name denotes, our boat's crew put in to shore, midway between Youghal and Lismore, to visit a clear spring, with the whereabouts of which they were familiar. The whisky-shops are closed or converted into coffee-houses; the distilleries have, for the most part, ceased to work; and the breweries are barely able to maintain a trade sufficient to prevent entire stoppage.\* Of the extent of the change, therefore, we have had ample experience; and it is

\* The Excise Returns may be referred to as conclusive evidence of the diminution in the consumption of ardent spirits: it is understood that in all the southern provinces the revenue is not sufficient to pay for the collection of it; and it is rumoured that arrangements are in progress for a large reduction of the expensive force employed by the Office. There are now but two distilleries at work in the whole county of Cork; and at the late fair of Ballinacloe—the great cattle fair of Ireland—there were

borne out by the assurances of so many who live in towns as well as in the country, that we can have no hesitation in describing sobriety to be almost universal throughout Ireland. For its continuance we look, not only with earnest hope, but with entire confidence. We are not sanguine enough to expect that the whole of the millions will endure to the end; but that a very large proportion of them will persevere there cannot be a rational doubt. Intoxication nowadays, instead of being a glory, is a reproach; the people look upon a drunken man, not with sympathy or even tolerance, but with absolute disgust, and point him out to their children as the Spartans did their helots—as a lesson, not to be forgotten, against vice. This alone affords a certain degree of security against any large return to evil habits.† But we trust mainly to the comforts, small luxuries, and guarantees against periodical visitations of want, that will be obtained by the people whose earnings were formerly squandered at 'shebeen shops.' Our readers may be assured that the temperance movement has not only no connexion with any secret or disaffected societies, but that it strikes at the root of all illegal combinations, and is the strongest and safest supporter of law and justice. In reference to no other country of the world, indeed, would the suspicion arise that what is so good in itself was projected for a bad purpose, and tended to evil; it is equally unwise, unjust, and cruel, to suppose that the Irish are the only exceptions to so universal a rule; and have become sober that they may be more dangerous to society, and more fatal enemies to its established institutions. We hope our testimony may be accepted—for our opinions, both religious and political, are certainly not of a nature to bias us unduly—when we state that we never knew Ireland so contented, so tranquil, or so likely to become prosperous, as we found it during the autumn of the year 1840. During our stay in Cork, we were naturally anxious to meet Mr. Mathew; for immediately after our arrival in that city, we had noted the wonderful and merciful changes his exertions, chiefly, had wrought. He resides in a bye-street, running off from one of the old Quays; here we saw him administer the 'pledge.' The neophyte receives it kneeling, and repeats, after the priest, the following words: 'I promise to abstain from all intoxicating drinks, except used medicinally, and by order of a medical man, and to discountenance the cause and practice of intemperance.' Mr. Mathew then marks on his forehead the sign of the cross, and says, 'God give you strength to keep your resolution.' Nothing can be more primitive or simple. A medal and a card are then delivered to the member. It would puzzle the most prejudiced or suspicious to point out a single word or object engraved on either, against which objection might be

but eight gallons of whisky consumed; the average consumption heretofore being between seven and eight puncheons; i.e. about 800 gallons. The private stills are, as we have stated, entirely abandoned; one of the most fertile sources of demoralisation among the peasantry has, therefore, been put an end to."

† "At Clonmell we had the safest means of knowing that out of four thousand, of which one society consists, there had been but four 'backsliders'; we naturally asked how it was possible to ascertain when the pledge was broken, if it were broken in private; and were told that each member was expected, as a moral duty, to communicate to the secretary the name of any member entering a public house, or sending one of his family to it. This is of importance, as breaking down one of the strongest barriers against Irish improvement—the unwillingness to inform against a person who has committed a crime, no matter how abhorrent may be the crime and its perpetrator to the feelings of the witness, arising out of the contempt and hatred with which an 'informer' is regarded."

taken. As the safest mode of satisfying our readers on this head, we have thought it desirable to procure an engraving of the medal.

The card is a copy of the medal, with the addition of two prints, one of 'Temperance,' picturing a happy cottage home, surmounted by a bee-hive; the other of 'Intemperance,' describing a wretched hovel and its miserable inmates; above it is a lighted candle, into the flame of which a poor moth rushes, and a bottle, round which a serpent coils. It contains also a passage from the Acts, 'He reasoned of righteousness, temperance, and judgment to come.' There is, consequently, nothing of 'superstition' associated with the perpetual reminder of the 'pledge'; although, beyond doubt, superstitious ideas are mixed up with it; a large proportion of those who have taken it conceiving that a breach of their promise would entail some fearful visitation. They go farther than this; many of the pledged believe that Mr. Mathew possesses the power to heal diseases, and preserve his followers from all spiritual and physical dangers,—an error which Mr. Mathew does not labour to remove, although he is, certainly, not charged with having striven to introduce or extend it. We cannot but lament the existence of this evil; yet all who know the Irish peasantry know that an attempt to direct or control them by mere appeals to reason must be utterly vain. It should, also, be borne in mind, that it is by no means a new thing with them to connect superstitious notions with their clergy."

Of Mr. Mathew, personally, we are told:— "No one who sees the Rev. Mr. Mathew will hesitate to believe that he has been stimulated by pure benevolence to the work he has undertaken. The expression of his countenance is peculiarly mild and gracious: his manner is persuasive to a degree, simple and easy, and humble without a shadow of affectation, and his voice is low and musical,—such as moves men." A man more naturally fitted to obtain influence over a people, easily led and proverbially swayed by the affections, we have

never encountered. No man has borne his honours more meekly; encountered opposition with greater gentleness and forbearance; or disarmed hostility by weapons better suited to a Christian. His age is somewhat above fifty, but he looks younger: his frame is strong, evidently calculated to endure great fatigue, and his aspect is that of established health—a serviceable illustration of the practical value of his system. He is somewhat above the middle size; his features are handsome as well as expressive. Our brief interview with him confirmed the favourable impression of his character we had obtained from a knowledge of the benefits derived from his labours; and we left him, with fervent thanks to God that a man so qualified to sway a multitude, had so wisely, so nobly, and so virtuously applied his power and directed the energies of his marvellously active mind—feeling how dangerous he might have proved if they had been exerted for evil and not for good."

With this gratifying, and, we trust, well-founded testimony, we conclude; for we think it would weaken the effect of the facts it communicates were we to indulge in the quotation of the heart-appelling stories with which Mrs. Hall enforces the working of the principle by the example of parties whom it has rescued from misery. We must again caution her on this score if the work is to be looked upon as one of authority; for readers are very apt to mistake pathos for idealism, and thence, perhaps, to disbelieve what is only the simple and genuine truth. By themselves these tales are worthy of their accomplished writer, and of her love for her native land.

*Cairo, Petra, and Damascus, in 1839. With Remarks on the Government of Mehemet Ali, and on the Present Prospects of Syria.* By John G. Kinnear, Esq. Post 8vo. pp. 348. London, 1840. Murray.

MR. KINNEAR sets out by telling us that his journey was purely mercantile; a statement which, high as our opinion of the educated British merchant is, certainly did not prepare us for a volume written in the neatest and clearest style, which would do honour to a professor of literature, nor for the cultivated taste which it displays in regard to the fine arts, and the mass of intelligence upon every subject which can interest the traveller in foreign lands. Above all, we were unprepared for the Scriptural and historical criticism with which Mr. Kinnear so modestly, and yet so judiciously, intersperses his narrative; evincing a mind well acquainted with biblical learning, and the works of commentators which bear upon the ancient inquiries it involves.

Having said so much for the general merits of his performance as a tourist, we may merely note, as affecting his opinions on the "present prospects" of Syria, that every hour varies the situation of that country so much, that events are calculated to beat both author and reviewer; and we shall, therefore, be prudent enough to offer few conjectures on the probabilities of the future. Still, as the most recent account of the seat of war, these pages are of very considerable importance.

Mr. Kinnear landed at Alexandria in January 1839; and thence went to Cairo by Atfee, a very disagreeable transit, with cheats of boatmen, and conveyers by land equally rogues and deceitful. It was his good fortune to meet an old friend, in Mr. David Roberts, as pleasant a companion as he is a splendid artist; and to make up a party

with him, Mr. Pell, and some others, to thread the Desert, and visit the grand ruins of Petra. At Cairo, we fall upon a trait of imagination which indicates to us, and will to most readers who have ever thought on the phenomena, how well qualified he was to enjoy this excursion; for he says:—

"It was some days before I quite got rid of the excitement and whirl of ideas which one feels on arriving in a great city, where every thing—climate, architecture, costume, language, manners—is so new and so strange. I had an odd feeling too, that, somehow or other, the scene was not quite new; the buildings and people seemed to revive some forgotten impression, like the recollection of a dream; and I could almost fancy that I recognised faces among the crowd of bearded and turbaned strangers around me."

This is a strange and incomprehensible idea; but there are few ardent or speculative spirits which will not recognise its common and natural existence; many have experienced its truth, though inexplicable in our darkened estate on this side of the grave. Turn we to things more real, on which the judgment of such a person as Mr. Kinnear is of great weight:—

"The Pacha's manufacturing speculations appear to be a complete failure: not that the articles made are very inferior in quality, but produced at an expense far above that at which they might be imported from England. I have seen a great deal of the cloth woven at the power-loom factory here. Both the spinning and weaving are bad; and, notwithstanding the low price of labour, the cost of production is so great that the cloth can scarcely be sold in the bazars, and is almost entirely used in clothing the soldiers. The climate is exceedingly unfavourable to the working of any fine machinery, as it is impossible to exclude the dust and fine sand. The machinery is quickly deteriorated by the increased and irregular friction; and it is impossible to obtain that degree of moisture which is indispensable for many parts of the process of spinning and weaving. Nor is it possible to obtain, in a factory of this kind, the same systematic neatness and economy of management as under the superintendence of the parties immediately interested in the profit to be realised. In fact, from the extensive competition which exists in England, great part of the manufacturer's profit arises from his economy of management; almost the only advantage he can gain over his competitors in trade is the discovery of some method by which he may be able to reduce his cost of production; and it is probable that Mehemet Ali will before long discover that it is more profitable to export the whole of his cotton, and to receive manufactured goods, from us. The whole system is a bad one for the country. The people will only improve in manufactures when they come to have a direct interest in them, and are stimulated by competition with each other. The same remarks apply to all the Pacha's speculations of this kind. Carpets, in imitation of the fabrics of England and France, are produced at a price far above the value of those of Turkey and Persia; and have, as yet, only been made for the Pacha himself; as in fact they could not be sold in the bazars. An engineer in the service of Ibrahim Pacha told me, that having to construct a small railroad at the coal-mines in Mount Libanus, the rails were sent from the government foundry at Boulak, charged at the rate of forty pounds per ton—about four times the price at which they might have been imported from England. Ibrahim Pacha has al-

ways seen the folly of these speculations, and has often remonstrated with his father on the subject; and it is generally believed that his improvements will turn out more beneficial to the country, and more profitable to himself. I have seen a good deal of a countryman of ours, from Jamaica, who is employed by Ibrahim in the superintendence of a large sugar-plantation on the Nile. He is a shrewd, sensible man, and appears to augur well of the undertaking, which is more suitable to the country and climate than any of the old Pacha's schemes. Ibrahim has also cleared a large tract of land, between Cairo and the island of Roda, which a few years ago was covered with ruins and rubbish; and it is now planted with two hundred thousand olive-trees, which will in a short time yield a considerable annual revenue. I have heard the profit calculated at a dollar per tree, or about 30,000% per annum.

Mehemet Ali is building a mosque in the citadel, on the site, and partly from the materials, of the palace of Saladin. It is to contain a mausoleum in which he will be buried; he fears, perhaps, that, 'after life's fitful fever,' he may not sleep well in his sepulchre among the Memlook Beys. I have made several unsuccessful attempts to see the famous magician, whose performances have astonished and puzzled so many English visitors to Cairo; but he has shut himself up under pretence of being engaged in some mysterious course of study and meditation; and no persuasion will induce him to hold any intercourse with us infidels. I suspect he will turn out to be no great conjuror after all. It appears that the person who first introduced him to English travellers was one Osman, a renegade Scotsman, and at one time, I believe, dragoman to the English consulate. At his house travellers generally lodged before the establishment of the present hotel; and he acted as interpreter at these magical exhibitions. From his knowledge of English costume and manners, and probably from his acquaintance with the personal appearance of some of our public men, he was, to say the least, well qualified to act as confederate with the Sheikh Abd'el Kader, the magician. It is rather a suspicious circumstance that, after the death of Osman, which took place about a year ago, the sheik began to blunder most egregiously; he then became more unwilling to exhibit; and now refuses to visit the English who are here on any terms."

Leaving Cairo, we will not minutely trace the difficult and uncomfortable route over the desert to Syria, nor touch upon the several brief geographical disquisitions which engage Mr. Kinnear's attention. One of their halts may suffice—it occurred on the borders of the Red Sea:—

"This was certainly the most uncomfortable evening we had had. Our eyes, noses, and ears, were filled with sand. I felt it grinding in my teeth the whole evening; it had got into one of my portmanteaus in considerable quantity, and, what was worse, had found its way among our provisions. The water, too, was worse than ever; stinking, and full of animalcules; and I could scarcely swallow it after being strained through two or three pocket-handkerchiefs. Next morning (26th) we sent forward the camels early, and had a delightful ride along the sands. The morning was most beautiful, numbers of small crabs were running about in every direction, and the sea appeared absolutely alive with shoals of fish. I felt very thirsty, and could almost fancy that the feeling was aggravated by the sight of the sea, so beau-

tiful, fresh, and clear. It reminded me of the lines in the 'Ancient Mariner'—

'Water, water, everywhere,  
And not a drop to drink.'

We had a swim, however, and felt much refreshed by it. During the heat of the day we rode slowly on, stopping now and then to pick up a few shells. At Ras Abasoar we struck again into the mountains; and, crossing the rocky and precipitous path over the promontory, came again upon the sea-shore at sunset. We had some difficulty in finding our tents, as we had lost the track of the camels' feet among the stones and hard gravel, and it was nearly dark when we arrived at the camp."

At Akaba, their previous faithful and attentive guides of the Beni Sayd Arabs handed them over to an escort of Alloeens, who engaged to convey them safely by Petra (staying there awhile) to Hebron. These turned out to be more extortionate and less to be depended upon; but, on the whole, the caravan, owing to their cool firmness and determination, seems to have fared better than preceding travellers. At Petra, the Bedaweens, probably in collusion with the Alloeens, levied a small impost upon them, and committed some depredations; but though frequently threatened with conflict and danger, our countrymen finally got well through, and reached Hebron in health and safety. Mr. Kinneer describes the magnificent and picturesque remains of Petra in a manner which affords some additions to former details; and we beg to refer readers particularly to this part of his journey.

From Hebron, the party went by Gaza to Jaffa, where their concerns called them different ways, and they separated, with strong mutual feelings of regret and friendship.

Now alone; March 26th, our author proceeded by Tyre and Sidon to Beyrout, attended by an Arab servant, Salem, and a surruee, with three indifferent horses. Soon after setting out he indulged, very contrary to their wishes, in a rather romantic ride, fitter, one might fancy, for a poet than a merchant; and of which we shall copy a few of the incidents, as a specimen of the attractive manner in which Mr. K. clothes his relation:—

"It was just four o'clock when I reached the khan, which is the usual termination of the first day's journey from Jaffa; but with two hours of daylight before me, and a fine moon, I felt no inclination to stop at this wretched place, with no better society than my own thoughts, for which I found more entertainment on the road. I determined to ride on, and take my chance of finding quarters at some of the villages before me; and I cut short the loud remonstrance of the surruee by riding on, and telling Salem to bring him along. I again struck down to the sea-side, that I might enjoy the cool breeze and the glorious sunset; and about five o'clock came to a beautiful bank sloping down to the beach, covered with rich green sward, and sprinkled with anemones, and sheltered by a thicket of myrtle. There I dismounted, and sat down to watch the setting sun; while Salem spread the carpet, and set out the provisions he had brought, and lighted a fire to boil the coffee. I rested here till the sun was quite set, and the moon shining in full splendour, for in this country there is scarcely any interval of twilight.

'No pale gradations quench his ray,  
No twilight dews his wrath allay;  
With disk like battle-target red,  
He rushes to his burning bed,  
Dyes the wide wave with bloody light,  
Then sinks at once—and all is night.'

We had scarcely left this spot, and were pro-

ceeding along the shore, when the surruee rode up to me, and 'begged to represent' that we ought to return to the regular road. Now it appeared to me, that, in a country where there were no proper roads, it mattered very little whether we kept to a beaten track or not, so we continued in the right direction; and, besides, I wanted to see the ruins of Cesarea, which lie close to the sea, by moonlight. But the surruee had been filling Salem's head with terrible stories of deserters, who were prowling about everywhere, and of the danger of travelling by night; and at the mention of *Kaiserieh*, they both held up their hands in amazement. 'What did I want there?—what could I want there? There was nothing but old walls,' they said, 'no houses, no people—it was a bad place.' At Salem's earnest entreaty, I loaded and pocketed my pistols, and buckled on my sabre, since he saw that I was resolved to go on; and we were scarcely again in motion when he called out, in a great fright, 'Ah, what is that?—see! it comes!' and sure enough I did see a dark object approaching under the shadow of the high bank. It was neither an Egyptian deserter, nor a bear, nor an hyena, all which agreeable ideas had arisen, one after another, in Salem's mind. It was so busy poking up the sand with its nose that it did not appear to notice us till it came within eight or ten yards, when it trotted out into the moonlight—a large wild-boar. 'Well,' thought I, 'if there is any danger, I have got a pretty couple of courageous followers!' About ten o'clock we reached Cesarea, once the capital of Palestine, but now a heap of ruins, and utterly deserted. The moon threw a bright but ghastly light over the old grey walls and towers; and the only sounds we heard were the hooting of the owl among the ruins, and the sullen, measured roar of the waves breaking among the rocks below. On the land side, a wide moat and an old wall still inclose the ruins, which appear to cover a considerable extent of ground; and on the north-eastern side there are ruins of an aqueduct with high arches. Immense blocks rising above the waves, at some distance from the shore, appear to be the remains of a semicircular mole, beginning at the south side and winding round to the west. The building of Cesarea was celebrated by a magnificent festival every fifth year; and it was on one of these 'set days' that Herod Agrippa, the grandson of the founder, was 'smitten by the angel of the Lord,' and died, as recorded in Acts, xii. 23. Here Cornelius and his kinamen were converted, and became 'the first-fruits of the Gentiles;' and here Paul delivered his eloquent defence against the Jews and their orator Tertullus. The surrender of Cesarea concluded the conquests of the victorious Khaled in Syria. It fell in the year 639, and was followed by the surrender of all the other cities, which as yet held out, to the Saracen yoke. It is frequently mentioned, as a place of some note, in the history of the crusades; but, after the expulsion of the Christians, it rapidly declined, and has long remained silent and tenantless, as now. 'The defended city is desolate; and the habitation forsaken, and left like a wilderness.' The night was beautiful, but bitterly cold, and my two companions grumbled a little at my lingering so long about the ruins. They were proceeding at a slow pace, and forty or fifty yards ahead of me, when they were stopped by two men; and, on riding up, I found them in conversation with two as ruffianly-looking fellows as one would like to meet with in such a place, and at such an hour,—Egyptians both of them, and like enough to be

deserters. Salem whispered to me that he knew them, by their faces, to be from Damietta. They said that a river, a little way on, was so swollen by the rain that we could not pass it; but that if we would follow them, pointing to the sandhills above the ruins, they would shew us a ford. Their tone and manner were not calculated to inspire much confidence, any more than their personal appearance; and, my guide declaring his perfect knowledge of a ford before us, I told him to ride on. On reaching the stream, we found it in heavy flood; and, after several attempts to cross, were obliged to give it up, as the horses sunk up to the knees in the soft wet sand at the very edge of the water. We had proceeded four or five hundred yards up the stream, in search of a ford, when I observed an old boat fastened to the bank, and was just telling Salem to go and see if it could carry one of the horses, when the two Egyptians suddenly reappeared. They both ran for the boat, into which one of them jumped, while the other waited to meet us. The fellow, when we came up, proposed that he and his companion should take me and the luggage across in the boat; and that Salem and the surruee might take the horses over by a ford, which, he said, was a little higher up. Well, thought I, if there is a ford, we may all cross at it, so this is a most barefaced attempt at reducing the odds, which, at present, are in my favour. I was completely covered by a large Greek capote, which concealed my arms, and which I took off and flung across my horse. 'Now, Salem,' said I, 'tell him that if one of them will take you and me across in the boat, with the luggage, and the other shew the surruee the ford, I'll give them ten piastres. Well, what does he say?' 'No, signior, non vuole.' 'Then, tell him this. We are three, and well armed; if they will agree to my proposal, well; if not, we'll take the boat from them: tell him to throw down that stick.' At the sight of the pistols the fellow stepped back two or three paces; but when he saw my capote tossed into the boat, and a portmanteau about to follow it, he beckoned to the surruee, and walked off without saying a word. We had scarcely pushed into the stream, when we saw them cross at a ford, not above knee deep, nor more than twenty yards above us. The whole affair did not occupy ten minutes, and the fellow in the boat, who was a lad of eighteen or nineteen, never opened his mouth. It was past twelve o'clock when we reached Tortura, the ancient Dora, a poor village close to the sea. There was no khan in the place, and I never doubted being received into one or other of the houses; but I soon found that I was reckoning without my host. I knocked at half-a-dozen inhospitable doors; some of them were not even opened, and the others were slammed in our faces the moment the inmates caught a sight of my unlucky *tarboosh*, which, having no hat, I was still obliged to wear. At last, by good fortune, we found our way to the house of the Sheikh el Bellad; but he, like a cautious man, instead of opening his door, came out on the roof to hold a parley with us. I was in the English dress, to be sure, but the red *tarboosh* was enough to convince him that I was not Inglez, and he positively refused to open his door; but, pointing to a large court, full of sheep and goats, said we would find a place to sleep in there. After looking into one or two out-houses that stood open, I fixed on one that had a dry floor, and a door that could be shut. A fire was soon lighted outside the door; and, after a cup of coffee and a pipe, two great comforts on such occasions, I wrapped

myself in my capote, and slept pretty well in spite of the fleas, which were rather abundant. At day-break I was again in the saddle."

On the 5th of May he arrived at Beyrout, and remained there during six months, including a visit to Damascus. The following remarks are interesting at this crisis:—

"From the best information I could obtain, founded on the returns for the *firde*," the Druse population is about 70,000, and the Maronites not less than 220,000. They are united under the jurisdiction of the Emir Besheer, who is a staunch and powerful adherent of Mehemet Ali. They were disarmed some years ago by the Pacha; but, in the present juncture, arms have been distributed among them, for the preservation of tranquillity in the country, during the absence of the regular troops. Farther to the north, in the district called the Kesrawan, are found the Anzaris, a race whose origin appears to be more enveloped in mystery than even that of the Druses. Burckhardt says, 'They are divided into three sects, of which nothing is known except the names, viz. Kelbyeh, Shem-syeh, and Mokladjyeh.' These names, however, afford some foundation for the belief which generally prevails in the country, that the Kelbyeh worship the dog, and the Shem-syeh, the sun. The Metawalis, whose principal station is at Baalbec, but who inhabit a considerable portion of the range of Anti-Libanus, are supposed to be descended from the ancient Syrians; although, as a distinct sect, they were not known earlier than the beginning of the eighteenth century. They are of the Shi-ite sect, the dominant one in Persia, and are hated equally by the Christians and the Sunnites, or orthodox Mahommedans. They are a turbulent, lawless race, and, at the present moment, infest the roads between this place and Damascus; and are said to be collected in considerable force between Baalbec and Zeldani, under the Emir Shooeh, one of their chiefs. Be assured, the government of Mehemet Ali in Syria, with all its faults,—and they are many,—is by no means so bad as is supposed in England. A great and beneficial change has been produced on the country in many respects. I am inclined to think that the government is more favourable to the interests of British merchants than that of the sultan: and that which is our interest is, in a great degree, the interest of the country."

The fidelity of the Emir Besheer has turned out to be treachery, and other events have greatly altered the state of affairs in Syria. On the new *status quo* to nearly the latest date Mr. Kinnear offers the observations with which his volume concludes; add to which we will, under the circumstances, devote only a few moments' notice:—

"Few travellers (he truly remarks) take the trouble to inquire how many evils which existed under the Turkish government have been reformed by Mehemet Ali, or how many abuses of power which they now witness did exist before he became ruler of Egypt and Syria. Few are sufficiently careful to distinguish between what may be justly attributed to his government and what exists only in spite of it."

It must be admitted that a government which, in a Mahommedan country, extends its protection equally over every Mooslim, Christian, and Jew; which has founded schools of medicine and military hospitals on a liberal and extensive scale; introduced the art of printing; and allowed

English missionary societies to establish their schools, and circulate their publications in the capital and in other towns—has done something to advance the country in the scale of civilisation.

It is not a good government; but what is bad in it belongs to the Turkish government also, and what is comparatively good is Mehemet Ali's. Many evils which may be attributed to him are not so much evils of system as of mode and degree. The conscription is practised in other countries, but here it is often enforced in a cruel manner and to a ruinous degree. On the whole, however, I have little hesitation in saying, that the government of Mehemet Ali in Syria is better than that of the Turkish pashas; and I have no hesitation at all in saying, that it has been very much misrepresented in England."

It is to be hoped that Syria, wrested from the power of Mehemet Ali by European alliances, will not be suffered to relapse into any species of despotic misgovernment—the destinies of the people must command, on every principle of humanity and justice, the interference and protection of those who have contributed to place them anew under a different system. The obligation on Mehemet Ali to maintain a great army, and, consequently, to resort to heavy taxes and more grinding conscriptions, appear, to Mr. Kinnear, to have been the chief cause of his oppressions. Turkey restored and guaranteed can have no need of such a force; and with its absence, we trust there will be an absence of the cruel means by which it was recruited and sustained. We trust also that the police regulations, the safety of persons, and the strict administration of the law equally to high and low, will not be disturbed. Mr. Kinnear seems to dread any reverse, and concludes in the following words:—

"If active measures are to be taken, a great blow must be struck at once, in mercy to the country, as well as for our own sakes. Any operations undertaken with inadequate means will only embitter and prolong the struggle. The slightest advantage gained at first will infuse additional energy into the Egyptian troops, already confident in the hitherto uninterrupted success of Ibrahim, and animated by a fanatic zeal in the cause of Islam. If once the war assumes a religious character, the Turkish troops will fall away from their European allies, and the country will rise against us: the rains will commence in October and continue till February; and the climate and pestilence will come in to aggravate all the horrors of war. Before these pages are printed, Mehemet Ali will have submitted to his fate, or active operations will have commenced; and, in the latter case, it is impossible not to fear that some very 'untoward event' may follow. France will not remain neuter, if the Russians occupy Constantinople, or if Russian troops are landed in Syria. Should Mehemet Ali accept the terms offered him by the four allied powers, the immediate danger may be averted; but his independent sovereignty of Egypt will be little better than a dependency of Great Britain, who, from her Indian territory, commands the entrance to the Red Sea, and may at any time land an army, already inured to a tropical climate, within three days' march of Cairo. If the object of our present policy in the East be to preserve the integrity of the Turkish dominions, we begin oddly enough by offering an important section of them to Mehemet Ali. We call him a rebel and usurper; with one hand we threaten to punish his rebellion, and with the other we reward it with the sovereignty of Egypt. Who gains by this partition

of the sultan's dominions? England alone; and her influence over this newly erected sovereignty may prove quite sufficient cause of jealousy to involve us in an European war."

Which Heaven avert! Amen. Need we add that Mr. Kinnear's volume cannot be too generally read, as not only ornamental to our literature, but highly honourable to the mercantile character?

*The Conspirators; or, the Romance of Military Life.* By Edward Quillinan. 3 vols. 12mo. London, 1840. Colburn.

THE staple of the various tales which fill these volumes consists in a development of the plots and operations of a secret society in France, called the Philadelphians, alluded to by Southey and Napier in their histories, and respecting which more circumstantial details have appeared in several French publications. Capt. Quillinan appears to have traced the conspirators more minutely; and his revelations are, certainly, of a very staggering description. From them it would be acknowledged that most of the designs against Buonaparte proceeded from this association; and that even in the midst of his armies it exercised a power to divert, control, and defeat his greatest undertakings, as it did several of Soult's in the Peninsular war. The organisation and management of this vast conspiracy are ascribed to General Oudet, killed at Wagram; and the chapter entitled "The Man without a Name" (occupying about 140 pages of the second and third volumes) gives a full account of this person, and his associates and plans. The whole is sufficiently extraordinary to excite our wonder; and yet seems to be supported by such data, that though forming a division in a publication of "Romance," we can hardly doubt its original reality, or question its general truth.

The "Sisters of the Douro," a story of Portugal, is interesting in itself, but chiefly connected with the main thread by having for its hero a Colonel Champelemont, who is a leader among the military Philadelphians. This, and the ensuing tale, "The Royalist," laid in Switzerland, seem to be founded on actual occurrences, in which invention could add but little to the marvellous of the real: and they are well told by the author. "The Rangers of Connaught," a narrative belonging to the period of William of Orange, and "The Moor of Andalusia," a piece of Spanish chivalry, complete the more imaginative compositions, and do credit to the writer's taste and talent. Novel-readers will peruse them all with gratification; but we must choose our path amid the mysteries of Oudet. Capt. Q. thus opens the subject:—

"In the character of Napoleon Bonaparte there was not an atom of what is termed romance; his genius and ambition, though equally vast, were the disciplined agents of a thoughtful and resolute self-love. His very heroism was more of a mathematical principle than a fervent impulse; and when he most startled the world into fearful admiration, he was but working out an answer to some studiously considered problem of self-aggrandisement. Men, with their force, physical and moral, their bodily energies and their passions, prejudices, delusions, enthusiasm, were to him but as fuel to swell the blaze on that altar of ambition, of which he was himself at once the priest and deity. As fellow-creatures he scarcely regarded them! For, from the hot Mayday of Lodi, if not sooner, till the autumnal night of Moscow, if not later, when he left

\* "The new tax imposed by Mehemet Ali; it is levied on all the males above the age of fifteen."

the flaming Kremlin he seemed to be unconscious that he was himself a created and responsible being. Yet not only are the prominent events of his life romantic, but there is at least one circumstance in deep shadow behind them, and hitherto little noticed or understood, of so marvellous a kind, that it might be treated as a mere creation of fancy, if it were not sufficiently substantiated—this is, the Philadelphian Conspiracy, which haunted him from the hour of his elevation to that of his fall. Its origin is attributable to the very barrenness of human sympathies in Buonaparte's mind; for, from the time that the means by which he brought about his appointment to the Chief Consularship of the French Republic made it manifest to many jealous observers that he aimed at sole and purely selfish power, this plot to baffle him sprung up and flourished in his own army. The anger of political visionaries, of all denominations, sects, and views, in France, Buonaparte might have disregarded, had he been assured of the absence of all such pests from his barracks and camps; but he had never that certainty. On the contrary, he knew that there were fierce and sullen factions among his soldiery; and the vigilance requisite to avert them was one of the most fatiguing penalties of his new greatness. This Philadelphian plot, in particular, disturbed him, because it was one that he could not grapple with. Vague rumours and warnings begot vague suspicions; these produced blind arrests and abortive examinations. Incidents were perpetually occurring that kept awake the sense of danger, but none that threw light beyond the outskirts of the mystery. Napoleon well knew how he was detested by the democrats whom he had duped, and that among them there were many respected men, whose hatred was dangerous. One of these was General Mallet, whom he pretended to suspect of Bourbonism, in order to weaken his credit with the republicans, but who, though sprung from the noblesse, was then, and for many years afterwards, of the popular party. When Buonaparte was declared First Consul, Mallet was quartered as adjutant-general at Besançon. Here it happened that several youths of the remote eastern province in which that fortified town is situated, had formed themselves into a friendly club, which they called the Society of Philadelphians. They had no political designs whatever; they were a band of warm-hearted boys, who 'swore eternal friendship' before they were dispersed through the world, and who agreed on certain rules and signs by which they and all future members of their society were to be pledged and known to each other, wherever any of them might meet. It was a game at free-masonry, as puerile and harmless as the solemn farce of hide-and-seek played so imposingly by the brethren of the Square and Compass. Mallet perceived nothing worthy of his attention in the proceedings of these young persons. He would have neglected no opportunity of strengthening parties against the First Consul; but he was not the man to discover, in the expansive sensibilities and lively imaginations of raw youths, the very qualities that, skilfully managed, give life and force to factions. There was, however, an officer on his staff, who had both the penetration that can detect the latent power of such vapour, and the ingenuity that can apply it to daring purposes. The name of this very remarkable individual was James Joseph Oudet, and the following description of his character and person is given from the report of one who assures us that he knew him intimately. Oudet was born near Menale, in the Jura, of

an agricultural family, in easy circumstances. He received the usual elementary education of youths of his station; but Nature, by the profusion of her gifts to him, seemed to have intended him for greatness. He became a soldier, and his bravery and talents soon signalised him. He had eloquence, which quickly became popular, because directed against monarchical institutions, and exerted in advocacy of that amiable theory of universal freedom and brotherhood which the moustached philosophers of France are so fond of listening to, and so ready to write out for the edification of the world, using bayonets for pens, and blood for ink. Yet Oudet himself had nothing in his manners that betrayed aught of the ruffianism of this sect of philosophers. He was the Admirable Crichton of the French army. Opposite qualities appeared in him to coalesce. He had the simplicity of manners of a child, with all the easy self-possession of a man of the world; the suavity of a girl, with the firmness of a stoic; he was the most active and the most careless of men; luxuriously idle when at leisure, indefatigable in enterprise, immovable in resolve, stern and gentle, playful and serious, yet always perfectly natural, unless he was perfectly and exquisitely artificial. Oudet began his career as a volunteer in La Vendée. From that time, until he attained the rank of Chief of Battalion in a famous brigade, it was a career of glory, and his exploits were as many as the actions in which he was engaged. His wounds, though not so numerous, were neither few nor always slight; his right arm was twice pierced by musket-balls, one thigh was fractured by a shot. The soldiers related his feats, and the officers repeated his sayings. He was grievously scalded by fused lead at San Bartolomeo; some grenadiers crossed their muskets by way of litter for him, laid him on them, and were bearing him to the rear. 'Comrades!' he cried, 'what are you about? You have turned your backs on the enemy!' An old serjeant, who thought him mortally hurt, answered, 'If we do not carry you off the ground, the enemy will trample on you.'—'Lay me down, and repulse them,' he said; 'and my body will not be in their way.' Oudet survived that wound by a miracle; and it was he who, three months afterwards, startled Buonaparte from a reverie, and blanched his cheek by this abrupt address. 'Hold up your head, that I may see your face, and be certain whether it is indeed Buonaparte who has returned from Egypt to enslave his country!'

He goes on to describe his adoption of the Young France at Besançon, and ramifying his secret designs beyond them to a vast extent in nearly every part of the country, and especially in the army:—

"Oudet formed a scale of distinctions, which he termed his Philadelphic ladder, and which, though perfectly understood by none but himself, was so graduated as to invite from all ranks of society all the strong minds that still retained independence, in the state of subserviency to which France was sinking. Of the three upper degrees on this scale, the highest was the censorship, nothing less than a kingly absolutism under another name. To this no one could arrive without having previously gained the two steps next in dignity. The second was one rather of forms and revelations than difficulties. But the third was very arduous of attainment, and accessible only to resolute and sure men, who were vowed to a more than monastic renunciation of all merely personal cares. The man who became a member of this class ceased to be any thing

else; and all his private duties were to give way to those imposed on him by the institution. He quitted his place in general society to become the blind instrument of that special fraternity to which he thus devoted himself; and, in his intercourse with it, he was no more to be known by the name of his fathers, but by some other appellation, usually an heroic one from ancient history, and one supposed to be appropriate to his character, as the Red Indians and other savages distinguish their men of mark by the names of the birds and beasts, whose qualities resemble theirs. Thus, an able and firm adept, likely to seize an opportunity of turning any popular excitement to the views of the institution, was named Marius; a young man of quick wit and warm spirit, yet of amiable and winning manners, received the name of Alcibiades. Then there was Spartacus, whose blunt, frank manners qualified him for the office of stirring up slaves against their masters. The spirit of imitation infused by these adoptive names was sometimes shockingly proved: Cato, Themistocles, and Cassius, all perished by suicide. Oudet's official station under Mallet at Besançon, and his family connexions with the Jura, enabled him easily to extend and strengthen his Philadelphian party in those quarters, and not only there, but through the whole of Franche Comté and Burgundy. He speedily diffused his influence much farther. Trusty emissaries were sent from province to province, feeling their way cautiously, and weaving secret intelligences with the disaffected every where. An understanding was established with the lawless rovers of the great mountains that border France on the east and south; for even smugglers and brigands were to be made useful. Auxiliary institutions of Barbets were cultivated in the towns and villages of the Alps; of Bandoilers, in those of the Jura, Switzerland, and Savoy; and of Miguelets, in the Pyrenees. But the nerves and sinews of the Philadelphian scheme were the band of blue brothers in the army. It was first introduced simultaneously into three regiments of the line, two of light infantry, and one of dragoons, and from them to other troops, till there were few corps in the French service in which there were no Philadelphians. By degrees, this audacious league became a nation within a nation; and a nation powerful in youth, intelligence, courage, and, above all, devotedness and obedience. It had, finally, its noblesse, its clergy, its magistrates, its army, its people, and its literature; and all the links of this combination so concealed as to baffle the keen eyes of such ministers and agents of police as Fouché, and Savary, and their satellites. Oudet stood in the midst of this confederacy, like the Gallic Hercules, the ingenious emblem of eloquence and strength, who, by the charm of words, holds multitudes of men together in invisible fetters."

Pichegru, Moreau, Georges Cadoudal, Mallet, and many others, were, it is affirmed, members of this Society, and their attempts against Buonaparte either originated in, or were supported by, it. The superior fortunes of Napoleon, however, prevailed over them all; and we conclude with the fall of their grand leader:—

"On the 6th of July, 1809, was fought the battle of Wagram, one of the days that have most powerfully contributed to the illustration of the French arms. The affair was almost decided at ten in the morning, and quite terminated by mid-day. Oudet and his chosen officers, on that morning, had astonished even the brave by their valour. The officers, for the

most part brought out from retirement and neglect by their commandant, as he had been by the minister of war, exulted in the opportunity of distinguishing themselves at once, and so proving their right to those posts in active service from which they had been excluded. Some of them were killed in the first onset; several others were wounded. Oudet himself received three lance-wounds, which, though not dangerous, caused him to lose so much blood that he was obliged to be tied on his horse, as he would not quit the ground, while faint from weakness. Oudet was not one of those Philadelphians who embarrassed Napoleon's road to victory by any failure of duty in the field: the emperor was to be got rid of by any fitting means; but the French were to be victorious, and then to force their neighbours to adopt their scheme of happiness; the evil of bloodshed and devastation was to be deplored, but was light when weighed against the felicity of surviving millions and of myriads unborn! This was the military philosophy of the Philadelphian reformers. Oudet, whose wounds had been dressed on the field after the battle, was waiting for orders to move towards Vienna, from which he was only about a mile and a half distant, when he received commands to repair with his regiment to a distance of three leagues in the opposite direction, towards one of the points on which the broken and dispersed enemy had vanished. He was required to place his regiment as a corps of observation in a good position, — there to leave each company under the command of one officer and a sub-officer, and then, with all the rest of his officers, to go back to head-quarters for further orders. The march and the details of this operation occupied him till night, and he was returning with nearly two-thirds of his officers, according to the curious order he had received, when, about eleven o'clock, he fell into the midst of an ambuscade, which, without discovering itself, killed all his companions by volleys of musketry. At sunrise, twenty-two dead officers were found crowded about Oudet, who alone still breathed. The disposition of the group was such as made it probable that his comrades had tried to make a rampart of their bodies for him, — a last testimony of their generous devotedness. He survived three days, and during that time he clearly settled some family affairs, whose adjustment demanded a close application of mind, and on which his only child's future resources depended. His later moments were entirely devoted to earnest conferences, — not with a minister of religion, — not with his own conscience, — but with some of his Philadelphian friends on the subject of his favourite project. The ruling passion was strong in death; and the last words he was heard to utter were, 'His doom is accomplished!' The smile that lingered round his month when he had ceased to breathe seemed to have been called there by the thought implied in those words, which were supposed to predict the downfall of his enemy, Napoleon. He expired in the midst of some wounded friends, who had forgotten their own ailments and wants in administering to his. The news of this event spread through the army with greater rapidity than was desired. The bulletin of Wagram, which accorded the honour of particular mention to a crowd of obscure officers, in vain disguised the circumstance of his fate under a common form of words, merely mentioning General Oudet as among the killed on the field of battle. He had only been put in orders by his new rank of general of brigade on the very eve of the action. But Oudet,

mortally wounded by an ambush on the night after the engagement, and picked up the following morning, certainly did not die on the field of battle. What, then, was the reason for giving an historical authority to this untruth? However that may be, Oudet and his friends were, for the short time that soldiers on service can afford to regrets, almost universally lamented in the army. The sorrow at the moment was impetuous: some of the wounded officers, who had been carried to the same hospital, tore off their bandages when they saw his corpse carried out. A young serjeant-major, who was one of the train that followed it, stabbed himself to the heart at a few paces from the grave. A lieutenant, who had served under Oudet, in the 68th regiment, destroyed himself with a pistol! Oudet's obsequies resembled those of Otho. This most impious madness is recorded with admiration by one of the eulogists of Oudet. Thus, in the summer of his age, for he was barely thirty-four years old, perished a man who possessed, perhaps, as many natural advantages, both of mind and body, and as much ambition as any man of modern times, but who so tortuously misapplied his advantages that his ambition was not only disappointed while he lived, but without any result of posthumous honour. He was soon forgotten, except by a few enthusiastic friends, themselves obscure; — forgotten even in his native Jura; and his fate strangely verified the whimsical designation by which old Mercier described him to Buonaparte, and which had been adopted as a convenient periphrasis by many of the Philadelphians. The words might now serve for his epitaph, if his grave could be found: — *The Man without a Name.*

The intervening adventures and events are full of deep interest; and though we cannot consent to receive the particulars of private meetings, and conversations between Fouché, Mercier, Oudet, and Buonaparte (see Vol. III. opening), as strictly consistent with what could be divulged to any third party for promulgation to the world, we are yet satisfied that the outline of Captain Quillinan's relation is well founded, and free from suspicion. At any rate it is very curious, and may serve to indicate the possibility of similar associations still existing in France.

#### SAM SLICK'S THIRD SERIES.

[Second notice.]

IN our first review of Sam's new volume we were so far seduced by his characteristic and humorous attractions as to delve deeply into our weekly garden, and leave less space for other productions. Sensible of this, we shall not indulge so much in our predilections for his writings as we might otherwise have done, by prolonging our present continuation beyond a very few additional examples. In our last we alluded to the Clockmaker's introduction to a leading Opposition Lord in England, who wished to gather matter from him for an attack upon the ministry. The whole is a capital description, but we can only quote a small portion. After the stranger had committed a dozen mistakes at his entry, taking the liveried servants for officers of state, &c., he proceeds to tell: —

'As I mounted the stairs I heard guide friend say again to the other man in plain clothes, Didn't I tell you he was a fool? — Madman, I should think, said the other. — Presently a door opened, and I was shewed into a room where member, who was nothin' but a common-sized man arter all, was standin' by the fire, and three or four young gentlemen in plain

clothes was a-writin' at a table, as hard as they could lay pen to paper. The officer that opened the door roared out again, 'Mr. Slick!' as loud as he could, and I raily felt so dander, I do believe I should have knocked him down if he hadn't a-stept back out of reach; but member came forward very perlitte, and shook me by the hand, and said it was very kind of me to come at such short notice, and that he was very happy to have the pleasure to see me. Then he jist gave a wave of his hand, and pointed to the door, as a hunter does to his dogs, without speakin', and the people writin' got up and went out backward, keepin' their faces to him and bowin'. Arter they were gone he said, Take a chair, sir, if you please: so I took one for myself, and lifted one for him, sayin', it was as cheap to sit as to stand, and every bit and grain as easy too: but he said he preferred standin', and kinder sorter looked at me, as much as to say, he was too good or too proud for that; so there he stood, his elbow on the mantel-piece, and his head restin' on his hand. Well, my bristles began to stand right up, like a dog's back: I didn't like the talk of the guide friend he sent for me; I didn't like the way the officers kept bawlin' out my name, and snickered in the entry, and I didn't relish the way I was set down on a chair alone, like a man to be shaved in a barber's shop. I felt as if I could chew him right up, I was so mad, and I was determined to act as ugly as him, for my coming was his seeking and not my own; and, as there was nothin' to be made out of it, and no trade spoiled, I didn't see as I had any occasion to put up with his nonsense, do you? for there is nothin' I hate so much as pride, especially when any of them benighted, insolent foreigners undertake to shew it to a free and enlightened American. So I jist put up my feet on his fender, free and easy, to shew him he couldn't darnt me by his airs and graces, and then spit right between the polished bars of the grate on the red hot coals till it cracked like a pistol. Well, he jumped a yard or so, as if he was shot, and if you had seen the tanyard look he gin me, it would have made you spit a-larfin. Don't be frightened, lord, said I, — for I didn't know which hense he belonged to, so I thought I'd give the title, as we call every stranger citizen, Kuruel, — Lord, said I, I won't hit you; I could spit thro' a keyhole and not wet the wards; but as you stand, I believe I will too, for talk atween two don't come kinder natel, unless both sit or both stand; and now, says I, as time presses, what may your business be with me, lord? Well, he stood back two or three feet, as if he was afeared I would touch him, and then he entered into a long parlover about the colonies, and asked me if the people was contented with the government. Mr. Stranger Lord, said I, they are not, and that's a fact. He brightened up when he heard that; he seemed as if it pleased him, as if he would rather hear that than that they were satisfied. Thinks I to myself, a nod is as good as a wink to a blind horse. I see what you be, you are an agitator, and want grievances to work on; but you get the wrong sow by the ear this time, any how. — Ah, said he, your testimony is valuable, Mr. Slick, for you are an impartial man, and have had great opportunities of knowing the condition of the people. Do you attribute this discontent to the government that has prevailed there since the American revolution, or to causes over which we have no control? — To the government, said I, some part, and some part to other causes, but to none over which you have no control. — Precisely, said he, that is exactly my

view of it. Will you allow me, said he (a-tryin' to lead me on by doin' the civil), to offer you some refreshment, sir; I ought to apologise to you for not having offered it before. Have you lunched yet?—Thank you, lord, said I; I have dined, and arnt no occasion for nothin'.—Then what remedies do you propose, said he; how would a union do?—Cure all evils, said I; you have hit the right nail on the head; it's exactly the right medicine.—How singular! said he; and he rubbed his hands, and walked up and down the room several times, lookin' very pleased; and I thought I heard him say, What will the duke say to this? You have heard, no doubt, said he, of responsible government; pray what is your opinion of that?—It is not only a good government, said I, but no country can be either happy or contented without it. It is absolutely indispensable; you will lose the colonies without you introduce it.—Mr. Slick, said he, I have heered much of your sagacity from others, and your conversation fully confirms the high opinion I had formed of you. I am delighted to have the pleasure of making your acquaintance. When do you leave town? (English folks always begins that way, afore they axe you to take pot luck with them.)—In the mornin', bright and airy, said I; have you any commands that way?—No, thank you, said he; but would you have any objections to my ordering up those gentlemen you saw here jist now, to hear this very gratifying confirmation of my opinions?—Not the least in the world, said I; I don't care if all London hears it. So he rang the bell, and who should answer but the self-same officer that shewed me in. Now, says Lord, I wish you to hear this man's (gentleman's, says he, a-catchin' himself as quick as wink), this gentleman's opinion yourselves. It is very satisfactory to have such good authority in our favour.—Discontent, says I, prevails to an alarmin' extent. It exists everywhere, (I'll move to have this feller examined before a committee, said he, a-whisperin' to my guide friend; the scoundrel is quite a god-send to us,) it pervades all classes, says I.—Good heavens! said he, I wasn't prepared to hear such a fearful account: but it's very satisfactory—very satisfactory indeed. Go on, sir; I am quite delighted.—Paradise wasn't good enough for some folks, says I; how can the colonies be? Them critturs there are not satisfied with the dispensations of Providence; how can you expect them to be so with the government? They would like to have a government to cost nothin', to have their bread grow'd ready baked, to be paid for eatin' it, and be fed with a silver spoon. Union, says I, that you inquired about, is most desirable, for it would heal all differences; but not a union of the provinces, for that would only open new sources of strife, and eend in your losin' 'em body and breeches; but a responsible government, says I, is indispensable. Jist thin I took a squint out of the corner of my eye, and I see he began to smell a rat, and to look all adrift; so on I went, knee-deep, and a foot deeper, a-pokin' it into him like fun. Men who rebel, says I, and commit murder and arson, ought to be held responsible for it, or you might as well be without any law at all, unless you like Lynch law best. Wherever you see loyalty, encourage it; and disloyalty, discourage it. Whatever changes is right, make them, and then tell them, now, that's the form that's settled; if you don't like it, leave the colonies, and go where you can find things more to your mind; but if you do stay there and rebel, you will be hanged as sure as you are born. You shall

have responsibility, but it shall be the responsibility of crime to law, and of offenders to justice. Heavens and airth! if you had a-only seed stranger lord, or whatever he was, how he looked, it would have done you good. It was as grand as a play. Oh, he was as mad as a hatter, and the madder because he could't help himself nohow he could fix it. He actilly looked as small as the little eend of nothin' whittled down. He was so bungfundered he couldn't speak, and t'other fellers looked as if they were afeerd of their lives to speak either. They seemed, them critturs, as if they darsn't call their souls their own, he kept them in such awe. Oh dear! what a bam it is for such men to talk liberal, when they actilly don't believe that they are made of the same clay as other folks! At last, things began to look rather serious for a joke; so, says I, risin' up and takin' my hat, I believe I must be a-movin', lord, says I; and if I don't sail, as I some expect, I shall be back next week; and if you want to see further into matters, jist send for me, and I will come with pleasure; or if you want to examine me before that committee, tip the scoundrel a subpener, and he'll testify through a three-inch plank for you. Do you take? (It made his teeth grit that, like two millstones; he grinned like a fox-trap: fact, I assure you.) Yes, says I, send for me, and I'll come; for you and I, I see, agree in opinion about them colonies 'zactly. Indeed you are the only man I've met since I came here that talks a word of sense about them. Good day! And I turned and walked out, guide and his companions follerin' me.—What a d—d hoax, said guide, a-whisperin' to the other. That feller is no fool, after all; he is more rogue than dunce that. He has given him a fit of the jaundice.

The other "Snubbings of Snobs" are equally felicitous: one passage, on the value of colonies, is worth many big pamphlets which we have read on that subject:—

"If ever you was to Antwarp (says Sam to one he was 'bungfundering'), you'd see what it is to lose colonies. When that place belonged to Holland, and had colonial trade, five thousand marchants used to meet on 'Change; now the Exchange is left, but the marchant is gone. Look at the great docks built there at so much expense, and no shipping there. Look at one man-of-war for a navy that has a pennant as long as from to-day to the middle of next week, that can't get out for the Dutch forts, is of no use in, and if it did get out has no place to go to. Buonaparte said he wanted ships, colonies, and commerce; one fool makes many! Every delegate, patriot, and humbug, that goes from here to London, if he gets by accident to a public dinner (for folks to see he ain't black), and is asked for a toast, rises up, lookin' as wise as a donkey, and says, 'Ships, colonies, and commerce!' 'till it becomes a standin' toast. Buonaparte was a fool, and didn't know what he was a-talkin' about, for colonies means all three. Them that have colonies will lose the other two along with them. Yes, John Bull is a blamed blockhead, a cus— Excuse me, said the stranger, rising and effecting his escape at last; but really, sir, your language is so offensive you must permit me to retire, and he very properly left the room.—Well, I didn't mean to offend him nother, said Mr. Slick. I vow. There was no occasion for him to hop about as mad as a parched pea that way, was there? I am sorry he kicked afore he was apurred tho', for I was only speakin' in a giniral way like. I wish he had a-heerd me out too, for I was

only a-breakin' of the crust when he began to look all wrath that way. I hadn't got rightly into the subject; I only spoke of manufactures, but that is merely one item; there are many other political ones that he never heerd of, I know. But what can you expect of such critturs? all they can do is to grunt like a pig at corn time. The way they don't know nothin' is most beautiful, and them that make speeches to England about the colonies too. There ain't, p'raps, no one subject there is so much nonsense talked about as these provinces: it's ridiculous, it makes me larf so, it actilly bursts my waistcoat-buttons off; it fairly gives me a stitch in the side; and I must say I do like, when I get a chance, to 'Snub a Snob.'"

The demand of exports from the mother country by the North American provinces is also illustrated in Sam's best style:—

"Jist look (he says) at Blue-nose, and see what a woppin', great, big, two-fisted crittur he is: you won't find such a made mar. nowhere a'most. He is more nor six foot high in his stocking feet (and he has got 'em to put on, too, which is more nor half the British have), as strong as a horse, and as supple as an eel. Well, when he is born, he isn't much bigger than a kitten; a squalin', squeelin', kickin', oongainly, little whelp as you ever see a'most. Now, what is the first thing they do with him? Why they wash the young acreech-owl in an English bowl; wrap him up in English flannel, and fasten it with English pins; and then dress him in an English frock, with an English cap trimmed with English lace. If the crittur is sick, they give him English physic with an English spoon; and the very first word he larns to speak is 'English.' As soon as he begins to use his trotters, and run about, he has an English hat, shirt of English linen, coat of English cloth, and shoes of English leather. Arter that they send him to school; an' he writes with an English pen, made from an English quill by an English knife, uses English ink out of an English inkstand, and paper made in your country, and ruled with an English pencil. He spells out of an English dictionary, and reads out of an English book. He has hardly learned what Ampersand means, afore they give him a horse, such as it is, and he puts an English bridle into his mouth, and an English saddle on his back, and whips the nasty, spavin'd, broken-winded brute, with an English whip; and when he stumbles and throws him off, he swears a mahel of horrid English oaths at him. He trims the great, shaggy, hairy beast with English scizzors; combs his nasty thick mane with an English comb, and carries his dirty hide with an English currycomb; and then ties him up in his stall with an English halter. Then comes sportin'; and, to give the crittur his due, he ain't a bad shot nother, seein' that he is fond of fowlin', or troutin', or any thing but work. Gunnin' is his delight; and a wild duck, a moose, or a cariboo, when they see him a-comin' to persecute them, know it's gone goose with them. But where does his gun come from? and his powder? and his shot? and his flask and his belt? why, clean away from England. Even his flint comes from there, for there ain't a flintstone in all Nova Scotia; and if there was, the crittur couldn't cut it into shape so as to be any use. He hante the tools; and if he had, he don't know how. That's the reason, I suppose, any one a'most can 'fix his flint for him.' It's more nateral this should be the case in gunnin' than in fishin'; but even here the chap can't help himself. Tho' the country is

covered with wood, he imports his rod, his net, his line, his leads, and even his flies. He does, upon my soul! altho' the forest is filled with flies big enough and strong enough to bite thro' a boot. As soon as his beard comes (and sometimes afore, for I have known boys actilly shave for a beard), why he goes and gets a British glass to admire his young mug in; he lathers his chin with an English brush and English soap, a-lookin' as big as all out doors, and mows away at it with an English razor, sharpened on a British hone, and stropped on a British strop; then he puts on an English collar, and ties it up with an English stock, and I hope I may be skinned if he don't call himself an Englishman. A chip of the old block he is too: and young Blue-nose is as like old John as two peas, the same proud, consaited, self-sufficient, know-nothin' crittur; a regular gag, that's a fact."

Mr. Slick affecting the *pocourants* is an admirable bit of satire, but we must reserve it for another *Gazette*.

## MISCELLANEOUS.

*Heath's Picturesque Annual for 1841. Belgium.* By Thomas Roscoe, Esq. 12mo. pp. 288. London, 1840. Longman and Co. Of a batch of the favourite Annuals, which has reached us too late for review in this *Gazette*, we can only notice the above and following. The *Picturesque Annual* is indebted to Mr. Allom for its illustrations, and to Mr. Roscoe for its descriptive text. The former will come under our head of "Fine Arts;" and of the latter we can justly state that it glances over the most prominent objects of Belgian interest with tact and judgment. The writer has judiciously selected and distributed his matter, and treated the whole subject with the skill and ability of a practised observer. A more agreeable tour in Belgium could not be referred to.

*Portraits of the Children of the Nobility.* Third Series. Edited by Mrs. Fairlie. Folio. London, 1841. Longman and Co. HIGHLY-FINISHED engravings of highly-born (as yet little) personages, of the families of North, Anson, Stanhope (Harrington and Chesterfield), Lascelles, Cavendish, Curzon, and Charleville, are the ornaments of this aristocratic tome; and each plate is heralded by a copy of elegant verses by Mrs. Fairlie, Miss Power, Lady Blessington, Professor Wansan, the Hon. E. Phipps, and Henry Reeve, Esq. Of these personal tributes, it may suffice generally to remark, that they are sweetly and poetically turned; and, with allusions of an individual nature, breathe fervent and pious prayers for the happiness of the youthful parties thus made known to the world by the pencil and pen. Nothing can be more appropriate; and though the strains are similar in spirit, there is much variety and talent displayed in the mode of expression.

## ORIGINAL CORRESPONDENCE.

## ABYSSINIA.

(Extract of a Letter from M. d'Abbadie.)

Aden, 1st September.

UBIE, whom we had visited in his province of Semen, had forbidden us — and, indeed, all whites — from travelling through his territory to Gondar, which obliged my brother and myself to return to the sea-coast of Tigre. We were detained at Dögwa, and I set out to visit the road, which, passing through Kajakor and Guzu, joins, by a gentle slope, the table-land of Tigre with the Qualla, near Massuah. It is the military road, lately described, but imper-

fectly, by M. von Katte: on my left hand was the convent of Bisen, visible at a great distance, on a nearly isolated group of high mountains. After I had measured a base near Adowa, and constructed a couple of triangles from Mount Buahet, in Semen, to Mount Börkeko, near Dögwa, I resolved to place my theodolite on the belfry of the convent, and thus to connect my little survey with Massuah, Arkiko, and Mount Godom, on the sea-coast. I was, however, compelled to leave my work unfinished; a frightful accident deprived me of one of my eyes; and I hastened to this place to obtain medical advice and assistance, which were immediately given me, though without success. I am now compelled to return to Europe; my vision is so weak that I am unable to read my own closely written MS. to give an account of my last journey in Tigre. When I left Massuah in June, my brother was on the point of fixing his abode for the winter at Halai, or at Dögwa, to complete a history of the wars under Ras Ulad Salessé; since then I had no news from Northern Abyssinia. This misfortune, which has destroyed all my prospects as a traveller, is not the greatest which the friends of geography have to deplore. Two enterprising Europeans have lately died on the frontiers of Schowa, whither they had travelled by way of Tadeschura. I never had the good fortune to become personally acquainted with Mr. Ayrstone; but my friends in Egypt and Arabia have represented him to me as a man who, like Mr. Lane and some others of the chosen few, was profoundly and extensively acquainted with the spirit of the East: his principal object was the study of the language and literature of Southern Abyssinia. He was detained for a long time on the coast, probably because the caravans are so scarce; and when he was not far from the kingdom of Sale Salessé, he was seized with the kwala fever, which is so fatal to all white men, in the lowlands of Africa. M. Rocher, a French chemist, who was then returning from Ankobar to Egypt, bled Mr. Ayrstone, which afforded him temporary relief: this was contrary to the practice of the Ethiopians, who affirm that bleeding in the kwala is dangerous. Mr. Ayrstone, not deterred by the death of his Egyptian servants, prosecuted his journey to the highlands, where he communicated with M. Krapff, a German missionary of the English Church, who obtained permission to present him to the King of Schowa. Mr. Ayrstone died on the following morning, alone, and without having reaped the fruit of a tedious, but new and interesting journey. The death of this unfortunate young man was soon followed by that of M. Kiemeier, of Stuttgart, a Würtemberg officer. He had passed several months at Adowa, spoke Arabic and Amharic, and was quite inured to the fatiguing African mode of travelling. By a mistake which I cannot comprehend, he drank water from a poisonous well, and immediately felt that his last hour was approaching. His faithful Abyssinian servant brought a piece of copper to Schowa, which, after having been plunged for a short time in that well, was completely corroded. I was personally acquainted with M. Kiemeier, and never, in the course of my long wanderings, met with a more noble-minded and high-spirited man.

According to a letter from the French traveller, Edmund Combes, dated Mocha, 22d June, he had left Abyssinia, after a short stay in that country: Ubie, the sovereign of Tigre, had, indeed, graciously received him, and the presents which he brought from the King of

the French; among which was the king's portrait. He was, on the contrary, very ungracious to the two brothers d'Abbadie, who arrived at Mai Tsalo soon after Combes. He accused them of having taken part in the late intrigues in his country, and commanded them to quit it without delay, on pain of having their feet cut off, if ever they again entered it. Abbadie's justification was not listened to; Ubie threatened to have him scourged if he were not silent. On the following day the two brothers departed; and Combes, though still well treated, hastened after them.

According to another account, Ubie was poisoned by one of his generals, who had an understanding with one of his wives. When the king perceived that he was poisoned, he ordered a pipe to be given him, and smoked an antidote; by means of which he recovered. The authors of the crime were soon discovered; there were eight of them; their right arms were chopped off, and they were then banished to a desert among the mountains. Nothing was done to the woman. One of the brothers of the king has revolted against him, and formed an alliance with King Ras Ali of Gondar.

To the Editor of the Literary Gazette.

83½ Pall Mall, Nov. 6, 1840.

Sir,—In September 1827, I sent to the *Literary Gazette* a description of an aquatic life-boat contrived by myself, the receipt of which was acknowledged in the notice to correspondents, page 639, thus: "We will attend to Mr. Howlett's communication." The letter, however, was never inserted.

Lately a gentleman of fortune has taken out a patent for the very same idea originally proposed by me in the letter named.

If you could find the letter to which I refer, and would print it, I should be very much obliged—I have the honour to be, Sir, your obedient Servant, SAMUEL B. HOWLETT.

We fear it will not be in our power to fulfil the reasonable desire of our correspondent; but, while endeavouring to do so amid a mass of papers which it is fearful to look at, we do him the imperfect and intermediate justice of publishing this reclamation.—Ed. L. G.

## ARTS AND SCIENCES.

## PEAT AND COAL.

AMONG the most important subjects investigated at the late meeting of the British Association, one that came the nearest to our domestic hearths and national interests was that which referred to the formation and uses of peat and coal. We accordingly took care to have our report upon this inquiry and its results full and correct, as may be seen by looking back upon our recent numbers. Since the meeting broke up, however, we learn that, like M. Agassiz, Dr. Buckland, Mr. Milne, Mr. Lyell, and many other members, Professor Johnston (of Durham) has seized the opportunity of an autumnal recess to extend his information by visiting and inspecting localities where further proof of the soundness or error (if any) of his opinions might be obtained. With this view, after visiting the Bog of Burrochan, near Paisley, from which the peculiar variety of peat was brought to the Glasgow Section; he examined several of the bogs in Ayrshire, chiefly with reference to the mode and rapidity of their growth as connected with the origin of coal, which he concludes to be derived from accumulations of vegetable matter of a similar kind.\*

\* From the difference of botanical species in these vegetable accumulations may we be enabled to account for the varieties of coals?—Ed. L. G.

He has found, we believe, the coal measures of Ayrshire, particularly interesting from the numerous modifications which the combustible matter has undergone from the more immediate or more remote action of igneous rocks. None of the English coalfields are presumed to be nearly so instructive in this respect.

Related to the subject we may here take occasion to mention one of those cases of imperfect observation which are continually presenting themselves to the cultivators of the sciences, and from which so many errors have crept into our books, our reasonings, and our convictions. Near Kilmarnock, the learned and astute Professor was asked to account for a bed of Peat occurring in a thick coal-seam, with the coal both above and below, and in immediate contact with it. The fact was doubted; but assurance doubly sure was given of its truth by apparently intelligent and competent eyewitnesses, and the conclusion that coal was formed from peat was inevitable. But, lo! on investigation, the bed of peat turned out to be a bed of transition coal!

#### SOCIETY OF ARTS.

THE popular illustrations of this Society for the present session were commenced this week by Mr. De Ville, who gave a discourse referring to the bronzes of antiquity. Many of the finest specimens of Egyptian, Chinese, Grecian, and Roman bronzes, were exhibited; one of the former class from Thebes, undoubtedly was at least four thousand years old. The bronzes which commanded the most attention were those of Benvenuto Cellini and Michael Angelo; the former for its exquisite chasing, which, indeed, formed its chief value. A beautiful group, "Æneas and Anchises," by M. Angelo, was much admired. It exemplified the prodigious power that this great master had of seizing a particular position; for example, that of Æneas bearing Anchises was perfectly natural; but it could only be a momentary one, the muscles not being able to maintain their tension for a longer period. Other bronzes, — as "Pluto and Proserpine," "Orpheus and Eurydice," "Hercules and Omphale," &c. — were also exhibited. According to Flaxman's analysis, bronze is composed of nine parts copper, and one of zinc; its colour is chiefly produced by colouring matter; but the fine and delicate colour so much admired by connoisseurs is imparted by time. The finest bronzes were unquestionably those of antiquity, — even the Egyptian, upon which Mr. D. thinks Roman workmen were employed. With the exception of these, and two or three other remarks, the remainder of the lecture was occupied with brief narratives of the lives of the chief artists of antiquity whose works were exhibited. The meeting was exceedingly well attended; and it appeared well pleased with the earnest and unaffected manner of Mr. De Ville.

#### GEOLOGICAL SOCIETY.

THE first meeting for the Session was held on the 4th instant. The Rev. Professor Buckland, D.D. President, in the chair. — A paper was read 'On Glaciers, and the Evidence of their having once existed in Scotland, Ireland, and England,' by Professor Agassiz. The memoir commences with an acknowledgment that the study of glaciers has long claimed attention, Scheuchzer, Gruner, and De Saussure, and in more recent times Hugi and Scoresby, having given much valuable information respecting their structure, and the attendant phenomena, though no important geological results emanated from their labours. He then

proceeds to show that Venetz and De Charpentier have been the first to attribute to glaciers the transport of the erratic boulders of Switzerland, on the supposition that the Alps formerly attained a greater altitude, and that their glaciers extended to the plains of Switzerland, and even to the Jura. M. Agassiz, however, dissents from the opinion that the Alps were once higher, as it is not enforced by any geological phenomena; and because to account for the universal distribution of boulders over the northern and temperate regions of Europe, Asia, and America, a more general cause must have operated than the comparatively local one of a greater elevation of the Alps. He also dissents from Charpentier's opinion, that the boulders were pushed forward by the glaciers, the arrangement of the transported materials proving that such could not have been the case. These difficulties induced M. Agassiz to resume the study of glaciers, and by devoting to their examination the most favourable portions of five successive summers, he has become convinced that the formation of those ancient glaciers did not depend upon the actual configuration of the earth only, but was also connected with the great geological operations which produced the last changes in the surface of our globe, that they were not local phenomena, and that their extension was connected with the disappearance of the great mammals now found in the polar ice. He is further of opinion, that the glaciers did not advance from the Alps into plains, but that they retreated from the plains they once covered to the mountains. These new views he supports by many considerations which escaped previous observers, depending chiefly upon the difference in the form as well as relative position of the erratic blocks, and the so-called diluvial gravel: and he adds, that the study of glaciers thus assumes an entirely new importance, as it introduces a long period of very intense cold between the present epoch and the one during which the animals lived, whose remains are buried in the usually termed diluvial formations. Having made himself thoroughly acquainted with the glaciers of Switzerland, and the neighbouring portions of France and Germany, M. Agassiz became anxious to examine a country in which they no longer exist, but where traces of them might be supposed to be left. This opportunity he has enjoyed since the meeting of the British Association at Glasgow, by having examined, in company with Dr. Buckland, a part of Scotland, and afterwards the north of England, and a considerable portion of Ireland; and he is persuaded, from a careful investigation of the gravel and erratic blocks, as well as of the polished and striated appearances of the surface of the rocks, that great crusts (nappes) of ice, and subsequently glaciers, once existed in Scotland, the north of England, and in the north, centre, west, and south-east of Ireland. He admits that the study of glaciers in different latitudes, and at different heights above the sea, in combination with the effects of the sea, where in contact with the glaciers, will introduce modifications in the consideration of analogous phenomena in countries in which glaciers have disappeared; and he doubts not, that the introduction of a new element, so powerful as glaciers into the explanation of geological phenomena, will excite a contest as keen, perhaps, as that which was carried on between the Neptunists and Platonists; but he is prepared to discuss the theory within the limits of observed facts, conscientiously having searched for truth solely to advance the in-

terests of science. To avoid useless controversy, he states, that though he attributes to glaciers a considerable portion of the effects hitherto assigned exclusively to the action of water, yet that he does not maintain that every result formerly believed to have been effected by water has been produced by glaciers. Long continued practice has, however, taught him to distinguish easily, in most cases, the effects of ice from those of water. Proceeding to the discussion of facts, he states, that the distribution of erratic blocks and diluvial gravel, in connexion with polished and striated rocks, could not have resulted from the agency of a great current flowing in a uniform direction, as the distribution diverges from the great central chains of the country following the courses of the valleys: the parent rock of the boulders and pebbles may, moreover, be generally found at the head of each valley; and this connexion M. Agassiz conceives is alone sufficient to prove that the transported materials have not been washed in dry currents. Of these ridges of dispersion, he mentions that which extends from Ben Nevis to Ben Lomond, the Grampians, the hills of the east of Argyshire, the mountains of Northumberland, Westmoreland, and Cumberland; those of Wales, Antrim, the centre of Ireland, and of Wicklow, — each being characterised by its peculiar blocks and gravel. This opinion he further states, is not contradicted by the occurrence of Swedish blocks on the east coast of England, as he adopts the view of their having been transported by floating masses of ice. M. Agassiz then examines in detail the superficial accumulations formed more or less immediately by glaciers, and the effects of moving masses of ice on solid rocks *in situ*, where in contact with them; but he first insists on the necessity of distinguishing between such deposits and the stratified gravel and mud which contain organic remains, and could not have been produced by true glaciers, although the materials may have been often originally derived from them. These stratified fossiliferous accumulations he conceives were formed posterior to the glacier epoch. The till of Scotland, or the great irregular unstratified masses of mud and gravel containing blocks, and rarely bones of mammalia and insignificant fragments of shells, he is of opinion, have also not resulted from true glaciers, though intimately connected with the phenomena of ice. The polish and striae on the enclosed blocks leave no doubt in his mind of the analogy of the blocks with those observed under the glaciers of Switzerland; and he conceives that the materials which compose the accumulations have been rearranged by the water produced by the melting of the glaciers. Similar detritus, he says, fills all the bottoms of the Alpine valleys, and was left where it is now found by the glaciers, when they extended so far. He dwells on the proofs that the superficial deposits of these valleys could not have been brought into their present position by rivers; and he instances more particularly the valley of the Aar as confirmatory of his views. The course of this river between the glacier from which it issues and Berne is interrupted first, by the barrier of Kirchet, afterwards, by the lake of Brienz, and lastly, by the Lake of Thun; and between these two bodies of water its force is so feeble that it transports only fine gravel and mud. Nevertheless, the whole extent of the valley is strewn with the same rolled Alpine pebbles. Admitting that the volume of river was once greater than it is now, he says it is impossible to un-

derstand why the Lakes of Brienz and Thun have not been filled in the same manner as the plain of Meyringen and the bottom of the valley which separates the two lakes. All these difficulties, however, he is of opinion, disappear as soon as the accumulations of pebbles are considered to be the detritus left by glaciers, when they retreated from lower to higher levels; and the Lakes of Thun and Brienz to have been hollows occupied by ice. This existence of a glacier, he states, is not imagined to explain the phenomena of the valley; as its occurrence is proved by a continuity of polish, presented by the rocks which enclose the valley from the glacier of the Aar to Meyringen, a distance of twenty English miles; and traceable even on the shores of the Lake of Thun. Similar phenomena, he says, are observable in Scotland in the valley of Loch Awe and Loch Leven, near Ballachulish; and in England, in the neighbourhood of Kendal. He then describes the moraines, or terraces, which occur on the flanks of valleys, following all the sinuosities of the country, and arranged at equal altitudes on the opposite declivities, and which frequently form transverse barriers. Their origin he proves to have been the accumulation of blocks and pebbles formed along the flanks and terminations of glaciers, and successively deposited by the melting of the ice. These moraines differ from the masses of remodelled glacier-detritus spread in the bottom of hollows, by being disposed in ridges with a double talus, one presented to the glacier, and the other to the wall of rock flanking the valley. Independently of occurring on the sides of all existing glaciers, moraines may be also traced at a distance from them in the valleys of the Rhone, the Arve, the Aar, &c. They are very distinct, M. Agassiz says, in many valleys in Scotland, as near Inverary, at Muc Airn, at the outlet of Loch Traig, at Strankaer, on the borders of the Bay of Beauley, &c.; in Ireland, to the south-east of Dublin, and near Enniskillen; and in England, in the valley of Kendal, and in the neighbourhood of Penrith and Shap. However great may be the distinction between moraines and the accumulations of pebbles and blocks previously noticed, the author states, that no doubt can exist of their common origin; the former being simple ridges produced on the surface of glaciers, and the latter, materials rounded and polished under glaciers or great bodies of ice; and which, after exposure, by the melting of the ice, have been rearranged by water. M. Agassiz then explains the marked differences in the form and internal arrangement of the materials comprising these various deposits. In stratified gravel, he says, the ingredients are comparatively much smaller than in the detritus of glaciers, and the finer portions are usually at the top, while in accumulations from ice, large and small blocks are confusedly intermixed, the largest being often in the upper part; and where great angular blocks occur, they rest upon the surface. In moraines, however, blocks of all dimensions and every variety of form are irregularly associated; and this difference, he says, is easily explained by moraines being composed of the angular fragments which fall on the surface of the glacier and of pebbles rounded on the edges, and deposited in ridges, which necessarily present no order of arrangement. The author next, in corroboration of his views of the connexion between glaciers and rolled masses, describes the polished and striated surfaces so often observed on rocks *in situ*. Without denying the power of water to pro-

duce such effects, he says, he has sought for them in vain on the borders of rivers, and lakes, and on sea-coasts; and that the action of water appears to him to be confined to the sinuous erosion of the softer portions of the rock; while, on the contrary, that of the glacier is totally independent of the composition of the surface, affecting equally the hardest and softest materials. The polish produced by the ice is uniform, but wherever movable substances are interposed between the glacier and the rock, and of a harder nature than the rock, the surface is also traversed by striae, which agree in their general direction with that of the movement of the ice. Another effect of glaciers is, to round projecting masses, and form those curved bosses which are of common occurrence in the Alps, and were called by De Saussure *roches moutonnées*. Similar phenomena, M. Agassiz says, are very common on the borders of Loch Awe and Loch Leven, and in the neighbourhood of Kendal. At the outlets of valleys the striae diverge, and on the flanks are never horizontal, as they would be if they were due to currents or floating ice; but are generally oblique, in consequence, the author states, of the expansion of the ice upwards, and the descending motion of the glacier. The most remarkable striated rocks in the Alps are near Handeck, and near the cascade of Pissevache; the finest examples noticed by M. Agassiz in Scotland are those of Ballachulish; and in Ireland, of Virginia. If his analogy of the facts which he has observed in Scotland, Ireland, and the north of England, with those of Switzerland, be correct, then, observes the author, it must be admitted, not only that glaciers formerly existed in those countries, but that great sheets (*nappes*) of ice covered all the surface, and progressively withdrew, at a later period, to the mountains, and at last totally disappeared. The author then enters upon the inquiry, whether glaciers have extended downwards from the mountains, or are the residue of the great masses of ice which formerly occupied the plains. It is evident, he says, if the former opinion be correct, that the largest moraines ought to be the most distant, and to be formed of the most rounded masses; whereas actual appearances are the reverse, the distant materials being widely spread, and true moraines being found only in valleys connected with great chains of lofty mountains. Therefore, he adds, it must be inferred that great sheets of ice resembling those now known to exist in Greenland once covered all the countries in which occur unstratified masses of gravel, or of gravel due to the triturating action of the bottom of the sheets of ice; that moraines are phenomena dependent on the retreat of glaciers; that the large angular blocks spread over rounded materials were left by the melting of the ice; and that as the advance and disappearance of great bodies of ice are known to produce debacles and considerable currents, so it may be inferred that by such operations in times past, masses of ice were set adrift, and conveyed, in diverging directions, the blocks with which they were charged. The connexion of stratified very recent fluvial deposits with glacier-detritus, M. Agassiz says is difficult to explain, but he conceives, that the same cause which could bar up valleys, and form lakes like those of Brienz, Thun, and Zurich, might have formed analogous bars at the point of contact with the sea, sufficiently extensive to have produced large salt marshes to be inhabited by the animals, whose remains are found in the clays super-

imposed on the till; and, he adds, that the known arctic character of these fossils ought to have great weight with those who study this vast subject. In conclusion, M. Agassiz observes, that the question of glaciers forms part of many of the great problems of geology; that it accounts for the disappearance of the great mammals enclosed in the polar ice, as well as for the disappearance of the organic beings of the so-called diluvian epoch: that in Switzerland it is associated with the elevation of the Alps and the dispersion of the erratic blocks; and that it is so intimately mixed up with the subject of a general diminution of the terrestrial heat, that a more profound acquaintance with the facts noticed in this paper will, probably, modify the opinions entertained respecting it.—A paper by Dr. Buckland, also on glaciers, and their former existence in England, was afterwards commenced.

## ROYAL GEOGRAPHICAL SOCIETY.

NOVEMBER 9. G. B. Greenough, Esq. in the chair.—Read, extracts from following letters.—1. From J. Brooke, Esq., dated Singapore, June 9, 1840, stating, that he had made a voyage in the Royalist yacht to the Bay of Boni, in the Island of Celebes, which he says is 180 miles long, by forty to fifty broad. That he had surveyed upwards of 400 miles coast line, and had made some observations on the physical geography of the interior. By a subsequent letter from Mr. Brooke, of July 18, he states his intention of making another survey along the coast of Borneo Proper.—2. Recent accounts had been received from Mr. Ainsworth, in which he states that he had just returned from the mountains of Kurdistan; that he had ascended the Peak of Rawandaz, visited Julamark, where he experienced a very friendly reception from the patriarch, and that he found every disposition on the part of the Chaldean Christians to enter into friendly relations with the Anglican Church.—A paper was next read by Captain John Shepherd, R.N., describing the volcano of Kirua, in Hawaii, one of the Sandwich Islands. Three concentric and precipitous walls of indurated lava of a circular form, or nearly so, enclose the space of volcanic action; the height of the outward wall is about 160 feet, that of the second nearly the same, but that of the third, which descends into the active crater, is 1000 feet. Connecting the foot of the outward and top of the second wall is a horizontal belt or ledge of the same material, about half a mile wide; its surface is broken and uneven. Between the second and third is a similar ledge, and of equal dimensions, the interior circumference of which incloses the space occupied by the crater, whose diameter is three miles. These precipices are by no means continuous, but in several places they have fallen in, having been undermined by the igneous action beneath, and hence slopes have been formed which admit of a descent to the crater. When the party arrived at the brink of the precipice overlooking the crater, a most imposing spectacle presented itself: numerous small cones, of from twenty to thirty feet high, were throwing out volumes of sulphurous vapour, and pouring forth liquid lava, accompanied by loud detonations; lakes of molten matter, in violent agitation, were throwing up to a considerable height their fiery contents, as the gaseous fluids from below passed through them; but towards the eastern circumference of the crater lay the principal point of interest, —a great lake of liquid lava, of an elliptical form, one mile long by half a mile broad.

In order to reach this the party descended into the crater on the western circumference, and, cautiously feeling their way over this dangerous ground, they visited several of the cones and small lakes as they passed, and at length arrived at the rocks which encircle the fiery gulf. On climbing to the summit of these, which are about 100 feet high, they looked down upon the expanse of liquid lava, which appeared to flow from south to north, the current being straitened in its course by a promontory which projects from the eastern shore about half way across. Violent ebullitions, caused by the passage of elastic fluids from beneath, threw up the spray in many parts thirty or forty feet; whilst in others, the liquid mass underwent constant changes both of colour and motion; being more or less bright, more or less agitated, according to the degree of energy exerted by the subterranean forces. In some places the current would seem to flow on as unruffled as if it had been becalmed by the high projecting cliffs, leaving ridges of scorie on the northern shore as the sea does weed on the beach. Having observed a gap in the surrounding rocks, in the south-eastern part, the party conceived that it would afford them an opportunity of contemplating the scene by night, if they should take up a position on the brink of the precipice bounding the great crater directly opposite to it. With this object in view they retraced their steps across the crater and gained the desired point at nightfall; they had passed about an hour enjoying the magnificent spectacle below, when a fresh outburst of lava from a part of the crater to the southward of the great lake arrested their attention. With violent detonations and a crashing noise, a flood of molten matter appeared, which, spreading in all directions, covered in a very short time a space of more than 300,000 square yards; and what had a few minutes before been a black scoriaceous surface, presented a vast sheet of fire, emitting intense light and heat, and glowing with indescribable brilliancy. At length, wearied with the fatigues of the day, the party left this exciting scene, and retired to rest in some Indian huts built on the brink of the precipice. A very remarkable feature of this volcano is the subsidence of the ground surrounding the crater. Let us imagine, in the first place, a plain of uneven surface from fifteen to sixteen miles in circumference, situated on the gentle slope of an enormous mountain—Mowna Roa, to be undermined in its whole extent, and to sink bodily and perpendicularly 100 feet, leaving a circular precipice formed by its subsidence, whose brink stands indicative of its former level. Secondly, the area of another circle of reduced diameter, a part of the surface of the already sunken circular plain, and concentric with it, to undergo a similar change of position, converting the remainder of the first sunken area into a ledge, or circular zone, of the breadth of half a mile. And, lastly, let us figure to ourselves that from the centre of this second sunken surface, the area of a third concentric circle three miles in diameter subsides 1000 feet, forming what is denominated the great crater, and leaving a second and similar zone to the first, also half a mile in width, and bordered by a precipice, from the brink of which you look down upon boiling lakes of liquid lava and numerous cones, vomiting fire with violent detonations; and some feeble idea may be formed of the extent and first appearance of this great volcanic phenomenon. Another singular circumstance attending the

change of level of the surface of the crater is its tendency to elevation, and the rapidity with which it is raised. In 1824, the level of this surface was between eight and nine hundred feet lower than at present; and there was at that time another circular ledge which is now obliterated. This is evidently caused by the flow of lava from the cones and other sources within it; and when we consider that seven square miles of surface have been raised 800 feet in sixteen years, equal to an accumulation of rather more than one cubic mile of lava, it conveys an idea of the vast extent of the subterranean agency. If the same rate of accumulation should continue eighteen or twenty years longer, it is evident that the present surface would be elevated to the level of the interior zone, or 1000 feet; but, in all probability, before this could happen, the lava would find a vent through rents and fissures in the ground, or the subterranean vault might give way, and another subsidence take place.

#### ROYAL BOTANIC SOCIETY.

GARDENS in the Regent's Park.—The first meeting of this Society for the session was held at their rooms in Pall Mall, on Tuesday last, when, the usual business having been transacted, the chairman, Dr. Sigmund, announced, *inter alia*, the Countess of Tankerville, the Marquess of Normanby, Viscount Palmerston, the Hon. Fox Maule, the Right Hon. Henry Labouchere, M.P., and several eminent physicians, &c. as newly elected fellows.—The Secretary then read an interesting paper, containing a summary of all the scientific communications made to the Society during the past session. After some remarks from Drs. A. T. Thompson and Sigmund, and other members, on the modes of growing plants in closed vessels, one of the subjects animadverted upon in this paper, this meeting adjourned.—It was with much satisfaction the fellows present remarked that the list of subscribers to the debenture fund, for immediately laying out the gardens, was being rapidly filled.

#### PARIS LETTER.

Academy of Sciences, Nov. 10, 1840.

SITTING of Nov. 2.—M. Pirouneau described to the Academy a new kind of oven for baking bread on board ships-of-war. It was heated with coals instead of wood, occasioning thereby a great saving of stowage-room formerly occupied by wood; and it was not so liable to get out of repair as one on the old principle.—A paper was read giving an account of a new and improved method of building piers for bridges, and other subaqueous works, by means of *caissons*, out of which all the water was not extracted. Rubble and lime were thrown in, and by improved methods were battened down into a mass that soon hardened, and formed a solid erection of masonry at a small expense. His plan had been tried with success in the bed of the river Agly, in Roussillon, when the stones and gravel forming the bed could only have been removed with great difficulty, and when the stream was only partially turned off.—M. Jaubert de Passa sent to the Academy drawings of hailstones, with numerous acute angles, and of various sizes, which had fallen at Monesti, in the Pyrénées Orientales, in May last. It was supposed that they had been formed by several hailstones adhering together in the air, and thus forming masses of unusual shape.—M. Duvernoy read a notice of a species of sponge, which formed a hole in the shell of a kind of oyster as its dwelling. This species of sponge he called the *spongia terebrans*; and he

observed it in the reticulated shell of the oyster commonly called at Dieppe the horse-shoe oyster, the whole outer surface of which was bored in every direction by a vast number of holes not more than a pin's head in diameter. The power of this spongy animal to make these perforations he attributed to the action of some peculiar liquid secreted by it.—M. Melloni read a memoir of the highest scientific interest on the constancy observable in the absorption of caloric by lamp-black and by metals; and on the existence of a diffusive power, which by its variations changes the value of the absorbent in other athermanic substances. He came to the following among other conclusions:—That the superficial strata of bodies cause to the radiating caloric a dispersion analogous to the diffusion of light; that there are sure methods of distinguishing caloric diffusion from the radiation resulting from the heat belonging to the bodies themselves; that lamp-black produces an extremely small diffusion, equal for every kind of radiation; that white bodies and others disperse incandescent rays strongly, and those which come from objects of low temperature only feebly; that the dispersive power of metals is more intense than that of white bodies, and by its invariability more nearly resembles that of lamp-black; that lamp-black is a true black substance, as well for light as for radiating caloric; that white bodies act towards radiating caloric like coloured substances towards light; and that metals act on luminous radiations.

*Academy of Inscriptions and Belles Lettres.* Sitting of November 6.—M. Berger de Xivrey occupied the greater part of this sitting with the reading of a memoir of much interest on the reign of the Emperor Manuel Palæologus.—The Academy then took into deliberation a proposition of M. Lajard, temporary secretary, concerning the acceleration of the publication of the Academy's memoirs. It is much to be desired that so precious a collection of papers should be given to the public with greater punctuality and less delay. The memoirs now printing date as far back as 1833.

*Academy of Moral and Political Sciences.* Sitting of October 31.—M. Bouchitté continued the reading of his memoir on the proofs of the existence of a Deity, as advanced by writers from the time of the compilation of the "Monologium" of Anselm of Canterbury. In this part he treated of Kant and the German schools of philosophers.—M. Mignet commenced reading a paper on a work by M. Pinheiro-Ferreira, upon the administration of criminal justice.

*Geographical Society.* Sitting of Nov. 6.—*Affinity between the Foulah and Malay Languages.* The sitting was attended more numerous than usual. M. Gustave d'Eichthal communicated an abstract of a work of considerable extent, which he has lately terminated upon a purely ethnological subject. It relates to the great African people of the Foulahs, or Fellatahs, the extent and power of whom have been much elucidated by the labours of British travellers. The special object of M. d'Eichthal has been the discovery of the origin of these populations, whom he believes to represent the descendants of Phut, mentioned in the book of Genesis. His investigations have led him to a singular and unexpected result, which cannot fail of producing great sensation among all those who study the general history of the human race, and its dispersion over the surface of the earth. Confining himself to a *fact*, and without going into the historical and ethnological considerations which may be made to depend upon it, M. d'Eichthal observed that it was a striking circumstance that there should

be an evident similitude between the language of a people of Interior Africa, and that of a people altogether insular. He shewed that out of a collection of 113 Foulah words, 67 were almost identical with words having the same significations in the Malay languages. These analogies were more numerous in the language of Java than in others. The memoir in question is to be printed at full length in the "Transactions" of the Ethnological Society—a flourishing society, which is preparing for publication a collection of dissertations and notices of more than ordinary interest.—At the same sitting, M. d'Avezac read a letter from M. Antoine d'Abbadie, written from Cairo on his return from Abyssinia. It contained the result of a great number of astronomical, geodesical, and other observations, made with the care for which that traveller's reputation is established.—M. d'Avezac remitted to the Society a note, in which he has, in a few words, given a most luminous and valuable account of all the documents now possessed in Europe for the studying of the Berber language and literature. He comprised among them the MSS. collected by the late Professor Ventura; by Mr. Hodgson, of Philadelphia; and by M. Pacifico de Laporte, son of the French consul at Mogador. This latter gentleman is at present possessor of several works in the Berber language, the compilation of which was made about two centuries ago. M. d'Avezac, in his interesting note, pointed out as fit objects for the assiduous research of European travellers and residents in the West of Africa three works of much more ancient date, and which may be expected to be found in the hands of some of the religious personages who make their retreats among the mountains of that country. One of these works is believed to date from the twelfth century of our era, and should be looked for in the south-eastern districts of Morocco; the second is of the tenth century, and may perhaps be found in the northern parts of the kingdom of Fez; while the third, the oldest of all, is of the eighth century, and may perhaps be found in the western parts of the same kingdom. This note of M. d'Avezac, as well as the letter of M. d'Abbadie, are to be printed in the journal of the Geographical Society.—The end of the sitting was devoted to the reading of a dissertation by M. de Saint Pilaye on the ancient Gaulish town of Caribio.

The tenth number of the "Revue Générale de l'Architecture et des Travaux Publics" contains a good engraving in bronze-green, relieved with white, of David's statue of Gutenberg, inaugurated this year at Strasburg, to commemorate the four hundredth anniversary of the invention of printing. Another engraving, in bronze-brown, represents the bas-reliefs of the pedestal; and which, if the engraver have represented them truly, are very *mediocre* affairs indeed! This number, besides a continuation of M. Lenoir's paper on Byzantine and mediæval architecture, and an able paper by M. Daly, the editor, on the application of improved systems of baths to domestic purposes, contains a valuable and spirited review, by the same gentleman, of a proposition by M. Martin, the architect, concerning the fortifications of Paris. Both these gentlemen coincide in their estimate of the enormous expenditure, and waste of time and capital, required to realise this mad scheme; and shew that the value of property and land applicable to building purposes, which will be absorbed by the lines of ramparts, far surpasses all previous computation. They propose, in case of this scheme for fortifying (or rather weakening) the

capital be persevered in, to make an immense canal applicable to the purposes of navigation all round Paris, which, from its size and form, would effectually prevent the advance of an army, and yet would be of the greatest value in time of peace to the trade of the capital. This is the only *sensible* proposition that has been made on the subject in the French capital!

The twenty-seventh volume of the "Encyclopédie des Gens du Monde" is published. It contains, among others, the following articles: Hieroglyphics, by M. Brunet; History, by M. Guignaut; Homer, by ditto; Hottentots, by M. d'Avezac; D. Hume, by M. Artaud; and W. Huskisson, by M. Larévellière.—M. Edouard Biot has published his work, which received the gold medal of the Institute, "On the Abolition of Ancient Slavery in the West." He attributes this immense improvement principally to the slow but gradually increasing power of Christianity; and, in so doing, gives a most luminous account of many of the most interesting social points of mediæval and modern history. His narration of the great rebellion of the slaves in Hungary in the sixteenth century, in the time of Ladislaus II. and Pope Leo X., under the famous George Zechely, which he has taken in great part from the German historian, Nicholas Isthvanus, is full of interest.

The Swedish Orientalist, M. Agrell, died recently at Skaleof, in the province of Smaeland, aged seventy-five.

A smart shock of earthquake was felt in the island of Bourbon on the 7th of July last. It came from south to north; but lasted only a few seconds. The volcano of the island was in full eruption at the time.—A shock of earthquake was felt in the canton of Thurgau, in Switzerland, on November 1.—We hear from Naples that an eruption of Vesuvius is expected immediately.

#### LITERARY AND LEARNED.

##### UNIVERSITY INTELLIGENCE.

CAMBRIDGE, November 2.—*The Scantonian Prize*.—The prize for the best English Poem, by a Master of Arts, of this university, was adjudged to the Rev. T. E. Hankinson, M.A. of Corpus Christi College: Subject—"The Ministry of Angels." Mr. Hankinson obtained the same prize in the years 1831, 1832, 1833, 1834, 1835, and 1838. The following degrees were conferred:—*Master of Arts*.—G. G. La Motte, Emanuel College. *Bachelors of Arts*.—W. H. Barrington, Trinity College; J. P. Tomlinson, A. Douglas, J. I. P. Wyatt, Magdalene College; A. R. V. Hamilton, Catherine Hall.

##### THE ROYAL SOCIETY OF LITERATURE

HELD its first seasonal sitting on Thursday, Mr. L. H. Pettitt in the chair, when two papers by Mr. Bonomi and Mr. Halliwell were read; the former, 'On an Egyptian Obelisk,' of so much interest, that we shall endeavour to give a perfect account of it.

##### ROYAL ASIATIC SOCIETY.

THE meetings of this Society recommenced on the 7th inst., Sir George Thomas Staunton, Bart., M.P. in the chair.—A large number of presents of books, principally on subjects relating to the East, were laid before the meeting.—A letter from the right hon. the President of the Society was read, announcing that he had had the honour of presenting to the Queen the congratulatory address of the Society upon her majesty's escape from assassination, and that her majesty had most graciously received the address. Mr. Wynn's letter also inclosed the gracious acknowledgment, communicated through Lord Robert Grosvenor, of his royal highness Prince Albert to a similar address from the Society.—A letter from Dr. Burn, of the Bombay Medical Service, was read, present-

ing to the Society three ancient copperplates, found near the city of Barosch, bearing grants of land, in a peculiar form, of the Deva Nagari character.—A letter was also read from one of the Society's corresponding members at Calcutta, Mahrâja Kali Krishna, giving an account of an armorial bearing on a seal, in imitation of European heraldic emblems, which had been granted to him by the government of India.—A paper was then read, containing an account of the town and neighbourhood of Kearnach, situated near the most western mouth of the Indus, in that part of Sindh which borders on Belochistan. This account was principally devoted to the mode of building now employed there by the natives, and to the architectural resources which the country would afford under better management.

#### LITERARY AND SCIENTIFIC MEETINGS FOR THE ENSUING WEEK.

Monday.—Statistical, 8 P.M.; Medical, 8 P.M.  
Tuesday.—Linnean, 8 P.M.; Electrical, 8 P.M.; Architectural, 8 P.M.  
Wednesday.—Society of Arts, 7½ P.M.; Geological, 8½ P.M.  
Thursday.—Royal Society, 8½ P.M.; Antiquaries, 8 P.M.  
Saturday.—Westminster Medical, 8 P.M.; Mathematical, 8 P.M.

#### ORIGINAL POETRY.

##### A Jolly New Ballad on the Chinese War.

JOHN Chinaman was a fat little chap,  
With a long-tailed head and a conical cap,  
But now Master John's fell out with we,  
And the devil a bit will he give us tea!  
Sing, fee, fo, fum,  
Commissioner Lin!  
When the man-of-war's come,\*  
The fun will begin!

John Chinaman, it now appears,  
Had read the "Times" for the last ten years,  
And learnt how Temperance made its way,  
And how the Paddies had took to tay.

Sing, &c.  
John Chinaman, it now comes out,  
Had sent Tee-totallers preaching about,  
How we made our lives full ten years shorter,  
By drinking wise 'stead of leaves and water.  
Sing, &c.

For John had a plan, as now we see,  
To induce all Britons to take to tea,  
For says he, The bravery they inherit  
Will evaporate when they're out of spirits!  
Sing, &c.

But some great patriots of our nation,  
Perceiving Britain's sad situation,  
Would have sent poor John to kingdom come,  
By poisoning him with opium!  
Sing, &c.

But cunning John of the plan got a peep,  
And swore, by Gum! he'd not go to sleep;  
And axed for the laudanum that we'd got,  
Or he'd spifficate Captain El-Iot!  
Sing, &c.

Says we, For your threats we don't care a d---  
We'll grow our own tea in Assam!  
Says he, Don't come your gammon on me,  
You hav'nt got enough of Assam Tea!  
Sing, &c.

Says we, In your chest we'll plant a shot,  
That will send both you and your tea to pot!  
Says he, By Fo and General Jang!  
Your kettles another tune shall sing!  
Sing, &c.

And now there's a row rich as never was seen  
'Twixt our Gunpowder and Howqua's green,  
As for Master John, to the devil we'll see him,  
And when he's licked we'll chant *Te Deum*!  
Sing, fee, fo, fum,  
Commissioner Lin!  
When the man-of-war's come,  
The fun will begin!

#### BIOGRAPHY.

##### MISS EMMA ROBERTS.

It is with sincere sorrow that we see the death of this estimable lady, and successful writer,

\* The best reward ever offered for service is, undoubtedly, that of Commissioner Lin, beginning with 20,000 Spanish dollars, for any John Chinaman who brings in the first eighty-gun British (barbarian) man-of-war.—"Wish he may get it!"

announced in the late accounts from India, where it is stated to have taken place at Poonah, unexpectedly, on the 17th of September. Miss Roberts had previously accompanied her sister, Mrs. Mac Naghten, to India, and resided in that country some time; but on her death returned to England, and employed her pen assiduously and advantageously in illustrating the condition of our Eastern dominions. Though considerably the elder, she was one of the early friends of the youthful L.E.L., and dwelt for several years with her in the same boarding-house, that of the Misses Lance (much valued by them both), in Hans Place. These were happy days, and little boded the premature and melancholy fate which awaited them in foreign climes. We believe that it was the example of the literary pursuits of Miss Landon which stimulated Miss Roberts to try her powers as an author; and we remember having the gratification to assist her in launching her first essay, an historical production, which reflected high credit on her talents, and at once established her in a fair position in the ranks of literature. Since then, she has been one of the most prolific of our female writers, and given to the public a number of works of interest and value. The expedition to India, on which she has unfortunately perished, was undertaken with comprehensive views towards the further illustration of the East; and portions of her descriptions have appeared, as she journeyed to her destination, in periodicals devoted to Asiatic subjects. Unhappily, the anticipated fruits of her completed labours are lost to us for ever, and she is mingled with the dust in a far distant region of the earth.

*The Rev. John Thomson* (of Duddingston).—This distinguished landscape-painter died at Duddingston, near Edinburgh, about three weeks ago. His works were less known in England than they deserved to be (though some of them adorn southern collections), for they are, in general, noble and poetical compositions, with much of the spirit and grandeur of *Salvator Rosa* in their execution. In his country, where better known, his productions stood very high in public estimation; and the possessors of his finest pictures have reason to congratulate themselves on the ownership of such as few amateurs ever painted, and which in a rare degree combine the often opposing qualities of the natural and the sublime.

#### THE DRAMA.

*Covent Garden*.—Sheridan's admirable dramatic sketch of *The Critic* has been revived at this theatre with great éclat. The points of the *ad libitum* passages elicits loud laughter; and the excellent cast and appointments must continue its popularity for a considerable time.

*Adelphi*.—A dramatic narrative, rather than a play, founded on Box's popular "Clock," was produced here on Monday; and, as a vehicle for exhibiting tableaux, taken from the magnificent woodcuts of Messrs Brown and Catermole, was perfectly successful. Almost all the personages who figure in the pages of the "Old Curiosity Shop" are introduced on the stage, and "One Hour from Humphrey's Clock" may be very agreeably passed with them. Of the actors, little can be said beyond running over their names and characters. Mrs. Keeley was *Nell*, and hung about her grandfather (Mr. Lyon) as if she had in truth been a child of fourteen; her acting was natural and beautiful, though she had hardly enough to do. *Dick Swineller* found a capital representative in Mr. Wright, who looked "a figure conspicuous for its dirty smartness" to admiration. *Codlin* and

*Short* were enacted by Messrs. Bedford and Wieland; *Kit*, by Mr. Wilkinson; and *Quilp*, by Mr. Yates, whose dress and appearance as the dwarf were really extraordinary. The scenery and dresses were good, and some of the tableaux drew down considerable applause; the best were "Quilp in Possession," and the "Tent at the Races." In the latter scene Mr. Nightingale introduced his imitations, which improve upon acquaintance.

*Olympio*.—*The Honeymoon*, curtailed of two-fifths of its fair proportions, has been produced here under the title of *How to Rule a Wife*. The principal parts are sustained by Mr. Butler and Miss J. Mordaunt.

*Prince's Theatre*.—The bills for the opening of this theatre on the 23d are out, and announce new English operas and musical afterpieces, under the management of Messrs. J. and M. Barnett; and with the talents of Miss Romer, A. Cooper, Phillips, Frazer, and other popular singers.

#### VARIETIES.

*H. B.* is again merrily at work. Nos. 658, 59, 60, and 61, are before us, and full of humour. The first represents Lord Palmerston, as a jocular, piping to wonderful animals (the tune is the *Treaty of July*), Prussia and Austria are dancing-dogs, and the Russian bear is tumbling fondly on his head, whilst the Gallic cock, on stilts, is kicking up a prodigious crowing! 2. "Don Quixote attacking the Windmill," embodies the Paris press as the Knight of the Rueful Countenance tilting at the mill, with the four powers as its sails. The Rosinante is rich, nor is the squire behind, on Dapple (Thiers), less ludicrous. 3. O'Connell as Guy Fawkes; Peel and Stanley discovering him in the midst of his combustibles, is a fine piece of art, with an effect far beyond caricaturing; and the last, Pandora, the Foreign Secretary, opening the fatal box with war to China, Syria, &c. &c.,—a superb classical figure.

*The New Comet*.—The elements of the new comet in *Draco*, the discovery of which we mentioned, are as follow:—

	Mean Time at Berlin.
Perihelion passage, November,	19-023
Place of perihelion .....	34° 16' 54"
Place of the node .....	247° 0' 20"
Inclination .....	53° 58' 58"
Log. of per. distance .....	0-11230

The daily motion in right ascension is about 1½ degree; but in declination only a few seconds.

*Royal Academy*.—Charles Barry, Esq., the distinguished architect, R. Redgrave, and T. Webster, were last week elected associates of the Royal Academy.

*Vitality of Seeds*.—Mr. M. Farquhar Tupper, of Albury, near Guildford, in a letter addressed to the Editor of "The Morning Post," gives an account of the vegetation of a seed of Egyptian wheat, taken from a mummy-case of the age of 3000 years, by Sir G. Wilkinson. He describes himself as having used every precaution in planting twelve seeds obtained from Mr. Pettigrew, and of these one germinated, and has produced two heads of bearded wheat, of 2½ and 3 inches in length, so that next year a small crop may be raised. The other seeds rotted, and were destroyed by a small white maggot—*quære*, if coeval with them? They were sown on the 7th of March, and the living specimen appeared on the 22d of April.

*Society for the Publication of Irish Manuscripts*.—A new literary institution has recently been formed at Dublin, the Rev. J. H. Todd as Secretary, on the plan of the Camden Society, and having for its object the publica-

tion of MSS. connected with the history and literature of Ireland. Among other works, "The Liber Niger of Christ Church" is proposed for publication.

*Wellington Portraits*.—The print-selling competition in Wellington portraits at this time is almost laughable, and reminds us of H.B.'s caricature of his Grace as the whole cabinet ministry. We know not which will attract most, whether the simple individual, the hero, the head of a university, the head of an army, the peer, the sitting or standing, the robed or the unrobed,—in short, there are varieties for every taste and class of people.

*Inundations*.—It is stated that more than a century has elapsed since the south of France was visited by such floods as at present prevail. The Saone and Isere have overflowed their banks to a very destructive extent, and contributed to a like overflow of the Rhone; and the Marne and other rivers have also laid the adjacent country under water. Lyons, Besançon, and other cities, are much injured, and many human lives have been lost.

*Walpoliana*.—*Anecdotes of Archbishop Blackbourne*.—"On the king's last journey to Hanover, before Lady Yarmouth came over, the archbishop being with her majesty, said to her, 'Madam, I have been with your minister Walpole, and he tells me that you are a wise woman, and do not mind your husband's having a mistress.' He was a little hurt at not being raised to Canterbury on Wake's death, and said to my father, 'You did not think on me; but it is true, I am too old—I am too old.'"

*Flattery*.—"It is a misfortune that words are become so much the current coin of society, that, like King William's shillings, they have no impression left; they are so smooth, that they mark no more to whom they first belonged than to whom they do belong, and are not worth even the twelve pence into which they may be changed."

*Edward IV*.—"I have got a few hairs of Edward the Fourth's head, not beard; they are of a darkish brown, not auburn."

*Bad Blood and Bores*.—"A person who was very apt to call on you every morning for a minute, and stay three hours, was with me the other day, and his grievance from the rain was the swarms of gnats. I said, I supposed I have very bad blood, for the gnats never bite me. He replied, 'I believe I have bad blood too, for dull people, who would tire me to death, never come near me.'"

#### LITERARY NOVELTIES.

*British Gulana: the Results of a Long Sojourn and Residence in that Country*. By John Hancock, M.D.

Under the title of "The Granger Society," for the Publication of Ancient Portraits and Family Pictures, another literary association is announced, with the most noble the Marquess of Salisbury as its President. The Prospectus is very seductive for the lovers of this species of pictorial wealth, in which Great Britain is so pre-eminently rich.

Mr. Laver has announced a mezzotint engraving of the Duke of Wellington, by C. E. Wagstaff, from Pickersgill's portrait, painted for the Oriental Club.

#### In the Press.

Mr. Murray's list of forthcoming publications for the season contains not a few volumes of much general interest. Among others, we are well pleased to see which we had once intended to make ourselves for the *Literary Gazette*, as a review of the original, but that we found the matter too extensive) "Selections from the Dispatches, General Orders, &c. of the Duke of Wellington," by Lieut. Colonel Gurwood, in a closely-printed octavo volume. There are also announced "A History of India," by the Hon. Mountstuart Elphinstone; than whom there can be no higher authority. A new edition, with addi-

\* The review of the sixth and concluding volume of Walpole's "Letters," &c., by far the most interesting of the whole of this excellent edition, is of necessity postponed; but we offer some of its *bon-bons* as a pledge that it is prepared for our readers.

tions, of "Ancient Spanish Ballads," translated, with Notes. By J. G. Lockhart.—A Winter in the West Indies, in Familiar Letters to Henry Clay, Esq., of Kentucky. By J. J. Gurney.—An Account of Discoveries made in Ancient Lycia; being a Journal kept during a Second Excursion in Asia Minor. By Charles Fellows, whose previous "Journal" excited a sensation, which will probably be increased by his new volume, which relates to many interesting antiquities, and to discoveries of great importance in the Lycian language and inscriptions.—A Popular History of Painting, Translated from the German of Dr. Franz Kugler; with Notes. By C. L. Eastlake, Esq. R.A.—The Martyrs of Science; or, the Lives of Galileo, Tycho Brahe, and Kepler. By Sir David Brewster.—A Companion to the Principal Public and Private Galleries of Art, in and near London. By Mrs. Jameson.—A Personal Narrative of a Journey to the Source of the River Oxus, by the Indus, Cabool, and Budukshan. By Lieut. John Wood, Indian Navy.—The Manners and Customs of the Japanese, described from the Travels and Journals of Siebold, Fischer, Meyer, Doelf, and other most recent and Authentic Dutch Authorities.—A Complete Edition of the Poetical Works of the late Rev. Reginald Heber, Lord Bishop of Calcutta.—The Domestic Life and Manners of the Romans. Translated from the German of Professor Becker, of Leipzig.—Travels in the Himalayan Provinces of Hindustan and the Panjab, &c. By Mr. W. Moorcroft and Mr. G. Trebeck.—History of the Reformation in Germany, from New and Original Sources. By Leopold Von Ranke.—A Second Series of the Manners and Customs of the Ancient Egyptians, comprising their Religion, Agriculture, &c. By Sir J. Gardner Wilkinson.—A Summer's day at Windsor Castle, and a Visit to Eton. By Edward Jesse, Esq.—A Series of Picturesque Views on the River Quorra, the Niger of the Ancients. By Commander William Allen, R.N.—A Hand-Book for Travellers in Egypt. By Sir Gardner Wilkinson.—A Hand-Book for London, Past and Present. By T. Crofton Croker, Esq.; and other Hand-Books for various Districts of England, for Northern Italy, for Southern Italy and Sicily, and for France.

## LIST OF NEW BOOKS.

Olla Podrida, by Captain Marryat, 3 vols. post 8vo. 1l. 11s. 6d.—R. Frankum's Discourse on the Enlarged and Pendulous Belly, fcap. 8vo. 4s.—New Happy Weds; or, Holidays at Beechwood, by M. Cobbett, 18mo. 4s. 6d.—Individual Effort, and the Active Christian, by J. H. Hinton, new edition, 12mo. 7s.—Hand-Book of Trade and Commerce, 18mo. 4s.—Stephen's Spirit of the Church of Rome, 2d edition, fcap. 3s. 6d.—Maxims of Kit Larosse, the Lord-Mayor's Fool, fcap. 2s. 6d.—Englishman's Library, Vol. XII.: The Five Empires, by the Rev. R. L. Willberforce, 18mo. 3s. 6d.—Demonstrations of Anatomy, by G. V. Ellis, Part I., post 8vo. 1s.—G. Davis's Architectural Precedents, 8vo. 6s.—Essay on the Genius of George Cruikshank, 8vo. 2s. 6d.—Review of the Management of our Affairs in China, 8vo. 6s.—Thierry's History of the Norman Conquest, medium 8vo. 7s.—Sermons in Aid of the Infant School, Ripon, by J. ## METEOROLOGICAL JOURNAL, 1840.

October.	Thermometer.	Barometer.
Thursday .. 5	From 46 to 51	29.18 to 29.24
Friday .. 6	.. 39 .. 51	29.10 .. 29.04
Saturday .. 7	.. 38 .. 54	29.10 .. 29.17
Sunday .. 8	.. 38 .. 53	29.25 .. 29.32
Monday .. 9	.. 42 .. 51	29.08 .. 29.09
Tuesday .. 10	.. 40 .. 53	29.04 .. 29.24
Wednesday 11	.. 35 .. 48	29.28 .. 29.18

Winds, south-east and south-west.

On the 5th, morning and evening cloudy, with rain, afternoon clear; the 6th, cloudy, with frequent showers; the 7th, generally clear, except the morning, when rain fell heavily; the 8th and two following days, generally clear, a shower of rain on the morning of the 9th; the 11th, generally cloudy, rain at times.

Rain fallen, .935 of an inch.  
Edmonton.

CHARLES HENRY ADAMS.

## TO CORRESPONDENTS.

"Z." a lines of compliment, though well deserved, are too directly personal, and would lead us into many effusions of the same kind, where beauty and talent excite warm admiration.

We must be pardoned for the apparent neglect (for the week) of matters which reach us late. If our friends were aware of the inconvenience and expense attendant upon such communications, and often the improbability of attending to or using them, they would be more ready to take time by the forelock.

Connected with Literature and the Arts.

**ERECHTHEIUM CLUB, St. James's Square.**—Notice is hereby given, that the Club-Mouse will be OPENED for the Use of Members on Friday, the 1st of January next. Noblemen and Gentlemen desirous of belonging to the Club are requested to send in their Names to the Committee, who have the power of Election until the General Meeting shall take place.

Signed,

HENRY E. PAYNE, Secretary.

**ENVELOPES, at BOWEN and SANFORD'S,** 315 Oxford Street. All Sizes, 4d. per Hundred. Copy-Books, 3s. per Dozen. Post-office Writing Paper, 4s. 6d. per Ream, or 3d. per Quire. Latest Copy Paper, 4s. per Ream, or 6d. per Quire. Foolscap, 6d. 8d. and 10d. per Quire. Gilt and plain-edged Letter and Note Papers. Sealing Wax, 4s. per lb. Pens and Quills, 2s. 6d. per Hundred. A most elegant Assortment of Envelope Cases, Blotting-Books, &c. Whitbrown or small hand, 3s. per Ream. At Bowens and Sanford's.

Just published,

**SIX VIEWS OF SINGAPORE and MACAO,** from Drawings made on the Spot, in the present Year; with Plans of the City and Suburbs of Canton. By a NATIVE ARTIST. Imperial 4to. stitched, price plain, 12s.; India, 15s. London: Ackermann and Co. 68 Strand.

**THE FORMATION OF READING and BOOK SOCIETIES.**—A useful little Pamphlet has just appeared, entitled "Hints for the Formation of Reading and Book Societies," which cannot fail to interest all who contemplate forming a Book Society, or carrying reform and improvement into those already established. The hints are really practical hints, and convey rules and information that render the formation of a Book-Club a matter of the greatest facility: the pamphlet is well put together, and evidently by one who has given much attention to the subject.

Also,

The Library Circular for November.

Baunders and Ouley, Publishers, Conduit Street.

**CHEAP MODERN PUBLICATIONS,** being the Duplicates (in every department of Literature, withdrawn from Andrews's Circulating Library, 127 New Bond Street. The Catalogue is now ready for delivery, gratis. It is printed on a large sheet of paper, and can be sent by post, free of expense. The Books are in good condition, and in very few instances exceed one-third of the original published price, and in numerous instances twenty-five and thirty per cent less. These Books are sold from the Library to make room for the multiplicity of new Publications announced, which are supplied in unlimited numbers to the subscribers of this Library. Terms of Subscription, &c. to be had on application, or forwarded to any part of the Country.—N.B. Persons desirous of establishing Book-Clubs or Circulating Libraries will find the above worthy their attention.

## MUSIC.

Just published, price 7s.

**CHORAL PSALMODY; or, a Collection** of Tunes to be Sung in Parts, without Instruments, by Village Choirs, containing One Hundred and Ten Tunes, as now Sung by a Choir (formed within the last Year), of Twenty-four Singers, in the Parish Church of Aylescombe, Devon. With simple Rudiments and Instructions annexed, for teaching Music on a short and easy Plan, the ultimate object of which is to terminate in Congregational Singing.

By F. A. HEAD. London: Cramer, Addison, and Beale, 301 Regent Street.

## BOOKS IN THE PRESS.

AN ELEGANT GIFT-BOOK.

On the 18th instant will be published, illustrated by Frontispiece from Design by Gilbert, and Vignette by Harvey, price 10s. 6d. 8vo. cloth elegant, gilt edges.

## THE PARLOUR TABLE BOOK.

Written and selected by the Author of "Lives of the English Sackbats." Joseph Rickerby, Sherbourn Lane, King William Street, City; and to be had, by order, of all Booksellers.

**FLORESTON, WITH TWENTY-FOUR ILLUSTRATIONS.** On the 1st of December, Part I. price 1s. to be continued monthly. In Parts, each containing Forty-eight pages of Letterpress and Three Illustrations, by O. P. Q. engraved by Hain (to be completed in Eight Parts).

**FLORESTON; or, the New Lord of the Manor.** A Tale of Humanity. Joseph Rickerby, Sherbourn Lane, King William Street, City; and to be had, by order, of all Booksellers.

In a few days will be published,

**THE COMIC ALMANACK for 1841,** with Twelve large Engravings by George Cruikshank, and numerous other Illustrations. Tilt and Bogue, 66 Fleet Street.

PROFESSOR SMYTH'S LECTURES.

Just ready, in 3 vols. 8vo. 1l. 11s. 6d.

## LECTURES ON THE FRENCH REVOLUTION.

By WILLIAM SMYTH, Professor of Modern History in the University of Cambridge. William Pickering, Publisher, Chancery Lane; and J. and J. J. Deighton, Cambridge.

**SWAINSON and SHUCKARD ON INSECTS.** On Tuesday, December 1st, in fcap 8vo. with Vignette Title and numerous Woodcuts, price 6s. cloth, lettered. **THE HISTORY and NATURAL ARRANGEMENT OF INSECTS.** By WILLIAM SWAINSON, Esq. and W. E. SHUCKARD, Esq. Being Vol. 120 of "The Cabinet Cyclopaedia." London: Longman, Orme, and Co.; and John Taylor.

**WHO SHALL BE HEIR? A Novel.** By MISS ELLEN PICKERING.

By the same Author, recently published,

Nan Darrell. 3 vols. post 8vo.

The Frigate. 3 vols. post 8vo.

The Quiet Husband. 3 vols. post 8vo.

T. and W. Moore, 29 New Street; Oliver and Boyd, Edinburgh.

**MOSHEIM'S ECCLESIASTICAL HISTORY.**

New edition, by Henry Soames, M.A.

Shortly will be published, in 4 large 8vo.

**THE INSTITUTES OF ECCLESIASTICAL HISTORY.** Ancient and Modern.

By JOHN LAWRENCE VON MOSHEIM, D.D.

Chancellor of the University of Göttingen.

A new and literal Translation from the original Latin, with copious additional Notes, original and selected.

By JAMES MURDOCH, D.D.

A new edition, with Additions.

By HENRY SOAMES, M.A.

Rector of Stapleford Tawney, with Thoydon Mount, Essex. London: Printed for Longman and Co.; T. Cadell; Hatchard and Son; W. T. Clarke; B. Bagger; J. G. F., and J. Rivington; J. By JAMES BURNES, LL.D. F.R.S.

Knight of the Royal Hanoverian Guelphic Order.

2d edition, with an Appendix of Rare and Curious Documents, &c.

William Blackwood and Sons, Edinburgh; Payne and Foss, London; John Canning, Dublin.

THE CORN LAWS.

In 8vo. price 7s. cloth, an

**EXPOSITION of CORN-LAW REPEALING ALLACIES and INCONSISTENCIES.**

By G. CALVERT HOLLAND, M.D.

London: Longman, Orme, and Co.

## LONDON MEDICAL GAZETTE.

Part I. for 1840-1 contains the first Six of a Course of Lectures 'On the Principles and Practice of Physic,' delivered at King's College, London, by Dr. Watson—Clinical Lectures on Dropsy, the Catarrhs, Anæmia, &c. &c. delivered by Dr. Prichard at the Bristol Hospital, and by Dr. Davidson at the Glasgow Infirmary—New Operation for Hæmorrhoids, with Engravings, by Mr. Wood, Surgeon to Gloucesters Infirmary—Observations on Insanity, by Caleb Williams, Surgeon to the Retreat, York—Remarkable Case of Constipation, by Mr. Whithead, Manchester—Original Papers on Scabimus, with Engravings, by Mr. Duffin, Dr. Franz, Mr. Hall, and Mr. Wade—On the Pilemonia, by Mr. Carmichael of Dublin, and Dr. Knox of Edinburgh—On Febricula, by Mr. Douglas—On the Mercurial Treatment of Phthisis, by Dr. Munn—On Bronchitis, by Dr. Hughes—On the Blood of the Ovary, by Mr. Marshall—On the Umbilical Cord, by Dr. Hannay, Glasgow—On Guaiacum in Cyanosis, by Mr. Bell—Report of the Experiments on the Heart, by the Committee appointed by the British Association of Letters, by Mr. Crose, of Norwich, and various others, on Medical Reform—Editorial Articles on the Study of Medicine, and State of the Medical Schools. On the State of the Profession, and Mr. Warburton's Bill—Translations from French and German Journals—Critical Notices of several recent Works, &c. There are now in course of Publication—A System of Medicine, as contained in the Lectures delivered by Dr. Watson at King's College; and Clinical Lectures, by Dr. Davidson, of Glasgow. Future Numbers will also contain Clinical Lectures, by Dr. Corrigan, of Dublin, and Dr. Cline, of London; Selections from the Lectures of Dr. Carpenter of Bristol; and M. Lugol of Paris; &c. &c. London: Longman, Orme, and Co.

# FINDENS' TABLEUX, THE IRIS OF PROSE, POETRY, AND ART, FOR 1841.

Embellished with Twelve highly finished Engravings, from original Drawings by J. O. STEPHANOFF, Esq. H. CORBOULD, &c.; and engraved by W. and E. FINDEN, Esqrs.

Edited by MARY RUSSELL MITFORD,

Author of "Our Village," &c.

BLACK and ARMSTRONG, Foreign Booksellers to Her Majesty and the Queen Dowager, Wellington Street (North), Strand.

## THE LIFE AND WORKS OF SIR WALTER SCOTT.

Uniform in 86 vols. small 8vo. 196 Engravings.  
1. Life by Mr. Lockhart. 10 vols. 21 Engravings. Just completed.

2. Waverley Novels. 48 vols. 96 Engravings.

3. Poetry. 12 vols. 25 Engravings.  
With the Author's Introductions of 1830, various Readings, and Editor's Notes, not to be found in any other editions.

4. Prose Writings. 28 vols. 56 Engravings.  
Any odd Volumes to make up Sets.  
R. Cadell, Edinburgh; Whittaker and Co. London.

## VAN BUTCHELL ON FISTULA, &c.

4th edition, in 8vo. cloth boards, price 7s. 6d. enlarged.

**FACTS AND OBSERVATIONS** relative to a Successful Mode of treating Piles, Fistula, Hemorrhoidal Excrescences, Tumours, and Strictures, without Cutting or Confinement: illustrated with numerous Cases. Being a Familiar Exposition of the Practice of Mr. S. J. Van Butchell, Surgeon Accoucheur.

"This volume presents to us a number of illustrations of his singular success under circumstances that would have induced despair in any professor of less mastery, or less accustomed to accomplish cures where cures seemed impossible. The statements here made are most convincing, and place beyond doubt the superiority of the treatment to which they refer."—*Court Journal*.

Published by H. Renshaw; Sold also by the Author, No. 10 Percy Street, Bedford Square.

## NEW WORK BY MR. WILLIS.

With Ten fine Engravings and a Portrait of the Author, engraved by Lewis, after a Painting by Lawrence, in neat cloth, with gilt leaves, price 1l.

## LETTERS FROM UNDER A BRIDGE, and POEMS.

By N. P. WILLIS, Esq.

Author of "Pencilings by the Way," "Inkings of Adventure," &c.  
London: George Virtue, and all Booksellers.

With Two Plates, 8vo. 5s.

## A WINTER IN THE WEST INDIES, described in familiar Letters to Henry Clay, Esq. of Kentucky.

By JOSEPH JOHN GURNEY, of Batham.  
John Murray, Albemarle Street.

## NEW WORK BY MISS PARDOE.

In 3 vols. cloth, price 1l. 11s. 6d. with Engravings.

## THE CITY OF THE MAGYAR; or, Hungary and her Institutions in 1830-40.

By MISS PARDOE.

Author of "The City of the Sultan," "The Beauties of the Bosphorus," &c.  
London: George Virtue, Ivy Lane.

## NEW WORK BY S. T. COLERIDGE.

In fcap 8vo. price 4s. 6d.

## CONFESSIONS OF an INQUIRING SPIRIT.

By SAMUEL TAYLOR COLERIDGE.  
William Pickering, Publisher, Chancery Lane.

## WORKS BY JONATHAN DUNCAN, ESQ. B.A.

1. Price 6s. cloth, elegant.

## THE DUKES OF NORMANDY, from the Time of Rolle to the Expulsion of King John by Philip Augustus of France.

2. With Frontispiece and Vignette, price 6s. cloth.

## THE RELIGIOUS WARS OF FRANCE, from the Accession of Henry II. to the Peace of Vervins.

3. In fcap 8vo. price 7s. cloth.

## THE RELIGIONS OF PROFANE ANTIQUITY; their Mythology, Fables, Hieroglyphics, and Doctrines.

4. Price 3s. each cloth, lettered, in 3 vols. (each Work may be had separately).

## FELIX BODIN'S SUMMARIES OF the HISTORIES OF ENGLAND AND FRANCE. Translated from the French by Jonathan Duncan, B.A.

"Mr. Duncan is an able writer; instruction, blended with entertainment, is his aim; both youth and age may peruse his works with advantage; the scholar and the parent may alike profit by them."—*Critical Notice*.

Joseph Rickhey, Sherborne Lane, King William Street, City; and to be had, by order, of all Booksellers.

## NEW WORKS, Printed for Longman, Orme, and Co.

## MOORE'S POETICAL WORKS.

## OLLA PODRIDA. By Captain Marryat.

3 vols. post 8vo. 1l. 11s. 6d.

## M'CULLOCH'S GEOGRAPHICAL DICTIONARY, Vol. I. 8vo. with Maps. On Decem-ber 1st.

## THE CONTINUOUS HISTORY OF ST. PAUL, with Paley's "Horse Paulina" subjoined. By the Rev. J. Tate, M.A. 8vo. with Map, 15s.

## THE REV. J. E. RIDDLE'S ECCLESIASTICAL CHRONOLOGY; or, Annals of the Church. 8vo. 15s.

## PEREIRA'S ELEMENTS OF MATERIA MEDICA; or, the Uses, Effects, Composition, &c. of all Medicines. 2 vols. 8vo. numerous Illustrations, 40s.

## DR. ELLIOTSON'S HUMAN PHYSIOLOGY. 8vo. numerous Illustrations, 2s.

## DR. URE'S DICTIONARY OF ARTS, MANUFACTURES, &c. New edition, 1841 Engravings, 50s.

In royal 8vo. 34 Plates, price 12s.

## THE SCIENCE OF VISION; or, Natural Perspective, containing the Philosophy or True Language of the Eye, New Optical Laws, the True Seat of Vision, &c.; with Practical Rules for every Branch of Art, Visual Science, and Design.

By ARTHUR PARSEY,  
Member of the British Association, &c. &c.  
London: Longman, Orme, and Co.

8vo. 12s.

## CHURCH PRINCIPLES CONSIDERED in their Results.

By W. E. GLADSTONE, M.P.

Contents:—1. Introductory—2. Rationalism—3. The Church—4. The Sacraments—5. The Apostolical Succession—6. Apostolic Claims of the Church of England—7. Church Principles in Relation to Present Circumstances.  
John Murray, Albemarle Street.

## NEW WORK BY THE AUTHOR OF "THE MORAL OF FLOWERS."

## RECOLLECTIONS OF THE LAKES; and other Poems.

By the Author of "Moral of Flowers," and "Spirit of the Woods."  
Tilt and Bogue, Fleet Street.

## NEW TRAVELS IN TURKEY AND PERSIA.

3 vols. 8vo. with Woodcuts and a large Map, price 15s.

## NARRATIVE OF a TOUR in Armenia, Kurdistan, Persia, and Mesopotamia, including a Residence in Constantinople, and a Visit to Tehran, Bagdad, &c. By the Rev. HORATIO SOUTHGATE. Tilt and Bogue, 56 Fleet Street.

## NEW WORK ON CHEMISTRY. BY DR. KANE.

Vol. I. Part I. 8vo. pp. 255, illustrated with 180 Woodcuts, price 6s.

## ELEMENTS OF CHEMISTRY including the most recent Discoveries and Applications of the Science to Medicine, to Pharmacy, and to the Arts.

By ROBERT KANE, M.D. M.R.I.A.

Professor to the Royal Dublin Society and the Apothecaries' Hall of Ireland; Member of the Societies of Pharmacy of France and Germany, &c. &c.

This Work will be completed in Three Parts, of which the Second will be published in December and the Third in January. Hodges and Smith, College Green, Dublin; Longman and Co. and Simpkin, Marshall, and Co. London; Maclellan and Stewart, Edinburgh.

## MR. COLBURN has just published the following NEW WORKS:—

I.  
**The Conspirators;**  
Or, the Romance of Military Life.  
By Captain Quillman.  
3 vols.

II.  
MAJOR NAPIER'S  
**Scenes and Sports in Foreign Lands.**  
2 vols. post 8vo. 21s. bound, with Nineteen Illustrations.

III.  
**The Siege of Florence; a Historical Romance.**  
By Daniel Macarthy, Esq.  
3 vols.

"One of the most promising first productions we have had since the 'Richelieu' of Mr. James."—*New Monthly*.

IV.  
**Oliver Cromwell; an Historical Romance.**

Edited by Horace Smith, Esq.  
Author of "Bramblety House," &c. 3 vols.

"The battle-scenes in this work are about the most spirited and thrilling since Scott described the gathering at Loudon Hill and Bothwell Brigs."—*Athenaeum*.

Also, just ready,

V.  
The Third and concluding Volume, in 8vo. of  
**Lady Blessington's Idler in Italy.**

VI.  
**Mr. Roby's Popular Traditions of England.**  
First Series—Lancashire.  
3 vols. post 8vo. with numerous Engravings on Wood.

VII.  
**MR. JAMES'S NEW WORK.**  
**The Vernon Letters.**  
Addressed to the Duke of Shrewsbury, illustrative of the Reign of William III.  
3 vols. 8vo. with Portraits.  
Henry Colburn, Publisher, 18 Great Marlborough Street.

8 New Burlington Street, November 14, 1840.

## MR. BENTLEY has just ready for publication the following NEW WORKS:—

I.  
**The Life, Journals, and Correspondence, of Samuel Pepys, Esq. F.R.S.**  
Secretary to the Admiralty in the Reigns of Charles II. and James II.  
Including a Narrative of his Voyage to Tangier, and Journal of his Residence there, &c.  
The whole now first published from the Originals.  
In 3 vols. 8vo. with a Portrait from an Original Picture.

II.  
**The Three Peers; a Novel.**  
By Lady Stieglitz.  
In 3 vols. post 8vo.

III.  
The 2d edition, revised and corrected, of  
**MAJOR FORBES'S**  
**Eleven Years in Ceylon.**  
2 vols. 8vo. with numerous Illustrations.

IV.  
**Elphinstone; a Novel.**  
In 3 vols. post 8vo.

V.  
**Memoirs of the Colman Family.**

By R. B. Peake, Esq.  
Including their Correspondence with the most distinguished Personages of their Time.  
In 2 vols. 8vo. with Portraits.

VI.  
**Tippoo Sultaun; an Historical Romance.**  
By Captain Meadows Taylor,  
Of the Service of His Highness the Nizam, Author of  
"Confessions of a Thug."  
In 3 vols. post 8vo.

VII.  
**MEMOIRS OF**  
**The Right Hon. Warren Hastings,**  
Late Governor-General of India.  
By the Rev. G. R. Glegg.  
Author of "The Life of Sir Thomas Munro," "Traditions of Chelsea College," &c.  
In 3 vols. demy 8vo. with a Portrait from an original Picture.  
Richard Bentley, New Burlington Street,  
Publisher in Ordinary to Her Majesty.

Printed by HANNAH PAGE MOYES, of Brook Green, Ham-mersmith, and GEORGE M. RCLA V, of Number 3 Pall-mall Place, in London, both in the County of Middlesex; Printers, at their Printing Office, Number 38 Castle Street, Leicester Square, in the said County; and published by WILLIAM AKMIGER SCRIPPS, of Number 13 South Molton Street, in the Parish of Saint George, Hanover Square, in the County aforesaid, at the LITERARY GAZETTE OFFICE, Number 7 Wellington Street, Waterloo Bridge, Strand, in the said County, on Saturday, November 14th, 1840.

### REVIEWS OF NEW BOOKS.

*Williams on the Combustion of Coal and the Prevention of Smoke.* 8vo. London, 1840. Weale.

THERE is, perhaps, no subject within the range of the arts of life upon which so much ignorance has been displayed as that which forms the topic of the book above cited. Ever since the invention of the steam-engine and the increased application of coal to the purposes of the mechanical arts, the press has teemed with treatises, each one surpassing its predecessor in the absurdity of its propositions for obviating the nuisance occasioned by smoke, and for preventing the waste of good combustible matter which is incurred by the imperfect construction of the furnaces now in use. The only exceptions which we can conscientiously make with respect to the class of publications referred to are, first, a valuable communication recently published in the "Transactions of the Institution of Civil Engineers," by Mr. Josiah Parkes (who, however, candidly admits that "we are yet far from having obtained either a complete knowledge of the most profitable manner of submitting coal to the process of combustion, or applying the caloric so obtained to the generation of steam"); and, in the second place, the work which we now propose to examine. Mr. Parkes having confined his inquiries to the best mode of increasing the evaporation in the steam-boiler, merely glancing incidentally at the preparatory operation in the furnace, has left the field open for Mr. Williams, who has gone into the subject thoroughly and, to our apprehension, with perfect success.

Mr. Williams prefaces his observations by stating that, as the managing director of a steam company, he naturally felt the greatest interest in endeavouring to diminish the consumption of fuel, by constructing the furnaces in such a manner as to obtain a more perfect degree of combustion of the fuel employed. He, therefore, directed his inquiries to this branch of the subject; and combining considerable chemical knowledge with a great share of mechanical skill, as well as much experience on this particular point, he was more than ordinarily qualified to pursue these researches. He divides his subject into three heads: first, the management of fuel in the generation of heat; secondly, the management of heat in the generation of steam; and, thirdly, the management of steam in the generation of power.

It is with the first of these propositions that Mr. Williams exclusively deals in the work before us; and as he enters, in the course of his investigations, somewhat at large upon the mysterious process which is commonly termed combustion, we propose shortly to give a general view of this matter before we proceed to examine the mode in which the author has applied the principles which he has so truly stated.

Combustion is the readiest, and the principal, if not the only, method to which nature has recourse in order to reduce organic as well as inorganic matter to its original elements, so as to maintain the balance between the constant absorption of the vital principle of the atmosphere by pouring a fresh supply into it from the substances thus consumed.

The perfect economy of this process, no less than its simplicity, is so admirable as to raise the strongest feeling of adoration and wonder in the mind of him who, contemplating, comprehends the outline of the great scheme of revivification and absorption which has been going on from the hour of the creation to the present time. The philosopher, looking at the proceedings of nature in this point of view, sees in all created matter the great store-house whence the supplies are drawn for the maintenance of organic life; and he learns, by actual experiment and observation, that the tree which is consumed to-day rises again in another form when the elementary gases of which it was composed come in contact with their affinities under certain fixed and simple laws.

How many of us are there who, in thrusting a stick or a sheet of paper into the flames, conclude, as the material vanishes before us, that it is destroyed; and how few of us deduce from it the importance of the discovery of the indestructibility of matter in general to all the best interests of man! A field of inquiry was opened to the practical and scientific as well as to the speculative inquirer, which has proved inexhaustible, and every step taken in it offers new wonders to the human mind.

Such is our imperfect and inadequate outline of the general process of combustion as the great regenerative means resorted to by nature. Let us now endeavour to apply the principles upon which she proceeds in effecting her purpose to the practical objects proposed by Mr. Williams.

In Section I. of the tract before us the author examines into the nature and quantity of the different varieties of coals, that being the material most used in common furnaces; in doing this he quotes the analyses furnished by Drs. Ure and Thomson, Professor Liebig, and Mr. T. Richardson, who differ from each other very materially in their estimates of the elementary gases of which the several kinds of coal are composed. We will not enter upon this part of the subject, but will proceed to a detail of the views upon which Mr. Williams founds his practical recommendations. Citing as his authority the incontrovertible dicta of Davy, Brande, and Faraday, he shows that the perfect combustion of the inflammable gases contained in coal, can only be accomplished by the admixture at the moment when the gas is evolved by the heat of a certain known and regulated proportion of oxygen; the quantity of that gas which is contained in the coal not being sufficient to effect the combustion of the carbon; which, therefore, flies off in the form of smoke, absorbing, instead of generating, heat, and thus occasioning a double waste.

In order to illustrate this branch of his subject, Mr. Williams resorts to the medium of diagrams, shewing mechanically, as it were, the process of combustion; the different gases being represented in their respective combinations, as their combustion is more or less perfectly accomplished.

The principal difficulty to be overcome in effecting perfect combustion consists, as we have already intimated, in providing an adequate supply of that supporter of combustion—oxy-

gen; and which, as most of our readers probably know, is the means by which the ordinary flame of a common lamp is enlarged and heightened into the brilliant conruscation called the Bude light, by which the House of Commons was illuminated during part of last session, as also are many of the lighthouses on the coast. The oxygen in this case is applied in a pure and unadulterated form; the nitrogen, which is the great constituent element of atmospheric air, having been disengaged and separated from it; but as this would be an expensive and impracticable process in so confined a space as a steam-vessel, it is obvious that unless some other means be devised for supplying the oxygen required at the proper moment to the furnace, the whole question would still remain a mere matter of theory, or at best form the subject of experiment before a lecture-room auditory.

It is, however, for the purpose of effecting a practical application of these great principles to the furnace, that Mr. Williams has published the work now under consideration, and (in the manner already shewn) cleared the way for his proposed improvements in the construction of furnaces, by proving that the leading, and, indeed, the indispensable, conditions towards effecting the complete combustion of coal consist in so constructing the furnace that a due proportion of oxygen shall be administered to the fuel undergoing combustion at the exact moment when this union is requisite, in order to consume the inflammable gases that are evolved. In illustration of the principle upon which his furnace is constructed, Mr. Williams refers to the argand lamp, and explains the difference which exists between the complete combustion of the gases as effected by the constant adequate supply of oxygen from the air, which is inhaled by the chimney of the lamp, and the imperfect combustion of coal in an ordinary furnace, where the process is attended by a volume of dense smoke; and it is by tracing this difference up to its source, and by a rigid inquiry into the means adopted by nature to effect her purposes that our author has succeeded in throwing a light upon this important subject, by proving that the success of the constructor depends wholly upon the exact proportion established between his arrangements in the furnace, and the imperative conditions imposed by nature upon the mysterious process of combustion.

It is unnecessary for us to enter into any details of the mode in which the principles so laid down are carried into effect; but they may be generally indicated by observing that the inventor has proceeded in his application of them to his furnace, by imitating the action of the air-jet, or blow-pipe, which, by throwing an increased, though regulated, supply of oxygen upon a flame, has been found to develop in the most perfect manner the full capacities of the inflammable gases when submitted to its action in that form and character.

The furnace planned by Mr. Williams is constructed so as to present, throughout its whole extent, a series of air-jets, or blow-pipes, which, being distributed along the extended surface of the ignited fuel, conveys, without

any mechanical aid, the requisite quantities of oxygen to the gases evolved by the heat, at the moment when the presence of that element is necessary for the purpose of effecting their perfect combustion, the air-jets being regulated so as to admit of complete control in the supply of air.

In conclusion, the author disclaims any wish or intention to interfere with the department of the chemist, or to propound new views of combustion considered chemically: on the contrary, he states that his object is confined to that of affording a practical guide in the art of constructing stoves and furnaces to those under whose charge this important department of the steam-engine manufactory is placed; and we must again repeat it to be our conviction that he has succeeded in an eminent degree, and well deserves the thanks of the mechanical world for his industry, his ingenuity, and his perseverance.

*Heath's Book of Beauty*, 1841. Edited by the Countess of Blessington. 8vo. pp. 280. London, Longman and Co.; New York, Appleton and Co.; Paris, Fisher and Co.

A FAIR and warm review of one of our splendid Annuals is not surely to be expected from a cloyed critic, as from any other competent judge who enjoyed the advantage of contemplating a single volume, or, perhaps, not more than two of these highly adorned publications. In the one case, many of the same artists, both painters and engravers, present themselves to the eye till it becomes too much familiarised with their particular styles to feel that freshness which is an almost indispensable cause of admiration; in the other, there is no repetition to exhaust the appetite, and just enough to excite the taste and please the fancy. Still if any thing could carry us away into the regions of enthusiasm, it must be the representation of British female beauty, as illustrated in a volume like this. To save trouble we will treat of its portraiture and literature together. That the flattering artists have done their endeavours to make every pretty woman an angel is tolerably evident; and some we have seen are really so transmogrified into youth and loveliness (and with complimentary verses to suit), that but for the inscriptions we should scarcely have recognised them. We suppose that this is all very allowable; and sure we are that there is in reality quite beauty enough to excuse it, and even greater departures from the exact truth.

Our gracious queen in her bridal dress (Heaven send her as gay and happy a one for the next grand royal ceremony!) heads the handsome train, looking a little taller than she is; and another queen (by Hayter), the Queen of Love and Beauty at the Eglintoun Tournament, follows in all the splendour of her charms. The Duchess of Beaufort is a striking likeness; the Marchioness of Douro is a noble Greek head, by the same artist; and the Countess Zichl, by F. Grant, is a simple and touching portrait. Lady Dangarvon (Hayter) and Mrs. Edward Ellice (Chalon) are sweetly painted; and the Hon. Mrs. Stanley, by the latter, is a perfect Lady Godiva, without a peeping Tom. The profusion of silken hair makes it very peculiar, and the face is exceedingly fine. Mrs. C. Martyn (Chalon) is piquant, and contrasts well with the *pensevole* of Mrs. Whyte, by W. Fisher; who is equally happy in the pensive expression he has imparted to the countenance of Mrs. Garden Campbell. Miss I. Montgomery (Hayter), in girlish grace; Mrs. O'Callaghan (Chalon), with stately brow; Mrs. B. Diaraeli (Chalon), combining intelli-

gence with sentiment; and Miss Tyndal (by Mrs. Hawkins), *petite* and animated,—conclude the line in a manner which might not only vie with the Beauties of the court of Charles II., but banish them from the royal walls of Windsor or Hampton, and supersede them for a hundred years.

The literary portion of the book is very miscellaneous and interesting. A number of contributors lend it variety; and the acknowledged taste of its accomplished editor has been advantageously exercised in selection and direction, as well as in original compositions. Among the writers we notice, Mrs. Fairlie, the Marchioness of Hastings, Miss Power, Miss I. Romer, Miss L. H. Sheridan (no longer Miss, we believe), Lady E. S. Wortley, Mrs. Torre Holme, Mrs. Maberly, Mrs. Abdy, Miss C. Toulmin, Miss T. Garrow, Mrs. C. B. Wilson, Lady Jarvis, together with Lady Blessington herself, as the feminine phalanx; whilst among the men, figure Lords Powerscourt, W. Lennox, Jocelyn, Gardner: M.P.'s,—Bulwer, B. Disraeli, R. Bernal, Sir H. Fleetwood, R. M. Milnes, W. J. Denison, Hon. G. F. Berkeley; and of others, Marryat, Savage Landor, the authors of "The Collegians" and "Miserrimus," Sir W. Somerville, Sir Gardner Wilkinson, Hon. E. Phipps, Tyrone Power, &c. &c. From such a mosaic who can pick lozenge, or square, or triangle, or stone-leaf, to afford an idea of the well-arranged and symmetrical design? We think we had better not try. Lady Blessington's "Old Irish Gentleman" is a genuine and characteristic tale, but too long to quote, and too good to abridge. Mr. Bernal has also given an interesting tale; and "The Knight of the Sheep," by the author of "The Collegians," is another clever Irish picture. By way of interlude, we copy the lines by W. S. Landor:—

"Pleasures away! they please no more.  
Friends! are they what they were before?  
Love! they are very idle things,  
The best about them are their wings.  
The dance! 'tis what the bear can do.  
Music! I hate your music too!  
Whene'er these witnesses that Time  
Hath snatch'd the chaplet from our prime  
Are call'd by Nature (as we go,  
With eye more wary, step more slow,  
And will be heard and noted down  
However we may fret or frown)  
Shall we desire to leave the scene  
Where all our former joys have been?  
No! 'twere ungrateful and unwise;  
But when die down our charities  
For human weal and human woes,  
Then is the hour our day should close."

As a variety, we add,—

"A Sensible Wife who ne'er Listens to Reason."  
By Miss Louisa H. Sheridan.

A sensible wife is a paragon rare,—  
Common sense being wanted at each time and season;  
But the husbands of sensible wives all declare  
That these sensible women ne'er listen to reason!  
They must go where they choose—they must flirt with each fop!  
They must dress unlike all—they must talk what they please on;  
But their 'sense' goes such lengths, quiet people oft drop  
Your sensible wives who ne'er listen to reason!  
When a sensible woman a 'victim' has found,  
Once married no longer she studies to please on;  
But doubts of his constancy soon will abound,  
And these sensible women ne'er listen to reason!  
His clubs must be over—his sporting must stop—  
His politics change with his friends of the season:  
Clever folk he must know—his own friends he must drop,—  
For these sensible wives never listen to reason!  
His sensible wife rules the steward and estate;  
All letters, from friends or on business, she'll seize on;  
She pays her own debts, while her husband's may wait,—  
For your sensible wives never listen to reason!  
For her children such rules,—she 'ne'er trusts them at schools;  
So, without education, they grow by degrees on,  
Till her sons are pert fops, and her daughters pert fools,—  
For your sensible mothers ne'er think about reason!

Oh! fall from your horse—fall in debt—fall in strife—  
Fall asleep in the fire—on the ice fall, and freeze on;  
But fall not in love—with a sensible wife,—  
For your sensible women ne'er listen to reason!  
When your temper's unbridled, and your fortune gone wrong—

When your tastes are all themes for your lady to tease on,  
You must own 'twas your fault;—you were warned by my song

That a sensible wife never listens to reason!"

"The Barber of Ferrara," by Col. H. Webster, is a remarkable anecdote of a monster duchess; and its brevity recommends it to us as our prose example:—

"Of all the palaces in Ferrara, that which had most interest for me was the ancient one of the Duke of Scandiana, on account of the remarkable catastrophe of one of its former mistresses, a woman of singular beauty, superior strength and stature, and unquestioned propriety of conduct. It was in her time that Ferrara was thrown into a state of much uneasiness in consequence of the sudden and unaccountable disappearance, one after another, of several of its citizens, all of them young men, and those most remarkable for personal merit. Among the rest, a young barber missed one of his brothers, to whom he was strongly attached; and in the course of his inquiries after him it struck him as singular, that the last place to which he could trace, not only his brother, but several others of the absent youths, was the entrance of the street of Santa Maria in Modo. This circumstance dwelt on his mind, and one morning as he was reflecting upon it, while passing through the very same street, his reverie was interrupted by something which suddenly fell at his feet. It was a white handkerchief; he looked up, and saw, standing at the window of her palace, the virtuous and beautiful young Duchess of Scandiana, who had just let her handkerchief fall. He immediately picked it up, and hastened to the palace to restore it to its owner. He found the doors open, and no impediment to obstruct his way, till he reached the room where he had seen the duchess, who received back the handkerchief with the most gracious thanks and apologies. But in the act of restoring it, to his great surprise, he perceived that something heavy was tied up in the corner; he started and changed colour, and the handkerchief falling from his hand, the sound produced upon the floor at once assured him that his discovery was just, and made the duchess aware of the cause of his agitation. But his emotions were very soon excited in a very different manner, when she honestly confessed to him that she had lost her handkerchief by design, not accident; and that she had previously fastened a piece of lead in one corner, in order that she might insure its falling at his feet the next time of his passing her palace, not doubting that civility would induce him to restore it, and thus afford her an opportunity of declaring her sentiments in his favour. Every thing but the beautiful duchess was now forgotten by the enamoured barber, and some hours passed rapidly away in her delightful society. A collation, which was ready in an alcove of the saloon, was next offered by the lady to her lover, and as, in the course of it, he happened to express his admiration at the splendour of the palace, she assured him that nothing he had yet seen was in any way to be compared with the remaining apartments, which she obligingly proposed to shew him. They passed through several splendid chambers: the door of one was locked, and the duchess desired the barber to turn the key, as it required some strength; he obeyed, threw open the door, and the duchess bade him enter, pointing out a Titian of great beauty for his

examination; but the young man stepped back to make way for her, and although she repeatedly bade him wave all such unnecessary forms, he could not be persuaded to commit so gross a violation of good breeding as to enter the room first. A sudden flush, for a moment, crimsoned the duchess's cheek, and as she passed on she cast on him a look of inquiry: the look acted upon him like an electrical shock. At once the recollection of his brother, of the street Maria in Modo, of the loaded handkerchief, of the collation in readiness, all presented themselves to 'his mind's eye.' He watched his conductress narrowly: he observed that, although the Titian exactly fronted the door by which they entered, she took a circuitous course round the chamber, and evidently avoided the centre part: so did the barber; he carefully trod in the lady's footsteps, and when she pointed out the most advantageous spot for viewing the picture, obstinately maintained that he saw it to the greatest perfection from the spot which he then occupied, close to the lady herself. Again her cheek crimsoned; but again she resumed her original complacency, and led him, smiling and chatting, to another chamber, which she was upon the point of entering, when, unfortunately, her foot slipped, and she fell upon the ground; her companion hastened to raise her, and place her upon a sofa, at no great distance from the door. She soon assured him that she was certain of not having done herself any material injury, the pain was already gone; but as she seemed to have sprained her ankle a little, she was willing to rest it, and begged him, in the meanwhile, to examine, by himself, a group of statues in the interior apartment. The youth protested that he could feel no pleasure or interest in anything, however admirable, while he knew her to be in pain, and entreated her to return to the saloon; the lady insisted upon his not losing the sight of such a *chef d'œuvre* on her account; the lover still declined to leave her even for a moment; and, indeed, at length refused so positively, that the duchess, perceiving his resolution was not to be shaken, determined to have recourse to a measure for effecting her object which the lad's extreme youth, and her own strength and stature (both which were superior to the generality of her sex), made her suppose likely to prove successful. Starting suddenly from the sofa, she grasped him by the throat with one hand, and, with the other, drew a stiletto from her bosom; but the youth was upon his guard: a sudden movement extricated him from her grasp, and supplying by dexterity what was wanting in strength, he wrenched the stiletto from her hand, and buried it in her bosom. He then lost no time in escaping from the palace, hurried to the police, and soon returned with the officers of justice. The duchess was found lying dead on the sofa; in six different rooms of the palace, as many trap-doors were found opening into subterranean dungeons, whose sides and floors were thickly stuck with knives, nails, and spikes; and the numerous bones which were strewn about them sufficiently accounted for the disappearance of the youths so long missing. The barber, for delivering the city from this female monster, was rewarded with a public pension: but her mother, who was a certain Duchess Grillo, was so highly incensed at the slanders thrown upon her favourite daughter, and at the impunity and protection afforded to her murderer, that, upon abandoning Ferrara, she caused the bridge to be broken down, and the gate to be built up

by which she left it, in order that she might manifest the more publicly her intention never to return. Her orders were executed, and the gate remains impracticable at this very period."

A narrative of some passages in the last days of the *Maréchal de Biron*, from an unpublished MS., thought to be of his Secretary Hébert, contains a singular relation of an apparition which warned him of his fate, and is altogether very affecting; Captain Marryat's "*Rencontre*" is a capital scena; "The Queen of the May" (another queen, by the by,) does credit to the descriptive powers of Lord W. Lennox, when addressed to English country life; "The Usher" seems an imitation of Boz at Dotheley's Hall; and for all the rest, why, we must refer to the *Book of Beauty*.

*The Keepsake for 1841.* Edited by the Countess of Blessington. Pp. 272. London: Longman and Co. New York: Appleton and Co. Paris: Fisher and Co.

A COUNTERPART of the "*Book of Beauty*," with subjects instead of persons; and with a different intermixture of contributors, among whom are the Marquess of Wellesley, Lord Leigh, Harrison Ainsworth, Barry Cornwall, Mrs. Norton, J. Kenyon, Lord Maidstone, Meadows Taylor, R. Westmacott, and a few others. Macclise, Herbert, Lami (a very queer picture, indeed), E. Corbould, Dyer, Bentley, Phillips, Hicks, and Meadows, also diversify the arts. From this volume we will not attempt quotation,—for our *week* is too small for a *year's* produce; suffice it to say, that Italian and Eastern tales of much merit, and a very pleasing miscellany of other prose narrations, as well as of verse on many attractive subjects, render it quite equal to any of its popular predecessors.

*The City of the Magyar; or, Hungary and her Institutions in 1839-40.* By Miss Pardoe, author of "Traits and Traditions of Portugal," "The City of the Sultan," "The Beauties of the Bosphorus," &c. London, 1840. 3 vols. 12mo. Virtus.

THE facilities in travelling to very distant corners of the earth have transferred the pen which was heretofore only held by male tourists into adventurous female hands; and a lady, nowadays, thinks little of trusting herself among Magyars, Turks, Barbarians, Pagans, or Cannibals. Among the foremost of the class we may rank Miss Pardoe, notwithstanding the soft and feminine-looking portrait of her which adorns these volumes, and indicates a gentleness and delicacy apparently little calculated to undergo the rough fatigues, and struggle with the privations and dangers, of rude peregrination. She, however, utters no complaint, but, on the contrary, gives her descriptions of Hungarian society and the face of the land as much at ease as if they had been written in an easy rocking-chair, such as a nurse might delight to roll in. Of her style and manner we need say nothing, as her previous productions have made them popularly known as graceful and lively. Of course much depth is not to be expected from any work of the kind, founded on a few months' observation of a foreign people; but as an agreeable superficial view of the country, and a readable report of the *on dits* from parties and persons whom she encountered on her path, these three volumes may be perused with general pleasure and satisfaction. For the reasons thus briefly indicated we shall abstain from the graver matters of politics and national business touched on by our fair author (seeing she could merely speak from hearsay, and have no means

of forming a mature judgment respecting them); and content ourselves with selecting a few scattered traits of character and manners as examples of her talent for observation and skill in sketching. Beyond Previt, the travellers came to a little village called Ozlan at the foot of a mountain-pass; and we are told,—

"Beside us, right and left along the lip of the precipice, clustered the huts of the peasantry; and from the largest of these, which proved to be the modest hostelry of the village, came the sounds of mirth and music, for here too the festival was kept. I will not mention the name of the saint, but it was precisely she whose skeleton I had seen in duplicate; and we were obliged to her for crossing our path so opportunely, as the good mountaineers told us frankly on our first apparition, that there was not a horse in the village, and that we could not stir thence under a couple of hours. The carriage was duly examined by a committee of serfs, and we were threatened with oxen to drag us up the mountain; but as we satisfied them that we carried no luggage, it was at length conceded that we might venture with six horses. Unluckily, these horses would not come at a wish, and therefore we had no remedy but patience; and having eaten some of the black bread encrusted with caraway-seeds, and goat's-milk cheese, and drunk a few drops of the sour wine of the hamlet, with as few grimaces as possible, we walked towards the little *gasthaus* to 'assist' at the village-bail. It was a curious scene, and we saw it distinctly through the grated and unglazed window which opened on the narrow street. A large room, reeking with the smoke of many pipes mingled with a strong savour of garlic, was tenanted by about forty peasants: the women and girls were seated on benches along one side of the apartment; another was occupied by four musicians, who were mounted upon a table, and the centre of the floor was alive with the dancers; the men wearing their large hats and their heavy leather boots reaching to the knee; and the women, generally speaking, barefooted, and clad in their thin linen jackets, and petticoats of dark chintz. The dance was intricate enough. It was a species of waltz, where the man suddenly whirled his partner round and round with a velocity and force that almost took away the breath; and then as suddenly loosed her, and whirling away in his turn left her to overtake him in the crowd. When they met their paces became almost funereal, and they merely set to each other, inclining first to the one side, and then to the other, until the fit returned, when away they bounded again, forming circles which the eye could scarcely follow. Sometimes the girl wearied, and, when her partner flung her off, seated herself on the nearest bench, when one of her companions instantly stood up, and the dance went on as before. At times the men gave out a shrill cry or yell, similar to that of Highlanders dancing the 'fling'; and at others they sang, merely balancing their partners from side to side; reminding me of the Bayadères, or the dancing-boys in Turkey; in short, although I wished to give an idea of this mountain-bail, I find it utterly impossible. We made them very happy, nevertheless, by paying liberally for our initiation into its mysteries; and they volunteered to vary the entertainment by singing a national glee, which was as wild as their own mountain-fastness. Half-a-dozen young men ranged themselves in front of the musicians, each with a glass in his hand, and sang alternate stanzas, relieved by one general chorus, of which the effect was thrilling; and then, at a given signal,

up sprang their partners again, the music burst into a more rapid measure, and the floor was once more covered with dancers. I am compelled, however, in some degree to injure the effect of my village-ball, by confessing that among the whole of the women there was not even one who was tolerably good-looking; but I have frequently remarked that beauty is very rare in mountainous regions. The men are tall, robust, handsome, and athletic; but the women are universally coarse, heavily-limbed, and ungainly; and thus it was at the hamlet of Oszlan: but, despite this drawback, they danced away with light hearts—lighter, perhaps, than that of many a belle whose attractions have been the boast of half London, and the glory of Almacks—for a night! and we amused ourselves by watching them only too long, for our relay was even more tardy than we anticipated; and three long hours were wasted ere we were again *en route*."

Our next quotation paints an important and rather remarkable portion of the kingdom:—

"There are immense tracts of country in Hungary totally uncultivated, and almost entirely sterile, which require only the labour of man to render them a source of national prosperity. The first of these are the *puszta*s—vast plains, or deserts, or prairies, sweeping away for leagues; and only partially available even as pastures for the enormous droves of cattle, swine and sheep, which wander over them in thousands, and gather a scant and meagre existence from the soil, where it yields in patches a rank and unvarnished vegetation. It has been calculated that if these far-reaching *puszta*s could be brought into cultivation, their produce alone would suffice to afford subsistence to eight millions of souls, and thus Hungary could support fifty millions of population out of her own natural riches. The monotony of these deserts, which are many of them one continuous and deep sand, is relieved only by the droves of half-wild cattle to which I have just alluded, guarded by serfs and dogs very little more civilised than themselves. All the public roads from Lower Hungary to Vienna are thronged with oxen for the markets of the hereditary Austrian provinces, which draw their supply almost entirely from this country. The animals are small and lean, a fact easily accounted for by the perpetual exercise necessitated by the extensive nature of their pastures, and the paucity of their vegetation. They are usually of a dun colour, with black legs and immense horns. Buffaloes are also to be found in the *puszta*s, as well as horses; and the pigs, which are bred originally in Serbia, are considered to be as fine as any in the world. The sheep are poor-looking, diminutive animals, kept entirely for their wool; the Hungarians scarcely ever making use of mutton, to which they are not partial. These multitudinous droves form the only moving feature of the plains; and no traveller can have gone down the Danube without being struck by their appearance, as they descend in thousands to the edge of the river. Another great mean of wealth are the gigantic primeval forests, into many of whose fastnesses the foot of man has never penetrated; and which, were they converted into an engine of national industry, would suffice to supply the whole Austrian monarchy with fuel. To render them available, however, Hungary must possess good roads and numerous canals; for at present there would be no possibility of transporting heavy loads through the country; and there is no immediate prospect of their formation. The wants of the population are

comparatively few, and the supply superabundant; and thus, not only the forests remain intact, but little labour is bestowed even upon the corn-land, which yields its produce with very slight demands on human exertion; and agriculture is, consequently, very imperfectly practised. It is only where a dense population requires a comparative supply, that the earth is compelled to yield up its produce by perseverance and art; and much prolific land lies comparatively waste in Hungary, because there is no necessity for great exertion. The mighty forests are a more grand and stately feature of the soil; they are vast, dark, and almost impenetrable: majestic elms, immense beeches, and umbrageous oaks, intermingled with the birch and the ash, and carpeted by a dense underwood, opening at intervals into a grassy glade, extend for several hundred miles, shutting out the sunlight, and seeming to defy the intrusion of mankind. To the influence of these aboriginal forests, to their majesty, their freedom, and their solitude, may probably be traced many of the fierce and haughty qualities of the peasantry who inhabit their outskirts; and who naturally become half-woodman and half-freebooter, as circumstances may serve to develop their natural character. One of the most extensive forests in the kingdom is that of Bakony, which traverses more than a dozen counties, many of them the most highly cultivated, and the most thickly populated in Hungary: viz., Oedenburg, Eisenburg, Szala, Fejervármezze (Weissenburg), Veszprém, Somágy, &c. Some parts of this mighty wood are so thickly grown as to appear impervious to the tread; while others are comparatively open, affording pasture for the droves of swine and flocks of sheep which feed there; and interspersed with the rude huts of the shepherd and the swineherd, and the solitary inns which alone offer refuge to the occasional traveller; and whose owners, half-robber and half-landlord, are probably quite as much to be feared as the more declared banditti of the forest. Here and there a small hamlet rises along the lip of the leafy solitude, but they are rare and rude; and the pilgrim must have a light heart and an empty purse who lingers among them from a mere love of the picturesque; for the Bakony bears no peaceful reputation, having long been the haunt of numerous bands of free woodsmen, as bold, if not as gay, as Robin Hood himself. These banditti are generally composed of deserters from the army, disgusted with Austrian discipline and German rule; but as opportunity makes thieves, their strength is constantly reinforced by peasant volunteers. A disappointment in love, or a reverse of fortune, leading to suicide in France, or to misanthropy with us, throws the Hungarian serf into one or other of the robber-bands of the forest; and the mystery and romance by which they are surrounded render them preferable to either in the eyes of a brave race. But who shall classify or even define the causes which may impel the young or the despairing to join these forest outlaws? The real motives and impulses of a score of banditti would probably furnish forth such a romance as the brains of all the bookmakers in Europe never engendered! A medley of ferocity and carelessness, of chivalry and baseness, of practical humour and reckless cruelty, would supervene; and the world would pause with wonder over a page of human life such as it never looked to contemplate. A few pages have from time to time been rent from this wild volume, and spread forth to startle the tame, matter-of-fact inhabitant of the cities, who have hung over them in wonder; but the great bulk is still unread, and will probably continue so

until the vast forest-fastnesses bow beneath the touch of time, and their hold tenants are no more. Meanwhile, there is every reason to believe that the drovers and shepherds of these wooded countries have generally a good understanding with the forest bands, to whom they give information which is not always very beneficial to the travelling merchants who are conveying their goods from one county to another. The master of the cattle exacts from his drover that none of them shall stray, and attaches a penalty to their loss; and to enable him the more readily to fulfil these very difficult conditions, the peasant forms an alliance with the band of the neighbourhood, serving the brigands when the occasion offers; affording any stray member of the community the shelter of his hut when he apprehends pursuit; and, in short, protecting the property committed to his charge, at the expense of that of his fellow-beings, when it chances to be coveted by his patrons. Nor is the serf the only tool of the freebooters; nor his good-will their only exterior dependence: for the *bosokaros nemese*k, or small proprietor, whose farm may lie within reach of a foray, is compelled to be equally complaisant if he desire to escape robbery and incendiarism. In Lower Hungary, during the winter months, it is a common practice with these *soi-diant Szegegy Legény* (poor fellows) to start off, a dozen at a time, to the isolated château of a noble; to remain there for three or four days, keeping the cellar and the kitchen in constant requisition, and then to take their departure, without any attempt on the part of their self-elected hosts to detain or molest them. They put their faith in the density of their forests and in the thinly-peopled solitudes which surround them; knowing full well that the imperfect police is unable to interfere; and that no landed proprietor, be his rank what it may, will venture to denounce them, and to draw down upon his own head the vengeance of the band."

We conclude with a vinous extract; we love to hear a lady's opinion of wines:—

"The most important and valuable crop is the wine-crop; vines cover the declivities of almost all the heights; and as vineyards, with some few exceptions, are not feudal property, and can never be taken from the peasant except under certain restrictions, which always involve a payment in full of their value, he is naturally partial to this description of produce, and frequently bestows great care upon its cultivation. But, notwithstanding the excellent quality, the great variety, and the immense quantity of the Hungarian wines, the duties imposed upon them on the Austrian frontier amount to a prohibition, the tax being equal to the price of the wine itself; add to which the fact, that the northern nations, Germans, Poles, and Russians, have of late years accustomed themselves so generally to the consumption of French wines, that the absence of nearly all external demand for those of Hungary has necessarily induced a great carelessness in their production. The vineyards are generally cultivated by the native Magyars, but a small proportion of Germans have also devoted themselves to this favourite avocation. Despite the laxity of the exterior trade, of which I have made mention above, several very valuable descriptions of wine are still produced in the country, and that, too, in quantities so enormous that, before the fact was fully proved to me, I had great difficulty in believing it to be possible. If, therefore, such be the case in the present languid and depressed state of the market, what might not be

the result to Hungary if she found a ready sale for her produce? The necessary impetus once given, the vintagers would put forth their strength; and not only the amount, but even the quality, of the wines would be increased by the additional care bestowed upon their production. The superior qualities of wine grown in the country are, Tokayer, Mènes, Rust, Erlau, Villaner, Somló, Badacson, Szard, Némil, and Dioszeg. The best descriptions of Ofner follow, and of these there is also a great variety: those known as Alderberg and 'Turk's Blood,' which are grown on the heights behind the city, are in much favour with the natives. Many of these wines are admirably calculated for the English market, being what is technically termed sound and full-bodied, as well as able to bear transport: among these the Tokayer requires no comment. Old Mènes, which is rich in quality, and of particularly fine and delicate flavour, may be purchased for from fifty to eighty silver florins the eimer.\* Erlau is well suited to the English palate as a dinner-wine, being both fruity and strong; its price (when of the best quality) is from twelve to fifteen florins the eimer. Villaner, of the first class, commands from eight to fifteen; and the best Ofner, fourteen florins for the same quantity. The most *recherché* wines of Hungary are the white; and the neighbourhood of Tokay produces not only the celebrated growth which bears its name, but also Tallya, Tarszai, Mada, and others, many of which are of superior quality; but a great portion of the produce is very poor, and only consumed by the peasantry. The process of making the different sorts of Tokayer is this:—the grapes are suffered to dry upon the vines, and are then piled lightly in casks which are filled up with a dry white wine. There they remain until they have absorbed it, when an aperture is made in the barrel through which the bloated fruit drips until it has discharged its juice: this is the essence of Tokayer, which will not bear transport, and is only used in the country to heighten the flavour of other wines. Next the grapes are pressed, and the liquor which they yield is the *Tokayer Ausbruch*, or Liqueur Tokayer, the finest description of wine known by that name. The common, or second class, Tokayer is produced by a second infusion of the same grapes in a dry white wine, where, after a time, they are once more pressed; and thus the fruit is made available over and over again, until eventually the result is a poor, thin, acrid drink, as contemptible in quality as any other of the common wines of the country. Including this inferior vintage, the quantity produced annually in the neighbourhood of Tokay averages from two to three thousand eimers; and all which are worthy of transport require bottling. Somló is another wine of great richness and flavour, and, when old and of a good vintage, is second to none on the Continent: it brings sixteen florins the eimer. Dioszeg, which is very cheap, is one of the most agreeable of the class of sweet wines: it averages only twelve florins an eimer. The present prices for export from the dépôts of Pesth is, by land to Trieste, guaranteed under three silver florins the eimer. The trade here are of opinion that it might, however, be exported by means of the Danube and the Save for about half that sum, should a steamboat be established on the last-named river. The year 1834 was so fertile in wine, that in many districts large quantities of grapes were left un-gathered for want of proper vessels to contain the juice; and so cheap was it, that for a half-penny, a bottle of very tolerable quality might

\* "An eimer fills about seventy Bordeaux bottles."

be purchased. • • • Twenty years ago, ere the taste for French wines had obtained so greatly in the neighbouring nations, Hungary exported largely to Austria, Germany, and Poland, as well as to other countries; and this trade alone produced a great revenue; while the internal consumption was also very considerable; but at the present day the use of tobacco has superseded that of wine to so great a degree among the Magyars themselves, that not more than one-tenth of the quantity formerly consumed is now required even in the country."

"Filthy tobacco" instead of wholesome wine is a sad exchange! Miss Pardoe estimates the annual production of the latter for home consumption at 12,000,000 of eimers, allowing sixty champagne bottles to the eimer; and the foreign exports at 400,000 eimers, at the cost of from four to twelve silver florins per eimer.

The work being addressed to the whole of Hungary, we are at a loss to account for the title of "*The City of the Magyar*;" but, as we have stated, no matter under what name, these pages are altogether lively and agreeable, except in the *ennui* of political discussions.

*Chronicles of Life.* By Mrs. Cornwell Baron Wilson. 3 vols. 12mo. London, 1840. Boone.

Mrs. WILSON has at length ventured into the arena of prose-writing, and we trust will find it, as in her case it well deserves to be, more profitable than the now rather sterile field of poetry. These *Chronicles*, twenty in number, do very great honour to her talent; and will be read with deep and varied interest by all who admire the strong delineation of natural feelings, acute perception of character, and a highly dramatic skill in weaving the facts on which the narratives are built into a consistent plot, only tinged by the imagination, and wrought out with the charms of fiction, so far as to give them point and effect. The main defect in some of the most striking of them ("*The Young Jew*," for example) is, that not having space to develop her theme in action, and the description of what may be supposed to pass in the minds of the parties, the author is obliged to make them speak more directly, and express opinions in dialogue with less reserve, than is consistent with the actual intercourse of life and conversation. People think more and talk less; though there may be extraordinary circumstances which elicit extraordinary plainness among Jewish money-lenders, popular *danseuses*, and men and women of fashion in a trais for loans and with intrigues. We may also remark that the defect to which we allude is rather critical than real; for it neither detracts from the construction of the story, its *denouement*, or the admirable traits with which every passion and emotion are elucidated and brought home to the heart. Take, for instance, the following sketch:—

"Frank Hamilton was two-and-twenty. His father, a major in the army, a short time before his death, obtained the promise of a pair of colours for his son. He had now been dead three years, and the promise was not yet fulfilled. He left no fortune, and Frank was still dependent on his mother—a burden on her humble pittance. It was a life which to most men would have been a painful one,—to him it was agony. He was too proud to dun his patron, and too sanguine not to trust him. Weeks, months, and years, passed away; without a profession, without earning a shilling, he lived in hope. If in the evening he was wretched with despondency, the morning sun brought

confidence with its gladdening beams; his state of mind prevented him from directing his thoughts to any means of temporary employment; he was fitted but for few, and these were difficult to be obtained. The feelings, perhaps the prejudices, of his education made him shrink from others; there was yet a 'to-morrow' to atone for the disappointment of to-day. And to-morrow came, and went again; but hope lingered still. It was a life of bitterness. Youth's burning ambition and manhood's native pride rebelled at the dull routine of his dependent condition; his character was ardent, but sensitive and generous; and the chivalry of his feelings made them prey upon himself. It crushed the buoyancy of his spirits, and damped the exhilaration which was natural to his years; but did not engender moroseness, for his nature had not selfishness for that; nor did it make his countenance abject, for Frank possessed that native dignity which poverty cannot hide, nor wealth bestow; and which, when the heart beats proudly, although beneath a threadbare coat, will still reveal the aspect of a gentleman."

This, to our taste, is not far behind Dr. Johnson, either in sentiment or language. Here is the opening of another affecting chronicle, called "*The Pawnbroker's Window*:"—

"There is more philosophy of life to be learned at a pawnbroker's window than in all the libraries in the world. The maxims and dogmas which wise men have chronicled disturb the mind for a moment, as the breeze ruffles the surface of the deep, still stream, and pass away; but there is something in the melancholy grouping of a pawnbroker's window which, like a record of ruin, sinks into the heart. The household gods—the cherished relics—the sacred possessions affection bestowed, or eyes now closed in death had once looked upon as their own—are here, at it were, profaned:—the associations of dear old times are here violated—the family hearth is here outraged—the ties of love, kindred, rank—all that the heart clings to are broken here: it is a sad picture, for, in spite of the glittering show, its associations are sombre. There hangs the watch, the old chased repeater, that hung above the head of a dying parent when bestowing his trembling blessing on the poor outcast who parted with it for bread: the widow's wedding-ring is there, the last and dearest of all her possessions; the trinket, the pledge of love of one now dead, the only relic of the heart's fondest memories; silver that graced the holy-day feast; the gilt-framed miniature that used to hang over the quiet mantel-shelf; the flute, the favourite of a dead son, surrendered by a starving mother to procure food for her remaining offspring; the locket that held a father's hair; or, gloomier still, the dress—the very covering—of the poor is there, waving like the flag of wretchedness and misery. It is a strange, sad sight! To those who feel aright there are more touching memorials to be seen at a pawnbroker's window than in all the monuments in Westminster Abbey. At no great distance from Limehouse, about eight years ago, there was a pawnbroker's shop which had many customers, and, to judge by the mingled collection which filled its window, they were of every rank and condition of life. The shop had a high narrow door, a dim abrupt entrance, and looked like a dusty spider's web to entangle the flies of a poor neighbourhood. It had a designing look. A baker's was next door; a grocer's on the other side; and when the sun shone upon them the two latter had an honest, hearty appearance; but the former, with all its glitter,

seemed to wear a sardonic smile. Yet let not the business of a pawnbroker be judged too harshly, since, if he follow his calling honestly, he is one of the most useful members of society, as but for him the last crumbs of life would often be withheld from the lips of misery. One cold, wet night, about the time already mentioned, there were three persons lingering near the pawnbroker's. It was quite dark, and the rain falling fast, and pattering loudly in the deserted street. Each of the three appeared anxious to enter the shop, but was restrained by the presence of another already there. They were all waiting until the shop was empty, and, although they did not speak to each other, each seemed to understand the other's errand, and, with the morbid pride of poverty, to wish to execute their own unnoticed and alone. One of these was an old man whose drooping attitude, feeble step, and the abject look which his features expressed when he turned them towards the light, proclaimed him most dejected of the three. He was shabbily dressed, his long grey hair hung over his hollow cheeks, and his almost shoeless feet were soaked with the rain. He was the first to enter the shop. With a trembling hand he drew a metal watch from his pocket. The pawnbroker rapidly uncased it, and after a word or two laid a few shillings on the counter. The old man gathered them up, and hurried out of the place as if anxious to remove himself from such a scene. He was succeeded in the shop by another of those who had been lingering near it, waiting until it was empty; a poor-looking woman, wrapped in a grey cloak. She entered with a timid, flurried look, drew a worn silver spoon from her pocket, received a small sum in exchange, and glided from the shop as stealthily as she had entered. The last of the three was now left alone. It was a young woman poorly dressed, she appeared more agitated than any of the others had been, and once or twice wrung her hands as if in agony of thought. As she drew near the shop the light that fell upon her features shewed that although pale and sorrow-worn, they were of touching beauty—while her youth (she could not be more than twenty) increased the interest which her evident distress of mind was calculated to inspire. She reached the door—her hand was raised to open it, but she shrank back again, and drawing a little miniature from her bosom, looked at it wistfully by the light of the window; the tears started to her large blue eyes—she kissed the portrait, and thrusting it again into her bosom, passed on. She walked a few yards—then paused—then proceeded—then came back again. There was now another customer in the shop, she had once more to pass on. It was still raining heavily, the November wind was sweeping the dark street, and the cold blasts were piercing; yet the young woman heeded them not; the struggle which was evidently going on in her own mind rendered her insensible to the miseries of the scene around her. Again she came to the pawnbroker's door. The shop was now empty, but again she appeared to hesitate. At that instant the clock of a neighbouring church struck eight. She started at the sound, and without another symptom of irresolution entered the door-way. She drew out the miniature and laid it on the counter."

On this incident hangs the story; one of the actors in which is thus drawn, with a pen as original as observant. A few days after the funeral of the heroine's mother,

"A gentleman visited the house. He was the landlord, and Nance recognised in him the

stranger who had followed her in the street. A quarter's rent was nearly due—the Irish-woman told Nance's case to him—he listened to it patiently, and begged the young woman not to distress herself about the rent—as she would not find him a hard creditor. The heart of the poor girl bounded with joy, for it seemed as if she should now have it in her power to regain the miniature. She continued her dull, irksome labour. To her it had lost its own character, and she regarded it but as the means of getting Frank's love-gift back again; it was only when her aching fingers and the prostration of wearied nature compelled her to pause, that she laid aside her task. The landlord frequently visited her. He was a man of about thirty, the idle son of a penurious father, who, dying, had left him considerable wealth. The other inmates of the house spoke cautiously of him; he had large property in the neighbourhood; his tenants for the most part were poor, often in arrears with their rent, and the iron hand which the law gives to a landlord, and the terror which the thought of being turned out of doors gives to poverty, sealed the lips of many who otherwise would have spoken in no flattering strain of old John Walters' son. It has been truly remarked that no fools are so tiresome as those who have some wit, and with the same truth may be observed, that no vicious character is so dangerous as that which has a sprinkling of virtue in it. Jack Walters, or young Jack Walters as he was called in the neighbourhood, was a person of a strong, but depraved and ill-cultivated mind; he had been brought up with great harshness, and in a contracted, even stunted, manner by his father; and when at the age of two-and-twenty he succeeded to an ample heritage, he suffered his passions to run wild, and pursued his schemes of pleasure with a recklessness which disguised in a great measure the sordid craftiness of his character. Nor was he devoid of seeming generosity either. His name was never withheld from any cause of charity in which it might be sought—his purse was freely opened on most occasions; he was hospitable, convivial, easy to his tenants, and few acts of sordid harshness were laid to his charge. Yet, with all this, Walters was not a generous man. Wealth had come upon him too fully and suddenly to foster any great attachment to amass or to save; the command of thousands had produced a disregard for smaller sums—he had obtained possession of far greater riches than for awhile his ideas, even of extravagance, came up to the income of; hence he was easy, open-handed, and sometimes lavish from the same cause, the direction of his thoughts and passions towards other objects than the amassing of wealth. His nature, nevertheless, was essentially sordid; and when the active feelings of youth had subsided, Jack Walters bade fair to be as great a miser, as hard a landlord, and as griping and as purse-proud a man, as his father was. He now gave carelessly what he valued lightly—it was no sacrifice; were it so, it would not have been given; for Walters was incapable of making one. He pursued a course of systematic profligacy, sullied—if such a course of life is capable of being sullied—by affected libertinism, vulgar habits, and a braggart's tongue."

The style in this extract would bear some polishing, but the character is admirably true. If we do not quote more from these volumes, it is because we wish our readers to enjoy them as we have done, and have no portion of the pleasure anticipated. We unreservedly recommend them.

SAM SLICK'S THIRD SERIES.  
[Third notice: conclusion.]

WITH the following extracts we conclude our notices of this amusing book, decidedly the best of the series:—

"I've often heard the ladies say to England, —Why, Mr. Slick, nothin' seems to astonish you here: you don't seem to praise any thing; you have no curiosity about you. What do you think of that noble structur', St. Paul's Church? —Pretty well, said I, just as if we had a thousand such; but it's gloomy, and not so big as I expected.—But Westminster Abbey, says they, don't that surprise you? for you have no abbeys in America, and we think that must appear to you very wonderful.—Well, says I, quite cool, like a cornsey-sewer, it's costly, but unconvenient for a large congregation. The finish is rather gimcrack, and so is its furnitur', and them old tattered banners in the chapel look for all the world like old rags we tie to sticks in the corn-fields to Slickville to frighten away the crows. They ain't fit for a meetin'-house like that are; and if they must have flags hung up in it, as we do them we took from your frigates in a ball-room, they might as well have new ones.—Oh! says they, did you ever? Then, says they, the delightful parks round the noblemen's seats, ain't they very beautiful? you must be astonished at them, we think. Were you not struck on entering them with—?—Struck! says I; oh, yes! and most delightfully skeered too. I am a narvous man, and sometimes sing out afore I am hit. Few people is so skittish and shy so bad as I do. Struck, indeed! No, miss, I warn't struck. I'd like to see the best lord that ever trod in shoe-leather strike me for enterin' his park, or so much even as to lay the weight of his finger on me. I'd soon let him know there was a warrant out arter him. Heavens and airth! I'd chaw him right up like mincemeat, titles, stars, garters, and all. I'd knock him to the north eend of creation in less time than a cat takes to lick her paw. Struck! why the very thorts of it sets my blood all in a gallopin' boil. I don't think he'd take the trouble to do it a second time; for I'd make him cut dirt as if he heard a whole team of thunderbolts arter him. Me struck, and him alive to brag of it! Well, I sorter guess not. No one ever struck me, miss, since I first sot foot in England, nor for many a long day afore nother. That pleasure is to come yet. Strikin' a stranger ain't thort friendly with us, and I didn't think it was the fashion here.—Why, Mr. Slick, says they, hante you got that word 'struck' in the States? it means astonished, strongly affected.—Oh, yes! says I, to be sure, 'struck up all of a heap;' it's common when used in jinein' hand that way, but never stands alone except for a blow. The truth is, I know'd well enough what she meant when she said it, but I answered that way just to give her a high idea of my courage; for I suppose she thought honour was only found in Europe, and mainly among officers, the bulk of whose business is to fight when they can't help it. Then, says I, to answer your question, miss, I have seed a nateral park, says I, to home, stretchin' clean away across from the Atlantic right slap thro' to the Pacific Ocean, all filled with deer, and so big, these English parks of dwarf trees look like a second growth of sprouts on the edge of a potato diggin' in a new clearin', or a shelter grove in a pastur'. Then, says I, your lakes is about as big as our duck-ponds, and your rivers the bigness of a sizeable creek when there is no freshets.—But, says they, we know natur' is

on a large scale in America, and your rivers and trees exceed in magnitude any thing of the kind in Europe; but look at the beautiful English landscape, the rich verdure, the high cultivation, the lawns, the shrubberies, the meadows, and the groves, so interspersed as to produce the greatest and best effect.—If the sun ever shined on it, said I, it would be scrumptious enough, I do suppose; but it's heavy, melancholy, and dull; it wants light in the landscape, and you hante water to give it, nor sun nother.—We are sorry, says they, England has nothin' to please you.—Haven't you tho' ? says I,—for it don't do to run down every thing either, especially to the ladies,—so, says I, haven't you tho' ? Oh ! says I, the ladies, I must say, are quite equal to ourn. It was a whapper, that tho', but they didn't know no better; and who has a better right to lie than them that pays taxes ? It wouldn't be patriotic to say they were superior, and not perille nor true, nother, to say inferior, but they are equal, says I, that's a fact; and that's no poor compliment, I can tell you, for our ladies lick ! but I say nothin'. Now that's what I call about right, squire. To go wanderin' and starein' about, and admirin' of every thing, shews a man has nothin' to home worth braggin' of or boastin' about, or hasn't seed nothin' of the world. It would make Europeans vain, and, cuss them, they are vain enough and proud enough already, especially the English; besides, it tainte good breedin', and ain't patriotic. I like to sustain the national character abroad, and give foreigners a proper idea of our enlightenment and freedom. Bein' stumpt is a sure mark of a fool. The only folks among us that's ever nonplussed, is them just caught in the woods, and some o' them, I will say, are as ignorant as a Britisher; but then it's only them as never seed nothin' but bears and Ingians. I mind once a gail we hired as a house help. They was agued out of the west was her family, and them that the Ingians left the fever was doin' for; so they cut and runs and come to Slickville. Well, she stared and pawed at every thing a'most, and actilly was the most ougenteelest crittur ever was broughten out from among the rattlesnakes. Father axed her one day at dinner to hand him some bread.—Did yau baul for any thing, old man ? says she, or was it the old woman that yelled ? for you and granny Slick speak so much alike, I can't tell, unless I see your jans a-movein', which it is.—I asked for some bread, says father.—Well, what does she do but ups with the head of the loaf, and stretchin' out her arms, takes aim and let's fly right at him; and if he hadn't a-been pretty active in fendin' off, it would have hit him right in the face, and takin' his nose off so clean he wouldn't have missed it till he went to blow it.—Why, Suckey, says he, what on airth do you mean by that are ? why don't you hand it ?—Hand it ! says she; I never heerd of such a way as that. Father always says pitch, and when we want a thing we always shy it. How onder the sun could yau unload a cart of bricks if you didn't pitch and catch ? why it would take a month of Sundays ! If people always carried every thing that every body wanted, they might be a-carryin' to all etarnity. Didn't I pitch the loaf fair for your breadbasket ? where the plague would yau have it, eh ? \* \* \* One time we had a tea-squall to our house, and Susan handed about the tea. Well, she got thro' this well enough; but what does she do arterwards but goes round among the company with the sugar-bowl in one hand, and the cream-jug in the other, sayin',—How are yau

off, yau stranger with the factory-coat, for sugar ? and old woman with the yaller petticoat, shall I milk yau, and so on ? When she came to me I couldn't hold in no longer, and I bust out a-larfin'.—Kiss my foot, will you, said she, Mr. Sam, and mind what I tell yau, if yau go for to cut any of yaur high shines with me, I'll fetch yau a kick in yaur western end that will give yau the dry gripes for a week, dod drot my old shoes if I don't, for yau are a bigger fool than I took yau to be. She felt equal to any of the company, and so she was, politically speaking, and nothin' darnted her. It tante more nor half convenient always, but it's the effect of our glorious institutions. She felt conscious she might be the mother of a president of our great nation, and it infused a spirit in her above her grade. In fact, no one, male or female, can forget that fact, that their child mought be an Albert Gotha for eight years. As for me, he said, I never was abashed before any man since I was knee high to a goose; I hope I may be skinned if I was. I do actilly believe, if your Queen was to ax me to dine with her, I should feel no more taken aback nor if it was Phoebe Hopewell. The fixin's of the table mought be a little grain different from what I had ever heern on, seein' that she is so much richer than I be; and havin' lords to wait behind cheers at dinner would seem, at first, strange, I do suppose, but I should jist cut my eye round like wink, and see how others did, like a well-bred man, and then right and left and down the middle, as they did, as oncoisarned as if I had been used to it all my life. Afore you go, I'll pint out to you some smart men in the same grade as myself, travellin' clock-venders, or in the tin line, who are men of great refinement in dress, and considerable taste in hose-flesh, and perfect gentlemen, who pride themselves on havin' the handsomest gail, the best trottin' beast, and the dearest coats in the city, and wouldn't let no man say boo to them for nothin'. Let a British duke ax one o' them to a party without fust callin' and gittin' introduced, as one of them did to another citizen of ourn not long ago, and see if he wouldn't make him a caution to behold. I'd trouble an old gouty lord to go a-hobblin' up-stairs afore 'em, a purpose to keep 'em back, and mortify 'em, 'cause they were Americans. I guess they'd give him a lift with the tip end of their toe that would help him to mend his pace, that's all. What your idea of a gentleman is, I don't know, but I suppose nothin' onder an airt is one in your eyes; but my idea of a gentleman is jist this, one who is rich enough, willin' enough, and knowin' enough, when the thing has to be done in first-rate style, to go the full figur', and to do the thing ginteel. That's what I call a gentleman."

But we find we are relapsing into our fondness for the illustrious representative of Slickville, and must come to a stop, or fill our *Gazette*. We cannot, however, dismiss the work without copying the following more grave, but not more acute or forcible, remarks on the causes of colonial grievances:—

"The great question, then, is, what induces men in the provinces to resort to them as pretexts ? The cause now, as in 1777, is the absence of all patronage, the impossibility there is for talent to rise—want of room—of that employment that is required for ability of a certain description; at least, this is the cause with those who have the power to influence—to lead—to direct public opinion. I allude only to these men, for the leaders are the workmen, and the multitude their tools. It is difficult to

make an Englishman comprehend this. Our successful rebellion, one would have supposed, would not easily have been forgotten; but, unfortunately, it was a lesson not at all understood. This was so novel a view of the subject, and the assertion that all the recent complaints were fictitious, was so different from what I had apprehended to be the case, that I could not resist asking him if there were no real grievances in 1777, when his countrymen took up arms against us ? No, sir, said he, none; none of any magnitude except the attempt to tax for the purpose of revenue, which was wrong, very wrong, indeed; but if that which was put forth as the main one had been the real cause, when it ceased the rebellion would have ceased also. But there was another, a secret and unavowed, the more powerful cause, the want of patronage. I will explain this to you. Statesmen have always been prone to consider the colonies as a field reserved for the support of their dependants, and they are, unfortunately, so distant from the parent state that the rays of royal favour do not easily penetrate so far. Noisy applicants, mercenary voters, and importunate suitors at home, engross the attention and monopolise the favour of those in power, and provincial merit is left to languish for want of encouragement. The provincials hear of coronation honours, of flattering distinctions, and of marks of royal favour; but, alas ! they participate not in them. A few of the petty local officers, which they pay themselves out of their little revenue, have long since been held their due, and, within these few years, I hear the reformers have generously promised not to deprive them of this valuable patronage in any case where it is not required for others. Beyond this honourable parish-rank no man can rise, and we look in vain for the name of a colonist, whatever his loyalty, his talent, or his services may be, out of the limits of his own country. The colonial clergy are excluded from the dignities of the Church of England, the lawyers from the preferments of the bar, and the medical men from practising out of their own country, while the professions in the colonies are open to all who migrate thither. The avenues to the army and navy, and all the departments of the imperial service, are practically closed to them. Notwithstanding the intimate knowledge they possess on colonial subjects, who of their leading men are ever selected to govern other provinces ? A captain in the navy, a colonel in the army, a London merchant, or an unprovided natural son, any person, in short, from whose previous education constitutional law has been wholly excluded, is thought better qualified, or more eligible, for these important duties than a colonist, while that department that manages and directs all these dependencies seldom contains one individual that has ever been out of Great Britain. A peerage generally awaits a governor-general, but indifference or neglect rewards those through whose intelligence and ability he is alone enabled to discharge his duties. The same remedy for this contemptuous neglect occurs to all men, in all ages."

Our readers will have observed the number of novel and expressive Yankee-isms interwoven in Sam's style—they add much to the drollery of the narrative. As, for instance,—“I will not non-concur with you;” “Lock and lock,” for arm in arm; “wrathy;” “dreadful pretty;” “scorny;” “onfakilled;” “sum-totalized;” “extinctified;” and “a piled-up-agony” ! Altogether, Sam is as great, or greater, than ever. Can we say more ?

## MISCELLANEOUS.

*Legends of Venice.* Illustrated by J. R. Herbert, Esq., and Edited by T. Roscoe, Esq. 4to. pp. 52. Printed for the Proprietor. 1841. London: Longman and Co. New York: Appleton and Co. Paris: Fisher and Co.

THIS appears to be a new and experimental Annual. It addresses itself, pictorially and descriptively, to the romantic traditions and legendary lore of Venice; rich in materials for such inquisition and elucidation. The plates are very dramatic in their designs and effects; and, with little exception, too dark in their ensemble, and too black in their shadows. There are, however, deep expression in some of the countenances, and force in the drawing of the figures, to compensate for the prevailing blemish. The "Brides of Venice" is a bold work, though we are aware of its copying considerably from elder masters: on the other hand, the "Musician of Ma-la-Marco" is the worst performance of the set. Marino Faliero, Foscarini, Dandolo, and other historical personages, almost necessarily occupy prominent places; but there are other events less, if at all known, which Mr. Roscoe has derived from Italian authorities, such as Sismondi, Donato, Sanuto, Navagero, Morelli, Muratori, Silbellico, as well as from authors in other countries, and of which he has made good use in compiling these tragic records. In "The Mistaken Hand," to which alone we shall allude, there is mention made of a singular prophecy regarding Venice, sinking under the bloody and mysterious tyranny of the Council:—"If thou changet not (it runs), thy liberty, which is already on the wing, will not endure a century more than the thousandth year (Guingenot, vol. ix. p. 144). Now if we carry back," says the historian, "the epoch of Venetian freedom to the establishment of the government under which the republic flourished, we shall find that the date of the election of the first doge is 697; and if we add one century to a thousand, that is 1100 years, we shall find the sense of the prediction to be literally this:—the liberty will not last till 1797. In 1796, the fifth year of the French republic, Venice ceased to be free; thus to a letter verifying the prediction!"

*The Juvenile Scrap-Book.* 1841. By Mrs. Ellis, Author of "The Women of England." 8vo. pp. 86. London: Fisher, Son, and Co. In this richly embellished annual\* Mrs. Ellis adopts a number of subjects historical, antiquarian, and descriptive; and treats them in a way well calculated to interest and instruct the youthful class of readers to whom they are addressed. A more fitting present could hardly be put into their hands.

*The Protestant Annual.* 1841. Edited by Charlotte Elizabeth. Pp. 307. London: Baileys.

THE belief that the Protestant Reformed Church is threatened with danger in our days gives rise to very many and various means of justification, defence, and eulogy; and among the rest we are not surprised to see an Annual devoted to the same ends. It is a lamentable thing that so many questions are afloat to disturb the quiet of the Church, distract its unanimity, and war with the genuine spirit of Christianity. Fierce disputes, passion instead of reason, new doctrines provoking opposition, and essential as well as trivial differences of opinion zealously enforced; it is too true, vex the public mind and injure and endanger the

stability of that faith which is founded on benevolence, harmony, and love. Whether the present work be calculated to allay or augment some of these evils, we will not presume to say. Suffice it, that the polemical topics are discussed agreeably to the notions of the high Church party; and that the scriptural, historical, and imaginative contributions are of a just, moral, and pious tendency.

*Findens' Tableaux: the Iris of Prose, Poetry, and Art,* for 1841. Illustrated with Engravings by W. and E. Finden, from Paintings by F. P. Stephanoff and H. Corbould. Edited by Mary Russell Mitford. Folio, pp. 69. London: Black and Armstrong.

BESIDES the popular editress, the contributors to this gay and handsome volume are Messrs. G. Darley, J. R. Chorley, R. Townsend, H. J. Shepherd, and Miss Harrison; Miss Mitford supplying six (or one half) of the twelve pieces of which the *Tableaux* consist. They all relate to rural affairs, such as "Harvest-Home," "Gleaning," "Hop-Gathering," "Returning from the Fair," &c. &c. and are partly in prose, partly in verse. As was to be expected, these rustic sketches have all the nature and freshness of Miss Mitford's pencil; but there is not one of them which is not too long to extract whole, and too connected to be partially quoted. All we can do, therefore, for the fair tome is to recommend it cordially to the lovers of the pastoral and true. There is no working up of effects—no exaggeration, but the pretty simplicity of country life and feelings is touched with a sweet and skilful hand. The designs are rather of a finer character: we should say, too fashionable-looking for true rusticity.

*The Juvenile Album; or, Tales from Far and Near.* By Mrs. S. Lee. London, 1841. 4to. pp. 70. Ackermann and Co.

WITH eight steel engravings by T. Woolnoth, which, however, as in the preceding instance, are already familiar to us, this volume, though larger in form, is addressed to yet younger capacities; and is indeed a book for children, with pretty domestic pictures to rivet their attention. Both the prints and the text merit our commendation, as well suited to the purpose for which they are intended.

*Church Principles Considered in their Results.* By W. E. Gladstone, Esq. late Student in Christ-Church, and M.P. for Newark. 8vo. pp. 562. London, 1840. Murray; Hatchard.

IN Mr. Gladstone the Apostolic Church of England has an earnest and able champion. He maintains her cause above all others; holds a national church responsible for the condition of the people; asserts her historical and spiritual right of succession; and deems that her recent trials have only strengthened her citadel and brightened her prospects. The nature of the work forbids our meddling further with it than to say, that it displays very great ability, and a truly just and religious spirit.

*Portraits of Public Characters.* By the Author of "Random Recollections," &c. &c. 2 vols. 12mo. London, 1840. Saunders, and Otley.

THE most indefatigable of caterers to public curiosity; Mr. Grant has produced another book of the day; and a strange medley it is. The personages "shewn up," in his own peculiar style, of some knowledge, little knowledge, and no knowledge of his subjects—part from inquiry, and a greater part from previous statements—partially founded on facts and true, and partially founded on rumours and false,—in no one instance to be entirely depended

upon, and yet very amusing, like a gallery of indifferently painted portraits,—in short, the finest possible illustration of imperfect biography, a class of authorship which requires more painstaking and research than any other in the whole circle of literature, but which our author concocts *more suo*, as it seems from the number and circulation of his productions, quite to the satisfaction of himself and publishers:—these personages being first and last,—Prince Albert and George Robins; and between them the Duke of Cambridge and George Cruikshank, Lord Clarendon and William Cloves, Lord Hardwick and Robert Owen, Mr. Muntz and Count d'Orsay, Sir Peter Laurie and N. P. Willis, Macready and Thomas Tegg, John Murray and Thomas Carlyle, Sir Charles Forbes and Sheridan Knowles, Campbell, Moore, Under-sheriff France, the Rev. Hugh M'Neile, Judge Haliburton, Mr. Adolphus, Mr. Easthope, Colonel Conolly, the Common Sergeant, the Rev. W. J. Fox, Joseph Sturge, Mr. Charles Phillips, George Byng, Thomas Clarkson, Mr. Clarkson (barrister), Daniel Webster, the Recorder of London, William Allen, and the Lord Advocate of Scotland, Rutherford. Such and so various are the men, and not a woman allowed (we dare say the sex will afford a future series); and what with his own observations as a newspaper reporter, the hearsays of the hour, and other sources of intelligence accessible to the casual inquirer, the whole is done up into a *mélange* quite as good and as readable as any of the preceding works from the same hand. The shrewdness and smartness of the author as a humorous caricaturist being cited from the "Edinburgh Review," it would be ill-natured in a less imposing reviewer to express a different opinion; and therefore we acknowledge Mr. Grant's smartness and spicings of personalities as ingredients to recommend his performances, with all their blemishes, to the readers for mere entertainment.

*Olla Podrida.* By the Author of "Peter Simple." 3 vols. 12mo. London, 1840. Longman and Co.

PRINCIPALLY a republication of such of Captain Marryat's contributions to periodicals which it pleases him to acknowledge, and repudiating all else as fugitive cast-aways. A volume and a half is given to the "Diary of a Blasé," a popular and piquant picture of Continental life. "The Monk of Seville," a five-act serious play, finishes the second volume; and the third is occupied with various clever sketches and light pieces, such as have hitherto entertained the public from the author's spirited pen. We dare not quote from memory at the risk of repetition, and have only to say that this miscellany is well fitted to dispel the dull hours of the general reader.

*Irish Life: in the Castle, the Court, and the Country.* 3 vols. 12mo. London, 1840. How and Parsons.

THE author says, "We wholly discard all rules of ordinary fictionists," which being the case, we may wholly discard all rules of ordinary criticism, and leave these three volumes to themselves. We dare say they are descriptive of actual circumstances, but then they are circumstances of such small interest that we care nothing about them, their progress, or their termination.

*Jest and Earnest: a Series of Essays.* 12mo. pp. 221. London, 1840. Cunningham.

THESE are the essays of a young, but very observant, writer, and bear the impress of talent, which only requires to be cultivated and cherished to ensure future fruits of high flavour. A clever engraving as a title-page in-

\* By Topham, Allom, Prout, Harding, Bartlett, Gill, Turner, and other eminent artists.

dicates the humour and gravity of the writings; and a smart preface prepares us for their variety. The numerous sketches of individual character, though slight, are founded both on a knowledge of life and a liberal fancy; and altogether, with the anecdotes, tales, and descriptions interspersed, the volume is a pleasant one, which does honour to a literary debutant.

*The Parlour Table-Book.* Written and Selected by the Author of "Lives of the Sacred Poets." 12mo. pp. 273. London, 1840. Rickerby.

THE nature of his preceding publication, and a dedication of this volume to James Montgomery, sufficiently indicate the bent of Mr. Willmott's studies and genius. His selections accordingly belong to the graver and purer classes of literature, and display his taste for elevation of thought and eloquence of expression. He has ransacked a multitude of our best authors for the fine extracts with which this volume is filled. His own compositions also shew a kindred spirit; and taste and intelligence mark his productions, whether they are based on classical reminiscences or exercise a critical judgment on more modern topics. The whole *recueil* is an interesting table companion, not only for the parlour, but for every room in a house where the *belles lettres* are cherished.

*The Cashmere Shawl.* By Charles White, Esq., Author of "Almacks Revisited," "The King's Page," &c. 3 vols. 12mo. London, 1840. Colburn.

THE author, who is a Sahib Calem (i. e. man of the pen, or quill-driver), gives us here an Oriental story, illustrating much of Eastern manners and customs, with which he seems to be familiar. The narratives are rather disjointed, but altogether they display a likely picture of the various people among whom the scenes are laid.

*The Five Empires.* By R. J. Wilberforce, M.A. &c. &c. Pp. 280. London, 1840. Burns.

AN outline of ancient history from the creation, through the Assyrian, Persian, Grecian, and Roman empires (the fifth, we presume, consists in the existing state of the world); with religious applications, and shewing the fulfilment of prophecies. It is very neatly got up, and has some etchings of curious sculptures, medals, &c. &c.

*The Literary Amaranth; or, Prose and Poetry,* by Nathan C. Brooks, author of "Scripture Anthology." Pp. 264. (Philadelphia, Kay and Brothers; Baltimore, Cushing and Brothers.)—A portrait of Mr. Brooks is prefixed to this collection of his fugitive pieces, in Latin, Greek, English, prose and verse. We are bound to welcome a stranger across the ocean, but, in sooth, we cannot speak very highly of these productions; which, having fulfilled their destiny in periodicals, were hardly worth a more Amaranthine stamp.

*Life of Mahomet Ali.* Pp. 96. (London, Churton.)—Pro tempore an acceptable little book, with a portrait of the pasha, a map of the seat of war, an account of his life in fifty pages, and an appendix of the Quadruple Treaty, and the principal official papers of Lord Palmerston and M. Thiers.

*Mahomet Ali, Lord Palmerston, Prussia, and France,* by W. Cargill, Esq. 8vo. pp. 96. (London, Reid and Co.; Newcastle-upon-Tyne, E. and T. Bruce.)—Another publication called forth by the existing position of affairs. Mr. Cargill takes an alarming view of the increasing power of Russia, and espouses the cause of the Pasha of Egypt in many of the circumstances in which he has been opposed to English and other interests.

*Church Tracts,* &c., by J. A. Thorntwaite. 18mo. (London, Groombridge.)—A volume in which many tracts in support of the reformed religion are incorporated, for the instruction of young churchmen and the benefit of the Protestant community at large.

## ARTS AND SCIENCES.

### GEOLOGICAL SOCIETY.

WEDNESDAY was another great night with the Geological Society, in consequence of the

continued discussion of M. Agassiz's Glacier Theory. Nearly all our leading geologists took part in it.—Buckland, Lyell, Greenough, Murchison, Whewell, Agassiz; and much animation was displayed *pro* and *con*. Some strong objections were urged, at least to the more general or universal application of the theory; but it seemed scarcely to be denied that ice must have had a very extensive and important share in producing the moraines or accumulations of gravel seen in almost every temperate region, in marking and striating the rocks, noticed by M. Agassiz, and producing phenomena hitherto inexplicable to the science. Above all, proving that the last great change on our earth's surface was from cold and congelation to a warmer temperature and the dissolution of the ice.

### STATISTICAL SOCIETY.

FIRST meeting of the session 1840—41.—Colonel Sykes in the chair.—Two fellows were elected.—A paper 'On the Mortality among the Poor in the City of Limerick,' by Dr. Griffin, was read. The population of Limerick in 1821 was rated at 59,045, and in 1831 at 67,576, of which number 44,100 were said to be in the city and suburbs, and the remainder in the rural districts called the Liberties. The city is divided into the English town, the Irish town, and the New town, called Newton Pevy. The inquiry which gave rise to the present paper extended to 1023 families, comprising 4461 individuals whose ages were ascertained, with the exception of sixty-six. The total number of deaths up to the time of the inquiry was 3014; but the ages of seventy-one were unrecorded. Out of 2943 deaths, at all ages, there occurred 37.2, or three-eighths per cent under one year; 62.7, or five-eighths per cent under three years; 75.1, or three-fourths per cent under five years. The number of deaths, on the other hand, at an advanced age, was very small. Between fifty and sixty there occurred forty-five deaths; between sixty and seventy, thirty-four deaths; between seventy and eighty, six; and above eighty, only one! A small proportion alone of those living reached longer ages in these families. Out of 4322 persons whose ages were ascertained, there were living, between fifty and sixty, only 278; between sixty and seventy, 136; between seventy and eighty, thirty-five; and at eighty and upwards, only six. All the deaths occurred since the period of marriage; and the duration in this term was taken down in about 789 families. From this the mean duration was found to be nearly eighteen years, and the annual mortality about 5.24 per cent. This high rate of mortality is, no doubt, in some degree owing to local circumstances; to the closeness of the houses, and the narrowness and filth of the lanes; as well as to the state of destitution in which the lower classes always live; and this is evident from the deaths that occurred in a different class in the same city. The following are the deaths that occurred in three Tontine societies established in Limerick in 1807, 1811, and 1814. In the Tontine of 1807, the original nominees were ninety-five, and there had been twenty-nine deaths in thirty-three years, or one in 108 annually. In the Tontine of 1811, the nominees were thirty-five, and of these twelve died in twenty-nine years, or one in eighty-one annually. In the Tontine of 1814, the nominees were also thirty-five, and the deaths in twenty-six years amounted to five, or one in 182 annually. These two facts, the deaths among the poor, and the deaths in the Tontine societies, may be considered to represent the extremes of mor-

tality,—the maximum and minimum of the waste of human life in Limerick. The productiveness and loss of children were as follows:—Mean number of children born in each family, 5.48; mean number lost in each family, 2.89; percentage of deaths on the number born, 51.79. Passing over other statistical details, we are told that the women (Limerick) carry on some little trade on small earnings out of their husbands', from the profits of which they obtain a very scanty subsistence; and sometimes a superior article of dress is pledged on Monday morning to obtain the little capital this trade requires, and is released on Saturday evening. In this manner the husband's Sunday coat has been released on Saturday evening for the purpose of being worn on Sunday, and returned to the pawnbroker's on Monday morning. But should the week's trade be unsuccessful, article follows article, until every thing on which a penny can be raised disappears, and immediate destitution follows. Dr. Griffin observed among many families, whose circumstances were of the most wretched description, a feeling of independence which caused them to shrink from accepting relief in a workhouse so long as it was at all possible to exist without it. Several individuals stated that they would be quite satisfied if they could by any means obtain a few potatoes once daily. Many were of a class who had seen better days, and were, in general, unwilling to complain: with these feelings of independence, they must inevitably languish and die away under such distressing circumstances; and it is, therefore, obvious that if it is found impossible to devise any means of procuring for them constant employment, such attention should at least be paid to the preservation of their health as may prevent them from being disabled for such occupations as may occasionally fall in their way. Some conversation followed the reading of Dr. Griffin's paper.

### BOTANICAL SOCIETY.

NOVEMBER 6th. Dr. H. A. Meeson in the chair.—Announced, donations of plants, British and foreign.—Exhibited, by Mr. Baxter, *Aspidium rigidum*, collected by Miss Beaver, near Silverdale, Westmoreland; by Mr. Gardner, jun., *Jungermannia ciliaris*, with *Calyces*, collected at Bassies Clova; by Mr. H. C. Watson, and presented to the Society, a specimen of *Trifolium repens*, in which the pistil had become a single leaf, and the segments of the calyx were more or less leaflike.—Read, 'Note on *Aspidium rigidum*,' by the Rev. W. T. Bree; 'Remarks on *Aspidium dilatatum* and *spinulosum*,' by Mr. S. P. Woodward; and the commencement of a paper 'On Mikaina Guasco,' by Mr. Harvey, who had long resided among the hunters of South America, and had proved in his own person the efficacy of the "Mikaina Guasco" to prevent hydrophobia. He had been bitten in the thumb by a rabid hound, foaming mad; he was made to drink freely, both at and between meals, for forty days, of the guasco decoction, and he experienced no ill effects from the bite. The value of the guasco, in this respect, is well known to the natives; as also for its antidotal properties and powers over venomous reptiles. The native huntsmen frequently mix it with their dogs' meat, and, in consequence, canine madness amongst the native animals is rare.

### PARIS LETTER.

Academy of Sciences, Nov. 17, 1840.

SITTING of November 9.—*Altitude of Clouds.* M. Pouillet read a learned memoir 'On the best Method of Determining the Height of

Clouds from Observations at the Surface, —a level surface, for instance, as distinguished from mountainous regions. He took a review of the various methods hitherto attempted, and mentioned the principal objections to them. His own opinion was in favour of one of the first thought of — that of simultaneous, or nearly simultaneous, observations being made on the same cloud by persons at the extremities of bases of known length. Thus, though it might be almost impossible for two distinct observers to make the requisite observations, yet, since any very remarkable point of a cloud did not so much alter its form and position on a tolerably fine day as to change considerably during the lapse of two or three minutes, it would be possible for a single observer to transport himself from one extremity to the other of a known base, and then take a second observation. Thus M. Pouillet recommended that a base of about 3000 feet should be chosen and carefully measured, and that theodolites should be fixed at each extremity. Chronometers should also be appended, and should be made to coincide even for seconds. Two observers should then meet in the middle of the base, and after having studied the sky and selected their cloud, and the point of the clouds to be observed, should transport themselves as quickly as possible to their respective extremities of the base, and there make simultaneous observations. M. Pouillet then laid down the following formulae:—

Let  $b$  be the length of the base, supposed horizontal;  $h$  the perpendicular height of the point of the cloud above the horizon;  $d$  and  $d'$  the distance of this point from each extremity of the base;  $p$  and  $p'$  the horizontal projection of  $d$  and  $d'$ ;  $\alpha$  the angle made by  $d$  and  $d'$ ;  $m$  the angle made by  $p$  with  $b$ ; and  $\alpha'$  the zenith distance;  $m'$  and  $\alpha'$  the corresponding angles at the other extremity of the base by  $p'$  and  $d'$ . The following equations will then be obtained:—

$$\begin{aligned} n &= 180^\circ - (m + m'), \\ p &= b \cdot \frac{\sin m'}{\sin \alpha}, \quad p' = b \cdot \frac{\sin m}{\sin \alpha}, \\ d &= \frac{p}{\sin \alpha}, \quad d' = \frac{p'}{\sin \alpha}, \\ n &= d \cdot \cos \alpha, \quad n' = d' \cdot \cos \alpha'. \end{aligned}$$

Then, when the observations are made at a small altitude above the horizon, the perpendicular let fall from the point of the cloud on the horizontal plane of the base will not coincide with the vertical, and the real altitude of the cloud above the plane will be expressed by the formula

$$H = \frac{h + r' \cdot \sin^2 \frac{c}{2}}{\cos c}$$

when  $r$  = terrestrial radius for the station, and  $c$  = the terrestrial arc between that station and the spot; of which the point of the cloud forms the exact zenith.

M. Duméril read to the Academy the result of several experiments on glow-worms, and other luminous insects, by which it appeared that this state of phosphorescence which was emitted by their sexual organs ceased the moment that the act of infecundation took place.

M. Munck, who had been sent into Egypt by the Minister of Public Instruction to look for MSS., has returned to Europe from his mission. The results of it, which have been much impeded by the state of political affairs in the East, is, that he has brought back a copy of the "History of Physicians," by Ibn-Abi-Osabee; a volume of the "Chronicle of Ibn-al-Athir;" and the "Sihah" of Djanhar. A considerable number of volumes on the rites and usages of the sect of the Cassites, and a gigantic

commentary on the Bible, of the tenth century, which he obtained from some Carates of Cairo, have also been procured by this gentleman.

M. Charles Constant le Tellier, a learned grammarian, died at Passy a few days since, aged seventy-nine.

#### NEW PUBLICATION.

*Map of Syria, Ancient and Modern.* By J. Wyld, Geographer to the Queen. London, 1840. Wyld.

WE have to notice this excellent and timely map with which Mr. Wyld has so appropriately enlightened our daily political reading. It is quite an essential to the understanding of the newspapers of the day, and is executed in the artist's clearest and best manner.

#### LITERARY AND LEARNED.

##### UNIVERSITY INTELLIGENCE.

Oxford, November 12.—The Rev. W. A. Evanson, M.A., of Trinity College, Dublin, was admitted ad eundem.

The following degrees were conferred:—

*Doctor in Civil Law.*—R. C. Sewell, Esq. Barrister-at-Law, Fellow of Magdalen College.

*Master of Arts.*—Sir W. C. James, Bart. Christ Church, Grand Compounder; Rev. W. J. Burgess, Exeter College; Rev. E. B. Ellman, Wadham College; A. Slocock, Trinity College.

*Bachelors of Arts.*—R. Hill, Worcester College; J. H. Janvris, Oriel College, Grand Compounders; Francis Baron de Paravicini, W. P. Walsh, T. E. Dorville, H. W. Cooke, Worcester College; J. D. Durell, Rev. I. Fisher, New Inn Hall; F. V. Cartwright, St. Mary Hall; G. Burder, H. Strong, E. Roberts, Magdalen Hall; J. H. Ashurst, G. J. Ford, Exeter College; N. Morgan, A. B. Stuart, W. C. Howell, Brasenose College; F. L. Colville, G. E. Alexander, Trinity College; C. G. T. Barlow, T. Woodhouse, J. Cooke, Balliol College; C. D. Everett, Queen's College; R. Lloyd, Merton College; A. Byge, J. E. Cox, University College; A. Mosley, Oriel College; O. A. Hodgson, Magdalen College; T. K. Chittenden, Fellow, F. W. Trenow, J. Scotland, S. Clarke, St. John's College; R. Cooper, T. Clarke Whitehead, E. Boys, L. Dobinson, W. O. Maclean, Wadham College; R. Cozens, Pembroke College; T. Debeny, J. White, J. L. Longmile, Lincoln College; P. Story, Hon. E. L. Gower, Christ Church.

#### ROYAL SOCIETY.

**THE Marquess of Northampton in the chair.**—We notice this meeting chiefly because it was the first of the session, for the sitting was principally occupied with the reading of abstracts of papers by Dr. Roget, which had been communicated at the close of last session.—A brief memoir by Professor Airy was then read. This paper is a supplementary one to other communications by the Professor, 'On a New Theory of the Polarisation of Light.' The pith of the paper is conveyed in symbols; hence no report. Professor Airy's theoretical investigations lead him, in some respects, to differ with Mr. Talbot on the same interesting subject.

#### ROYAL ASIATIC SOCIETY.

**THE present condition of Kurachee, to which we introduced our readers in our last, is stated to be of the most miserable description. The houses are huddled together without any regularity; they are intersected by very narrow alleys, just allowing the passage of two persons; and are built either of wicker-work, plastered with mud; or of mud alone. Although plenty of stone is found in the neighbourhood of the town, it is not used in building, because it is not the Sindhan custom to do so. The windows are very few, and are merely loopholes. The doors are narrow, and rarely perpendicular: a single "shovel-shaped chimney" lets out the smoke, and admits the wind and rain. It is remarked that the character of the place is indicative of the lightness of the moonsoon, and that a week or ten days' rain, such as is experienced in Bombay, would lay the whole level with the ground. The timber of Sindh is in-**

variably small; no large trees whatever grow in the territory; and the shipwrights import teak from the Malabar coast at considerable cost. Tiles and bricks might be made; and some persons have recently attempted to establish such a manufacture, but with little success, from the smallness of the demand, though there is a considerable manufactory of earthen vessels in the town. Limestone of good quality is found in the neighbourhood; and considerable quantities are brought to the town for the purpose of making *chunam*, which is used for plastering the terraces of the more wealthy inhabitants. Good thatch is manufactured of *pun*, a sort of bulrush like the *panbajree* of many Indian rivers. This *pun* is obtained in large quantities on the delta of the Indus, and a great deal is brought to Kurachee, where it is much employed, and is found to be an effectual defence against the rain. Hinges, nails, and other ironmongery, are rudely manufactured at Kurachee; but much is also imported from Bombay: paint, oil, and dammer, are also imported, and sold at high prices. There being no roads through the country, all carriage is performed, on the backs of oxen, asses, or camels. The two former animals are strong and efficient; but the camel is very inferior to that of India, and cannot travel under a heavy load. The workmen to be had in Kurachee are described as very unskilful, and remarkably indolent. Half their time is employed in smoking, attended by a pipe-bearer, the hire of whom is paid by the employer of the workman. Any bricklayer or carpenter of Bombay, however unskilful, will perform three times the work of a Kurachee artisan. Boys are employed to carry rubbish, and beat *chunam*; and they exert themselves far more readily than do the men. The paper concluded with a remark that with all these disadvantages, it is not to be wondered at that Kurachee should have the appearance of having been built after the models supplied by the beaver, the magpie, and the pismire.—The Secretary read a portion of a report furnished by a Committee nominated by the government of India, with reference to the production of coal in the different provinces subject to our dominion in the east. This summary was kindly sent to the Society by the East India Company. It contains a very satisfactory account of the resources producible in the East in aid of steam navigation; and the investigations extend over Tenasserim, Assam, Sylhet, Cuttack, Burdwan, Rajmahal, the Soan, and the Nerbudda. The portion read embraced that part of the report relative to the Tenasserim province.—The next meeting was announced for the 21st instant.

#### THE SOCIETY OF ANTIQUARIES

**HELD their first meeting for the season on Thursday.** Mr. Amyott, Treasurer, in the chair.—The Secretary announced a long list of books presented to the Society.—Sir Edward Home presented four drawings of the ruins of Odham Castle, with a description of the site.—Mr. C. R. Smith exhibited drawings of a large number of Roman antiquities, discovered near Strood in Kent, and described in a communication to the Society, by Mr. Smith, in May last.—Mr. Corner exhibited a sketch, accompanied by a short description, of a very curious wheel-window, discovered in the Temple Church during the repairs now in progress there.—A paper, accompanied by drawings and a ground plan, describing some very ancient ruins at Crendi in Malta, apparently an extensive temple, containing several large apartments, altars, some rude statues, &c., communi-

cated by Mr. Vance, was partly read, and the remainder postponed.

#### LITERARY AND SCIENTIFIC MEETINGS FOR THE ENSUING WEEK.

*Monday.*—Geographical, 9 P.M.; Medical, 8 P.M.  
*Tuesday.*—Medical and Chirurgical, 8½ P.M.; Zoological, 8½ P.M.  
*Wednesday.*—Society of Arts, 7½ P.M.; Medico-Botanical, 8 P.M.  
*Thursday.*—Antiquaries, 8 P.M.; Royal Society of Literature, 4 P.M.; Numismatic, 7 P.M.  
*Friday.*—Botanical (Anniversary), 8 P.M.  
*Saturday.*—Royal (Anniversary), 8 P.M.; Westminster Medical, 8 P.M.; Guy's Hospital Physical Society, 8 P.M.

#### FINE ARTS.

##### NEW PUBLICATIONS.

*Heath's Children of the Nobility.* Portfolio. In our last the letterpress of this publication was noticed, and we have here only briefly to speak of it as a production of art. A. E. Chalon has delineated five of the eight engravings with his accustomed talent, and something of that flutter which is, perhaps, a characteristic of fashionable dress. The best group is that of the three Ansons, where a little Puck-looking figure is very clever. In the Lascelles, the pretty, simple employment of stringing daisies is not kept in countenance by the little artisan, who is looking thoughtfully out of the picture instead of the work in hand. In Lord Chesterfield's boy and girl, the latter is very wooden doll-like, and the former has an odd expression of face—a remark which equally applies to the boy in Lord Charleville's family party, where, however, the girl is very lovely, and has her pet dog, a King Charles's breed, to match. Mote and Edwards are the engravers of these, and have done justice to their task. The remaining three pieces are Blanche Stanhope (daughter of Lord Harrington), a sylph in the attitude of dancing, and charmingly done by Hayter (engraver, Austen); Lord Cavendish, by Lucas, a manly infantile portrait, if we can so speak, though the head and hat seem large and ponderous for the child; and, finally, two Curzons, by Ziegler, of which performance we can say nothing in commendation. In one or two other plates there are hands and feet that would not bear anatomical examination, but we are not going to extremes in our critique.

#### *Heath's Picturesque Annual: Belgium.* Portfolio.

SIXTEEN, justly stated to be highly-finished engravings, from original drawings by T. Allom, are the fine embellishments of this Annual. The subjects are as well chosen as their execution is excellent: at Brussels, Ghent, Mechlin, Antwerp, Liege, Louvain, with two landscapes on the Meuse, furnish abundant objects, which have been treated with all an artist's taste and skill, under various aspects of light and shade, interior and exterior, moon and sun, with and without groups, so as to afford as much variety as beauty for the gratification of the spectator. The engravers, W. Wallis, J. B. Allen, Mottram, Radcliffe (2), Higham, J. H. Le Keux, J. C. Varrell, E. Roberts, Bradshaw, Capone, M. J. Starling, Prior, Deeble, T. Turnbull, and T. Goodman, appear in most honourable competition, and it would be difficult to pronounce to whose talent the greatest merit was due.

*The Providential Deliverance of John Wesley, when Six Years of Age, from the Fire of the Parsonage-House at Epworth, Lincolnshire.* Painted by H. P. Parker. Engraved by S. W. Reynolds. Parker.

An animated scene, painted for the Centenary Hall of the Wesleys in Bishopsgate Street. The child being rescued from the flames, the

father praying fervently for his escape, the cattle being with difficulty removed, and the various interesting groups of human beings differently affected by the dangers and events around them, are all portrayed with spirit and effect. As we noticed the picture, however, at great length, we need only say that its merits are faithfully preserved in the engraving.

*The Duke of Wellington, in his Robes as Chancellor of the University of Oxford.* Painted by H. P. Briggs, Esq. R.A. Engraved by G. H. Phillips. Hodgson and Graves.

This is a beautiful work of art, and, as we intimated last week, claims the especial attention of members of the University, and all who would love to see the hero in the robes of peace.

#### *Findens' Portraits of the Female Aristocracy of Great Britain.* No. XV.

CONTAINS portrait of Lady Susan North, from the pencil of A. E. Chalon, R.A., engraved by W. H. Mote; Lady Olivia Conway, painted by C. J. Basevi, engraved by Findens; and Lady Georgiana Toler, painted by John Hayter, and engraved by W. H. Holl. This number, like all which have preceded it, displays the same uniform excellence in the execution which distinguishes others of Messrs. Findens' publications.

*The Blue Stocking.* Engraved by H. Rolle, after the Painting by R. W. Buss. A. Graves.

A FINISHED satire, as well from its point as from the style of its execution, which, like the works of the late Theodore Lane, may give it a value in the eye of the collector, as its humour will in that of the general observer. The mania of the scribbling lady is heightened by the ridiculous situation in which she appears of starting from her bed to jot down a thought; leaving her helpmate to quiet the awakened infant. A further interest is imparted by the elegance of her figure; for

"Satire itself may have a grace,  
 Nor always shew a frightful face."

*Six Views of Singapore and Macao, from Drawings made on the Spot in 1840.* Ackermann and Co.

THESE lithographs are executed with spirit, and afford perfect ideas of two places of more than common interest at the present time. The dwellings of our countrymen, and the means of defence, are not only pictorial, but gratifying objects.

*Dundee. Painted on the Spot, Oct. 1830.* By W. J. Huggins, Marine Painter to his late Majesty, William IV.; Engraved by E. Duncan. Huggins.

A PANORAMIC and tinted view of the beautifully situated town of Dundee; which has, however, made great advances in prosperity within the ten years since Mr. Huggins exercised his faithful pencil upon it. The town, with the noble *déboisement* of the Tay, is picturesque; but the effect is greatly improved by the mountain scenery by which it is encompassed. Altogether, this is a very sweet and pictorial production, and the natural charms are enlivened by ships, boats, and figures, skilfully introduced, and artistically disposed.

#### BIOGRAPHY.

##### GEORGE CHAMBERS.

THE following account of that able and interesting young artist, George Chambers, may

not be unacceptable to the possessors of his works, or to those who take delight in watching the efforts of genius surmounting all obstacles in an arduous career.

George Chambers was the son of a seafaring man, of Whitby, in Yorkshire, where he was born on the 3d of September, 1803. At ten years of age he was sent to sea with his uncle, the owner of a small sloop trading on the coast, with whom he remained two years. He was there bound apprentice to Captain Storr, of the *Equity*, a brig trading to the Baltic and Mediterranean. Whilst on board this vessel his taste for painting first manifested itself, for he frequently occupied his leisure hours in sketching with a pencil on scraps of paper: here he served five years, at the end of which period, feeling unequal to the hardships of a sailor's life, and bent on following the inclination of his mind, he obtained, though with difficulty, the cancelling of his indentures.

We afterwards find him in London, befriended by Mr. Crawford, through whose interest with the captains of vessels he got employment in painting the portraits of their ships; which, for their extreme accuracy, gave general satisfaction. This kind patron persevered in assisting him in every way in his power, and has done so through life: he procured for him a situation as painter in the Colosseum; indeed, he could do that of which few artists were capable, namely, painting whilst swinging in a cot suspended by a single cord at a considerable height from the ground. An appointment as scene-painter to the Pavilion Theatre was also procured for him; where he displayed his talents in an eminent degree; and it was by his beautiful scenes that he attracted the public admiration, and acquired many patrons. Amongst others, was Admiral the Hon. Sir Thomas Bladen Capel, and the late benevolent Admiral Lord Mark Kerr, who, being struck with his powers of depicting nature, and the freedom of his pencil, took him by the hand, and introduced him to that well-known patron of the arts, Mr. Carpenter, who, seeing a second Bonington in young Chambers, lent him all the countenance and aid in his power. Thus assisted, he painted several well-known pictures, one of which was the "Ferry Boat," exhibited about ten years ago in Suffolk Street, and which procured for him many commissions. About this time, Lord Mark Kerr obtained for him the patronage of William the Fourth, to whom and his royal consort, Queen Adelaide, he was personally introduced. They gave him several works to execute, in which he was eminently successful: one of them represented the opening of London Bridge, and was presented by his late majesty to Sir Byam Martin.

He had now obtained the great object of his wishes; his merit was acknowledged; he had only to give the reins to his imagination; but, alas, how brief is human happiness! little did those less-favoured artists, who perhaps envied him his lot, know of his constant sufferings—alleviated, it is true, by the unwearied attentions of his kind physician and friend, Dr. Roupell. But the disease at length grew beyond all human power to control—an aneurism of the aorta, possibly occasioned by some great effort of bodily strength while at sea, gradually increasing until it burst, and put an end to his sufferings at Brighton on the 29th of October last. It was a source of comfort to him to know, that his royal patroness Queen Adelaide was the purchaser of one of his last drawings, at the Old Waterloo Gallery, of which he was a member; and it will be gratifying to those who possess his latest productions, to be aware that

their liberality had assisted him materially in his last days; for poor Chambers, besides his well-known unassuming disposition, was of too liberal a mind, and had too much to contend with, to have accumulated property. He has left a widow and three children, two of whom are promising lads, the other an infant girl.

Amongst the commissions which he felt most proud of receiving were those for Greenwich Hospital. Having been selected by Mr. Locker to paint for that national repository some of the battles of his country, he will there be handed down to posterity by the nation which will be proud of the young sailor artist.

#### ORIGINAL POETRY.

TO THE AUTHOR OF "THE PLEASURES OF MEMORY,"  
ON RECEIVING SOME FLOWERS FROM HIM.

Oh! that some magic art could give  
These fragile blossoms power to live  
Coeval, Rogers, with thy song,—  
Then should they flourish fair and strong,  
Until the language that we speak  
Becomes as dead as Homer's Greek.  
To perish, then? No, future times  
Shall crave translation of thy rhymes;  
And Rogers, then too learned grown,  
Live in a language not his own.  
Oh, foolish thought! oh, vain endeavour!  
To wish a flower to bloom for ever. C. M.

#### SPEAK TO MAMMA.

WHEN the gentleman comes to the point,  
And proposes to Ellen or Charlotte:  
To cry "My dear man, to be sure!"  
Would be going a little too far—  
And young ladies can't do it, of course;  
So they blush, and say, "Speak to mamma!"  
Then the gentleman mounts to his feet,  
And, kissing his Ellen or Charlotte,  
Says many adorable things,  
Which ain't true, though he vows that they are;  
And, fixing his hat on his head,  
Sets forward to "speak to mamma!"  
Who's remarkably soon to be found—  
Being up to Miss Ellen or Charlotte,  
She sits, with her work in her hand,  
Alone in the little back-parlour,  
And hopes that that girl won't forget  
To remind him to "speak to mamma!" SNOOK.

#### SKETCHES.

##### NORTH AMERICAN INDIANS.

WE have several times directed attention to "Catlin's Indian Gallery," containing portraits, landscapes, costumes, representations of manners, customs, &c. As an exhibition it has attained great popularity, and has been admitted to be a most complete pictorial history of the red men, amongst whom Mr. Catlin spent eight years of his life with an enthusiasm and devotedness rarely paralleled. During his sojourn in the tents of the wanderers and in the wigwam villages of the stationary tribes, he was treated with a friendliness and respect, the firmer and deeper because imbued with superstitious awe. How far this latter feeling influenced the Indian it is not now our intention to canvass, or with what deduction, therefore, Mr. Catlin's testimony should be received as to the honour and honesty of his entertainers. The awe, however, was felt towards him, the artist was considered a spirit with power to create half-life; the portrait, with the eye ever resting on the beholder, evidenced to the thousands who looked thereon the power of the hand of him who appeared to have called the half-life into existence; and that hand was dreaded. Fear is the religion of the uneducated; superstitious fear, the restraint of the savage; and must be an element in any investigation of the character of the North American Indians. This we may have occasion to discuss at length when Mr. Catlin's promised work may be published. At present we desire to recommend to our readers a visit to the evening

\* "Oh! that the chemist's magic art," &c.—Lines to a Tear.

exhibitions at the Egyptian Hall, and promise them much gratification. The pictorial illustrations and the costumes, &c. hanging on the walls of the gallery, afford a vivid idea of the prairie people. But representations on the stage were wanting to realise that idea. These are now supplied, and are most picturesque and curious. The spectator beholds the representatives of the Indians, dressed in their very costume, and instructed by one well-acquainted with the practices of the characters they enact, go through the ceremonies of the several dances with all the gesture, action, shouts, and yells, incident to the real scene. Uniformity of costume would add to the tribal truth of the exhibition, but its absence detracts nothing from the exciting effect and reality of the representation. The dances of the Indians are numerous, many of them religious ceremonies, for instance, the Buffalo Dance among the Mandan tribe, with the mask of the buffalo on, to make buffalo come. It is—or rather was, for the Mandans, a tribe of 2000, have been recently destroyed by small-pox, introduced by the traders, "they hold nowhere an existence on earth,"—generally danced when starvation stared them in the face, and always accompanied with a song to the Great Spirit, imploring him to send them buffalo, and promising to cook the best of it for him. This promise was invariably most religiously fulfilled, and before a morsel was used to satisfy their craving hunger. The Green Corn Dance (the tribe of Minatawees, or People of the Willows), when the first kettle is sacrificed to the Great Spirit. The Snow-Shoe Dance (Ojibbeways), at the first fall of snow, with a song of thanks to the Great Spirit. Snow-time is the period of plenty; the buffalo herds are easily tracked and overtaken, and great slaughter is made amongst them. Several other dances have religious tendencies. One we beheld on Monday evening was the nightly dance, or the ceremony of putting the fire out by dancing round and stamping thereon; the occurrences of the day are recited, and thanks for benefits received offered up. The war-dance of the Sioux, the taking of the scalp, the tracking an enemy, coming in view, trailing along the ground to approach unobserved, shooting the arrow, throwing the tomahawk, the retreat backwards, covering the footmarks, &c. &c., were severally and well represented. We had evidence of the truth of these several exhibitions in the countenance of a Seminole boy on the platform in his native costume. A curl of his lip once or twice appeared to bespeak the poverty of the imitation as compared with the enthusiastic excitement of the real ceremony, but his fixed attention and his glistening eyes gave full proof of the faithfulness of the scene. This lad has been recently brought to England to be educated; he has an intelligent look, and has already acquired great proficiency. Between the dances, during a pause in the performances, one of the spectators, Mr. Hoskill we understood, requested permission to address the audience. He spoke to confirm Mr. Catlin's relation of the cruelties and horrors arising to the Red Indian from the reckless traffic of civilised man; to represent the persecutions they endure; to awaken Christian and benevolent feelings to their rescue; and to command the exertions of the Aborigines Society. He was listened to attentively, and much applauded.

#### THE DRAMA.

Covent Garden.—On Monday, the *Midsummer Night's Dream* was revived here with most beautiful and splendid scenery, and all

the accessories of fairy costume, and lights and flights of a dazzling description. Messrs. Grieves have surpassed themselves in several of the supernatural landscapes; and especially in one where a striking tree in the centre is illumined by a bluish light; and another where the Morning descends in pearls among the waving foliage of a forest. The *finale*, with sprites running through fine architectural galleries, and floating in the air with censers of coloured flames, is also magnificent. With respect to this glorious poem as an acting play, it is impossible for us to speak in terms of admiration. It is too exquisite for the stage—too subtle for representation. There is too much of action to admit of its being made an efficient spectacle; and too little of interest in the plot and characters to allow of its producing any powerful dramatic effects. From the first to the last we care not one iota for either mortal or fairy engaged in it; and but for the music, in aid of the decorations and scenery, the three hours and a half occupied in the performance would be a wearisome dream indeed. As it is, it is dull enough, in despite of the vocal exertions of Vestris, Rainforth, and Miss Grant, and the comic humours of the hard-handed men of Athens—*Peter Quince, Bully Bottom, Flute, Starveling, Snug, and Snout*, drolly enacted by Bartley, Harley, Keeley, W. H. Payne, F. Mathews, and Meadows. Of these, Harley and Keeley, as *Pyramus and Thisbe*, had most to do; and the boisterous burlesque of the one, and the ineffable quiet of the other (except in a very unseemly tumble to please the vulgar groundlings), not only contrasted happily, but furnished the only food for laughter during the night. We cannot say that much was made of the many passages of delicious poetry with which the play abounds. With the exception of *Helena's* (Miss Cooper's) touching appeal to the youthful friendship of her "parted cherry" *Hermia* (Mrs. Nisbett), and, in a lesser degree, *Titania's* (Mrs. Walter Lacy's) reasons for refusing to surrender to *Oberon* the child of her Indian votary, all the rest fell flatly and unimpressibly upon the ear. We have only to add that there was a pretty dance; that the curtain descended to shouts of applause from a very full house; and that the fair manageress was called, and announced the piece for repetition four times (too often) a-week.

Adelphi.—On Monday, after *Laffarge and The Old Curiosity Shop*—both pieces not only established, but growing in popularity—a travesty of *The Beggar's Opera* was produced here with perfect success. The same sort of thing was done at the Haymarket many years ago, when old Bannister, we believe, played the part of *Polly*; and the rest of the characters were cast with the same ludicrous non-conformity of sex and talent. In the present instance, *Macheath* was assigned to Mrs. Keeley, and *Peachum, Lookit, Fitch, Mat o' the Mint*, to *Mistresses Fosbrooke, Pearse, Nailer, and Gower*; whilst the female honours of the opera, *Polly, Lucy, Mrs. Peachum, Mrs. Coarser, and Jenny Diver*, found representatives in Paul Bedford, H. Hall, Wright, Wilkinson, and Yates. Some of our critical brethren are inclined to sport an exhibition of false and mawkish sentiment upon the Adelphi performances; but the fact is, that a majority of playgoers are more inclined to be amused, and enjoy a good laugh, than gaze for weary hours at glittering show, or be always suffused with tragic tears. This little theatre offers the public the means of being entertained with this species of drama, mingling the fun and merriment of caricature with the natural personations of Mrs. Yates

and Mrs. Keeley, in a manner to make an evening pass most agreeably. With this arrangement we are, and, from houses nightly filled to overflow, the world appears to be, quite satisfied; and the manager is reaping the well-deserved fruits of indefatigable enterprise and exertion to please. Of the novelty of Monday we shall merely say, that it offered not a syllable to offend the most fastidious taste, and was a very ludicrous termination to the various treats of the night.

At this period we might observe on the peculiar condition of our stage. Every theatre is pursuing its own course; and there is hardly aught that can be deemed competition. *Covent Garden*, elegant and splendid, takes its way with dramatic works of the lighter and more showy description; its company of fine women, a small proportion of musical talent, and a party of actors lively and amusing in genteel and low comedy, prescribe and limit its efforts. *Drury Lane* is consigned to instrumental music, such as has never before been heard within the walls of an English playhouse; and is continually crowded at prices of admission so moderate, that we only hope they may remunerate the caterers of this charming relaxation. The *Haymarket* is now the sole place at which the regular and legitimate drama can be witnessed. Tragedies of the highest order are performed in a style of individual and general excellence; and comedies, and less ambitious trifles, are hardly less ably sustained by a corps including Macready, Wallack, Webster, Strickland, Wrench, Lacy, Phelps, Faucit, Horton, Glover, and other eminent artists. Then comes the *Adelphi* with such claims as we have noticed; and the *Olympic*, with its pretty and merry little vaudevilles, as attractions of yet another different sort. The choice, therefore, lies in the taste and humour of the moment; and we go to the theatre where that is announced which we think we shall like best to while away these few dark hours of November; if for the neat and graceful, we seek the *Garden*; if for those charms that soothe the savage and delight the civilised, *Drury Lane*; if for the strength and truth of the dramatic muse, the *Haymarket*; if for a laugh to drive off the blues of the tender and pathetic, the *Adelphi*; if a gentle variety, the *Olympic*. "*Chacun à son goût*, as we say at Duukirk."

*Olympic*.—A new half-grave, half-gay drama, called *Paul the Brazier*, has been successfully played here during the week. The characters are cleverly supported by the best performers of the company, including Messrs. Baker, Norton, and Balla, Miss J. Mordaunt, and Mrs. H. Beverley.

#### VARIETIES.

*Glasgow Wellington Statue*.—The newspapers of the week have called attention to the probable decision of the committee in appointing a sculptor to execute this work, their first resolution being in favour of a foreign artist. The bare fact is monstrous, and an intolerable insult to the fine arts of Great Britain! What would we think if France or Italy were to call in the aid of an English artist to erect for either a national monument? At present we shall say nothing farther. If our country is so wretched in art as to be incapable of supplying a man of genius enough to carve an equestrian statue of the Duke of Wellington, this committee is right in procuring such a work from the chisel of some second-rate foreigner.

*Thomas Griffiths, Esq.*—It is always pleasant to record any grateful acknowledgment of services rendered to art or literature; and for this

reason we have read, with gratification, in the newspapers, that a handsome piece of plate has been presented to Mr. Griffiths by a number of our principal water-colour painters, as a testimony of their estimation of his liberal patronage for many years, and aiding them in the disposal of their productions without fee or reward.

*Orfila on Tests of Poisons*.—All France seems disturbed by the grand dispute whether Marsh's apparatus is or is not a certain test of the presence of arsenic, antimony, or other poisons. The questions are nice and difficult, and the only conclusion we would arrive at is, that there can be no sufficient evidence to affect the lives of parties accused of murder in such very fine experiments and appearances as are described in the Parisian journals.

*Cambridge Camden Society*.—The fourteenth meeting of this Society was held at the Philosophical Rooms last Saturday. The President took the chair at half past seven, and, after the election of twenty-five new members, proceeded to make some observations on what had been done during the long vacation; instancing particularly the uncoating of the tower of St. Benedict's, which has now been restored to its original condition, entirely at the expense of the Society; the discovery of the beautiful rood loft at Llan Egryn, Merionethshire; a curious painting at Llan Dannwg, in the same county, both of which will appear in the "*Transactions of the Society*"; and of two Chantry altars, the one in Abbot's house at Much Wenlock, the other at Liddbury, Salop. He adverted to the numerous sketches and drawings of details which had been sent in, and remarked on the necessity of forming such collections, if a pure school of Christian architecture is to be formed. The Secretary then read the names of 220 churches visited and described during the vacation. Some of the most curious brasses in the room were then described. Among these were Prior Nelond, Cowfold, Sussex (1499); Sir John Wantele, Amberley, Sussex (1424); Sir Hugh and Lady Haltham, West Grinstead, Sussex (1441); Sir Peter Legh, Winwick, Lancashire; a fine cross to John Corby, Broadwater, Sussex (1415); with several interesting specimens from Kent and Gloucestershire. Mr. Neale, of Downing, then read an account of the restorations of the fine Norman church of Old Shoreham, Sussex, illustrated by drawings; the Society having, both by money and influence, contributed to that restoration. He also presented a small host-bell, discovered in the excavations made round the church. Mr. Webb, of Trinity, read a second paper "*On Crypts*," illustrated by sketches and plans, in which he proved that these originally had their origin in the cavada of the Romans, and traced their progress downward.

*Of Almanacks for 1841*, "*The Sporting*" (Churton, pp. 84), amusing in its views of different sports, abroad and at home, and containing the sporting intelligence for the ensuing year; "*The Meteorologist*" (by W. J. Simmonite; Tyas, pp. 48), full of weather prognostications; and "*The Historical, Moral, and Weather*" (Orr and Co., pp. 48), adding to weather predictions, &c. a long series of moral maxims, and chronological summary of memorable events, all claim one notice, and may truly be mentioned as fairly performing the promises of their titles.

*Earthquake in Ireland*.—The Derry paper states, that the shocks of an earthquake were felt in the northern parts of Ireland, on Tuesday the 10th, between the hour of three and

four o'clock, A.M. The vibrations are described as having lasted about twenty seconds, and a sound, as of heavy wagons passing over the ground, was heard. Twenty minutes after, a vivid flash of sheet lightning, and a terrible thunder-crash occurred.

*Scientific Expedition*.—The Russian scientific expedition for the exploration of Nova Zembla has been brought up by the Arctic ices, and the party disembarked at Wardochaus in Norway. They purpose passing the winter in the northern parts of Lapland.

*Baron Geramb*.—The newspapers announce the death of this well-known personage, whose eccentricities ended by his becoming a monk of La Trappe, and superior of that severe order.

*Electrical Clock*.—A German artist is stated to have invented a simple and accurate clock, to go by electric action; the pendulum vibrating between two voltaic piles, repelling it at the extremes alternately in contrary directions.

*Jervas the Painter*.—"You will be pleased, too, sir, with a story Lord Chesterfield told me (too late too) of Jervas, who piqued himself on the reverse—on total infidelity. One day that he had talked very indecently in that strain, Dr. Arbuthnot, who was as devout as Richardson, said to him, 'Come, Jervas, this is all an air and affectation; nobody is a sounder believer than you.' 'I!' said Jervas, 'I believe nothing.' 'Yes, but you do,' replied the Doctor; 'nay, you not only believe, but practise: you are so scrupulous an observer of the commandments, that you never make the likeness of any thing that is in heaven, or on the earth beneath, or,' &c."—*Horace Walpole's Letters*.

*Wisdom of Retiring from the World in Time*.—"My opinion, is, that when any personage has shone as much as is possible in his or her best walk (and, not to repeat both genders every minute, I will use the male as the common of the two), he should take up his Strulbrugium, and be heard of no more. Instances will be still more explanatory. Voltaire ought to have pretended to die after 'Alzire,' 'Mahomet,' and 'Semiramis,' and not have produced his wretched last piece: Lord Chatham should have closed his political career with his immortal war: and how weak was Garrick, when he had quitted the stage, to limp after the tatters of fame by writing and reading pitiful poems; and even by sitting to read plays which he had acted with such fire and energy! We have another example in Mr. Anstey; who, if he had a friend upon earth, would have been obliged to him for being knocked on the head the moment he had published the first edition of the '*Bath Guide*;' for, even in the second, he had exhausted his whole stock of inspiration, and has never written any thing tolerable since. When such unequal authors print their works together, one may apply in a new light the old hacked simile of Mezentius, who tied together the living and the dead."—*Ibid.*

#### LITERARY NOVELTIES.

Mr. Schloe this year announces his fairy gift, the "*Bijou Almanack*," with the poetical illustrations by Mrs. Norton. The subjects are,—Napoleon, Tagliani, Sheridan Knowles, Princess Maria of Hesse Darmstadt, and the fair Editor herself, portraits; and Cernarvon Castle, a landscape. The feeling with which Mrs. Norton has turned the task of writing to her own likeness into a touching homage to her predecessor L.E.L. (who took much delight in the tiny *Bijou*), is exceedingly feminine and graceful.

#### In the Press.

A Lady (the wife of an officer in the 16th Foot) has in the press A Narrative of a Three Months' March in India.

and a Residence in the Doab, illustrated from drawings made on the spot.—The Life of the late Marquis of Londonderry, edited by Mr. Pote, under the auspices of the present Marquis.

## LIST OF NEW BOOKS.

Transactions of the Entomological Society of London, Vol. II. Part IV. 6s.—Transactions of the Medical-Chirurgical Society of London, Vol. XXIII. (Second Series, Vol. V.), 8vo, 10s.—Treatise on the Nervous Diseases of Women, by T. Laycock, M.D., 8vo, 10s. 6d.—The Russia Trader's Assistant, by C. Clark; Vol. I. Exports, 8vo, 8s.—Flora of Yorkshire, by H. Bates, 8vo, 7s. 6d.—The Housekeeper's Manual, 12mo, 2s.—The Psalms, with Notes, by Rev. W. H. Tucker, post 8vo, 8s.—The Standing Orders of the Lords and Commons relative to Private Bills, 12mo, 3s.—The Rocky Island, and other Parables, by Archdeacon Wilberforce, 18mo, 2s. 6d.—The Book of Mottos, fcap, 3s.—The Life of Mohammed Ali, Viscount of Egypt, 12mo, 3s.—Mammon, by the Rev. J. J. Harris, D.D. (People's Edition), 8vo, sewed, 2s. 6d.—Barnham's Questions on a Legal Education, fourth edition, by E. Inge, 12mo, 8s.—Practical Treatise on Locomotive Engines, by Comte de Pambour, new edition, 8vo, 10s.—The Protestant Annual, 1841, edited by Charlotte Elizabeth, 8vo, 15s.; India Proof, 25s.—Poems, by Mrs. Follen, 12mo, 6s.—Rev. W. B. Staveley's Sermons, 8vo, 10s. 6d.—Garrison Sermons, by the Rev. J. T. H. Le Maurier, 12mo, 6s.—Theory and Practice of Valuing Tithes, by L. Cooke, 12mo, 10s.—Bills of Costs in Chancery, by G. Farren, jun. 12mo, 5s.—Western and Bone's Precedents in Conveyancing, 4 vols. royal 8vo, 3l. 12s.—Sketches of Sermons on Types and Metaphors, by a Dissenting Minister, 12mo, 4s. 6d.—Who shall be Heir? by Miss Ellen Pickering, 3 vols. post 8vo, 1l. 15s. 6d.—Jest and Earnest; a Series of Essays, post 8vo, 7s. 6d.—Sketches and Legends amid the Mountains of Wales, in Verse, by Janet W. Wilkinson, 8vo, 7s.—British Military Biography, fcap, 12mo, 5s.—Mayo on Digestion, 3d edition, post 8vo, 6s. 6d.—Humboldt's Travels and Discoveries in South America, 18mo, 2s. 6d.—A Second Series of Useful Hints to Labourers, 18mo, 1s. 6d.—Bishop Sanderson's Sermons, with Life by Isaac Walton, and Essay by R. Montgomery, 2 vols. 8vo, 24s.—Lect's Book for all Seasons, 18mo, 1s. 6d.—Hittopides; the Sanskrit Text of the First Book, or Metra Laksh, with an Analysis by Johnson, 4to, 15s.—W. E. Hickson's Present State of Education in the Dutch and German Schools, 8vo, 2s. 6d.—Turner's Elements of Chemistry, 7th edition, edited by Dr. Liebig and Dr. Gregory, 8vo, 21s.—The Parlor Table-Book, 8vo, 10s. 6d.—Complete System of Geography, compiled and arranged by F. G. Tomline, royal 8vo, 21s.—Illustrations of the Comparative Anatomy of the Nervous System, by J. Swan, Part VI. 4to, 7s.—Domestic Duties; or, Instructions to Young Married Ladies, by Mrs. W. Parkes, 8th edition, fcap 8vo, 9s.

Wednesday 18	... 34 ... 40	29.73 ... 29.60

Prevailing wind, south-west.

On the 19th, afternoon, clear, otherwise cloudy; the 13th, cloudy, with heavy rain, and wind boisterous; the 14th, and following day, generally clear; the 16th, morning cloudy, with rain, otherwise clear, wind boisterous; the 17th, a general overcast, with frequent showers of rain, wind very boisterous during the evening; the 18th, cloudy, snowing nearly all the afternoon, flakes large, frequent and heavy rain in the evening.

Rain fallen, 1 inch and  $\frac{1}{15}$  of an inch.

November Meteors.—The evening of the 13th, as also the two preceding evenings, were here very unfavourable for observing these phenomena. Shortly before six, and again at about eleven in the evening, of the 14th, several unusually fine meteors were seen, accompanied with frequent lightning.

Edmonton.

CHARLES HENRY ADAMS.

## TO CORRESPONDENTS.

There are so many *novelties* in the novel line upon our hands just now that we must postpone some of them, to be taken in turn, and not fill a whole *Gazette* at once.

We thank Mr. S. for his letter, but it would lead to controversy for which we have not room; and there are, besides, in it, points that could be easily answered. Better wait till the matter is more developed.

ERRATUM.—Line 4 of the drama in our last, for "elicit" read "elicit."

\* The very low state of the barometer on the 13th is worthy of particular notice; yet still more remarkable is the great change in the temperature of the 18th, and the following day, viz. an increase of no less than thirty degrees! Indeed, as early as half-past seven in the morning of the 16th the thermometer stood at the unusual height of fifty-seven degrees.

## ADVERTISEMENTS.

Connected with Literature and the Arts.

## SCOTTISH (WIDOWS' FUND) LIFE ASSURANCE, founded on the original Basis of THE LONDON EQUITABLE.

THIS IS THE OLDEST AND MOST EXTENSIVE LIFE OFFICE IN SCOTLAND. Instituted A.D. 1815.

Accumulated Fund,  
NINE HUNDRED AND SEVENTY THOUSAND POUNDS,  
Annual Revenue,  
ONE HUNDRED AND SEVENTY THOUSAND POUNDS.  
Whole Profits belong to the Assured.

The Additions made by way of Bonus to the Policies of this Office vary from Ten per cent to upwards of Sixty per cent on the Capital Sum assured, according to the duration of the Policy. Parties desirous of insuring are reminded of the advantages which will arise to such as are affected within the current year, the Regulations of the Society requiring that, before additions can become absolutely vested, the Policies entitled thereto must have been in endurance at least five full and complete years. This condition, which forms part of the system of most of the Mutual Insurance Societies, will, of course, be satisfied at the next periodical investigation, on 31st December, 1841, in regard to all Policies opened within the year 1840.

Tabular View of the Amount of Additions, Retrospective or Vested, and Contingent Prospective, declared at 1st January, 1839.

Year of Entry	Sum Assured.	Total Benefit with Vested Additions at 1st Jan. 1839.	Sum Payable if deceased takes place after Payment of the Premium due in 1841.
1815	41000	41007 4 6	41000 8 7
1820	1000	1045 4 0	1033 10 7
1825	1000	1250 14 0	1240 1 2
1830	1000	1174 4 0	1200 11 9
1835	1000	1000 0 0	1201 4 0

Every information may be readily obtained on application to the Manager in Edinburgh, or to any of the Society's Agencies throughout the country. Parties wishing to effect Assurances so as best to meet any particular contingency, or effect any specific object, will receive the requisite information, and have the suitable Form of Proposal transmitted to them, and all official communications of this nature are considered strictly confidential.

Annual Premium payable during Life for an Assurance of £100.

## MILL'S SEAL WAFERS.

EDWIN HILL begs to express his gratitude for the extensive support he has received as a Manufacturer of these Wafers, and especially to those who have been pleased to make known to him their admiration and approval.

Crests of Arms, Crests, Address, or Initial Wafers, made to order in the most careful and beautiful manner; all are WARRANTED ADHESIVE.

Forbearers are requested to state the S. H.'s Name and Address are printed in full on each Wrapper.

A Large Stock of Initial and Fancy Wafers always on hand at the Warehouses of the Agents, and at the Manufactory, 18 Bartholomew Street, Birmingham.

Agents.—London: Mr. Thomas Wade, 184 Bishopsgate Street, West. Bath: Messrs. Simms and Son, George Street. Dublin: Messrs. Jordan, Whelan, and Co. 1 Capel Street.

## THE SHAKSPEARE SOCIETY.

It is remarkable that all that has hitherto been done for the illustration of Shakspeare has been accomplished by individuals, and that the Literary Association has yet been formed for the purpose of collecting materials, or of circulating information by which he may be thoroughly understood and fully appreciated.

To supply this deficiency "The Shakspeare Society" has been established; and it is hoped that, when once its purpose is generally known, it will produce a spirit of inquiry and examination, the result of which may be the discovery of much curious and valuable information, in private hands and among family papers, of the very existence of which the possessors are not at present aware. Every name, mentioned from manuscript or printed sources, that will throw light on our early Dramatic literature and stage, will come within the design of the Society. The cabinets of collectors and our public libraries contain much that will contribute to this end.

Some of the productions of our Dramatists prior to the Restoration have never yet been published, and the printed copies of many Old Plays have the rarity of manuscripts. The best of these will be edited under the sanction of the Society, accompanied by Biographical Sketches and Notes.

The Tracts by such prolific and able as Nash, Green, Harvey, Dekker, Breton, Munday, Rowlands, Rich, Taylor, Jordan, &c. are known to comprise matter of great interest and curiosity, in connection, either immediate or remote, with our early Stage and its Poetry; and to the republication of these the attention of the Society will also be directed. In time, complete sets may thus be

afforded of the scattered productions of distinguished and once popular Writers.

The Works of Gosson, Lodge, Northbrooke, Rankins, Whetstone, Stubbes, Heywood, and others, who wrote for or against theatrical representations in their comparative infancy, are important in the History of our Drama, and these (most of which are of the rarest possible occurrence) it is intended to reprint in a connected series.

The Annual Subscription is 1l.

A Council for the management of the affairs of the Society has been formed, consisting of the following Members:—

Amoy, Thomas, Esq. F.R.S. Harcourt, Rev. William  
Treasurer S. A. Jerrard, Douglas, Esq.  
Aytton, William, Esq. F.R.S. Kenney, James, Esq.  
F.S.A. Knight Charles, Esq.  
Bruce, John, Esq. F.R.A. Macready, William, C. Esq.  
Campbell, Thomas, Esq. Madden, Mr. F.R.S. F.S.A. Keeper of the MSS. in the  
Collier, J. Payne, Esq. F.S.A. British Museum  
Smith, George L. Esq. Meeson, Rev. Henry Hart  
Dike, C. W. Esq. Treasurer Talford, Mr. Sergeant, M.P.  
Lyce, Rev. Alexander Tomlin, F. Guest, Esq. Sec.  
Halliwell, J. O. Esq. F.R.S. Wright, Thomas, Esq. F.S.A.  
F.S.A. &c. Young, Charles M. Esq.

The Society is limited to 1000 Members, and, by one of its laws, no copies of its works are to be sold.

The first work, "The Life of Edward Alleyn," from original sources, and containing new information regarding Shakspeare, Ben Jonson, and their contemporaries, will be ready for delivery in January.

Communications relative to the Society may be addressed to any Member of the Council, or to Mr. Rodd, 3 Newport Street, Long Acre. Subscriptions received at the Metropolitan Bank, 4 Pall Mall East.

## BOOKS IN THE PRESS.

FLORESTON, WITH TWENTY-FOUR ILLUSTRATIONS. On the 1st of December, Part I. is to be continued monthly in Parts, each containing Forty-eight pages of Letterpress and Three Illustrations, by O. P. G. engraved by Brain (to be completed in Eight Parts).

FLORESTON; or, the New Lord of the Manor. A Tale of Humanity. Joseph Rickerby, Sherbourn Lane, King William Street, City; and to be had, by order, of all Booksellers.

Will be ready early in December, in fcap 8vo, bound, THE LONDON ALMANACK, Official Register, and County Calendar, for England and Wales, for the Year 1841.

Containing The Almanack, with full and copious Tables, the Royal Family of England, with their Households, the Navy Ministry, and Privy Council; a complete existing and extinct

FERRAGE AND BARONETAGE; Orders of Knighthood, &c.; the Imperial Parliament; all the Official Departments of Government; East India Company; a complete

NAVY AND ARMY LIST; The Courts of Law, Judges, and Legal Officials; the County Authorities, Lord and Deputy Lieutenants, High Sheriff, Militia, &c. and the

JUSTICES OF THE PEACE IN EACH COUNTY; A Clerical List, the Bishops, and Dignitaries; and a complete List of THE BENEFICED CLERGY OF ENGLAND AND WALES.

The Universities, Colleges, and Public Schools throughout the Kingdom.

THE CORPORATION, &c. OF THE CITY OF LONDON; The Police, City and Public Companies, Learned and Scientific Societies and Institutions, Hospitals, Charitable and Benevolent Institutions, Religious Societies, &c.; and a mass of valuable Statistical Information, chiefly compiled from Parliamentary Returns.

The want of a comprehensive book of reference for England and Wales, of a similar character to those already existing for Scotland and Ireland, has induced the Publishers to undertake the present work, on which no labour or expense has been spared to obtain full and authentic information. They believe it will be found not only of a much more comprehensive, but also a far more accurate Register, than any previously published.

LONDON: Scott, Webster, and Geary, Charterhouse Square.

ROMANCE OF JEWISH HISTORY. On Wednesday next, in 3 vols. post 8vo. THE ROMANCE OF JEWISH HISTORY.

By the MRS. MOSS. Dedicated, by permission, to Sir E. L. Bulwer, Bart. Saunders and Orley, Publishers, Conduit Street.

BRITISH INDIA. On the 28th, post 8vo. Illustrated from Drawings made on the spot, 12s. cloth, lettered.

NARRATIVE of a THREE MONTHS' MAROH in INDIA, and a Residence in the Doab. By the WIFE of an OFFICER in the 16th Foot.

LONDON: H. Hastings, 18 Carey Street, Lincoln's Inn; and all Booksellers and Public Libraries.

To be published on the 1st of December, THE PROTESTANT ANNUAL for 1841.

Post 8vo. morocco elegant, 15s. Edited by CHA. KILPATRICK ELIZABETH. Dedicated to the Bishop and Clergy of the British Empire, as the rightful Guardians of our Protestant Institutions.

This Work is not only of national but universal interest, being devoted to the support of our Bible Christianity and Protestant Institutions. It consists of original Articles in Prose and Verse, Contributions of the highest talent and soundest Christian principle; among whom we may mention the Revs. Dr. Chalmers, Hugh McNeill, Edward Bickersteth, Robert Montgomery, Dr. Muir, J. Cunningham, and the Author of "Isaacs on the Church;" together with G. Finch, Esq. M.P. Stodard, Miss Barbe, and other distinguished writers of the day. Among the illustrations, designed and engraved expressly for this work by eminent Artists, are original and striking Portraits of the Rev. Hugh McNeill, by Robertson, and the Earl of Winchester, by Phillips.

LONDON: P. Baisler's Protestant Depository, 184 Oxford Street.

**AN ELEGANT GIFT-BOOK.**  
On the 15th instant will be published, illustrated by Frontispiece from Design by Gilbert, and Vignette by Harvey, price 10s. 6d. Svo. cloth elegant, gilt edges.

By the Author of "The Comic Latin Grammar." In post 8vo. with upwards of Fifty humorous Illustrations, price 8s.

#### NEW WORKS NOW READY:—

### MRS. GORE'S NEW NOVEL, THE DOWAGER;

OR, THE MODERN SCHOOL FOR SCANDAL. In 3 vols. post 8vo.

"This is a very clever book. The style is easy, lively, and unaffected; never for an instant inflated or dull; studded every where, indeed, with brilliant epigram."—*Examiner*.  
"Full of genuine comedy, which, if transferred to the stage, would be most effective. Mrs. Gore depends principally for success upon her powers of wit; and what she sees vividly she traces with vivacity. Her pages are a complete *Rochefoucauld* of English high life. This is a work that forms a feature in the literature of the year."—*Athenaeum*.  
"An admirable picture of modern manners in the higher circles of society, mingled with judicious remarks and pungent satire, set off by a composition easy, animated, and piquant."—*Spectator*.

### THE CLOCKMAKER;

OR, SAYINGS AND DOINGS OF SAM SLICK, OF SLICKVILLE. First, Second, and Third Series.

In 3 vols. post 8vo. with numerous Illustrations.

\*.\* Either Series may be had separately, in 1 vol. price 10s. 6d.

### REVIEWS OF NEW BOOKS.

*A Journey from La Trappe to Rome.* By the Rev. Father Baron Geramb, Abbot and Procurator-General of La Trappe. 12mo: pp. 267. 1840. London: Dolman. Liverpool: Booker and Co.

THE famous Baron Geramb dead! no such thing! Though announced in the foreign journals, and copied into those of England, our own among the rest, it was only that sort of death which attends opera-dancers and singers abroad after their having been engaged, and previous to their appearance, for the ensuing season at Her Majesty's Theatre in the Haymarket. So far from being defunct, we now feel perfect assurance that he went to Rome in 1837, stayed there a few months, and was in 1838, by a bull of the Pope, made Abbot and Procurator-General of La Trappe, which would require his residence in that busy capital, instead of the seclusion and austerities of the convent. But, indeed, it does not seem that, in his case, our ideas of the rigid discipline and mortifications of La Trappe were realised; for we had his journey to Jerusalem, and travels to, in, and from the Holy Land, to amuse us by way of interlude; and now we have his Roman tour—an equally worldlike, and far from cenobitical, production. As with regard to the pious abbot's death, it is antedated, being published by Mr. Dolman in 1841,—a miracle of "the trade," however, by no means confined to the Romish branches of it.

Having resumed a living interest, our author, in his preface, shews himself very anxious to make a book at least as entertaining as his Eastern narrative; and complains of the difficulty of doing so with a subject so hackneyed as Rome; and his *pis aller* is that, "profoundly afflicted at the outrages offered to Jesus Christ in the person of his vicar, he has proposed to embody in these letters some observations on the court of Rome, the spirit of the church, and the character of the Italians." The church is to be pitied in such a champion, in whom the competency of weak enthusiasm and excessive vanity is manifested to a degree almost beyond parallel: inasmuch that we should wonder how the Baron could be tolerated, and still more at his being caressed and elevated; except that we found in one of his pages that he laments the "embarrassment of his riches;" and, when a person is so afflicted, we are aware that he is thereby rendered tolerably acceptable to a religious, or any other community, whatever his character may happen to be in indifferent respects. No doubt this embarrassment made the Trappist a traveller; the monk, a man of the world; the lowly hermit, an Abbot and Procurator-General. In secular life it would produce as extraordinary effects,—convert numskulls into sages, jobbers into legislators, and vulgar nuisances into the ornaments of high and courtly circles. Therefore this is another miracle not exclusively Romish.

But come we to the volume. It opens with a translator's preface, in which that literary functionary, with due humility, confesses his manifold faults, and proclaims that he had executed his work from the same benevolent and holy motives which influenced his principal—

*Arcades ambo.* The first letter is profanely, and *ad scriptandum*, headed "GOD ALONE," and gives an account of M. Geramb's departure from Lyons, on his return from Jerusalem, and arrival at the Monastery of La Trappe! Posing this offence against propriety, in luging in the name of the Almighty as a claptrap to catch the eye of a reader, we have the Baron's somewhat dubious details of his arrival at Mount Olivet, his sensations, and adventures:—

"How sweet it is (says he), on returning from a long pilgrimage, after so many incidents and dangers, to find oneself again in the calm, the silence, and even the monotony, of La Trappe! I need not describe what I felt when, from Reiningen, I discovered the walls of this holy monastery, where I had suffered so much, and had been so happy.

"Some time before, a distressing event spread terror in the two monasteries of Mount Olivet. I say the two houses, for not far from our house is another, belonging to nuns of the same order. On Sunday, the 13th of November, while both communities were singing vespers in their respective churches, a violent fire broke out in the convent. We ran to the scene of conflagration; but, notwithstanding our efforts—notwithstanding the exertions of the inhabitants of Reiningen and the environs, who flew to our relief, in the space of two hours the destructive element consumed the barn, the harvest which had been gathered in it, and the stables. The flames, rising to the clouds, spread dismay far around, and, aided by the wind, enveloped the two monasteries, and menaced them with destruction. Judge what must have been the situation of the nuns. The confused voices of those who gave the aid of their assistance—the tolling of the bell—the action of the engines—the hissing of the water which overwhelmed the flames—the crash of the burning beams which fell—the falling of the walls—in a word, the tumult inseparable from such circumstances, filled with terror those spouses of Jesus Christ—those timid doves, habituated to the silence of the sanctuary, which is rarely disturbed by any other sound than that of the aspirations which hourly ascend from their innocent hearts. There was but one gate by which they could escape; it was the principal entrance, a door which was only opened to receive those who came to dedicate themselves to penance, or to admit the minister of God when he came to administer the last sacraments to the dying, or commit their remains to the earth. The flames, however, precluded approach to this gate; and there was reason to apprehend that the progress of the destructive element would prove fatal to these poor creatures, many of whom, being old and sickly, could only employ sighs and prayers for their delivery. These prayers were heard; the wind lost its strength, the fire its activity; the conflagration was gradually subdued, and finally extinguished. One choir-sister, however, soon after fell a victim to the consequences of its destructive influence."

As many of those "timid doves" were "old and sickly," the only casualty recorded is not surprising; and, with such effectual prayers to still the wind and put out the fire, there is

reason to be thankful that nothing worse happened either to the monks or nuns, who, like Pyramus and Thisbe, *habuit contiguere domus*,"—"lived in contiguous houses."

The attractions of La Trappe, with all its charming "monotony," however, appear not to have detained the erratic Baron long; for in a few months he left for Paris. But before we accompany him we may as well copy his description of the "calm, silence, and even the monotony," from which he tore himself away. It is thus sweetly and deliciously pictured:—

"By a particular disposition of Providence, who, doubtless, wished to increase my difficulties and my merits, the cell which I occupied in the intervals between the various duties of the house was exposed to all the noise that was heard in the community. At my right, was the brother-shoemaker, whose hammer seemed his most favourite tool; on my left, the carpenter's saw was always in operation; and above me was the Abbot's cell, which seemed never vacant. Add to this two miffed dogs, who never ceased to bark, and you will have an idea of my situation and sufferings. Do not, however, be scandalised. I do not complain. I only ask of God to give me patience, as I know that these light and transient inconveniences may obtain for me a great degree of glory."

Not desiring, as it should seem, a very immediate accession to this supreme glory, M. Geramb set out on his errand to Rome, which ended in the different sort of earthly elevation we have mentioned; and he took Switzerland on his route, apparently with personally beneficial consequences, for he tells us:—

"I was so reduced at the time of my departure, that those who had not seen me for a year could scarcely recognise me; but when I arrived in that country—when I had inhaled the perfume of the salubrious herbage with which it abounds, I began to revive. My health was soon re-established. I contented myself at first with a walk in the verdant valleys, where the shepherds and their flocks afforded me matter for amusement and reflection; but soon, becoming more invigorated, I passed lakes, climbed up mountains, traversed different localities, and approached the elevated cascade, the snow-capped rock, and the eternal glacier."

And he must have got fatter and fatter every day, since within less than ten months after we find him such a weighty porpoise as to be quite the laughing-stock of a young Italian artist, who had been sent for to paint his being tumbled off his mule without being killed, as a miracle to be preserved in the church of the monastery of Sacro Speco. When he fell in his white La Trappe uniform, "the labourers (he states), who had not lost sight of us, ran up eagerly. 'Miracle! Miracle!' they all cried out: 'Oh! father, you owe your life to St. Benedict.' I admired the faith of these poor people. I thanked them for the interest they had manifested for me, and tranquilly resumed my route."

He continues, afterwards, with the sequel:—  
"In my providential escape, the religious of

*\* Contiguas habuere domos, as Ovid has it.*

Sacro Speco recognised the hand of God, and thought of erecting some memorial of the event in the place where my life was so seriously endangered. There was an artist at Subiaco, whom they thought capable of carrying their design into execution. They sent for him; he came without waiting for a second invitation. When his arrival was announced I was in my room with some of the monks. The door was opened, and in came a man, who, by his appearance and manners, resembled one of those brigands of Calabria that painters delight in sketching. We told him what we wanted, and had agreed on the price, when one of the fathers repeated what had befallen me, and dwelt with especial emphasis on my miraculous preservation. 'I do not,' said our new friend, with a solemn tone, 'I do not see any miracle in the matter. The mule was heavy, and he,' pointing me out with his finger, 'was still heavier than the mule. It could not have happened otherwise.' We could not suppress the laugh this drollery excited. I laughed more heartily than the rest. I was, however, a little annoyed at my *embonpoint*, which had procured for me the advantage of the comparison."

Nevertheless, and in spite of the artist's joke, "the memorial was put up. It is a column, surmounted by a cross. On the pedestal the religious have caused the words of the Psalmist to be inscribed: 'In manibus portabunt te.'—In their hands they shall bear thee up.' And there can be no question but that, in 500 years or less, the preservation of Baron Geramb on a mule with a broken leg, which he afterwards rode to the monastery, will be cited as a miracle to man and beast, as extraordinary as many others of the same most wonderful description.

Truly, for ourselves and our present opinion, we think the Baron as much *Baron Humbug* as ever, and not at all worthy of being canonised, though he has been Abbatised and Procurator-Generalised. And in the interim we should like to be informed, if all the votaries of La Trappe, embarrassed with riches or otherwise, are allowed to tramp over the wide world and tell lies? Getting on, we learn that while at Paris, the Baron visited Vincennes, where he was confined by Buonaparte for two years (1812); and he speaks feelingly of his emotions on re-viewing his "dungeon," which was up three pair of stairs! (Pages 16 and 21.) Be it remarked that, though a *resurrectionary*, the Baron never was an *insurrectionary*, character: on the contrary, he is royalist and loyalist to the back-bone, so nearly broken by the confounded Italian mule: and he finely recalls to mind his early exploits:—

"I was arrested (he informs us) on my return from England in 1812, at Husum, a seaport of Denmark, more than 600 miles from France. I was brought first to Hamburg, and thence to Paris, and was cast into the dungeon of Vincennes. I will say nothing of the injustice of such an arrest. Being a subject of the Emperor of Austria, and having no relation to France, I have yet to learn what could have justified this manifest violation of the rights of nations. It is true, I had always declared myself against Buonaparte; and, when he was approaching Vienna in 1807, I issued a proclamation, in which the youth of the city were called on to fight under the banner of a regiment called, from the late Empress, Maria Theresa. This address was not couched in insulting language—it concluded thus: 'To meet the enemy, I tear myself from a beloved wife and six small children; but I was a citizen before I became a husband or a father.'—I

had also served against him in Spain; in all this I only did my duty. At Hamburg I was deprived of my *valet de chambre*, and escorted afterwards by gens d'arms, at my own expense! I had two of them in my carriage and one on the box."

We hope "here he truths," as Froth says of his dish of stewed prunes, of the value of some threepence; and only to think of the gen d'arme on the box before as a substitute for the *valet de chambre* in the rumble behind! What are the austerities of La Trappe to compare with such suffering as that! But, indeed, the poor Baron has been through his entire career an involuntary or voluntary martyr (we remember him and his whiskers in London, when attorneys' clerks and drapers' apprentices did not venture to wear these military and fierce appendages). On his journey from Paris to Rome, he thus lets us in to other miseries which he was doomed to endure:—

"Marseilles, 13th of December, 1837.  
"It would be impossible for me to describe what I have to suffer, when preparing to leave a city in which I have for a while resided; I have to undergo the torture of packing up my trunks. This is to me inexpressibly perplexing; and you would smile and sympathise with me, were you to witness my embarrassment. With five or six trunks, valises, &c., before me, I go from one to another, not knowing where to begin: I open them and look at the objects they are to contain, and which lie scattered round my room in admirable disorder. At this sight, as I stoop with difficulty, I become uneasy, and let an occasional sigh escape. Still, I make a beginning. I mislay several things, and then, losing courage, go and sit down at some distance from the causes of my vexation, on which I close my eyes."

And it is here that he alludes to the melancholy cause in these pathetic words:—

"Must I, then, continue to experience the embarrassments of wealth? Why should a Trappist monk have so much baggage? Is this the poverty of those who have left all to follow Jesus Christ? When I propose these questions to myself, a thousand weak reasons occur to me, to shew that I have not any thing superfluous, and that I could not leave a single article behind. Moreover, this time I had my monastic dress with me."

Oh, wretchedness intolerable! griefs unutterable! What a moral is to be drawn from such human miseries: almost as touching as one from a tomb at Lyons, with a sculptured skeleton and an epitaph, which the Baron extracts:—

"I was once of all women the flower, the belle;  
I am now what thou see'st me in this lone cell.  
White as snow was my skin, and fresh and tender;  
It is long since dry and dark as a cinder."

Let all pretty ladies take warning from this; and,—

"Lady, fair lady, bright lips hailed me then,  
'Twill be long ere they speak of my beauty again."

And much more to the same purpose, for which see page 55, *passim*.

Once at Rome, after all his troubles, our Baron-monk-abbot takes the character of a great theologian and amusing traveller. Looking forward to his own probable erection into a right worshipful saint, he asserts that no one can ever reach that honour without conclusive proof of their having wrought miracles being laid before the Congregation of Rites; and he informs us:—

"It watches over the tradition of the church; regulates its feasts, and determines its ceremonies throughout the wide extent of Christendom. It is in this congregation that the pope

declares, that one, whose life has been distinguished by the practice of heroic virtues, and whose sanctity has been attested by some miracles, is worthy to be canonised; that is, solemnly enrolled among the saints whom we may honour. Protestants amuse themselves by turning the canonisation of saints into ridicule; but few, if any of them, have ever heard of the long and rigorous examinations which always precede so solemn and important an action. This tribunal has its judges, its officers, and notary; it employs interpreters when there is question of acts written in foreign languages. When circumstances require it, it profits by the counsels of physicians, natural philosophers, and mathematicians. The maxim on which it proceeds is, that the facts must be proved with the same certainty as if there were question of condemning a person accused of crimes. Suspicious or inconclusive evidence, such as would not justify the judge in pronouncing sentence of death against a person accused of a capital crime, is rejected by this tribunal. The author of the 'Life of St. Francis Regis,' relates on this subject the following anecdote, which he heard from a person of undoubted authority:—'An English gentleman in Rome was expressing his preconceived notions on the subject to a Roman prelate, when the latter gave him a process, containing the proofs of several miracles, to read. The Protestant read them with attention, and returning them, said, 'This is an unexceptionable manner of proving miracles. If all those which the Roman Church receives were sustained by proofs equally satisfactory, we could not reasonably object to them, and would cease to make your miracles the subject of our raileries.' 'Well,' said the prelate, 'you must know that of all the miracles which appear to you so well proved, not one has been admitted by the Congregation of Rites, because not sustained by sufficient proof.' The Protestant, astonished at this reply, acknowledged that nothing but a blind prejudice could question the certainty of facts, ascertained by such a scrutiny, and confessed that he never imagined that the Church of Rome went so far in the examination of miraculous events.' Modern Protestants have not the same frankness; besides this, when holiness is rare, we are less disposed to believe in, and acknowledge, its existence."

Thus are all miracles indubitably substantiated; and as Lord Peter says, in the 'Tale of a Tub,' "If any one doubts after this, let him doubt and be d—d." Let us select another lovely and pastoral piece of Romish ceremonial, so naturally and appropriately described by the Switzerland-revived Baron:—

"There is another ceremony which I have seen with pleasure, and which is indeed interesting and appropriate. The first year of their pontificate, and every seven years, the popes, in the octave of Easter, bless a certain number of medals marked with the image of a lamb,—a symbol of the sweetness and patience of Jesus Christ. Neither gold nor silver enter into the composition of these medals; they are made of what remains of the pascal candle of the preceding year. On Easter Tuesday, the pope mixes some holy water, balm, and chrism, in which he dips them. From this odoriferous immersion they take the name of *Agnus Dei*. On Holy Saturday, a sub-deacon, preceded by the cross, presents himself at the gate of the chapel where mass is being celebrated, and holding a basin full of these medals, he intones, in a loud voice, the following words: 'Holy Father, here are the lambs which announced the resurrection to you, the messengers who

brought tidings of victory; they now come to the fountain, they are shining with brightness.' The choir answers, 'Alleluia, praise to God, alleluia.' He then advances to the throne, and the pope taking these medals, distributes them to the dignitaries of the chapel. Urban V., in sending three of them to the Greek emperor, John Paleologus, thus enumerates the graces attached to the gift:—'They bring down,' says he, 'the blessings of heaven on those who carry them, and who honour them by the sanctity of their lives—they preserve from fire and shipwreck, and are a pledge of peace and tranquillity.' There is another memorial of youth, the day of St. Agnes, virgin and martyr. How this name pleases me! I find it so sweet; it has a bloom of innocence, an odour of strength, an indescribable charm which is of heavenly origin. When I hear it pronounced, I have the idea of whatever is most amiable in a timorous sex, and whatever is most admirable in the courage of a hero. On the day on which the church celebrates the festival of St. Agnes, the pope blesses two lambs, of whose wool the *pallium* is woven. This ornament, which appertains of right to the sovereign pontiffs, has been communicated by them to patriarchs, to archbishops, and some privileged bishops. The lambs are brought from the church of St. Agnes, where they have been first blessed, to the pope, who imparts to them a second benediction. They are then confided to the care of a monastery of nuns, who undertake to feed them. One of my wishes would be, to see these favoured animals browsing in a field that was never trodden by a profane foot; what pleasure would I feel in caressing them! Nothing more innocent, nothing more pure, but nothing more difficult, to witness. These little guests partake of the inclosure of their chaste hostesses, whom an impenetrable barrier secludes from the public eye. On the vigil of St. Peter, the *pallia* are laid on the tomb of the apostles; the following day they are placed among the relics, where they remain until the dean of the cardinal-deacons sends them to the candidates, who have first formally to apply for them."

All the Agnenses in Europe should enter into a subscription to present the abbot with a magnificent golden set of tea-service for this passage, all chased and surmounted with little lambkins and *Pallii-ases*.

The accounts of the religious institutions and charities at Rome are, with all the follies and cant of this book, interesting, and in most instances more particular and ample than we have seen them any where else. We select one as a popular specimen, but they are all well-deserving of being read:—

"Among the pious institutions which adorn the capital of the Christian world, and display in all its brilliancy that charity which is the distinctive mark of catholicity, there is one specially consecrated to assist those condemned to undergo the last sentence of the law. It is called 'The Arch-Confraternity of the Decolation of St. John the Baptist.' It is composed of pious men, both lay and ecclesiastic. The popes have endowed it with privileges and indulgences, in consideration of the service it renders to the unhappy criminals. On the eve of the day of execution, the confraternity give notice by placards, put up in different quarters of the city, that the blessed sacrament will be exposed in their church, and invite the faithful to come and implore a happy death for the convict. The same notice is given in all the monasteries, and the same invitation published. Afterwards, they go through the city, dressed in their distinctive habit, which resembles a

sack thrown over them, and collect alms for the purpose of getting masses said for the repose of the criminal. The civil authorities give regular notice to the confraternity, when and where the execution is to take place. As soon as the proper officer of the confraternity receives this notice, he invites four or five of his brethren, of whom one must be a priest, to meet in the evening in the church of St. John, and thence to accompany him to the prison. Having recited some prayers before the altar to implore Divine assistance, they proceed two by two to the prison, where they are received by the officers of government. They immediately repair to a small chapel in it, called *Conforteria*, where they put on their black habit and rough girdle. In an adjoining room the *providitore* assigns to each the office he is to discharge. Two are called assistants; they have care of the spiritual wants of the condemned: one is to act as sacristan; and the fourth is to write exact minutes of all that passes, from the moment the culprit hears the order for his execution until it is carried into effect. These minutes are subsequently registered; and the archives of the confraternity, which reach back to an ancient period, contain much interesting and instructive reading. At midnight the gaolers visit the condemned, tie his hands, and make him ascend a private staircase, which leads to the *Conforteria*. At the top of this staircase is a room, where the notary of the government intimates to him the sentence of death. When this is done, the brothers present themselves to him, embrace him, and holding before his view an image of Jesus crucified, and of the Mother of Sorrows, endeavour to diminish the bitterness of his feeling by every motive which religion suggests. This is ordinarily a terrific moment. The criminal is generally more affected by the sentence which he has heard than by the consolations which are offered to him. When his violent feelings subside, they then commence to prepare him for a good confession, by suggesting salutary reflections. They interrogate him on the principal articles of religion, to see if he be sufficiently instructed; but they are careful not to fatigue him by too lengthy instructions, as experience shews that such conduct only irritates and disgusts those who require to be instructed and consoled. They leave him for a time to himself. An interior voice then speaks to his heart, and repentance procures for him the grace of reconciliation. When the condemned has finished his confession, he makes his will if he wishes, and declares in the same act that he dies in the Catholic church; that he pardons all who have injured him, and that he wishes to repair the evil he may have done his neighbour. In the meantime the brothers recite in the chapel certain prayers, to obtain God's mercy for the unhappy convict. They communicate at one of the masses, which is said very early in the chapel on the day of execution, and the convict himself is permitted to receive, by way of viaticum, at one of those masses. In proportion as the fatal hour approaches, and the convict manifests dejection, and prostration of his physical powers, the charitable exertions of the pious brotherhood are also multiplied. The litany of the saints is recited; the stations of the cross are made; and, at the moment of departure, the papal benediction is imparted to the unfortunate victim of the laws. He is also blessed with a relic of the wood of the cross. In the meantime, the remaining portion of the confraternity, having heard mass in their church, come in procession to accompany him to the

place of execution. Before them is carried, between two yellow torches, an image of Jesus crucified, covered at the extremity with black cloth. On descending the steps of the prison, the condemned finds an image of the blessed Virgin, before which he kneels to pray. The assisting priest exhorts him to put his confidence in this Mother of Mercy. At the bottom of the steps he finds the before-mentioned image of Jesus crucified. The priest points out to him the Saviour's wounds, and recalls to his mind the infinite value of that blood, which was shed for the redemption of man. It is but seldom that the condemned is unaffected by this preparation. Should he, however, prove obdurate, the efforts of the brothers and of the assisting priests are redoubled. They cast themselves at his feet, and implore him to have pity on his soul. Should all prove ineffectual, they endeavour to obtain a respite of some hours from the government. In the meantime, public and private prayers are offered up; other ecclesiastics, distinguished for their learning and piety, are called in, that they may endeavour to overcome his obstinacy. God generally blesses these efforts of truly Christian zeal. The culprit, whose obduracy seemed invincible, and struck horror into the hearts of the assistants, edifies them by giving all the marks of true contrition. Let us follow the unhappy man. The hour is come. He gets into a cart, and proceeds to execution, with his back turned to the place where he is to die. Alas! in this we all—the virtuous no less than the vicious—resemble him. We turn away our eyes from the death which awaits us; the thought of death affrights us; and we are hurried to the grave before we permit ourselves to reflect on it. Two of the brotherhood accompany him in the cart, and while one presents to him a picture representing Jesus and Mary, the other seeks to keep alive the sentiments of piety with which he ought to regard them. Thus his attention is turned away from the sight of the populace, which is but too eager to witness these sad spectacles. The cart stops; the criminal is introduced into a hall hung in black, and lit only by a dim lamp: a crucifix is placed there; he embraces it; confesses again; receives absolution; while he repeats some ejaculatory prayers, among which are acts of faith, hope, and charity, the executioner binds his hands, leads him to the fatal spot, lets drop the iron, and satisfies human justice."

We have gone so much into the work that we cannot touch upon the Baron's panegyrics upon the pope, the cardinals, and all downwards, belonging to the Church of Rome; nor even in his defence of the Virgin Mary, except, perhaps, a mite of the latter, of whose worship he says:—

"We only lay before her our necessities, and invoke her protection, because we know that she will not reject the unfortunate who implore her aid, and that she is the canal by which the most abundant graces are communicated to men."

\* And reason good—we revert to Lyons, where the Baron writes: "It is particularly on the feast of the Virgin, and on Saturday, which is consecrated to her veneration, that you will be edified by the pilgrimage of Fourvières. What a concourse! In this ascending and tortuous road faith sustains and fortifies the women, the children, and the old men; love is in their hearts, and hope in their looks. Enter the chapel, if the dense crowd permit you, what sentiments will you experience! What impression will not be made on you by the multitudes engaged in prayer, the flambeaux which burn before the altar, and the numerous votive offerings which cover the walls,—pictures, indeed, which the artist would not always admire, but which nevertheless attest the goodness and protection of Mary, and the gratitude of her votaries! This chapel is truly worthy of the Queen of Heaven; there she is pleased to be invoked, and there she is never

A miraculous intervention is thus related, which as Dominie Samson would exclaim is "prodigious!"—

"There is in the sacred college a cardinal (Cardinal Mezzofanti) known to all Europe, who unites with a sublime piety the gift of tongues, of which he speaks about forty, with a facility and correctness that astonishes those who hear him. One day, speaking on this subject to a holy prelate, intimately connected with the cardinal, I observed, that nothing of the kind had been seen since the day of Pentecost. He answered, that it was an evident gift with which God had rewarded his zeal. When a simple priest, he dedicated himself to the service of the sick in the hospitals, where he passed his days and nights in administering the consolations of religion to the sick. He was afflicted at not being able to understand the foreign soldiers who were brought there, or to make himself understood by them: and he resolved to apply to the study of languages, imploring God with tears to facilitate their acquisition for him. The God of charity heard his prayer, and rewarding his noble and pure design, communicated to him the talent which makes him the most extraordinary man of his age."

And with this we would conclude, only that we wish to end in perfect love and charity with the Baron, and therefore cannot finish without sincerely wishing him a hearty and daily participation of an exercise which he praises highly, and expresses an ardent desire to partake of. May he enjoy it largely and fully, and continually among his new companions, were it only to put him in mind of what he has lost by quitting La Trappe. It is thus described, in his visit to the Roman College directed by the Jesuits at Rome:—

"I expected that the exercises would terminate by benediction of the holy sacrament, and that the congregation which consisted entirely of men could then retire in peace; but suddenly, and as if it were by enchantment, the lights were put out, and all remained in darkness. What, thought I to myself, what can this be a prelude to? Presently I heard the rattling of keys, and the door close with a crash. This, thought I, is quite an adventure; what can they be about? I listen to every sound. For three or four minutes, all was as silent as the grave. At length I hear these solemn words, pronounced by a voice which was admirably suited to the occasion: 'Christ has died for us: he has expiated our iniquities. After the example of St. Paul, let us accomplish, by the mortification of the flesh, what is wanting of his passion. Let us offer our bodies in sacrifice, and obtain not only the pardon of our sins, but the delivery of the most destitute soul in purgatory.' At once, some voices began to chant the *Miserere*, which was accompanied by a shower of lashes, of disciplines, and other penitential instruments! What a moment for me! What was my surprise! As a Trappist monk, I was not afraid of the discipline, and yet I could not overcome a certain feeling of horror; for the holy austerities of my convent had never

invoked in vain. Twice did the cholera approach Lyons. The inhabitants redoubled their fervour; they multiplied their offerings; and during nine days the venerable prelate, who is charged with the administration of this diocese, notwithstanding his great age and infirmities, visited this chapel with a portion of his clergy, to offer himself a victim for his flock. These prayers were not disregarded. Mary presented them at the throne of her Eternal Son, and the exterminating angel turned aside from this favoured city. An inscription placed over the principal entrance perpetuates the recollection of the danger; and the Lyonsese cease not turn their eyes towards that hill whence they derived assistance."

produced so profound an impression on my soul. It would be impossible for me to describe to you my feelings or my thoughts at that time, the reproaches I made myself, or the resolutions I took. This penitential act lasted while the *Miserere* was being slowly and seriously sung; it even went beyond that, for the fervor of the penitents was not satisfied until the bell rang three times; the first and second sound not having been heard, or, at least, heeded."

*Elphinstone*. 3 vols. 12mo. London, 1840. Bentley.

A DIRECT attempt to follow in the footsteps of Fielding, and revive the characteristics of "Tom Jones" after a pretty long generation of works of fiction, running almost entirely in new channels and different directions, is so bold a measure, that we must devote a few remarks to the appearance of *Elphinstone*. Within the memory of the present race of readers, with, perhaps, an approximating exception in some of the productions of Holcroft, Godwin, and one or two others, these publications may be chiefly classed under the heads of wild and descriptive romance; tales of personal notoriety and fashionable society; the historical and the philosophical novel; the moral and religious inculcator; the painting of foreign customs and manners; and, occasionally, the like attention to home; but in a limited degree, and more applicable to particular sets and circumstances, than to generalisation and broad views of the subject, founded on a study of the nature of man, and the probable effects produced under all the aspects of our existing habits, feelings, and social system. Our author, on the contrary, makes his hero the vehicle of a dozen of sketches of the active community of England, the clergy, medical profession, lawyers, shopkeepers, merchants, gamblers, and blacklegs, &c. &c.; with many incidental touches referring to other classes. He has also imitated Fielding more closely in writing introductory chapters, or essays, to each of his twelve books; and discussing in them topics of the day, in some measure connected with his story, and the opinions and speculations which it develops. In all these parts there is very considerable talent displayed; and we could only have wished that as much discretion had been evinced in the choice of some of the subjects as there is sense and judgment in the remarks on other writers of fiction. It is astonishing that one who could so clearly apprehend, and so cleverly and satirically point out, the faults of others, should be so blind to his own error in this respect. His very apology for it ought to have convinced him that he was wrong. We will adduce its strongest reasoning:—

"About a century back lived a man with a fancy totally depraved, an imagination fitted rather to grovel than to soar, and a disordered brain, yet gifted with the most brilliant and eloquent language that ever conveyed human thought. This man passed a long life without acquiring a particle of common sense, or being suspected of a single virtue. Hating the world, his fellow-men, and all the virtues of social life, he gave to the world, for its destruction, a book which sunk not into contempt until it had accomplished some of its author's intentions, and is not yet totally forgotten. He gave the world a series of domestic scenes, in which every actor is elaborately wicked and conscientiously infamous; and by a showy sophistry made the most loathsome domestic vice lead to, and end in, moral happiness, which might possibly be true if man had no con-

science; but he also made it result in domestic comfort, which never could be true, unless men were without either senses, tastes, or passions. This man was Rousseau, and the work '*La Nouvelle Héloïse*,' a work which, thrown up in the moral convulsion that preceded a social chaos, obtained for itself what all new theories then do, the examination of the world; but being found to war against human nature, to sicken every powerful mind, and disgust every delicate heart, its eloquence and sophistry could not retain it in the hands of men, but it rapidly sank into the smuggled instrument for debauching the minds of precocious children at boarding-schools. The German imagination, as though a nightmare lay upon it to conjure up the most loathsome images for its unnatural love, seized the principle so well worked out by Rousseau, and improved on the original; for as the honest Germans had learned the great picturesqueness and beauty of that rottenness of heart which had always been considered utterly destructive of domestic peace and social existence, they went so far as to appeal to our sympathies on behalf of those horrible crimes which no decent lips dare to name. Considering that what mankind is already convinced of must be unworthy of further discussion, they turned round and combated all the principles inherent in the very nature of man. The amiability of virtue, the beauty of the struggle against temptation! 'Pshaw!' they said, 'sixty centuries have been engaged in teaching that; we will be original and shew the beauty of vice, and the charming struggles of a person against those old superstitions, until he settles down comfortably in infamy.' Such was the language of German imagination; and acting on it, adultery, murder, and incest, became most interesting and engaging events, and the men and women delightful heroes and heroines, who made such compromises and engagements as to commit them without danger from the laws. Then came the French, riotous from the disorders of a bloody revolution. With an intense hatred of every thing belonging to the system they had destroyed, they strove to root out of the national mind every virtue as well as vice that belonged to it. The magnificent propriety of their ancient literature, reflecting, as it did, the stately politeness of public manners, became utterly hateful to them; and to be the very reverse of the great lights of the monarchy was a legitimate title to national applause. Something unbearable then must be adored now. The violet must be plucked from the button-hole to make way for a fungus. The historical drama, the polite novel, both chaster than human life, simpler than Greek tragedy, but colder than Greek statuary, became, with other objects of external decency, objects of suspicion and disgust; and instead of infusing into those beautiful forms a little of the warmth of a heartier humanity, they rushed to the extreme of beating them to the earth, and worshipping the only literature which formed a complete contrast to it. Then moral impossibilities, physical monstrosities, conflicting sentiments which never existed in the same breast, and situations in which no man ever could be placed, became the staple of the French imaginative literature, — a literature which has corrupted the present generation, but happily will not reach the next. English writers, following close in originality their Continental guides, finding the charms of virtue long exhausted, and the graces of the more horrible and tremendous vices occupied by their neighbours, and daring not to introduce them before a nation which would not endure a loathsome literature, leave untouched the

rich archives of British virtue, and explore the pages of the Newgate Calendar, whence they extract the meanest and most contemptible wickedness of our criminals; and the liar, the traitor, the pickpocket, are pictured with the tenderness of love, the buoyancy of adventure, or the brilliancy of generosity: and thus we are taught to condemn the attributes of virtue when we see them not incompatible with the vices that we view with loathing, or crimes that we punish with death.

I am not strait-laced—I can enjoy Boccaccio and Rabelais, and luxuriate in the vigorous license of a youthful literature. I believe that for every edition of a Bowdlerised Shakspeare the world will see a thousand editions of its own Shakspeare. I know of no book from which I would expunge the 'objectionable parts.' I know not even a single criminal which the pen of genius might not bring within the reach of human sympathy, by dwelling, not on his vices, but on those qualities which he possesses in common with all mankind. But I know there are vices and crimes which genius alone can touch without infamy. There are vices which, if a writer dare to invest with the graces of sentiment, with the heroism of adventure, or the picturesqueness of romance, he gives the world a proof that he is not worthy of being a member of it, and the reputation he acquires for his memory is the very reverse of that of a benefactor to his fellow-men.

"This much I have said, as an explanation of, or an apology for, some scenes introduced in the last and present books. It is not my intention to give this work a shocking interest by startling pictures of horrid vice, or by a sentimental gloss on moral deformity. The vice portrayed here is not meant to be attractive; and if any person who is a participator in it interests the feelings of the reader, it will be in spite of, and not on account of, actions which ought to be detested. In other words, the sympathy awakened is for those sentiments which the purest minds cannot help sympathising with, whether they arise in the mind of the pure or of the depraved."

But will these arguments excuse the minute details of seduction, the annals of daily and nightly life in bagnios, and exact descriptions of the orgies of low rouds? We can assure the author they will not. There is a guilty knowledge and contamination in the bare glance at such abominations; and no moral can be affixed to them one hundredth part so valuable as ignorance of their existence. Their presence is a great blot upon an otherwise very able production; and if, as we believe, from a not very mature hand, a production which may be the forerunner of works of unquestionable excellence. Let us take a single sketch of one of the classes treated of, as a specimen—"The Doctor:"

"Some historians assume so much knowledge to be possessed by their readers, that what they tell us is nearly incomprehensible. For my own part, I do not see what a writer has to do with the reader's knowledge; all he ought to consider is, how he may shew off his own as much as possible: for even if the reader already knows what the writer tells him, it gives him pleasure to see it in print, as it makes him flatter himself with the belief that he is as knowing a person as the writer. For such of my readers, therefore, as have been so fortunate as to be unacquainted with doctors, I will give a description of the genus before I introduce the individual. A doctor—that is, a medical man—is a person who lives by ministering to the self-love of sick persons.

Other industrious individuals live by furnishing the public with articles of necessity or luxury—articles which may be appealed to as of value: but 'the doctor' furnishes that which is not only of no value, but that which the receiver is ashamed to remember, and cannot return. The doctor is employed for two purposes which are despised as soon as fulfilled—one is to listen to the interminable complaints of egotism; the other to say that a sick person will possibly recover. Thus the doctor is employed to gratify two forms of self-love, and as that passion is continually shifting into a thousand different forms, so the gratitude for one gratification is instantly merged in the necessity for fresh gratifications. As all persons like flattery, he is the person with whom a debt is most readily contracted; and as nobody likes to pay for past flattery, he is the person most unwillingly paid. He is the man whose skill no one trusts, yet the very man whom every one is happy to employ, for the reason that he is supposed to be the only unprejudiced person, as he is the only person indifferent as to the fate of the patient. Suppose, for instance, a poor fellow to be taken poorly, he hires the doctor to say, he hopes he will get well. The man, to be sure, might have the same words said to him by his wife, but what guarantee could he have that they were in earnest unless, perhaps, he happened to have been married within the last month! A rich old man is sick, he would rather trust the doctor's hopes than those of his heir. An old maid from her *protégée*, a peer from the heir to his title, all fly to the doctor. A dead patient puts no money in the doctor's purse, and hence the fancied security for the earnestness of his hopes. No man, of course, retains so much infantine simplicity as to suppose that the draught, mixtures, &c. named in a doctor's bill, are the things really paid for;—that they are not is proved by the fact that nobody would think of swallowing them; they are really like John Doe and Richard Roe—fictions invented by the politeness of the law as an inoffensive cover for things which would be disagreeable in a too literal description. Imagine a bill consisting of such items as listening for half an hour to Mr. S's complaints. Ditto—a very dull statement. Walking to his house to tell him that his disorder was of an uncertain nature. Assuring him that he would get better soon. Telling the widow that she had done all in her power for the dear deceased. Hinting to her that her charms would assure her a choice of lovers, &c. Surely it is better to pay for draughts than to have such items as these in a bill.

\* Coal all' egro fanciul porgiamo aspersi  
Di soavi licor gli orli del vaso:  
Succihi amari, ingannato, intanto ei beve;  
E dall' inganno suo vita riceve."

Substitute *morte* for *vita*, and the verse will be as good, and the description complete. To be sure 'the doctor' has one important duty to perform, and that is in the coroner's court. If a man happens to have a knife through his heart or a bullet through his brains, the doctor is called to give evidence. He shews that he has examined the liver, and found a slight inflammation, but is ready to swear that, to the best of his knowledge, he believes the knife or bullet would, after all, be most likely to cause the death; and after he has given the twelve plain honest men unintelligible and unpronounceable names for one half of the organs of the body, the coroner, who understands as much about it as they, pays him a compliment on his interesting and scientific evidence, and the

plain, honest twelve painfully arrive at the important decision—found dead. Such a man was Mr. Pounder. Having learned to read and write at a charity school, he had, while a boy, lived some time with a dealer in physic for all kinds of animals, where he had acquired a smattering of that gibberish used in the medical profession, which the generosity of the rest of the world has consented to call Latin. He afterwards went to London to finish his studies—that is, to frequent the theatres and taverns while professors were delivering lectures on the incapacities of their brother professors: and, in due time, having been duly crammed for the purpose, he passed an examination, and received a certificate from the magnates of 'the hall,' that they considered his attainments such as to make him a fit person to become one of themselves—which, perhaps, was not far from the truth."

Here is also a girlish delineation, which may well speak for the writer's powers:—

"She was twelve years of age when her father died—the saddest of all ages to become an orphan; for the thoughtlessness of childhood is past, and the self-dependence of maturity not yet come; the heart is sufficiently ripe to ascertain the magnitude of its loss, and the habits are too unformed to be a shield against such a crushing calamity. And she—what was she?—the gentlest, the most obedient, the kindest-hearted creature, in which was ever enshrined the spirit of an angel. Ripe too, for her age, was she in all feminine accomplishments, but bashful, and to be drawn forward, not brilliant, and struggling for pre-eminence. No happy retort from her lips had ever set her father's table in a roar, but no self-will had ever given her mother's heart a pang. She was not one of those dazzling and precocious intelligences, over whose cradled sleep an anxious and far-seeing mother, in her dying hour, would bend with a fearful heart, and sigh,—'No middle path will be thine, my child, thou wilt carve out thy path through the world, and very dark or very light it must be;—would that I could stay with thee!' But how often did her dying mother kneel beside her cradle, with a heart beating more with love than fear, and exclaim, 'How very happy thou mayest be, my child! thou never wilt be long miserable, for the first unkindness from one thou lovest will break thy heart—would I could take thee with me.' Her person was not an unsuitable casket for the intellectual jewel. I have seen very beautiful children—children of great intellectual readiness and activity, with features as finished, and an expression as decided as those of a full-grown woman; and however charming may have been the light carelessness and innocence of childhood playing over the finely-marked and intelligent features, yet they always gave me the idea of woman in miniature, of children with faces of unbecoming precocity; and I question whether a child whose features are as fully elaborated as those of a mature woman, will not, when a woman, be of too masculine or imperious a visage—I doubt whether her riper years will be adorned by those soft and winning graces which are the very essence of female beauty. Womanhood, that beautifies the frame, will not leave the face untouched; and if that be already formed, the alteration will not be a beauty. Clara Prior was tall for her years, and slender; but she gave promise of a woman intensely to be admired, and dearly to be loved. Her eyes were bright as the sun, but her cheeks were somewhat pale, and her nose and chin wanted somewhat of prominence, which made her appear a child. She was looked at with

pleasure, with tenderness, with love, but with hope; for the simple and infantine expression of her countenance made you think of the time when her face and form would be, as the heart was now, all that love could desire—all that love could worship."

Hardman, the country shopkeeper, and *civili-avant* churchwarden, and his counterpart, Prior, the country attorney in London; Parkinson, the merchant's clerk, with his comrades, and their affectation and practice of fashionable vices; and Holton, the hero himself, especially in his earlier career, are admirably drawn; but the finest of all is the story of the hapless Amelia Williams, the village victim of the heartless seducer's arts. We have nothing to regret in this pathetic tale, but some of the scenes to illustrate it, against which we have entered our most solemn protest.

We cannot, however, conclude without a sample of Mr. Hardman's platitude; when the marriage ceremony of Holton is interrupted:—

"'Young gentleman,' said Mr. Hardman, very solemnly, extending his hands like a blind man in a strange road, or what often amounts to the same thing, an orator beginning a speech, 'young gentleman, it is my opinion that this is a strange proceeding of yours. I must therefore inform you that marriage is a very serious thing, and, consequently, ought not to be interrupted; for when a man has fully made up his mind, and particularly wishes to be married, he does not like to be disappointed. I advise you, therefore, to stand aside like a gentleman, and let the ceremony take place, and if you have any thing to say—any objection to make—you can do it privately afterwards.'"

*The Letters of Horace Walpole, Earl of Orford: including Numerous Letters now First Published from the Original Manuscripts.* In 6 vols. 8vo. Vol. V. pp. 496. London, 1840. Bentley.

WE are now approaching the end of this acceptable publication, in which we have an increased, and increasing, number of additions to a Correspondence previously so various and entertaining, that we question much whether it could be matched in our own, or any other, language. Another volume concludes it. In the present, the new letters are chiefly to the Countess of Suffolk, Sir David Dalrymple (Lord Hailes), and the Hon. H. S. Conway; though there are a few others to Mr. Jephson (the dramatist), Mrs. Abington, Gibbon the historian, the Hon. Mrs. Grey, &c. From these we shall select such as appear to be best suited to our literary columns, and most likely to interest the general reader. They are from 1765 to 1778; and our first extract is from one which speaks of the "Castle of Otranto" in the diffident style of authorship affected in those days; and not only in authorship, but in letter-writing, speech-making, and all occasions where complimentary insincerity on one hand, and humble declaimer of desert on the other, could be applied or introduced. Thus Walpole writes to Dalrymple (April 21, 1765):—

"'Lately I have had little leisure to attend to literary pursuits. I have been much out of order with a violent cold and cough for great part of the winter; and the distractions of this country, which reach even those who mean the least to profit by their country, have not left even me, who hate politics, without some share in them. Yet as what one does not love cannot engross one entirely, I have amused myself a little with writing. Our friend, Lord Finlater, will, perhaps, shew you the fruit of that

trifling, though I had not the confidence to trouble you with such a strange thing as a miraculous story, of which I fear the greatest merit is the novelty. I have lately perused with much pleasure a collection of old ballads, to which I see, sir, you have contributed with your usual benevolence. Continue this kindness to the public, and smile as I do when the pains you take for them are misunderstood or perverted. Authors must content themselves with hoping that two or three intelligent persons in an age will understand the merit of their writings, and those authors are bound in good breeding to suppose that the public in general is enlightened. They who are in the secret know how few of that public they have any reason to wish should read their works. I beg pardon of my masters the public, and am confident, sir, you will not betray me; but let me beg you not to defraud the few that deserve your information, in compliment to those who are not capable of receiving it. Do as I do about my small house here. Every body that comes to see it or me are so good as to wonder that I don't make this or that alteration. I never haggle with them; but always say I intend it. They are satisfied with the attention and themselves, and I remain with the enjoyment of my house as I like it. Adieu! dear sir."

Our next examples shew how playful a stout-minded man may be with the gout, even though he should not resort to the now favourite remedy of drinking champagne as a cure for it:—

"To the Countess of Suffolk.

"London, July 3, 1765.

"Your ladyship's goodness to me on all occasions makes me flatter myself that I am not doing an impertinence in telling you I am alive; though, after what I have suffered, you may be sure there cannot be much of me left. The gout has been a little in my stomach, much more in my head, but, luckily, never out of my right foot, and for twelve, thirteen, and seventeen hours together, insisting upon having its way as absolutely as ever my Lady Blandford did. The extremity of pain seems to be over, though I sometimes think my tyrant puts in his claim to t'other foot; and surely he is, like most tyrants, mean as well as cruel, or he could never have thought the leg of a lark such a prize. The fever, the tyrant's first minister, has been as vexatious as his master, and makes use of this hot day to plague me more; yet, as I was sending a servant to Twickenham, I could not help scrawling out a few lines to ask how your ladyship does, to tell you how I am, and to lament the roses, strawberries, and banks of the river. I know nothing, madam, of any kings or ministers but those I have mentioned; and this administration I fervently hope will be changed soon, and for all others I shall be very indifferent. Had a great prince come to my bed-side yesterday, I should have begged that the honour might last a very few minutes.

I am, &c.

"To the Countess of Suffolk.

"Arlington Street, July 9, 1765.

"Madam,—Though instead of getting better, as I flattered myself I should, I have gone through two very painful and sleepless nights, yet as I give audience here in my bed to new ministers, and foreign ministers, I think it full as much my duty to give an account of myself to those who are so good as to wish me well. I am reduced to nothing but bones and spirits; but the latter make me bear the inconvenience of the former, though they (I mean my bones) lie in a heap over one another like the bits of

ivory at the game of straws. It is very melancholy, at the instant I was getting quit of politics, to be visited with the only thing that is still more plaguing. However, I believe the fit of politics going off makes me support the new-comer better. Neither of them, indeed, will leave me plumper; but if they will both leave me at peace, your ladyship knows it is all I have ever desired. The chiefs of the new ministry were to have kissed hands to-day; but Mr. Charles Townshend, who, besides not knowing either of his own minds, has his brother's minds to know too, could not determine last night. Both brothers are gone to the king to-day. I was much concerned to hear so bad an account of your ladyship's health. Other people would wish you a severe fit, which is a very cheap wish to them who do not feel it: I, who do, advise you to be content with it in detail. Adieu! madam. Pray keep a little summer for me. I will give you a bushel of politics, when I come to Marble Hill, for a tea-cup of strawberries and cream. Mr. Chetwynd, I suppose, is making the utmost advantage of my absence, frisking and cutting capers before Miss Hotham, and advising her not to throw herself away on a decrepit old man. Well, well; fifty years hence he may begin to be an old man too; and then I shall not pity him, though I own he is the best-humoured lad in the world now.—Yours, &c."

A collection of the letters of a man's life, and especially when that man is a wit, is a severe test of his talents; but though we see Walpole often repeat the same ideas, and even words, there is yet such a diversity of liveliness in the way he puts them, that we never cease to be amused. Here, again:—

"To the Countess of Suffolk.

"Paris, Oct. 16, 1765.

"Though I begin my letter to-day, madam, it may not be finished and set out these four days; but serving a tyrant who does not allow me many holyday-minutes, I am forced to seize the first that offer. Even now when I am writing upon the table, he is giving me malicious pinches under it. I was exceedingly obliged to Miss Hotham for her letter, though it did not give me so good an account of your ladyship as I wished. I will not advise you to come to Paris, where, I assure you, one has not a nip less of the gout than at London, and where it is rather more difficult to keep one's chamber pure; water not being reckoned here one of the elements of cleanliness. If ever my Lady Blandford and I make a match, I shall insist on her coming hither for a month first to learn patience. I need have a great stock, who have only travelled from one sick bed to another; who have seen nothing; and who hear of nothing but the braveries of Fontainebleau, where the Duc de Richelieu, whose year it is, has ordered seven new operas, besides other shows. However, if I cannot be diverted, my ruin at least is protracted, as I cannot go to a single shop. Lady Mary Chabot has been so good as to make me a visit. She is again gone into the country till November, but charged me over and over to say a great deal for her to your ladyship, for whom she expresses the highest regard. Lady Brown is still in the country too; but as she loves laughing more than is fashionable here, I expect her return with great impatience. As I neither desire to change their religion or government, I am tired of their perpetual dissertations on those subjects. As when I was here last, which, alas! is four-and-twenty years ago, I was much at Mrs. Hayes's, I thought it but civil to wait on her now that her situation is a little less bril-

liant. She was not at home, but invited me to supper next night. The moment she saw me, I thought I had done very right not to neglect her; for she overwhelmed me with professions of her fondness for me and all my family. When the first torrent was over, she asked me if I was son of the Horace Walpole who had been ambassador here. I said, No, he was my uncle. Oh! then you are he I used to call my Neddy!—No, madam; I believe that is my brother.—Your brother! what is my Lord Walpole?—My cousin, madam.—Your cousin! why, then, who are you? I found that if I had omitted my visit, her memory of me would not have reproached me much. Lord and Lady Fife are expected here every day from Spa; but we hear nothing certain yet of their graces of Richmond, for whom I am a little impatient; and for Pam too, who I hope comes with them. In French houses it is impossible to meet with anything but what, which I am determined never to learn again. I sit by, and yawn; which, however, is better than sitting at it to yawn. I hope to be able to take the air in a few days; for though I have had sharp pain and terrible nights, this codicil to my gout promises to be of much shorter duration than what I had in England, and has kept entirely to my feet. My diet sounds like an English farmer's, being nothing but beef and pudding; in truth, the beef is bouilli, and the pudding bread. This last night has been the first in which I have got a wink of sleep before six in the morning; but skeletons can live very well without eating or sleeping; nay, they can laugh too, when they meet with a jolly mortal of this world. Mr. Chetwynd, I conclude, is dancing at country-balls and horse-races. It is charming to be so young; but I do not envy one whose youth is so good-humoured and good-natured. When he gallops post to town, or swims his horse through a millpond in November, pray make my compliments to him, and to Lady Blandford, and Lady Denbigh. The joys of the gout do not put one's old friends out of one's head, even at this distance. I am, &c."

The next letter we have to quote has some striking allusions to prominent persons:—

"To the Hon. H. S. Conway.

"Paris, Wednesday, Sept. 9, 1767.

"Last night, by Lord Rochford's courier, we heard of Charles Townshend's death; for which, indeed, your letter had prepared me. As a man of incomparable parts, the most entertaining to a spectator, I regret his death. His good-humour prevented one from hating him, and his levity from loving him; but, in a political light, I own I cannot look upon it as a misfortune. His treachery alarmed me, and I apprehended every thing from it. It was not advisable to throw him into the arm of the Opposition. His death avoids both kinds of mischief. I take for granted you will have Lord North for chancellor of the exchequer. He is very inferior to Charles in parts; but what he wants in those will be supplied by firmness and spirit. With regard to my brother, I should apprehend nothing, were he like other men; but I shall not be astonished if he throws his life away; and I have seen so much of the precariousness of it lately, that I am prepared for the event, if it shall happen. I will say nothing about Mr. Harris; he is an old man, and his death will be natural. For Lord Chatham, he is really or intentionally mad, but I still doubt which of the two. Thomas Walpole has writ to his brother here, that the day before Lord Chatham set out for Pynsent, he executed a letter of attorney, with

full powers to his wife, and the moment it was signed he began singing. You may depend upon it I shall only stay here to the end of the month; but if you should want me sooner, I will set out at a moment's warning, on your sending me a line by Lord Rochford's courier. This goes by Lady Mary Coke, who sets out to-morrow morning early, on the notice of Mr. Townshend's death, or she would have stayed ten days longer. I sent you a letter by Mr. Fletcher, but I fear he did not go away till the day before yesterday. I am just come from dining *en famille* with the Duke de Choiseul: he was very civil—but much more civil to Mr. Wood, who dined there too. I forgive this gratitude to the *peacemakers*. I must finish; for I am going to Lady Mary, and then return to sup with the Duchess de Choiseul, who is not civiler to any body than to me. Adieu! Yours ever."

The following is a good example of light satirical criticism:—

"To the Hon. H. S. Conway.

"Strawberry Hill, June 17, 1771.

"I was very sure you would grant my request, if you could, and I am perfectly satisfied with your reasons; but I do not believe the parties concerned will be so too, especially the heads of the family, who are not so ready to serve their relations at their own expense as gratis. When I see you, I will tell you more, and what I thought I had told you. You tax me with four days in Bedfordshire; I was but three at most, and of those the evening I went and the morning I came away made the third day. I will try to see you before I go. The Edgcomb I should like and Lady Lyttelton, but Garrick does not tempt me at all. I have no taste for his perpetual buffoonery, and am sick of his endless expectation of flattery; but you who charge me with making a long visit to Lord and Lady Ossory,—you do not see the mote in your own eye; at least, I am sure Lady Ailesbury does not see that in hers. I could not obtain a single day from her all last year, and with difficulty got her to give me a few hours this. There is always an indispensable pheasantry that must be visited, or something from which she cannot spare four-and-twenty hours. Strawberry sets this down in its pocket-book, and resents the neglect. At two miles from Houghton Park is the mausoleum of the Bruces, where I saw the most ridiculous monument of one of Lady Ailesbury's predecessors that ever was imagined; I beg she will never keep such company. In the midst of an octagon chapel is the tomb of Diana, countess of Oxford and Elgin. From a huge, unwieldy base of white marble rises a black marble cistern; literally a cistern that would serve for an eating-room. In the midst of this, to the knees, stands her ladyship in a white domino or shroud, with her left hand erect as giving her blessing. It put me in mind of Mrs. Cavendish when she got drunk in the bathing-tub. At another church is a kind of catacomb for the Earls of Kent: there are ten sumptuous monuments. Wrest and Hawnes are both ugly places; the house at the former is ridiculously old and bad. The state bedchamber (not ten feet high) and its drawing-room are laced with Ionic columns of spotted velvet, and friezes of patchwork. There are bushels of deplorable earls and countesses. The garden was execrable too, but is something mended by Brown. Houghton Park and Amptill stand finely: the last is a very good house, and has a beautiful park. The other has three beautiful old fronts, in the style of Holland House, with turrets and loggias, but

not so large within. It is the worst-contrived dwelling I ever saw. Upon the whole, I was much diverted with my journey. On my return I stayed but a single hour in London, saw no soul, and came hither to meet the deluge. It has rained all night and all day; but it is midsummer, consequently mid-winter, and one can expect no better. Adieu!"

And here we conclude our notice, at least for the present.

*Legendary Tales of the Highlands: A Sequel to "Highland Rambles."* By Sir T. Dick Lauder, Bart., author of "Lochandhu," "The Wolfe of Badenoch," "The Moray Floods," &c. 3 vols. 12mo. London, 1841. Colburn.

A CONTINUATION of the author's work published three years ago, and directed, as the introduction informs us, to preserve as many interesting Highland traditions as he could from perishing, with the aged parties in whose memories alone they lived. This is a worthy design, and we only wish it were more widely applied, both by Sir T. D. Lauder and others. For, with regard to these three volumes, the traditions preserved are few, and have little of that ancient and legendary character which the title leads us to expect. The stories, in fact, are but five in number: viz. 1. "The Water-Kelpie's Bridle and the Mermaid's Stone;" 2. "Legend," or rather account handed down, "of the Clan-Allan Stewarts;" 3. "Legend of Charley Stewart Tailleair-Crubach" (lame Taylor), in the time of James III.; 4. "The Legend (quære?) of Serjeant John Smith's Adventures," a marvellous tale founded on the battle and results of Culloden; and lastly, 5. "The Legend of the Vision of Campbell of Inverawe," date of the American war, and in our sense of the word, the only genuine legend among the whole. The other parts consist of various descriptions of Highland scenery, inns, &c.—colloquies in which many topics are slightly glanced at,—the services of Highland regiments, and other matters and incidents of a very miscellaneous nature, which are introduced in order to give a sort of coherence to the collection.

Taking the series altogether, we would say that *labor superabat opus* might be its critical motto; but some of the tales boast of an historical, and others of a northern superstitious, interest, and all are told in a forcible dramatic manner. In arguing for a partial belief in even the most incredible traditions, the author illustrates his point by a ludicrous relation:—

"Some of the Welsh legendary historians tell us, that in the year 500 there flourished a renowned chief called Benlli Gawr. His usual residence was where the present town of Mold now stands, and his hill-fort, or place of strength, was erected on the highest of the Clwydian range, nearly due west from Mold, and about half way between that place and Ruthin. The hill on which the remains of this fortalice still exist, is called Moel Benlli, or the conical hill of Benlli; and it presents a conspicuous object from Mold, Ruthin, and Denbigh. An immense *carnedd*, or cairn of stones, which was still to be seen some years ago in an entire state in a field about half a mile from the town of Mold, was supposed to have been the place of this hero's interment; and if we may believe what we read in the Welsh verses on the graves of the warriors of the Isle of Britain, his son's place of sepulture was in a spot about eight miles distant, and is thus noticed in the following rhymes:—

‘Plan y bedd yn y Maes Mawr,  
Belen a law ar ei larn awr !  
Bedd Beli ab Benlli Gawr.’

That is,—

‘He who owns the grave in the large field,  
Proud his hand on his blade;  
The grave of Beli, son of Benlli Gawr.’

But to return to the great *carneidd* of Benlli himself in the field near Mold. It was always called *Tomen y r Ellyllon*, or the *Tumulus* of the Goblins; and for this reason, that from time immemorial it was believed that the grim ghost of Benlli, in the form of a knight clad in splendid gear, and especially wearing a *celain aur*, or golden corselet, appeared after sunset, standing on the cairn, or walking round it; and that there he continued to maintain his cold post till the scent of the morning air, or the crowing of the cock, drove him to the necessity of retiring from it to some more comfortable quarters. This legend had for generations so terrified the people, that no tribe could have tempted any one to have passed by that way after nightfall. Yet, though nobody went thither, and that every possibility of having any thing like direct evidence as to what the spectre knight's personal appearance and dress really were, had been thus precluded by the circumstance that every one slunned his dreaded presence, the most wonderful and incredible accounts of his stern countenance and terrific bearing, together with the most fearful stories of their effects upon people who had beheld them, continued to be propagated, although no one could specify the individuals who had seen them, or been so affected by them. Towards the end of the year 1833, it happened that the occupier of the field where the *carneidd* stood, took it into his head that the stones of which it was composed might be of use for the construction of a road, or for filling drains, or for some such rural purpose. It was with some difficulty that he could procure workmen bold enough to make such an assault on the very castle of the goblin, even although it was to be carried on during the hours that the blessed sun was abroad. But, having at last succeeded in obtaining these, he proceeded to work, and soon drove away some four or five hundred cart-loads of stones from the cairn, when, at last, the workmen came upon something of a strange shape, which was manifestly constructed of some sort of metal. It was with no little dread that they ventured to touch it; but their observation having led them to believe that it was some old brass pot-lid, or frying-pan, it ceased to be an object either of dread or of interest in their unlearned eyes, and they threw it carelessly into a hedge, where it lay all night neglected. Some person of education having come to the spot next morning, who had heard of such a thing having been found, was led by curiosity to examine it, when, to the astonishment of all who heard of it, the brazen frying-pan was discovered to be a *lorica*, or corselet of gold! The metal was found to be of about the same degree of purity as our present coin. It was so thin, that it weighed altogether no more than sixty sovereigns, and therefore it appears evident that it could not have been used as armour of defence in combat. It is more than probable that it must have been worn merely as an ornamental piece of armour on occasions of state or parade, in which case it was, very likely, originally lined with leather. It was embossed all over it, of a simple pattern, but it was not perforated. The obliging correspondent through whose kindness, and that of his friends, I have become possessed of these very remarkable facts, amuses himself by calculating the

immense value which such a piece of dress must have had in the time of Benlli-Gawr, its wearer, that is, in the year 500. ‘This,’ says he, ‘may be done by referring to the ancient laws of Wales, now publishing under the Government Commission. In these laws, the average price of a cow was five shillings, and, allowing for the difference in the value of money, a cow would now cost about ten pounds. Then one pound at that time would buy four cows, and the ten pounds would buy forty cows, and the sixty sovereigns would be the value of two hundred and forty cows, or two thousand four hundred pounds sterling.’ This curious and highly valuable *morceau* of antiquity was immediately claimed by the Honourable Edward Mostyn Lloyd Mostyn as lord of the manor, and by Colonel Salusbury of Gallbar-nan as the possessor of the field where it was found, and the law having determined that it should belong to the former gentleman, it is now in his possession.”

“The Vision of Campbell of Inverawe” is, in our opinion, the light of the book—romantic, supernatural, and highly tragic. One incident in which Campbell consents to afford the protection of hospitality to a fugitive murderer is so remarkable a highland trait that we select it:—

“‘For mercy’s sake pardon my unceremonious entrance, Inverawe!’ said the stranger, in a hollow, husky, and exhausted voice. ‘And be not alarmed, for I come with no hostile intention against you or yours. I am an unfortunate wretch, who, in a sudden quarrel, have shed the blood of a fellow-creature. He was a man of Lorn. I have been hotly pursued by his friends, and though I have thrown those who are after me considerably out during the long chase they have kept up, yet they are still pressing like blood-hounds on my track. To baffle them, if possible, I threw myself into the river, and swam across it, and I now claim that protection, and that hospitality, which no one ever failed to find within the house of Inverawe.’ ‘By Cruachan!’ cried Inverawe, sheathing his dirk, and slapping it smartly with the open palm of his hand. ‘By Cruachan, I swear that you shall have both!’ Now, I must tell you, that this was considered as the most solemn pledge that a Campbell of Inverawe could give. Their war-cry was, ‘Coar-a-Cruachan,’ that is, ‘Help from Cruachan.’ And this expression had a double meaning, inasmuch as the word Cruachan had reference both to the mountain of that name, and to the hip where the dirk hung. To swear by Cruachan, therefore, and to strengthen the oath by slapping the dirk with the open palm, was to utter an oath, which must, under all circumstances, be for ever held inviolable.”

The character of a “wee body,” both in person and property, called from the latter, small as it is, Inchroory, is drawn with humorous effect, as exhibiting the excessive pride of a “Heeland Shentleman.” We copy the concluding anecdote:—

“I dare say, gentlemen, I have given you enough of Inchroory to make you sufficiently well acquainted with his character. But I have yet one more anecdote of him, which I think brings it out more than all the others. His wife, Ealsach, was one morning occupied in tending the cattle at the shieling of Altanarroch. Lonely as you already know this place of Inchroory to be, its loneliness was nothing when compared to that of the shieling of Altanarroch, where even the cattle themselves could only exist for a month or two during the finest part of the year. Now it happened that Ealsach, being in the family

way, became extremely anxious and unhappy as her time of confinement approached; and her anxiety went on increasing daily, till at last she began to think it very expedient to go home to Inchroory. The distance was considerable, and the way rough enough in all conscience. But, having the spirit of a Highland woman within her, she set out boldly on foot, and arrived at Inchroory at an early hour in the morning. Her husband met her at the door of the house, where she looked for a kind welcome from him, and modestly signified the cause of her coming. ‘Ha!’ exclaimed he, proudly, and with anger in his eye. ‘How is this that you come on foot? How dared you to come home till I sent a horse for you, that you might travel as Inchroory’s wife ought to do?’ ‘No one saw how I came,’ replied his wife, meekly. ‘I met nothing but the moor-cocks and the pease-weeps on the hill.’ ‘No matter,’ said Inchroory, ‘even the moor-cocks and the pease-weeps should not have it to say, that they saw the wife of Inchroory tramping home a-foot through the heather. Get thee back this moment every foot of the way to Altanarroch, that I may send for thee as Inchroory’s wife ought to be sent for.’ The poor woman knew that argument with him was useless. Without entering the house, therefore, she was compelled to turn her weary steps back to Altanarroch; and she was no sooner there, than a servant appeared, leading by the bridle a horse, having a saddle on its back covered with a green cloth, on which she was compelled to mount forthwith, in order to ride home over the barren and desert moors and mooses in such style as might satisfy the moor-cocks and the pease-weeps that she was the wife of Inchroory.”

#### MISCELLANEOUS.

*The Three Peers.* By Lady Stepney. 3 vols. 12mo. London, 1840. Bentley.

THE title of *Three Peers* prepares us for a tale of the aristocratic circles; and her personal acquaintance with them points out the author as a competent painter of their characters, and chronicler of their habits and doings. If we add to these qualifications, that the story is involved in the dramatic mysteries of unacknowledged offspring and unknown relationships,—that villainy and virtue are contrasted in action and in destiny,—that love bears its due proportion in crossing events, and finally triumphing, we have noticed the leading ingredients of a proper novel in high life from a not incurious observer nor unpractised hand. We have, however, in vain looked through these three volumes for a suitable extract to exemplify them, without violating the interest in which readers of this class of publication are more especially disposed to take a pleasure. Why, indeed, should we, in a brief critique, divulge secrets which the author relies on for the effects of her conclusion, and keeps carefully guarded till within a few pages of the close of the third volume? Holding such conduct to be altogether unwarrantable, and finding we could give no sufficient extract without trenching on the plot, we must be content with recording this creation of *Three Peers* for the gratification of the lovers of fiction, grafted on the form and pressure of fashionable society.

*Low's Illustrations of Domestic Animals.* Part V. London, 1840. Longman and Co.

WHAT animal is more important to man than the sheep, of which this Part so ably treats? Not the horse nor the ox to civilised Europe, nor the dog or reindeer to the frozen north, nor the camel to the burning and barren desert,

not the pointer to the sportsman, nor the cat to the old maid! Of various breeds, Mr. Low has given us the best accounts of "the Kerry," "the Black-faced Heath," and "the Cheviot;" to all of which these islands are so extensively indebted for food and clothing. As in the preceding parts, the species are beautifully pictured; so that, whilst we are taught their uses and merits by the descriptions, our eye is gratified by their correct delineation, though grouped with great pictorial effect. In the latter point of view they are indeed so excellent, that we know of no more suitable and interesting ornament to the grange or farm-house, than a series of these engravings neatly framed, whilst the text lies on the table for reference and information.

*The Dowager; or, the New School for Scandal.*  
By Mrs. Gore, authoress of "Mrs. Armitage," "Stokeshill Park," &c. 3 vols. 12mo. London, 1840. Bentley.

THE *Dowager* is the head of a fashionable and scandalous clique, who, by their prying curiosity and malicious misinterpretations and calumnies, embroil all the worthy people within the sphere of their operations in difficulties and distress. In the end *éclaircissements* take place, and poetical justice is done. As in the whole of Mrs. Gore's *spiritual* productions, there is a keen appreciation of character; and if the portraits and events are coloured as highly as probabilities allow, they are yet all within the pale, and in perfect keeping. Of the talent displayed in general, in contriving the incidents, making the speakers feel, act, and talk as they would naturally do under the impressions created, and elaborating out of the whole a good story to paint the moral and interest the reader, we need only say that it is worthy of this lady's established popularity. For reasons assigned elsewhere we offer no extracts.

#### ORIGINAL CORRESPONDENCE.

DR. HELFER.

Prague, Oct. 29.

SOME months ago, the "Allgemeine Zeitung" (the "Augsburg Universal Gazette") first, and then the English journals, published the news of the death of our countryman, Dr. Helfer, who was visiting the islands of Southern Asia; but letters from his wife having been received just before, dated nearly at the time when the misfortune was said to have happened, the relations of the enterprising traveller were induced to hope that the accounts given by those newspapers would not be confirmed. We were, therefore, the more deeply grieved by the contents of later letters just received from his wife and her brother, M. Otto des Granges, which unhappily confirm the fact, that Dr. Helfer, in the flower of his age, and on the road to well-earned fame, has fallen a victim to his zeal for the promotion of natural history and geography. On the 13th of January, this year, leaving Mergui (where his wife stayed in the meantime), in company with his above-mentioned brother-in-law, for the purpose of exploring the Andaman Islands, he reached them on the fourth day, and explored several of them by landing at different places. On the 30th, being at anchor off the largest of them, and the wind being contrary, Dr. Helfer resolved to make an attempt to communicate with the very savage natives, and proceeded with two small boats, accompanied only by the captain of the Catherine schooner, and some Birmese and Malays, towards the coast. Just as they were about to land, they were received by thirty of the natives with showers of arrows, from which they endeavoured to

escape by leaping into the water and swimming to the ship, which was scarcely 1000 paces distant, their boats being upset in the confusion. Meantime almost all his companions were wounded by the arrows of the savages; he himself was wounded by an arrow in the neck, and by a second in the head, and, being borne down by the weight of his arms and his cartridge-box, he sank, and rose no more. The endeavours of his brother-in-law, who had remained on board the ship at anchor, to approach the shore and give assistance, were baffled by violent contrary winds; and equally fruitless were his subsequent endeavours to find the body. The other wounded persons, who had got possession of one of the boats which had been got afloat, reached the ship, which arrived at Mergui on the 19th of February, bringing the fatal news to his unfortunate widow. This faithful partner in the zeal of her husband is already on her return to Europe; and we are fully persuaded that the rich collections made by her and her husband respecting the natural history and geography of Asia will be duly communicated to the scientific world.

#### ARTS AND SCIENCES. GEOLOGICAL SOCIETY.

Nov. 18th. The Rev. Dr. Buckland, President, in the chair.—Dr. Buckland's paper, 'On the Proofs of the former Existence of Glaciers in Scotland and England,' commenced on the 4th instant, was resumed. When the author's attention was first directed by Prof. Agassiz, in Oct. 1838, to the polished striated and furrowed surfaces of the rocks on the slopes of the Jura near Neuchâtel, as the effects of glaciers, he doubted the correctness of the inference; but, after devoting some days to the examination of actual glaciers, and the effects produced by them, he became a complete convert to the glacier theory, as far as relates to Switzerland. On his return to Neuchâtel, in the same year, he informed M. Agassiz, that he had noticed similarly polished and striated rocks, in 1811, on the left side of the gorge of the Tay, near Dunkeld, though he then attributed the appearance to diluvial action; that, in 1824, he had noticed, when in company with Mr. Lyell, grooves and striæ on the surface of granite rocks, near the east base of Ben Nevis; and that, near the base of Ben Wevis, Sir G. MacKenzie pointed out to him a high ridge of gravel arranged obliquely across a valley, and not explicable by any action of water. Those phenomena, however, since his examination of the Swiss glaciers, he has been convinced, may be explained by the friction of ice upon rocks, and the production of transverse moraines. After these preliminary remarks, Dr. Buckland proceeds to describe the evidences of glaciers observed during a tour made in the autumn of this year, partly before, and partly subsequent to, an excursion in company with Prof. Agassiz. He, however, omits for the present all details respecting parallel terraces, though he is convinced that they are intimately connected with the glacier theory. The observations commenced in the neighbourhood of Dumfries, and were afterwards extended over a line of country ranging from Aberdeen by Forfar, Blairgowrie, Dunkeld, Loch Tummel, and Loch Rannoch, to Schiehallion and Taymouth; and thence by Crief, Comrie, Loch Earn Head, Callender, and Stirling, to Edinburgh. The tour was subsequently prolonged in England, by Berwick, the Cheviots, Alston Moor, and Shap Fell, to Lancashire and Cheshire; but the details of this portion of the series of ob-

servations will be given in a paper to be read on the 2d of December. The evidence of the former existence of glaciers in the vicinity of Dumfries occurs in the picturesque ravine of Crickhope Linn. On emerging from the chasm at the upper end of this ravine, a remarkable example of a long terminal moraine is visible, stretching across the mountain valley, from which the Dolland Burn descends to fall into Crickhope Linn. When seen from a distance, it resembles the vallum of an ancient camp, being covered with turf; but it is composed of rolled pebbles, chiefly of slate rocks, originally derived from the adjacent Lammermuir Hills, and of a few rolled fragments of granite. It presents no traces of stratification. The height varies from 20 to 30 feet; the breadth of the base is about 100 feet; and the length is 400 yards, occupying the entire breadth of the valley, except near the centre, where the moraine is intersected by a road, and at the west end, where it is traversed by the Dolland rivulet. To moraines, or the detritus of moraines, Dr. Buckland refers the gravel and sand which cover the granitic table-land between Aberdeen and Stonehaven; the large insulated tumuli and tortuous ridges of gravel which occupy a tract of 100 acres near Forden, one mile east of Achinbald; the blocks, and more or less stratified gravel which are spread over the first level portion of the valley of the North Esk, after it emerges from the sub-Grampians; also the ridges and cones of gravel at Cortachy and Pierie, not far from Kerriemuir. Near the summit of the hill which forms the left side of the main valley at the confluent point of the Pierie and Prosen valleys is a polished surface of porphyry, striated in the direction which a glacier descending the valley would have maintained. The vast longitudinal and insulated ridges of gravel, extending two or three miles up the valley east of Blairgowrie, and the transverse barriers, which form a series of small lakes on its west, in the valley of Lunanburn, Dr. Buckland considers to be moraines, also the lofty mounds composing the ornamental grounds adjacent to Dunkeld Castle—the detritus which covers the left flank of the Tay, along a great part of the road from Dunkeld to Logierait; the left flank of the Tummel valley from Logierait to Killcrankie, and the left flank of the Garrie from Killcrankie to Blair Athol; likewise the vast congeries of gravel and boulders lodged in the shoulders of the mountain opposite the gorge of the Tummel, and accumulated, the author believes, by glaciers which descended the valley of the Tummel, from the north side of Schiehallion, and the mountains around Loch Rannoch. This elevated mass of moraines, and detritus of moraines, in the lateral valley of the Tummel, Dr. Buckland conceives, was formed across the longitudinal valley of the Garrie, in the same manner that modern glaciers of the Alps, as in the case of the Val de Bagnes, occasionally descend from the transverse across the longitudinal valleys. The mammellated, polished, and striated slate rocks, about one mile above the falls of Tummel, and forming the left portal of the gorge of the valley, Dr. Buckland mentions as proofs of the action of a glacier which descended the gorge: he alludes also to the indications of polish on veins of quartz which project eight or ten inches above the surface of weathered masses of mica-slate near the same locality; and to the slight scratches on mammellated rocks at Bohaly, one mile and a half east of Tummel Bridge. The evidence of glaciers on Schiehallion, he shews is visible on the north and north-east shoulders of the mountain,

in rounded, polished, and striated surfaces, many of which have been recently laid bare in forming a new road. The surface of a porphyry dike about 40 feet wide, and lately exposed, near the thirteenth milestone, on the left flank of the valley called the Braes of Foss, is polished and covered with striae, parallel to the line of descent, which a glacier from Schiehallion would assume; and, on the right flank of the same valley, 100 yards north of the eleventh milestone, is another smaller vein of red porphyry, similarly polished and striated. In the intermediate space, newly uncovered surfaces of hard slate rocks and quartzite present characters of the same nature; and the whole of these phenomena are ascribed to the agency of glaciers. The two lofty ridges of gravel in Taymouth Park, ranging at right angles to the sides of the valley, between the village of Kenmore and the castle; the mound on which stands the ornamental dairy, and the gravel on which are situated the woods overhanging the left bank of the lower end of Loch Tay, Dr. Buckland considers to be moraines, or the detritus of moraines; likewise the deeply scored and fluted boulders of hornblende rock with other débris, which occur at the junction of Glen Moulin with the Lyon. The proofs of glacier-action in Glen Cofield are shewn to be a remarkable assemblage of moraines upon the high land which divides the valley of the Tay from that of the Bran; also a group between the sixteenth and fourteenth milestones, consisting of forty or fifty round-topped moraines, from 30 to 60 feet high, crowded together like tumuli. It is impossible, Dr. Buckland says, to refer these mounds of gravel and blocks to the action of a current of water, as they are placed precisely at the point where a stream, descending from the high lands, would have acted with the greatest velocity; they moreover exactly resemble some of those moraines which occur in the valley of the Rhone between Martigny and Lâck. The village of Amburle, Dr. Buckland conceives, is situated on a group of low moraines; and he states that the road, for two or three miles towards Glen Almond, passes over similar accumulations, and surfaces of mica-slate rounded by glaciers. The proofs of the action of ice in and near Strath Earn consist, between Crieff and Comrie, in irregular terraces of gravel, or detritus of moraines; and in rounded as well as guttered surfaces of slate rocks at the west end of Comrie, near the bridge; and in the woods adjacent to Lawer's House. In the valley of the Lednoch, Dr. Buckland found further proofs of glacial action, and at points where, if the glacier theory were true, he had assumed they ought to exist. Immediately above the gorge called the Devil's Caldron, particularly near Tentallich, he noticed rounded surfaces of greenstone partially covered with moraines; and at Kenagart, also immediately above the gorge, a small cluster of moraines, easily separable into lateral and terminal. Two miles higher, at the confluence of Glen Lednoch with Glen Garrow, a distinct medial moraine forms an insulated ridge in front of the point of union of the two valleys. The farm-house of Invergeldy is said to stand on the detritus of a moraine; and the surface of the granite at Invergeldy, from which the stone was procured to erect Lord Melville's monument near Crieff, is stated to bear evidence of having been rounded by glacier-action. On a hill of trap, half a mile south of the farm of Lurg, on the left side of Glen Lednoch, a striated and polished surface is distinctly preserved. In Glen

Turret, Dr. Buckland found, on the shoulder of the mountain immediately above the S.W. extremity of the Loch, a vast lateral moraine in a deep ravine; and at the falls of Turret, at the lower extremity of the gorge, an extensive lodgement of moraines; whilst at the upper end of the gorge, on the left bank of the river, near a gate which crosses the road, he noticed polished and furrowed surfaces of slate-rocks, at precisely the place where, theoretically, he had asserted they ought to be found. The banks of Loch Earn, and the surrounding country, afforded Dr. Buckland the following evidence of glaciers having existed in that district. On the north bank of the loch, he observed rounded and furrowed surfaces and portions of lateral moraines exposed in roadside sections; and at Iosh Earn Head a group of conical moraines occupying the middle of the valley, at a point where, had the detritus been brought by a rapid current, it must have been propelled into the loch, but if brought by a glacier would have been deposited as a terminal moraine. Further evidence of moraines are stated to occur in the valley of the Teith, from Loch Katherine to Callender; and the lofty parallel terraces in the same valley are considered to be detritus of moraines modified by the great floods which accompanied the melting of the ice. One of them near Callender has been hitherto believed to be a Roman camp, and has been mapped as such. The little lakes on the right banks of the Teith, four miles east of Callender, Dr. Buckland considers due to a series of moraines obstructing the drainage of the country; and the first table-land, after crossing the river towards Doune, to be composed of rearranged glacial detritus; also the ground on Mr. Smith's farm near Doune is situated. Having thus proved that glaciers once occurred in the glens and mountainous districts of Scotland, Dr. Buckland was anxious to ascertain the amount of evidence which Stirling and Edinburgh would afford of their action at points but little raised above the level of the sea, and far distant from any group of mountains. He had noticed, in 1824, on the summit of the hill at Stirling, that the surface of the trap then recently uncovered, between the castle and the church, was polished and striated; but at his last visit those proofs had been obliterated. The grooves and scratches, described by Sir James Hall, on the Costorpin Hills, near Edinburgh, and on Calton Hill, Professor Agassiz informed him, entirely resemble the effects produced by the under-surface of modern glaciers. In his recent examination, in company with Mr. Mac-laren, of the castle-rock at Edinburgh, he found polished and striated surfaces at the N.W. and S.W. angles; and at the base of the N.W. angle a nearly horizontal portion of the rock covered with rude striae, ranging E. and W. Some of these scratches and rounded surfaces, Dr. Buckland says, may have been produced by stones projecting from the sides or bottom of floating masses of ice, but that it is impossible to account by this means for the polish and striae on rocks at Black Law Hill, two miles south of Edinburgh. On the southern face of this hill, at the base of a nearly vertical cliff of trap, is a natural vault, partially filled with a breccia composed of gravel and sand cemented by a modern infiltration of carbonate of lime. The sides and roof of the vault are highly polished, and covered with striae, irregularly arranged with respect to the whole area, but parallel over limited extents. It is impossible, Dr. Buckland observes, to refer these striae to the action of pebbles set in mo-

tion by water, because fragments of stone moving in a fluid cannot produce continuous parallel lines; and because, if they could produce them, the striae would be parallel to the direction of the current. It is impossible, he also states, to refer them to the effects of stones fixed in floating ice, as no such masses could have come in contact with the roof of a low vault; but that it is easy to explain the phenomena, by the long-continued action of fragments of ice forced into the cave literally from the bottom of a glacier, descending the valley, on the margin of which the vault is placed; and the irregular grouping of the parallel striae to the unequal motion of the ice, charged with fragments of stone. The position of the cave does not exceed 300 feet above the level of the sea; and the proving of glacial action at this point, the author states, justifies the opinion that glaciers may also have covered Calton Hill, and the Castle hills of Edinburgh and Stirling.—A paper 'On the Geological Evidence of the former Existence of Glaciers in Forfarshire,' by Mr. Lyell, was commenced.

## BOTANICAL SOCIETY.

Nov. 20th. Mr. Reynolds in the chair.—Exhibited the following specimens, presented by Mr. H. C. Watson, *Ceranium pusillum*, in which the branches terminated in umbels, imperfectly formed by the multiplication and adhesion of flowers and their stalks, the petals being mostly green and imperfect; *Saxifraga sarmentacea*, having the parts of the flowers foliaceous, the seed-vessel being transformed into two leaves and the seeds into very small leaf-buds, resembling the young plants on the runners.—Read, extracts of a letter from Dr. H. Willshire, who left England in August last to explore the botany of Morocco; also, the conclusion of Mr. James Harvey's paper 'On *Mikaina guaco*.'

## PARIS LETTER.

Academy of Sciences, Nov. 24, 1840.

SITTING of November 19.—M. Despretz read a memoir 'On Certain Experiments Recently Undertaken by him for Ascertaining the Quantity of Caloric Absorbed in the Fusion of Bodies,' and explained an ingenious apparatus for operating by means of immersion in a box that kept the heated matter free from contact with the liquid in which the immersion was made. It resulted from his observations, that the *specific* of a body is greater when in a liquid than when in a solid state, and that the latent heat is nearly in an inverse proportion with the atomic weight.—M. Lallemand, of Montpellier, read an elaborate memoir 'On the General Laws of Reproduction in all Animals.'—M. Duhamel read the second part of a paper 'On the Vibration of Strings charged with Riders.' He shewed that for a determinate weight of the riders, and for any determinate position of them, there are, when the cord is made to vibrate, an infinity of simple sounds, which the cord emits, and which correspond each to a particular system of nodi. These sounds and the positions of these nodi were each to be determined by the roots of a transcendental equation. In a great number of cases solutions were obtained which did not correspond with any of these roots; and, in this paper, M. Duhamel shewed the method of recognising these cases, and of forming the proper solutions. A numerous series of experiments in support and trial of this theory had been made, and the differences found to exist between the actual and theoretical results were so trifling, that the theory was considered to be

thereby satisfactorily confirmed. Thus in a first series of experiments, the differences between the practical and theoretical results were the following:—

+ 0.0005, - 0.0088, - 0.0064, + 0.0005, - 0.01, - 0.0005.

differences following no regular order either in magnitude or signs. These differences were therefore to be looked as all lying within the limits of errors to which the most careful experiments were always subject.

*November Shooting Stars.*—M. Arago remarked to the Academy that the weather had been so exceedingly unfavourable this year that no observations of the periodicity of these meteoric phenomena could be made on the 13th or 14th. On the 12th there had been only a few seen, though the night was cloudless; but what was remarkable was, that lightning had been observed that night, notwithstanding the absence of clouds.

A young shepherd-boy, ten years old, possessed of calculating powers similar to those of the young Mangiamelo, was introduced to the Academy, and answered several mathematical questions with the greatest facility. The guardian of this boy, M. Jacobi, a school-master of Tours, explained that in many cases of multiplication he operated in his mind by the usual algebraical formulæ. The square of 756 he gave, accurately, in less than a minute; and he gave the number of seconds, minutes, &c. in fifty-two years in about one-fourth of the time that it would have required to do it with the common aids of pen and paper.

A curious instance of the effect of steam in extinguishing a fire was mentioned to the Academy as having recently occurred near Amiens. A manufactory was in flames, when the engine-men succeeded in turning on into a room where the fire was raging all the steam of the engine which gave the moving power to the machinery of the establishment, and the consequence was, that the force of the fire was immediately diminished in a very remarkable degree.—M. Payer mentioned that the waters proceeding from a manufactory for the extraction of fœcula from various substances, situated near Versailles, had been turned on to some fields with beneficial effects, acting as a rich manure.

M. Dumont d'Urville's report of the voyage which he has just terminated has been received, but is not yet published, by the Minister of Marine. It appears that, after leaving Van Diemen's land, the ships, the *Astrolabe* and *Zélée*, visited New Zealand, and then steered across the Pacific for Louisiana and Torres Straits. All the southern part of that land for 200 leagues from Russell Island was carefully surveyed; and on the 28th May, 1840, it was proved that there was no strait existing between Louisiana and New Guinea; and, therefore, that the great island of D'Entrecasteaux is nothing else than the eastern extremity of New Guinea. The expedition continued to trace the coast for thirty leagues from Cape Rodney,—a district of the beauty of which the officers of the expedition speak in high terms. The vessels ran on a dangerous coral reef in Torres Straits, from having mistaken a channel insufficiently indicated in Bligh's sketch, but got off again with the loss of their false keels. The vessels arrived at Toulon on the 6th instant.

M. Ingres, Director of the French Academy of Fine Arts at Rome, terminates his five years, the usual period for holding that office, on the 31st December next; and M. Schnetz has just been appointed to succeed him. The

former gentleman has just been commissioned by the Minister of the Interior to paint the ceiling of the New Chamber of Peers, for 100,000 francs, or 4000*l.*—A beautiful little picture, by Robert Fleury, "*Le Colloque de Poissy*," which attracted much well-deserved attention at the last *Salon*, has been purchased for the Museum of the Luxembourg, and placed in the Gallery of Modern Paintings.—Gudin's magnificent view of "*Gibraltar from the South-east*," which was one of the principal gems of this year's exhibition at the Louvre, has been purchased by Sasse, the picture-dealer; and he has recently shewn it in his window. He asks 4500 francs, or 180*l.* for it, —a high price, notwithstanding its great merit. Whilst talking of pictures, we may mention that we learn from Berlin that M. Lipmann has succeeded by his new method in copying in oil a small portrait by F. Mieris, producing a work of great beauty. It was always supposed that this mechanical process was not applicable to any but large pictures.—Professor Camporese, a distinguished architect of Rome, and formerly President of the Academy of St. Luke, died there a short time since, aged eighty-four.

Most of the French papers have been stating that Father Gêramb, of the order of La Trappe, was dead. This is erroneous; it is his son, whose decease was announced by the "*Ami de la Religion*" in a paragraph commencing with the words, "*Le R. P. Gêramb en quittant le monde*," &c., alluding to his embracing the monastic life; and hence came the error,—a careless editor not having taken the trouble to read to the end of the passage.

A learned "*History of the City and County of Nantes*," by the Abbé Travers, is now in course of publication. The archaeological, as well as historical, information contained in it, is at once profound and extensive. A similar work, at least in an archaeological point of view, is coming out at Bordeaux, being an account of the ancient and modern edifices, monuments, &c. of that city, by M. Bordès, an architect who has been upwards of ten years amassing the materials for it.—Napier's "*Peninsular War*" has been translated into French, and is now selling in Paris. The edition is in four volumes, including all the maps, plans, &c., and sells for only fifty-four francs.

#### LITERARY AND LEARNED. UNIVERSITY INTELLIGENCE.

Oxford, November 19.—The following degrees were conferred:—

*Masters of Arts.*—Rev. W. H. Ridley, Grand Compounder, Rev. H. W. Phillott, Students of Christ Church.

*Bachelors of Arts.*—J. W. Empson, Grand Compounder, W. Cartwright, Brasenose College; J. Welch, Queen's College; W. E. Smith, W. T. A. Radford, Exeter College; A. Kent, Oriel College.

#### DESCRIPTION OF THE ALNWICK OBELISK.

BY JOSEPH BONOMI, ESQ.

Read, Nov. 12, 1840.

I beg permission to lay before the Royal Society of Literature a drawing and description of an Egyptian obelisk, in the collection of an honoured and learned member of the Society, which was brought to this country in the present year; together with some observations regarding the historical and chronological value of the monument, for which I am indebted to a learned member of this Society, my friend Mr. Cullimore, and by which it will appear, that although not of the colossal proportions of the monuments I had last season the pleasure of describing, it possesses some features which render it equally deserving the attention of the

Society. This obelisk was recently found in one of the villages of the Thebaid, and presented to Lord Prudhoe, during his last visit to Egypt in 1838, by the present ruler of that country, whence it has been transferred to the museum of Alnwick Castle, formed through the munificence of this liberal patron and promoter of the arts and sciences. It is thus happily rescued from the destruction which has deprived us of some of the most interesting monuments of the ancient world; many of them having within the last twenty years been broken into small fragments, to make lime for the walls of the cotton manufactories of the Pasha. The temples of Egypt may be viewed, not only as monuments of the intelligence and ancient civilisation of mankind—as vignettes in the great book of history, but also as possessing a peculiar interest, belonging, as they do, to a people intimately connected with the sacred records—a circumstance, which of itself gives to every fragment of them a charm that compensates for that grace and elegance so much to be admired in the antiquities of Greece and Rome. The obelisk in question is of the red granite of Upper Egypt, and measures from its base to the extremity of its broken apex, seven feet three inches. The greatest width is nine inches and three-quarters, and nine inches on the two other sides of the base. The base of the pyramidion on two sides is eight inches and three-quarters; and on the other two, eight and a quarter. In this irregularity of the transverse dimensions it resembles all the other monuments of the same class, no less than in its general proportions, the base being about a tenth of the entire height, as restored in the accompanying delineation. On reference to the scale of the relative sizes of Egyptian obelisks on their original sites, and in the collections of Europe, which on a former occasion I had the honour to lay before the Society, it will be found that the present raises the number of standing obelisks to thirty, of which eight are in Egypt, fourteen in Italy, two in Constantinople, two in France, four in England; and descending from 105 feet, the colossal proportions of the Lateran, to five feet ten inches, the dimensions of the minor Florentine obelisk.\* Immediately before the latter, and next to the two of basalt in the British Museum, which measure eight feet one inch and a half, the subject of these remarks comes in as the twenty-ninth of the series, when marshalled in the order of their sizes, although, in point of antiquity, it will appear that its place is among the earliest of these monuments; since it bears the nomen and prenomen of Amonoph the Second, who ascended the throne of Thebes in the 160th year of Manetho's eighteenth dynasty, as the immediate successor of Thothmes the Third,† Mœris or Menophres, the author of the canonical period which goes by his name, and originates in the quadriennium B.C. 1325—1. So that we can hardly mistake in referring the present monument to the end of the fourteenth century before the Christian era; the obelisks of Osirteon, Amon Nitocr, and the Thothmeses

\* Alexandria, one; Heliopolis, one; Karnak, four; Luxor, one; Philæ, one sandstone, uninscribed; Rome, twelve; Florence, two; Paris, one; Arles, one; British Museum, two; seat of Mr. Banks, one; Alnwick Castle, one. If to this list we add the prostrate obelisk of Alexandria, the nine among the ruins of Saïs, or Tanis, and the two at Karnak (of which fragments only remain), in all twelve of the colossal order, and of the period of the eighteen and twenty-second dynasties, the total number of known Egyptian obelisks will be augmented to forty-two. † The statement of Herodotus, X. c. XIII., that scarcely 300 years had elapsed from the death of Menes, when the historian visited Egypt, appears to identify him with Menophres, whom Theon refers to the same period.

being its only predecessors, and the great majority of a subsequent period, among which are the two obelisks of Amyrtæus in the British Museum, and that of Ptolemy and Cleopatra at the seat of Mr. Banks: its relative chronological place is immediately before the great Sphinx, the work of Thothmes the Fourth, the son and successor of this Pharaoh. While Amonoph the Third, whose remains are abundant, more particularly in our national collection, is the accredited Memnon of the Greek and Roman writers; Amonoph the Second, whose remains are scarce in the same ratio, there being, I believe, not a single example in the British Museum, is the Memnon of the Egyptian historian Manetho, whose Rathotis corresponds in name and place with the lower shield (Rathek), the third Amonoph of the hieroglyphic tablets, and of the statues in the plains of Goorna. "Amonophis reigned thirty-one years; he is supposed to be the Memnon to whom the musical statue was erected," (Manetho *apud Syncell.*; Cory's "Ancient Fragments," page 116.) To this piece of information Eusebius adds, "the Ethiopians, arriving from the river Indus, settled on the confines of Egypt," ("Chron. Hieronym." num. 400-403),—a remark which gives date to a tradition preserved by Herodotus (VII. 70), Strabo (II.), and other writers, that the same race inhabited the banks of the Indus and of the Upper Nile, and which has derived confirmation from the affinity between the Ethiopic and Sanscrit systems of writing, pointed out by two learned men, Dr. Wall and Mr. Tudor ("Proceedings of the Royal Irish Academy," Nov. 1837; "Proceedings of the Numismatic Society," Jan. 1839), apparently without either being aware of the theory of the other. The hieroglyphics of this interesting monument are nearly allied to that kind which may be strictly denominated *Incavo*, there being scarcely any rotundity within the outline,—a style unusual in monuments of this class and period. A peculiar feature of this obelisk is that it is inscribed only on one face; and, excepting two characters, which are a little doubtful (owing rather to the slight *incavo* of the sculpture than to any subsequent injury), the inscription is entire: as usual, however, on many of the remains of the Amonoph family, the nomen, where it is most prominent, appears to have been inserted to the prejudice of some former characters; the surface within the shield having been sufficiently lowered to obliterate whatever was engraved before the present characters were inserted, as may be easily ascertained by placing a ruler along the surface; whilst the same nomen also occurs among the small hieroglyphics on the upper part, which appears not to be an after work. The after-insertion of the nomen in all the known remains of Amonoph the Third, the grandson of the present Pharaoh, to the prejudice of a more ancient one which agreed with the prenomen of Amonoph the Third, is a fact which has not been sufficiently considered nor satisfactorily explained; and the problem in this instance extends to the second Amonoph, while the difficulty seems to be increased by the circumstance of the nomen on the upper part being of the original work. Did the Amonophs, by the insertion of a name founded on that of their tutelar divinity Amon, mean to supersede the worship of the divinity from whom the obliterated royal name was derived? In a former paper, on Three of the Roman Obelisks, I alluded to the usurping propensities of the god Amon. The recovery of an obelisk of so interesting a reign, and certainly the only one of

Amonoph the Second, of whom so few remains are to be found amidst the abundant relics of the eighteenth dynasty, is, therefore, a subject of congratulation to the noble possessor and the world of antiquaries, independently of the peculiarities which it offers for solution; among which, the fact of the surface within the contour of the sculptures being nearly flat is not the least worthy of notice—a kind of sculpture found only in tombs and on stelæ, generally of the age of Psammethichus; for the significant decorations on the walls of Egyptian temples are either in low relief (*basso-relievo*), or in a kind of sculpture peculiar to Egypt, which may be denominated *Incavo-relievo*, or sunk relief, in which the figure is expressed in relief within the outline, but never so prominent as to exceed the general surface.

On Thursday the first paper read was by Mr. Hamilton, translating from the French into English a letter from Mr. Prisse to Sir Gardner Wilkinson, dated Luxor, 15th January, relating to the temples of Karnak, which were lately destroyed for the sake of the stones, to construct factories and other public buildings. The hieroglyphics and inscriptions on some of these were of a very remarkable nature; and the writer supposed, might have commemorated four of the dynasty of Shepherd kings; and have been mutilated and defaced (as they appeared to be) after these conquerors and tyrants were expelled. The worship of the sun was clearly indicated by the representations of the Pharaohs offering sacrifice to that orb and its rays descending upon it.—The second was also an Egyptian communication of great interest, from Lieut. Newbold, of the Madras army, and gave a melancholy account of the gradual but rapid disappearance of the magnificent ruins of Antipolis, Antinoë, and Hermapolis, in the Thebais, and on the eastern bank of the Nile; which bank is far more exposed to the obliteration of its monuments than the western side. So late in the week, we have not time for a more particular report; but with Mr. Bonomi's important paper on the obelisk at the former meeting, there will be sufficient for the gratification of our readers who study and delight in Egyptian archaeology.

#### ROYAL SOCIETY.

SIR JOHN BARROW, Bart. in the chair.—Auditors preparatory to the anniversary on Monday next were elected.—Read, a memorandum referring to the germinal vesicle in the mammiferous ovum, by Mr. Jones.—Read, likewise, a description of the electro-magnetic clock, by Professor Wheatstone. By this very ingenious invention, were a pair of wires laid down, exact time—to a second—may be indicated at various points, from one terminus of a railway to the other.—Read, also, a note by Captain Norton, 'On a Percussion Shell to Explode at the Bottom of the Sea.'

#### SOCIETY OF ANTIQUARIES.

MR. HAMILTON, Vice-President, in the chair.—Dr. Lee exhibited a stone, purchased by him at Aleppo, deeply cut on all sides with medallions and other ornaments, and doubtless an artist's mould. Dr. Lee considered it of the time of the Lower Empire. He also presented casts from the stone, for the Society's museum.—Mr. Spence, in a letter to Mr. J. G. Nichols, communicated an account of some fragments of a monumental brass in the church of St. Margaret, near Rochester, to the memory of Thomas Codd, a vicar of that parish, who died in 1465. It had been accidentally discovered that this brass was engraved on *both sides*, the en-

graving on the lower side being so fresh as to shew the marks of the tool.—The reading of Mr. Vance's description of the ruins excavated at Crendi, Malta, was concluded.

#### ROYAL ASIATIC SOCIETY.

NOVEMBER 21.—The Director of the Society in the Chair.—Captain Sir Henry Dillon, R.N., Admiral Sir Charles Malcolm, and Arthur W. Ravenscroft, Esq., were elected resident members. The reading of the Report of the Committee instituted by the Government of India for the examination of the coal-beds found in various parts of that country, was concluded.—The Honorary Secretary then read an interesting paper 'On the Intermixture of Buddhism and Brahmanism in the Religion of the Hindus of the Dekhin,' by the Rev. Dr. Stevenson, who is already known by some remarkable speculations on the religion of the Hindus previous to the introduction of Brahmanism, as well as by a grammar of the Maharratta language. The writer observes that the extensive spread of Buddhism in the Dekhin is proved, not only by the well-known caverns of Ellora, Karli, Ajanta, and Salsette, but by numerous smaller excavations found throughout the country, several of which contain inscriptions in the cave character, with *dagobas*, and other Buddhist relics; and that, in all probability, it once had a decided superiority over Brahmanism. It was the religion of reason, in opposition to that of tradition, as represented by Brahmanism. It rejected all that was repugnant to reason; while the Brahmins considered themselves bound to perform all that was inculcated by tradition, without reference to its reasonableness. It appears that Buddhism had influence enough to procure the abolition of many practices of the Brahmins: some of which have never been restored; among them are—the killing of cows for sacrifice; the killing of animals, generally in the sacred feasts held in honour of ancestors; and the marrying of a deceased brother's wife, all inculcated in the sacred books, and practised in ancient times; other matters, also abolished under the same influence, have been restored with the ascendancy of Brahmanism, such as the sacrifice to fire and the self-torturing austerities of the *Sanyâsas*. The Doctor admits that pure Buddhism no longer exists in Western India; but the Jains, a sect evidently allied to the Buddhists, are numerous; and the Maharrattas themselves trace the origin, or restoration, of their religion to Sankara Acharya, who flourished about a thousand years ago; and whom they consider an *avatâra* of Siva, raised up to destroy Buddhism. A curious instance of the influence of Buddhism upon Brahmanism is the transformation of the Buddhist devotees, Vithoba and Rokhami, into the Hindu gods; though, perhaps, not so extraordinary as the metamorphosis of Buddha himself into an *avatâra* of Vishnu, sent down to propagate error that men should not go to heaven in such numbers as to incommode the gods! It appears that in order to render Vithoba and Rokhami more Brahmanical in their appearance, they are regularly clothed, and that cloth is annually purchased for the purpose. A singular lawsuit rose a few years ago from a circumstance connected with this practice, at a village near Poonah. At this place, the cast-off apparel of the gods became the perquisite of the family employed as dressers, and it was not unreasonably expected that the wear and tear of cloth would not be very great; but somehow it happened that the clothes were always so worn at the end of every year, that the gods were not fit to be seen in them. On

investigation, it appeared that the cunning image-dresser, to enhance the value of his office, had, on every occasion of a marriage or a festival, been so bold as to borrow the god's dress overnight, taking care always to restore it the next morning, early enough to obviate discovery. The practice was not denied; but the case was dismissed by the judge as not coming within his jurisdiction. Many Brahmins of the present day are hostile to the claims of Vithoba, and assert that his great temple at Pandharpur was originally a Jain temple bought from the Jains by a party of Brahmins, who still pay a quit-rent to the descendants of the original possessor. In the reign of Mahadeo Rao Peshwa, an attempt was made to induce the government to prohibit a worship not sanctioned by Veda or Purana, but the plan was defeated by Nana Farnavis, who was attached to the opposite party. Another reason for connecting the temple of Pandharpur with Buddhism, is the fact, that within its precincts all distinction of caste ceases. This is quite contrary to Brahmanism, but accords with Buddhism, and exists also in the temple of Jagannath, in Orissa, where Buddhism prevailed very extensively in ancient times, as appears from the still existing remains found there. The Doctor adduces other facts to shew that the Hindus are by no means so unchangeable in their religious practices as they are generally believed to be; among others, that many of them present offerings to Mahomedan *pirs*, and worship at Mahomedan tombs; and that he has himself seen at Poonah two or three hundred Hindus actively engaged in celebrating the Moslem festival of Hassan and Hussein. He concludes with the opinion that further researches into Hindu practices will shew that this supposed unalterable people have been constantly undergoing a change in their religious opinions, which has been unknown only because it has not been more diligently sought for. At the conclusion of the paper, Colonel Sykes remarked it was a singular coincidence, that he had himself, at this moment, a paper in the press which agreed with the opinion of Dr. Stevenson, as to the identity of Buddha and Jagannath; and that he had himself seen several figures exhibited as Sivas, which had originally been Buddhas, but altered in some of their more characteristic features by zealous Brahmins.

#### CAMBRIDGE ANTIQUARIAN SOCIETY.

WEDNESDAY, November 25th.—A meeting of the Society was held this day at the Lodge of St. John's College, the Rev. Dr. Tatham, Master of St. John's College, and President of the Society, in the chair.—M. Guizot and Professor Von Huber of Marburg were elected honorary members, and several ordinary members were elected.—The new publication of the Society, being a Catalogue of Books given by the founder to Catherine Hall, edited by the Rev. Professor Corrie, handsomely printed in quarto at the University Press, was laid upon the table. The Secretary announced that another work, edited by the Rev. J. J. Smith, was nearly ready for publication.—Numerous presents were received; including two slingstones from Ireland; original deeds relating to the church and parish of Thaxted; several impressions of seals; and a copy of a curious painting of the fourteenth century.—The following communications were read before the Society:—1. 'Copies of Original Letters of Oliver Cromwell, from the Collection of Sir Thomas Phillips, Bart. M.A. F.R.S.' 2. 'An Essay on the Application of Heraldry to Illustrate the Public Buildings of the University,'

by Henry A. Woodham, Esq. B.A., fellow of Jesus College. 3. 'A Catalogue of the Library of Thomas Markaunt, Fellow of Corpus Christi College,' which was bequeathed by him to the library of that College in 1439, together with a list of the prices at which they were purchased, from the original register on vellum, preserved in the library of that College, with explanatory notes, by James Orchard Halliwell, Esq. F.R.S. &c. Secretary to the Society.

#### LITERARY AND SCIENTIFIC MEETINGS FOR THE ENSUING WEEK.

*Monday*.—Entomological, 8 P.M.; British Architects, 8 P.M.; Medical, 8 P.M.  
*Tuesday*.—Linnean, 8 P.M.; Horticultural, 3 P.M.; Electrical, 8 P.M.; Architectural, 8 P.M.  
*Wednesday*.—Society of Arts, 7½ P.M.; Geological, 8½ P.M.  
*Thursday*.—Royal, 8½ P.M.; Antiquaries, 8 P.M.; Zoological, 3 P.M.  
*Friday*.—Botanical, 8 P.M.  
*Saturday*.—Asiatic, 3 P.M.; Westminster Medical, 8 P.M.; Mathematical, 8 P.M.

#### FINE ARTS.

##### NEW PUBLICATIONS.

*Historic Illustrations of the Bible, principally after the Old Masters.* 4to. pp. 30. 1844. London, Liverpool, and Paris: Fisher, Son, and Co.

THIS is the first division of a most beautiful work, and contains exquisitely engraved prints of "The Judgment of Solomon," after Rubens; "Christ and the Doctors," after Houbraken; "The Calling of Samuel," after Copley, the Royal Academician; "Moses Smiting the Rock," after Poussin; "The Conviction of Achan," after a drawing by Melville; "Christ Raising the Widow's Son to Life," after Van Overbeck; "Jacob Blessing Ephraim and Manasseh," after Franklin; "The Raising of Lazarus," after Rembrandt; "Hagar in the Desert," after Mola; "The Deluge," after Poussin; "Mordecai's Honour," after Melville; and the "Prodigal Son," after Spada;—in all, twelve engravings, which are accompanied with descriptions in English, French, and German. Such a work must command an extensive sale.

*Portrait of George Birkbeck, M.D. F.G.S.*

&c. &c.

THIS "picture in little" (for such it is) is not ushered in with the sound of drum or trumpet, but with a display of varied penmanship and ornamental flourish, quite sufficient to satisfy us of the taste and talent of Mr. C. Bunning, who, we perceive, is the designer and engraver of both penmanship and portrait.

#### ORIGINAL POETRY.

##### THE REMONSTRANCE OF THE PALETTE.

*A Pictorial Sketch.*

"And now the pencil, now the burin plies,  
As fresh excitements to the fancy rise."

An ardent votary of the painting tribe,  
Whom even interest could never bribe  
To hold his course upon the beaten track,  
But he would push his hobby, though a hack,  
Into each open field of pictured art,  
Just take a nibble, and then off would start.  
Would leap a fence, in search of sweet variety,  
And so on, till it ended in satiety.

Our Painter, then, would lay his Palette by,  
And on the copper's shining surface try  
A more extensive course of future fame  
Than from his pencil's practice ever came.  
In mid pursuit, a momentary pause  
His labour asks, when the short respite draws  
His vacant gaze to where his Palette hung,  
Which, in a fable way, had found a tongue;  
And in a suppliant tone it thus address'd  
His fickle master, as its suit it press'd:—

"None better than yourself can tell  
How much neglect can hope annoy.  
Can every generous impulse quell,  
And, like the mildew's blight, destroy."

Time was, my surface smooth and fair,  
Poured its enchantments on the light,  
Where tints and colours, ranged with care  
Could wing imagination's flight.

Scarce giving time to pause and choose,  
E'er tracing on the canvass clear  
Some subject from the painting muse;—  
So strong and ardent the career.

But now the copper, shining bright,  
An *ignifatus* lustre sheds;  
Marks a few moments with delight,  
And all its false allurements spreads.

And though repeated proofs declare  
How much of labour's spent in vain,  
Another trial speaks you fair,  
And tempts you to the task again.

Another, and another yet,  
And still the never-ending score  
(E'en though you scold, and fume, and fret),  
Still craves a little—little more.

But, ah! remember life is brief,  
And age will dim the keenest eye;  
Then seek in change at least relief,  
And once again my colours try."

Whether the artist took the hint  
Has not, as yet, appear'd in print.

R. D.

### THE DRAMA.

*The Prince's Theatre* opened on Thursday evening with an opera called *Fridolin*, composed by Mr. F. Romer, and the words by Mr. M. Lemon. Several ballads, sung by Miss Romer, H. Phillips, and Frazer, were successful; and the concluding music partially redeemed the want of interest in what preceded. A farce, entitled *The Sergeant's Wife*, was absurd enough to provoke the opposite noises of hissing and laughter.

*Adelphi*.—In noticing the performances at the *Adelphi*, we neglected to mention the exceedingly clever imitations of Mr. Nightingale. There is no effort or stage-trick about them, but they are very curious and effective. Macready, C. Kemble, Harley, C. Kean, and Keeley, spoke and walked before us, with a happy seizure of their peculiarities in voice and action; and, as we have said, without any adventitious assistance from dress or machinery.

*Haymarket*.—A heavy domestic calamity has, we are very sorry to say, befallen Mr. Macready, in the sudden death of a very promising child. Sir Edward Bulwer's comedy is, of course, postponed.

*The Olympic* finished its ante-Christmas season last night: the whole performances having reflected credit on the enterprise and skill of the management; so that the opening anew may be looked for with interest.

### VARIETIES.

*Oxford Society for Promoting the Study of Gothic Architecture*.—At the last meeting many distinguished members were admitted, and many presents received, including an impression of a curious brass in Appleton Church, Berks, representing a skeleton in a shroud, with a singular inscription of the date 1618: presented by Mr. Derick. A paper was read by Mr. M. H. Estcourt, of Exeter College, 'On Ensham Church, Oxfordshire,' illustrated by several sketches and sections of the piers and mouldings. The form of the piers is very unusual, but it occurs also in Campden Church, Gloucestershire, and some others, and appears to belong to the early part of the fifteenth century, or end of the fourteenth. The chancel is of the early decorated style, and the side windows have good geometrical tracery, a drawing and section of one of which were shewn. It is the end of the thirteenth or beginning of the fourteenth century; but the east window has passed under the hands of the churchwardens, and suffered the usual mutilations. The altar-screen is detestable, and the pulpit

perfectly ludicrous—striding across the aisle formed by the pews, and occupying the position formerly assigned to the holy rood, or crucifix. There are some very good old open seats, with ornamented ends. The tower and the rest of the church are of the fifteenth century,—good early perpendicular work. There is an interesting cross near this church, but scarcely any vestiges of the once large and celebrated abbey now remain.

*The Stormy Petrel*.—On Wednesday, the 18th instant, about noon, a stormy petrel, or, as it is frequently called, Mother Cary's chicken, was taken up in a state of exhaustion by the game-keeper of J. F. Ledsam, Esq., in a field of the Park Farm at Northfield, four miles from Birmingham, whither it had been driven by the storm which prevailed from noon on Monday until nearly six o'clock on Tuesday morning, from the south-west. The pressure of the gale, as indicated by Osler's anemometer at the Birmingham Philosophical Institution, amounted at one time to thirty-three pounds on the square foot. This bird, the *Procellaria pelagica*, is rarely seen even on our shores, much more seldom so far inland. It breeds in some of the northern islands in June and July, and keeps at all other times far out at sea, being met with in every part of the Atlantic Ocean, especially on the approach of stormy weather.

The newspapers mention that another stormy petrel was picked up on Bagshot Heath, during one of the late hurricanes, by Lord William Beresford.

*Fossil Remains*.—"The Manchester Guardian" states that some remarkable fossil remains, apparently of "an antediluvian forest," have been discovered at Dixon Fold, on the Bolton Railway. They have been visited by many persons, and, among others, by the intelligent Professor Agassiz; and casts of the trees are being taken in plaster of Paris, thence to make models for the Manchester Museum.

*Clocks*.—Both St. Martin's and St. James's clocks stopped on Thursday; "Master Humphrey's" continued to go capitolly; so that people did not come altogether to a stupid standstill.

*Anecdotes of the Pope*.—"His manner of living is that of a private gentleman of small fortune. It is said, that when he was made Pope, his *maître d'hôtel* came to ask him in what manner he wished his table to be served—"Do you think," answered the Pope, "that my stomach has changed?" One of his relatives, who was about to marry her daughter, wished to come to Rome to have the ceremony performed by his holiness. "She has her parish priest; that is enough," was the Pope's reply.—*Baron Gérardin*.

*Westminster Election*.—"I pity Charles Fox to be kept on the Westminster gridiron. Before I came out of town, I was diverted by a story from the hustings: one of the mob called to Fox, 'Well, Charley, are you not sick of your coalition?' 'Poor gentleman!' cried an old woman in the crowd, 'why should he not like a coalition?'"—*Horace Walpole's Letters*.

*Marie Antoinette*.—"She went with the king to see the manufacture of glass, and as they passed the Halles, the poissards huzzared them: 'Upon my word,' said the queen, 'these folks are civiler when you visit them, than when they visit you.' This marked both spirit and good humour. For my part, I am so shocked at French barbarity, that I begin to think that our hatred of them is not national prejudice, but natural instinct; as tame animals are born with an antipathy to beasts of prey."—*Ibid.*

*Gambling*.—"Pray, delight in the following

story: Caroline Vernon, *filie d'honneur*, lost 't'other night two hundred pounds at faro, and bade Martindale mark it up. He said he had rather have a draft on her banker. 'Oh! willingly,' said she gave him one. Next morning he hurried to Drummond's, lest all her money should be drawn out. 'Sir,' said the clerk, 'would you receive the contents immediately?' 'Assuredly.' 'Why, sir, have you read the note?' Martindale took it; it was, 'Pay to the bearer two hundred blows, well applied.' The nymph tells the story herself; and yet I think the clerk had the more humour of the two."—*Ibid.*

### LITERARY NOVELTIES.

KEY TO SCHILLER'S POEMS.  
In 18mo. price 2s. 6d. cloth.

**THE POEMS of SCHILLER**  
EXPLAINED; with a Glossary, elucidating the Difficulties of Language, Construction, and Historical and other Allusions.

By EDMUND BACH,  
Of the British Museum.

"A book small in size, but likely to be of considerable use to the students of German poetry."—*Times*, May 15.  
"Though purporting to be only a key to Schiller's poems, this volume contains much of interest for the German scholar and critic, and at the same time suggests the value of poetical thoughts and expressions, which are applicable to all languages. An illustration of the poet himself, every page may be consulted with advantage."—*Literary Gazette*.

In the press,  
Schiller's W. Tell explained.

London: Black and Armstrong, Foreign Booksellers to the Queen, 8 Wellington Street, North.

Price 5s. bound in roan, with a clasp, the 5th edition of

By the Author of "The Comic Latin Grammar."  
In post 8vo. with upwards of Fifty characteristic Illustrations by Leech.

III. **Elphinstone; a Novel.**  
In 3 vols. post 8vo.

IV. **The Three Peers; a Novel.**  
By Lady Steeple.  
In 3 vols. post 8vo.

V. **The Dowager:**  
Or, the Modern School for Scandal.  
By Mrs. Gore.  
Author of "Mothers and Daughters," "Stokeshill Place," &c.  
In 3 vols. post 8vo.

"An admirable picture of modern manners in the higher circles of society, mingled with judicious remarks and pungent satire, set off by a composition easy, animated, and piquant."—*Spectator*.  
"This is a very clever book. The style is easy, lively, and unaffected; never for an instant inflated or dull; studied every where, indeed, with brilliant epigram."—*Examiner*.

VI. **The Thames and its Tributaries.**  
By Charles Mackay, Esq.  
2 vols. 8vo. with numerous Illustrations.

"A most felicitous subject: such a book has long been wanted. The author has here made a valuable and graceful addition to the literature of the day."—*Morning Herald*.  
Richard Bentley, New Burlington Street, Publisher in Ordinary to Her Majesty.

SMITH'S STANDARD LIBRARY.  
In medium 8vo. uniform with Byron's Works, &c. price 2s. 8d.  
**THE LINDWORKS.**  
By MISS SEDGWICK.  
London: William Smith, 113 Fleet Street; Fraser and Co. Edinburgh; and Curry and Co. Dublin.

32mo. cloth, gilt edges, price 3s.  
**THE GENIUS of SHELLEY;** being Selections from his Poetry. With a Sketch of his Life.  
"To those who are so young as to run any risk in reading the strange, crude, and even false opinions to be found in his works, the present selection may be safely recommended."  
George Bell, 168 Fleet Street.

Now complete, in 7 vols. price 2l. 12s. in boards,  
**A HISTORY of ENGLAND;** in which it is intended to consider Men and Events on Christian Principles.  
By HENRY WALTER, B.D. F.R.S.  
Rector of Haslebury Bryan; late Fellow of St. John's College, Cambridge; and Professor of Natural Philosophy in the East India Company's College, Hertford.  
Livingtons, St. Paul's Churchyard, and Waterloo Place.  
\*\* Any volumes or Numbers may be had to complete Sets.  
A superior Edition may be had, on royal paper, price 2l. 3s. boards.

JENKS'S DEVOTIONS, IMPROVED BY SIMON.  
In 18mo. price 3s. bound, a new edition of  
**PRAYERS and OFFICES of DEVOTION**  
for FAMILIES, and for particular Persons upon most Occasions.

By BENJAMIN JENKS.  
Improved by the Rev. CHARLES SIMON.  
Longman and Co.; Hatchard and Son; J. G. F., and J. Rivington; Hamilton and Co.; Duncan and Co.; Black and Co.; Whittaker and Co.; Simpkin and Co.; Hearne; L. and G. Seeley; Nisbet and Co.; and Houlston and Co.  
Lately published,  
An edition in large type, price 4s. 6d. bound.

THEOLOGICAL LIBRARY, Vol. XV.  
In small 8vo. with Frontispiece, price 6s.  
**BIOGRAPHY of the EARLY CHURCH,**  
Second Series.  
Contents.—Origen—Cyprian—Novatian—Dionysius of Alexandria—Paul of Samosata.  
By the Rev. R. W. EVANS, M.A.  
Fellow of Trinity College, Cambridge; and Vicar of Tarvin.  
Livingtons, St. Paul's Churchyard, and Waterloo Place.  
Lately published, by the same Author,  
**Scripture Biography.** 2 vols. 12s.

In 12mo. price 5s. 6d. bound and lettered, the 4th edition of  
**THE PARENT'S POETICAL ANTHOLOGY;** being a Selection of English Poems, primarily designed to assist in forming the Taste and the Sentiments of Young Readers. They are classed under the following heads:—  
1. Hymns  
2. Scriptural Pieces  
3. Religious and Moral Poems  
4. Odes and Lyrical Pieces  
5. Elegiac Poems  
6. Epitaphs  
7. Pathetic Pieces  
8. Inscriptions  
9. Descriptive and Narrative Pieces, &c.  
10. Sonnets  
11. Longer Poems, including Bishop Heber's, "Palestine," &c.  
Longman and Co.; J. G. F., and J. Rivington; Whittaker and Co.; Simpkin and Co.; and J. Souter.

In 1 vol. 8vo. price 10s. 6d. in boards,  
**PRIMITIVE CHRISTIAN WORSHIP;**  
or, the Evidence of Holy Scripture and the Church concerning the Invocation of Saints and Angels, and the Blessed Virgin Mary.  
By J. ENDELL TYLER, B.D.  
Rector of St. Giles's in the Fields, and late Fellow of Oriel.  
Livingtons, St. Paul's Churchyard, and Waterloo Place.

In 12mo. cloth, price 4s.  
**MEMOIR of the Rev. HENRY MOWES,**  
late Pastor of Altenhausen and Iseurode, Prussia; principally translated from the German. With an Introduction by the Rev. J. D. WILES, B.D. Rector of Gateshead, Durham, Author of "An Estimate of the Human Mind," &c.  
"Written in a catholic and amiable spirit. We commend it to all such as desire, when contemplating spiritual things, to escape from the miserable bickerings of human prejudices and human infirmity. No good man, of whatever sect or denomination, could rise from the book without having found repose, if not strength, in its pages."—*Athenaeum*.  
J. Hatchard and Son, 187 Piccadilly.

VALUABLE PRESENTS FOR CHRISTMAS AND THE NEW YEAR.  
**AN ELEGANT POCKET FRENCH BIBLE,** with copious illustrative References, and several highly finished Maps. The beautiful little volume is the French Version of the Miniature Series of "Bagster's Polyglot Bible." Price, in the best flexible Turkey morocco binding, 18s.; or in cloth binding, 12s.

The English Version is a similar volume, equal in beauty, of the same elegant form. In the flexible Turkey morocco, price as above, 18s.; or 12s. in neat cloth.  
These Versions when combined, present a most interesting display of the two Translations, which, being arranged page opposite to page, may be compared with the greatest facility. Price, in Turkey morocco, flexible, 30s. In this way the two complete Bibles form a neat volume, not larger than a single ordinary pocket Bible. A great variety of works of similar interest are constantly on sale.  
A Catalogue of Bibles, Common Prayer, Concordances, and Lexicons, in various Languages, may be obtained (without charge).  
Samuel Bagster and Sons, Paternoster Row, London.

Printed by HANNAH PAGE MOYES, of Brook Green, Hammer-smith, and GEORGE HARRIS, of Number 3 Pullin's Place, Islington, both in the County of Middlesex, Printed at their Printing Office, Number 28 Castle Street, Leicester Square, in the said County; and published by WILLIAM ARMISTEAD SCRIPPS, of Number 13 South Molton Street, in the Parish of Saint George, in the County of Devon, at the LITERARY GAZETTE OFFICE, Number 7 Wellington Street, Waterloo Bridge, Strand, in the said County, on Saturday, November 28th, 1840.

### REVIEWS OF NEW BOOKS.

*The Life, Journals, and Correspondence of Samuel Pepys, Esq. F.R.S. Secretary to the Admiralty in the Reigns of Charles II. and James II.; including a Narrative of his Voyage to Tangier.* Deciphered from the Shorthand MSS. in the Bodleian Library. By the Rev. J. Smith, A.M. Now First Published from the Originals. 2 vols. 8vo. London, 1840. Bentley.

"PEPYS' Diary," edited by Lord Braybrooke, and published fourteen years ago, made the "worthy secretary" and his concerns so familiarly known to the world, that neither he nor they need any new introduction. He was a person who so curiously reflected the manners of the times in which he lived, that every thing connected with him, what he did and what he said, what he thought and what he wrote, possesses an antique value, pretty much of the same kind as the plate and jewellery of the period. The very oldness of their fashions confers an interest on the trifling articles; and in others there is a sufficiency of the sterling to recommend them. On these grounds, the remains which may yet be recovered from the repositories of the Bodleian Library, or Magdalene College, Cambridge, will always be welcome; as are even the less significant portions of the two volumes now before us. For it must be owned that Mr. Smith has given us many notices so indefinite, as to convey no useful intelligence; and many naval, and electioneering, and petty family details, which add more to the bulk than to the worth of his performance. But still there is an abundance of matter, historical, political, literary, and scientific, to reward us for the careful perusal of the whole; and there are few good librarians that will not covet the immediate possession of this publication.

Pepys was the son of John Pepys, a London tailor, who retired about 1660, on succeeding to a small estate. The present Lord Cottenham is stated to be descended from an elder branch. Samuel was educated at St. Paul's School; is mentioned amid some perplexity of dates (see p. 65) as a sizar of Trinity, and afterwards a resident of Magdalene College. Sir E. Montague, afterwards Earl of Sandwich, was his relative, friend, and patron; and it was under his influence that he made his way in the world, and rose to wealth and authority. From his position at the Admiralty, we learn many particulars of the famous battle of Solbay; and much correspondence in the first volume, commencing June 4, 1665, speaks of that fight, without disclosing any novelty with which we shall trouble our readers. The earliest letter we shall quote relates to a singular superstition: it is from a Mr. John Gibbon to Pepys, in August 1675, and runs thus:—

"Good Sir,—I pray pardon me; I am sorry I appeared so abruptly before you. I'll assure you, a paper of the same nature with the inclosed was left for you at the public office, some ten days since, as likewise for every one of the commissioners. But, sir, I am heartily glad of the miscarriage, for now I have an opportunity to request a favour, by writing,

that I could hardly have had confidence by word of mouth to have done; and in that I have much want of my friend Mr. —. Sir, a gentlewoman of my acquaintance told me she had it for a great certainty, from the family of the Montagus, that as you were one night playing late upon some musical instrument, together with your friends, there suddenly appeared a human feminine shape, and vanished, and after that continued. Walking in the garden you espied the appearing person, demanded of her if at such a time she was not in such a place. She answered, no; but she dreamed she was, and heard excellent music. Sir, satisfaction is to you my humble request. And if it be so, it confirms the opinions of the ancient Romans concerning their genii, and confutes those of the Sadducees and Epicures (Epicureans).

"Sir, your most humble Servant,  
"JOHN GIBBON."

In the following year, and considerably later, there occur some remarkable letters on the subject of Milton's Latin work, "De Doctrinâ Christianâ," found in the State Paper Office, and edited by that learned and excellent prelate, the Bishop of Winchester. The readers of the *Literary Gazette* will remember how keenly its authenticity was questioned by the late good and venerated Bishop of Salisbury; but it must now be acknowledged not only to be proven beyond a doubt, but that the whole course of its MS. migration is clearly traced till its deposit among the papers belonging to the government of the country. It was found, as Bishop Sumner informed us, "in one of the presses, loosely wrapped in two or three sheets of printed paper, with a large number of original letters, informations, examinations, and other curious records, relative to the Popish plots in 1677 and 1678, and to the Rye-House Plot in 1683. The same parcel likewise contained a complete and corrected copy of all the Latin letters to foreign princes and states written by Milton while he officiated as Latin secretary; and the whole was inclosed in an envelope superscribed, 'To Mr. Skinner, Merchant.'"

And Mr. Smith goes on to notice:—

"As soon as George IV. had intrusted to Dr. Sumner the translation and publication of this Latin MS., the learned editor, with a promptitude worthy of the occasion, pursued his researches respecting his very unexpected discovery. There was then, however, no documentary evidence accessible to Dr. Sumner, beyond Aubrey's well-known report of Milton's 'Idea Theologiæ,' in MS., in the hands of Mr. Skinner, a merchant's son in Mark Lane.' Wood, referring to a 'friend' (whom Mr. Bliss, his latest editor, has ascertained to be Aubrey), assumes, without this friend's authority, that the 'Mr. Skinner, Merchant,' was unquestionably 'Cyriac'; though Aubrey does not so describe him, but introduces another 'Mr. Skinner, of the Jerker's Office, up two pair of stairs, at the Custom House.' This, it is now highly probable, was Pepy's correspondent, the Skinner of whom Dr. Sumner thus wrote to Mr. Todd: 'Mr. Pulman, of the Herald's Office, is inclined to believe that he was the eldest son of Daniel

Skinner, Merchant, of the parish of St. Olave, Hart Street, which parish comprises a considerable part of Mark Lane.' It may be further conjectured, that the correspondent of Pepys had been for the last two years a junior fellow of Trinity College, Cambridge."

The first letter now recovered is from Daniel Skinner (probably named after his father), dated Rotterdam, Nov. 19th, 1676, and addressed to Pepys. It gives a very particular account of the writer being frustrated of preferment in London, borrowing 10l. of Pepys, pursuing a literary career at Nimeguen, and being promoted to a post in the English Embassy of Sir Leoline Jenkyns. Here he relates that he had provoked the disapprobation and hostility of Sir Joseph Williamson (*Keeper of the State Paper Office*), by having agreed with Daniel Elzevir, printer at Amsterdam, to print an edition of the works of Milton, of which he says:—

"Your worship may please to remember, I once acquainted you with my having the works of Milton, which he left behind him to me, which, out of pure indiscretion, not dreaming any prejudice might accrue to me, I had agreed with a printer at Amsterdam to have them printed. As good fortune would have it, he has not printed one title of them. About a month ago there creeps out into the world a little imperfect book of Milton's State Letters, procured to be printed by one Pitts, a bookseller in London, which he had bought of a poor fellow that had formerly surreptitiously got them from Milton. These coming out so slyly, and quite unknown to me, and when I had the true and more perfect copy, with many other papers, I made my addresses to Sir Joseph Williamson, to acquaint him that there was a book come out against his authority: that, if his honour connived at that, he would please to grant me license to print mine; if not, that he would either suppress that little book, or give me leave to put (in the bottom of the Gazette) that they were printing in Holland in a larger, more complete edition. Now, sir (little thinking that Sir Joseph was such an enemy to the name of Milton), he told me he could countenance nothing of that man's writings. In his answer I acquiesced. A little while after, his honour sends for me to know what papers I had of Milton's by me, and that I should oblige him if I would permit them to his perusal; which very readily I did, thinking that it might prove advantageous to me. And finding upon this so great an access to his honour, I presented him with a Latin petitionary epistle for some preferment, either under him or by his means. His honour was pleased graciously to receive it, and in a most expressive manner to promise me any advancement that might be in his power. During this, the opportunity of going to Nimeguen happened; and, the day before I went out of England, I went to his honour for some recommendations. He returned me my papers with many thanks, and was pleased to give me a great deal of advice not to proceed in the printing of my papers at Amsterdam; that it would be an undoubted rub in any preferments of mine; and this, he said, he spoke out of

mere kindness and affection to me. I returned his honour many humble thanks, and did expressively ensure him that, as soon as I got to Amsterdam (which I took in my way on purpose), I would return my copies, and suppress them for ever. Which, sir, I have done, and have followed his honour's advice to every punctilio."

We thus see at once how the MS. came into the possession of Sir J. Williamson, and consequently into the press of the State Paper Office. Elzevir's letters to Sir J. Williamson, recently found in the same office (see Appendix, p. 297, *et seq.*), completely confirms this interesting literary history.

To vary our theme, we copy from a letter of Sir Robert Southwell his recipe for repairing a broken constitution:—

"I am here among my children, at least an innocent scene of life, and I endeavour to explain to them the difference between right and wrong. My next care is to contrive for the health which I lost by sitting many years at the sack-bottle, so that to keep myself in idleness and in motion is a great part of my discipline."

There is a good deal of correspondence respecting the invention of a secret chemical cipher, called *cryptoosivianicon*; a good deal about Pepys being accused of Papistry, and confined for more than a year in the Tower; and a good deal more of his journal of the "Expedition to Tangier," and his travel thence to "Old England again." Of the last, though there are many anecdotes and matters of curiosity and interest, we shall only select one passage. Pepys writes:—

"I would not wish my sweet W. or little Jemmy here; for, with sorrow and indignation I speak, it is a place of the world I would last send a young man to, but to hell. Therefore, on God's account as well as the king's, I think it high time it were dissolved."

The corruption, inefficiency, and disgrace, which attended this wretched expedition, are strikingly exhibited in all that Pepys writes concerning it. But, at least for this week, we must leave our task; and we do so with a letter from Evelyn to Pepys, which will be read with great gratification by all the literary world:—

"Deptford, October 4, 1689.

"I had been reading Aristotle's book, *Περί της μαντικής*, &c., on divination by dreams, which follows his other treatises, 'De Animâ,' 'Memoriâ,' and 'Reminescentiâ.' The very night after, methought Mr. Pepys and I were discoursing in his library, among other things, about the ceremonious part of conversation, and visits of form, between well-bred persons; and I distinctly remember that I told him (what was true and no dream) that the late Earl of St. Alban's, uncle to Henry Jermy, took extraordinary care at Paris that his young nephew should learn by heart all the forms of encounter and court address; such as the Latins would express by *verba honestatis*, and the French, who, if I mistake not, are masters to excess in these civilities, by *l'entre-gent*; as on occasions of giving or taking the wall, sitting down, entering in at, or going out of, the door, taking leave, *l'entrée de la ruelle*, and other encounters, *à la cavalière*, among the ladies, &c.; in all which, never was person more adroit than my late neighbour the Marquis de Ruviñe. The Italians, indeed, and Spaniards, exceed us infinitely in this point of good-breeding. Nay, I observe generally, that our women of quality often put us to 'O Lord, madam!' when we have nothing to fill

up and reply. But, *quorsum hæc?* (a little patience), I was never in my life subject to night-visions, till of late, I seldom pass without some reverie; which verifies that of St. Peter, cited from the Prophet, 'Your old men shall dream dreams;' and so you will shortly give me over for a dotard, should I continue to interrupt you with my impertinences. I will only tell you that my wife, of a much sedater temper, yet often dreaming, has now and then diverted me with stories, that hung as orderly together as studied narratives. Some I had formerly made her write down for their prettiness, very seldom broken or inconsistent, such as mine commonly are, but such as the Peripatetic means when he says, 'quieto sanguine fiunt pura somnia,' comparing those other extravagant and confused dreams to resemblances the circles of disturbed and agitated waters reflect, that blend and confound the species, and present centaurs and terrible spectres; whilst the calmer fountain gives the entire image (as it did of Narcissus in the fable) and entertains us with our waking thoughts. What could be more explicit than the above, of the cause of this variety of dreams, which he as well as Hippocrates, and others from them, attribute to the crasis and constitution of the body, and complexions co-operating with other perturbations affecting the fancy. But, leaving these to the Oneirocriticks,\* I shall use them no further than to let you see how often you are in my best and serenest thoughts: 'Amici de amicis certa sæpe somniant;'—*ἡμεῖς οὖν ἐν ἡμεῖς*. And if the subject of my wild phantasm (which was a dialogue with you, about forms of speaking on ceremonious occasions) naturally leading me to something I lately mentioned, where I spake of academies and refining our language, have not already quite worn out your patience, I would entertain you here with a copy of what I sent our chairman some years since, as an appendix to my former letter, and as you enjoined me. 'I conceive the reason both of additions to and corruptions of the English language, as of most other tongues, has proceeded from the same causes; namely, from victories, plantations and colonies, frontiers, staples of commerce, pedantry of schools, affectation of travellers, fancy style of court, vernility and mincing of citizens, pulpita, the bar, politicians, remonstrations, theatres, shops, &c. The parts affected with it may be found to proceed from the accent, analogy, direct interpretation, tropes, phrases, and the like. I did therefore humbly propose,—1. That there might be compiled a grammar for the precepts, which (as it did the Romans, when Crates transferred the art to that city, followed by Diomedes, Priscian, and others who understood it) might only insist on the rules, the sole means of rendering it a learned and a learnable tongue. 2. That with this, a more certain orthography were introduced, as by leaving out superfluous letters, &c. such as o in women, people; u in honour; a in reproach; ugh in thought, and the like. 3. That there were invented some new periods and accentuations, besides such as our grammarians and critics use, which might assist, in spirit, and modify the pronunciation of words and whole sentences, and stand as marks and warnings before them, how the voice and tone of the reader is to be governed; as in reciting plays, reading verses, &c., for regulating the key, and varying the tone of the voice and affection, not without some directions for the hand, and gesture of the body. 4. To this might follow a lexicon, comprehending by them-

\* "Interpreters of dreams."

selves all pure and genuine English words. Then, derivatives with prime, certain, and natural significations. Then symbolical, so as no innovation be admitted or favoured, till there arise some necessity of a new edition amplifying the old on mature consideration. 5. That, in order to this, some were appointed to collect all technical words and terms, especially those of the more liberal employments, as the author of the '*Essais des Merveilles de la Nature et des plus Nobles Artifices*' has done for the French; Monsieur Felibien, the mechanical; Mr. Moxon, for some of the English; and Fr. Junius, John Laët, and others, endeavoured for the Latin: but these must be gleaned from shops, not from books. 6. That things difficult to be translated or expressed, and such as are, as it were, incommensurable one to another, *verbi gratia*, determinations of weights and measures, coins, honours, national habits, arms, dishes, drinks, municipal constitutions of courts, old and abrogated customs, &c., were better interpreted than, as yet, we find them, in dictionaries, glossaries, and noted in the lexicon. 7. That a full catalogue of exotic words and phrases, daily minted by our *logodadali*, were exhibited, and it were resolved on what should be sufficient to render them current *ut civitate donata*; since without some restraining that same *indomitam novandi verborum licentiam*, it must in time quite disguise the language. There are elegant words, chiefly introduced by physicians and philosophers, &c., worthy to be entertained: others, perhaps, fitter to be discarded, seeing there ought to be a law, as well as a liberty, in this particular. In this choice, some regard should be had to well-sounding and more harmonious words, and such as are numerous and apt to fall gracefully into their cadences and periods, and so recommend themselves, as it were, at the very first sight. Others, like false stones, will never shine or be set to any advantage in whatever light they are placed, but embase the rest. Here it may be noted, that such as continue long in universities greatly affect words and expressions nowhere in use besides, as may be observed, for Cambridge, in Cleveland's Poems: and there are some Oxford words, as I might instance in several used by others. 8. Previous inquiry should be made what particular dialects, idioms, and proverbs, are in use in several parts and counties of England; for the words of the present age being properly the vernacular, or classic rather, special regard is to be had of them; and this consideration alone admits of vast improvements. 9. It were haply not amiss that there were a collection of the most quaint and courtly expressions, by way of *florilegium*, distinct from provincialisms, &c. For we are exceedingly defective in our civil addresses, excuses, apologies, and forms, on sudden and unpremeditated, though daily encounters, in which the Frenchman, Italian, and Spaniard, have a kind of natural grace and talent, which furnishes the conversation, and renders it very agreeable. Here might come in *synonyma*, *homonymia*, &c. 10. Since there is likewise a manifest rotation and circling of words and phrases, which go out and come in, like the mode and fashion, books would be consulted for the reduction of some of the old-laid-aside words and expressions, had formerly in *delicis*; for our language is in some places barren by reason of this depopulation, as I may call it, and therefore such wastes and deserts should be cultivated and enriched, either with the former, if significant, or some other. For example, we have hardly any words that so fully express the French *clinquant*, *naïveté*,

*ennui, bizarre, concert, façonnier, chicaneries, consommé, emotion, deferes, effort, choc, tour, detaché.* Ital. *vaghezza, garbato, doello, cruppo*, &c. We should therefore, as the Romans did the Greek, make as many of these do homage as are likely to prove good citizens. 11. Something might well be translated out of Cicero, Demosthenes, the Greek and Latin poets, and even of the modern languages, that so some judgment might be made concerning the elegance of the style and colours, and so a laudable and unaffected imitation of the best and choicest recommended. Nor should there be wanting *copia* of epithets, and variety of expressing the same thing, several ways, such as the 'Poetische Diction' of Tomaso Caraffa, for the help of poets, preachers, orators, &c. 12. Finally, there must be a stock of reputation gained by some public writings and compositions of the members of the assembly, that so, as I intimated in my letter to you, others may not think it a grace to come under the test, and accept them for judges and approbators, &c. Were the design thus far advanced, I conceive a very small matter would despatch the art of rhetoric, which the French proposed as the next to be recommended to their academicians.

Τούτοι μὲν οὖν τούτοις ἵνατοι γέγονεν.

So much for this, and I fear, too much, now I see how I have blurred; but 'tis not worth the writing fairer. I stayed, sir, at Lambeth with his grace till past four, being to return with the bishops, and go home, as I was engaged, that evening. I called at your house, but you were gone forth, they told me, in your coach, which made me conclude it was not to Lambeth, where I should have been sorry not to have waited on you. I have now gotten me a pair of new horses, but they are very young, and hardly broken to the coach as yet. So soon as I may trust them, and that the weather be a little settled, I shall not fail of waiting on you at Mr. Charleton's, and those other virtuosos."

*Fugitive Verses.* By Joanna Baillie, author of "Dramas of the Passions," &c. 12mo. pp. 408. London, 1840. Moxon.

AMONG the services being continually rendered by this publisher to the polite literature and poetical taste of his country,—services which entitle him to the applause of every lover of either,—he could hardly have rendered one more agreeable than by giving us this edition of Joanna Baillie's *Fugitive Verses*. They belong to a school which has been too much obliterated by the stronger features of romance and passion, of highly wrought sentiment and highly painted guilt, which, appealing to the public mind with extraordinary force, have monopolised, rather than taken their fair share in, the general productive circle of a nation's genius. But after stimulants and excitement it is pleasant to bring the appetite again to what is simple and natural, as it is to forget the storm in the bosom of repose, or retire from the thundering of eloquence into the easy familiarity of rational conversation. It is thus that we are charmed with the nature and simplicity of poems composed anterior to the last half century—"written previous to 1790;" and scarcely less so with the more familiar pieces since that period; the former occupying 116 pages, and the latter the remainder of the volume.

Of the whole Mrs. Baillie says, with a true feeling of modest self-esteem:—

"This book does not hold out the allurements of novelty. As among an assembly of strangers, however, we sometimes look with

more good-will upon a few recognised faces that had been nearly lost or forgotten, though never much valued at any time, than upon those whom we have never before beheld; so I venture to hope, that upon the simple plea of old acquaintances they may be received with some degree of favour. Be this as it may, I am unwilling to quit the world and leave them behind me in their unconnected state, or to leave the trouble of collecting and correcting them to another; the songs written in the Scotch dialect making it somewhat more difficult. The occasional pieces for the first time offered to the public have another disadvantage to contend with. Modern poetry, within these last thirty years, has become so imaginative, impassioned, and sentimental, that more homely subjects, in simple diction, are held in comparatively small estimation. This, however, is a natural progress of the art, and the obstacles it may cast in the way of a less gifted, or less aspiring genius, must be submitted to with a good grace. Nay, they may even sometimes be read with more relish from their very want of the more elevated flights of fancy, from our natural love of relaxation after having had our minds kept on the stretch, by following, or endeavouring to follow, more sublime and obscure conceptions. He who has been coursing through the air in a balloon, or ploughing the boundless ocean in the bark of some dauntless discoverer, or careering over the field on a war-horse, may be very well pleased after all to seat himself on a bench by his neighbour's door, and look at the meadows around him, or country people passing along the common from their daily work. Let me then be encouraged to suppose that something of this nature may, with the courteous reader, operate in my behalf. The early poems that stand first in the arrangement of this book, I now mention last. They are taken from a small volume, published by me anonymously many years ago, but not noticed by the public, or circulated in any considerable degree. Indeed, in the course of after years it became almost forgotten by myself, and the feelings of my mind in a good measure coincided with the neglect it had met with. A review of those days had spoken of it encouragingly, and the chief commendation bestowed was, that it contained true, unsophisticated representations of nature. This cheered me at the time, and then gradually faded from my thoughts.

Having," she adds, after some further explanation, "said all that I dare to procure a lenient reception to the following pages, which contain nearly all the occasional lines written under various circumstances and impressions of a long life, I have nothing more to urge, as I will not, from feelings that may easily be imagined, make any remarks on the latter part of the volume, appropriated to devotional and sacred subjects. To avoid any imputation of forwardness or presumption, however, I think it right to mention that those hymns marked 'For the Kirk,' were written at the request of an eminent member of the Scotch Church, at a time when it was in contemplation to compile, by authority, a new collection of hymns and sacred poetry for the general use of parochial congregations. It would have gratified me extremely to have been of the smallest service to the venerable church of my native land, which the conscientious zeal of the great majority of an intelligent and virtuous nation had founded; which their unconquerable courage, endurance of persecution, and unwearied perseverance, had reared into a church as effective for private virtue and ecclesiastical government, as any Protestant establishment in

Europe. I was proud to be so occupied; my heart and my duty went along with it; but the General Assembly, when afterwards applied to, refused their sanction to any new compilation, and what I had written, and many sacred verses from far better poets, proved abortive. That clergymen, who had been accustomed from their youth to hear the noble Psalms of David sung by the mingled voices of a large congregation swelling often to a sublime volume of sound, elevating the mind and quickening the feelings beyond all studied excitements of art, should regard any additions or changes as presumptuous, is a circumstance at which we ought not to be surprised."

Would that "the Kirk" shewed as much wisdom now, or as well merited the warm eulogium the writer here bestows upon it: but our task is with poetry, not polemics.

The first poem in the volume is entitled "The Winter's Day," and it is paired by another called "The Summer's Day;" both reminding us much of Thomson, upon whom it is evident the young Scottish aspirant formed her earlier efforts. The inspiration was from a pure source, and the thoughts and style not unworthy of the original model. Miss Baillie is, indeed, even more faithful in details, polishes and elevates less, and yet is at no great distance for sweet and captivating poetry.

*Ex. gr.:*—

"The night comes on apace—  
Chill blows the blast and drives the snow in wreaths;  
Now every creature looks around for shelter,  
And, whether man or beast, all move alike  
Towards their homes, and happy they who have  
A house to screen them from the piercing cold!  
Lo, o'er the frost a reverend form advances!  
His hair white as the snow on which he treads,  
His forehead marked with many a care-worn furrow,  
Whose feeble body bending o'er a staff,  
Shews still that once it was the seat of strength,  
Though now it shakes like some old ruin'd tower.  
Clothed indeed, but not disgraced, with rags,  
He still maintains that decent dignity  
Which well becomes those who have served their country.

With tottering steps he gains the cottage door:  
The wife within, who hears his hollow cough  
And pattering of his stick upon the threshold,  
Sends out her little boy to see who's there.  
The child looks up to mark the stranger's face,  
And, seeing it enlightened with a smile,  
Holds out his tiny hand to lead him in.  
Round from her work the mother turns her head,  
And views them, not ill pleased.  
The stranger whines not with a piteous tale,  
But only asks a little to relieve  
A poor old soldier's wants.  
The gentle matron brings the ready chair,  
And bids him sit to rest his weary limbs,  
And warm himself before her blazing fire.  
The children, full of curiosity,  
Flock round, and with their fingers in their mouths  
Stand staring at him, while the stranger, pleased,  
Takes up the youngest urchin on his knee.  
Proud of its seat, it wags its little feet.  
And prates, and laughs, and plays with his white locks.  
But soon a change comes o'er the soldier's face:  
His thoughtful mind is turned on other days,  
When his own boys were wont to play around him,  
Who now lie distant from their native land  
In honourable but untimely graves:  
He feels how helpless and forlorn he is,  
And big, round tears course down his withered cheeks.  
His toilsome daily labour at an end,  
In comes the wearied master of the house,  
And marks with satisfaction his old guest  
In the chief seat, with all the children round him.  
His honest heart is filled with manly kindness,  
He bids him stay and share their homely meal,  
And take with them his quarters for the night.  
The aged wanderer thankfully accepts,  
And by the simple hospitable board,  
Forgets the by-past hardships of the day.

When all are satisfied, about the fire  
They draw their seats, and form a cheerful ring.  
The thrifty housewife turns her spinning-wheel;  
The husband, useful even in his hour  
Of ease and rest, a stocking knits, belike,  
Or plaits stored rushes, which, with after-skill  
Into a basket formed, may do good service,  
With eggs or butter filled at fair or market."

The whole poem is like to this, and all its pictures of rural life equally touching and true. We must endeavour to select a passage

from "Summer" as another example,—this is morning:—

"For now the sun, slow moving in his glory,  
Above the eastern mountains lifts his head;  
The webs of dew spread o'er the hoary lawn,  
The smooth, clear bosom of the settled pool,  
The polished ploughshare on the distant field,  
Catch fire from him, and dart their new got beams  
Upon the gazing rustic's dazzled sight.

The wakened birds upon the branches hop,  
Peck their soft down, and bristle out their feathers,  
Then stretch their throats, and trill their morning song,  
While dusky crows, high swinging over head,  
Upon the topmost boughs, in lordly pride,  
Mix their hoarse croaking with the linnets' note,  
Till, in a gathered band of close array,  
They take their flight to seek their daily food.  
The villager wakes with the early light,  
That through the window of his cot appears,  
And quits his easy bed; then o'er the fields  
With lengthened active strides betakes his way,  
Bearing his spade or hoe across his shoulder,  
Seen glancing as he moves, and with good will  
His daily work begins.

The sturdy sunburnt boy drives forth the cattle,  
And, pleased with power, bawls to the lagging kine  
With stern authority, who fain would stop  
To crop the tempting bushes as they pass.  
At every open door, in lawn or lane,  
Half-naked children, half-awake are seen  
Scratching their heads, and blinking to the light,  
Till, rousing by degrees, they run about,  
Roll on the sward, and in some sandy nook  
Dig caves, and houses build, full oft defaced,  
And oft begun again, a daily pastime.  
The housewife, up by times, her morning cares  
Tends busily; from tubs of curdled milk,  
With skilful patience draws the clear green whey  
From the pressed bosom of the snowy curd,  
While her brown comely maid, with tucked-up sleeves  
And swelling arm, assists her. Work proceeds,  
Pots smoke, pails rattle, and the warm confusion  
Still more confused becomes, till in the mould  
With heavy hands the well-squeezed curd is placed."

In the latter portion of the volume, "Lines to Scott," and "to Sotheby," draw delightful portraits of these departed sons of song; and to the accuracy of their traits, though painted in the kindest spirit, we can bear testimony. We cannot help quoting the opening of the last, as a just tribute to the memory of our old and esteemed friend, whom Byron so sarcastically and injuriously called "Some bustling Botheby."

"Learning and fancy were combined  
To stimulate his manly mind;  
Open, generous, and acute,  
Steady of purpose, in pursuit  
Ardent and hopeful; all the while  
In childlike ignorance of guile.  
There are, who say, that envy lurks concealed  
Where genius strives, by slightest traits revealed,  
A truth, if truth it be, by him forgot,  
He turned his eyes away and saw it not.  
Success in others, frank and free,  
He hailed with words of friendly glee.  
Praise given to them he could not feel  
Did aught from his own portion steal;  
And when offence, designed and rude,  
Did on his peaceful path obtrude,  
He soon forgave the paltry pain,  
Nor could resentment in his breast retain.  
His was the charity of right good-will,  
That loves, confides, believes, and thinks no ill.  
He, by his Saviour's noble precepts led,  
Still followed what was right with heart and head.  
Religion did with lofty honour dwell  
Within his bosom's sacred cell."

We must now content ourselves,—leaving the fine Scottish, tragic, and supernatural ballade, the songs which are not so good, and the sacred poesy, which is most honourable to the heart and head of the author,—with a brief specimen of the familiar style in part of an address to a steamboat:—

"Freighted with passengers of every sort,  
A motley throng, thou leavest the busy port:  
Thy long and ample deck,—where scattered lie,  
Baskets, and cloaks, and shawls of crimson dye;  
Where dogs and children through the crowd are straying,  
And on his bench apart the fiddler playing,  
While matron dames to tresselled seats repair,—  
Seems, on the glassy waves, a floating fair.

Its dark form on the sky's pale azure cast,  
Towers from this clustering group thy pillared mast;  
The dense smoke, issuing from its narrow vent,  
Is to the air in curly volumes sent,  
Which coiling and uncoiling on the wind,  
Trails, like a writhing serpent, far behind.  
Beneath, as each merged wheel its motion plies,  
On either side the white-churned waters rise,

And newly parted from the noisy fray,  
Track with light ridgy fumes thy recent way,  
Then far diverged, in many a lustrous line  
On the still-moving distant surface shine.

Thou holdest thy course in independent pride;  
No leave askest thou of either wind or tide;  
To whate'er point the breeze inconstant veer,  
Still doth thy careless helmsman onward steer;  
As if the stroke of some magician's wand  
Had lent thee power the ocean to command.  
What is this power which thus within thee lurks,  
And all unseen, like a masked giant works?  
Even that which gentle dames at morning tea,  
From silver urn ascending, daily see  
With tressy wreathings borne upon the air  
Like loosened ringlets of a lady's hair;  
Or rising from th' enamelled cup beneath:  
With the soft fragrance of an infant's breath:  
That which within the peasant's humble cot  
Comes from the uncovered mouth of savoury pot,  
As his kind mate prepares his noonday fare,  
Which cur, and cat, and rosy urchins, share;  
That which, all silvered by the moon's pale beam  
Precedes the mighty Geyser's up-cast stream,  
What time, with bellying din, exploded forth,  
It decks the midnight of the frozen north,  
While travellers from their skin-spread couches rise  
To gaze upon the sight with wondering eyes.

Thou hast to those 'in populous city pent'  
Glimpses of wild and beauteous nature lent,  
A bright remembrance ne'er to be destroyed,  
That proves to them a treasure long enjoyed,  
And for this scope to beings erst confined,  
I fain would hail thee with a grateful mind."

*The Hour and the Man. A Historical Romance.* By Harriet Martineau. 3 vols. 12mo. London, 1841. Moxon.

TOUSSAINT L'OUVERTURE, one of the most extraordinary men of the Negro race with whose exploits we are acquainted, is the hero of this new work by Miss Martineau; and the revolution in St Domingo supplies the scene and incidents. The choice is a curious one, but the character possesses novelty, the seat of action is susceptible of picturesque descriptions, and the events are of a stirring kind. A sense of justice also seems to have prompted the pen in this selection; and believing that Toussaint has been misrepresented and vilified by the French authorities, our country-woman has stood forward to rescue his memory from these aspersions, and point indignation where it is truly deserved, to his cruel betrayal and dismal murder.

As in other cases, we are sorry to see fiction mixed up with so excellent a design. Unable to separate the absolute facts from the inventions meant to embellish them, the reader knows not where to attach weight to the statements laid before him, and is lost between the two discordant materials. Indeed, Miss Martineau's narrative is but an expansion of the real story which she tells in an appendix; and thus, in the present instance, we may be kept from the paths of ornamental error: the whole may be summed up in her own words:—

"Those who feel interest enough in the extraordinary fortunes of Toussaint l'Ouverture to inquire concerning him from the Biographical Dictionaries and Popular Histories of the day, will find in them all the same brief and peremptory decision concerning his character. They all pronounce him to have been a man of wonderful sagacity, endowed with a native genius for both war and government; but savage in warfare; hypocritical in religion,—using piety as a political mask; and in all his affairs the very prince of dissemblers. It is true that this account consists neither with the facts of his life, the opinions of the people he delivered, nor the state documents of the island he governed. Yet it is easy to account for. The first notices of him were French, reported by the discomfited invaders of St. Domingo to writers imbued with the philosophy of the days of the Revolution; and later accounts are copies of these earlier ones. From the time when my attention was first fixed on this hero,

I have been struck with the inconsistencies contained in all reports of his character which ascribe to him cruelty and hypocrisy; and, after a long and careful comparison of such views with his words and deeds, with the evidence obtainable from St. Domingo, and with the temper of his times in France, I have arrived at the conclusion that his character was, in sober truth, such as I have endeavoured to represent it in the foregoing work. \* \* The wars of St. Domingo were conducted in a most barbarous spirit before the time of Toussaint's acquisition of power and after his abduction. During the interval, the whole weight of his influence was given to curb the ferocity of both parties. He pardoned his personal enemies (as in the instance of the mulattoes in the church); and he punished in his followers, as the most unpardonable offence they could commit, any infringement of his rule of 'No Retaliation.' When it is considered that the cruelties perpetrated in the rising of 1791, and renewed after the fall of Toussaint, were invented by the whites, and copied by the negroes (who were wont to imitate their masters in all they did), it is no small evidence of L'Ouverture's magnanimity that he conceived, illustrated, and enforced, in such times, such a principle as that of 'No Retaliation.' All the accounts of him agree that, from his earliest childhood, he was distinguished by a tenderness of nature which would not let him hurt a fly. He attached to himself the cattle and horses which were under his charge when a boy, to a degree which made him famous in a region where cruelty to animals at the hands of slaves was almost universal. A man who lived till fifty, remarkable for a singular gentleness and placability, ought not to be believed sanguinary from that time forward, on the strength of the unsupported charges of his disappointed enemies. Piety was also his undisputed early characteristic. A slave, bringing to the subject of religion the aptitude of the negro nature, early treated with kindness by a priest, evincing the spirit of piety from his infant years, finding in it the consolations required by a life of slavery, and guided by it in a course of the strictest domestic morality, while surrounded by licentiousness, may well be supposed sincere in his religion, under a change of circumstances occurring after he was fifty years of age. The imputation of hypocrisy is not, however, much to be wondered at, when it is considered that, at the time when the first notices of Toussaint were written at Paris, it was the fashion there to believe that no wise man could be sincerely religious. As for the charge of general and habitual dissimulation, it can only be said that, while no proof of the assertion is offered, there is evidence, in all the anecdotes preserved of him, of absolute frankness and simplicity. I rather think that it was the incredible extent of his simplicity which gave rise to the belief that it was assumed in order to hide cunning. \* \* The charge of personal ambition is, above all, contradicted by facts. If any thing is clear in Toussaint's history, it is that his ruin was owing to his loyalty to France, his misplaced trust in Napoleon, and his want of personal ambition. He did not, as he might have done, make himself a sovereign when France was wholly occupied with European warfare. He did not, as he might have done, prepare his people to resist the power of the mother country, when she should at length be at liberty to reclaim the colony. He sent away the French commissaries only when, by their ignorance

and incompetency, they perilled the peace and safety of the colony. He cherished the love of the mother country in the hearts of the negroes to the very last moment,—till the armament which came to re-establish slavery appeared on the shores,—till it was too late to offer that resistance which would have made him a king. Christophe's view of this part of his conduct is given in a manifesto, dated in the eleventh year of the Independence of Hayti:—'Toussaint l'Ouverture, under his paternal administration, had reinstated, in full force, law, morals, religion, education, and industry. Agriculture and commerce were flourishing. He favoured the white colonists, particularly the planters. Indeed, his attentions and partialities had been carried to such a length, that he was loudly blamed for entertaining more affection for them than for those of his own colour. Nor was this reproach without foundation; for, a few months before the arrival of the French, he sacrificed his own nephew, General Moyse, who had disregarded the orders he had given for the protection of the colonists. That act of the governor, added to the great confidence he had placed in the French authorities, was the principal cause of the feeble resistance the French encountered in Hayti. Indeed, his confidence in these authorities was such, that he had discharged the greater part of the regular troops, and sent them back to the tillage of the soil.'—*Haytian Papers*, p. 158. Such conduct is a sufficient answer to the allegation that Toussaint was actuated by a selfish ambition, cunning in its aims, and cruel in its use of means."

Then we have the sad account of his mysterious death:—

"Great mystery hangs over the tale of Toussaint's imprisonment and death. It appears that he was confined in the Temple only as long as Napoleon had hopes of extorting from him information about the treasures, absurdly reported to have been buried by him in the *mornes*,\* under circumstances of atrocious cruelty. It has been suggested that torture was employed by Buonaparte's aide, Caffarelli, to procure the desired confession: but I do not know that the conjecture is founded on any evidence. As to the precise mode of L'Ouverture's death, there is no certainty. The only point on which all authorities agree is, that he was deliberately murdered: but whether by mere confinement in a cell whose floor was covered with water, and the walls with ice (a confinement necessarily fatal to a negro), or by poison, or by starvation in conjunction with disease, may, perhaps, never be known. The report which is, I believe, the most generally believed in France, is that which I have adopted,—that the commandant, when his prisoner was extremely ill, left the fortress for two or three days, with the key of Toussaint's cell in his pocket; that on his return he found his prisoner dead; and that he summoned physicians from Pontarlier, who examined the body, and pronounced a serous apoplexy to be the cause of death. It so happened that I was able, in the spring of last year, to make some inquiry upon the spot; the result of which I will relate. I was travelling in Switzerland with a party of friends, with whom I had one day discussed the fortunes and character of Toussaint. I had then no settled purpose of writing about him, but was strongly urged to it by my companions. On the morning of the 15th of May, when we were draw-

ing near Payerne from Freyburgh, on our way to Lausanne, I remembered and mentioned that we were not very far from the fortress of Joux, where Toussaint's bones lay. My party were all eager that I should visit it. There were difficulties in the way of the scheme; the chief of which was that our passports were not so signed as to enable us to enter France; and the nearest place where the necessary signature could be obtained was Berne, which we had left behind us the preceding day. I had, however, very fortunately, a secretary of state's passport, besides the Prussian consul's; and this second passport, made out for myself and a *femme-de-chambre*, had been signed by the French minister in London. One of my kind companions offered to cross the frontier with me as my *femme-de-chambre*, and to help me in obtaining access to the prison of Toussaint,—an offer I was very thankful to accept. At Payerne, we separated ourselves and a very small portion of luggage from our party, whom we promised to overtake at Lausanne in two or three days. We engaged for the trip a double *char-à-banc*, with two stout little horses, and a *brave homme* of a driver, as our courteous landlady at Payerne assured us. Passing through Yverdon, we reached Orbe by five in the afternoon, and took up our quarters at the Guillaume Tell, full of expectation for the morrow. On the 16th, we had breakfasted, and were beginning the ascent of the Jura before seven o'clock. The weather was fine; and we enjoyed a succession of interesting objects, till we reached that which was the motive of our excursion. First, we had that view of the Alps which, if it were possible, it would be equally useless to describe to any who have and any who have not stood on the eastern slope of the Jura, on a clear day. Then we wound among the singular defiles of this mountain-range till we reached the valley which is commanded by Jougne. Here we alighted, climbing the slope to the gate of the town, while the carriage was slowly dragged up the steep, winding road. Our appearance obviously perplexed the two custom-house officers, who questioned us, and peeped into our one bag and our one book ('The Handbook of Switzerland') with an amusing air of suspicion. My companion told that the aim of our journey was the fortress of Joux; and that we expected to pass the frontier again in the afternoon on our return to Orbe. Whether they believed us, or, believing, thought us very foolish, is best known to themselves; but I suspect the latter, by their compliments on our cleverness on our return. At Jougne we supplied ourselves with provisions, and then proceeded through valleys, each narrower than the last, more dismal with pines, and more chequered with snow. The air of desolation, here and there rendered more striking by the dreary settlements of the charcoal-burners, would have been impressive enough, if our minds had not been full of the great negro, and therefore disposed to view every thing with his eyes. The scene was exactly what I have described in my story, except that a good road, made since Toussaint's time, now passes round and up the opposite side of the rock from that by which he mounted. The old road, narrow and steep, remains, and we descended by it. We reached the court-yard without difficulty, passing the two drawbridges and portcullis described. The commandant was absent, and his lieutenant declared against our seeing any thing more than the great wheel and a small section of the battlements. But for great perseverance, we should have seen nothing more; but we obtained, at last, all we wanted. We passed through the vault and

passages I have described, and thoroughly examined the cell. No words can convey a sense of its dreariness. I have exaggerated nothing;—the dim light, the rotten floor, shining like a pond, the drip of water, the falling flakes of ice, were all there. The stove was removed, but we were shewn where it stood. There were only three persons who pretended to possess any information concerning the negro prisoner. The soldier who was our principal guide appeared never to have heard of him. A very old man in the village, to whom we were referred, could tell us nothing but one fact, which I knew before,—that Toussaint was deprived of his servant some time before his death. A woman in the sutler's department of the fortress pretended to know all about him; but she had never seen him, and had no further title to authority than that her first husband had died in the St. Domingo invasion. She did us the good service of pointing out the grave, however. The brickwork which surrounds the coffin now forms part of a new wall; but it was till lately within the church. This woman's story was that which was probably given out on the spot, to be told to inquirers; so inconsistent is it in itself, and with known facts. Her account was, that Toussaint was carried off from St. Domingo by the ship in which he was banqueted by Leclerc (the last of a line of two hundred) weighing anchor without his perceiving it, while he was at dinner. The absurdity of this beginning shews how much reliance is to be placed upon the rest of her story. She declared that the Commandant Rubaut had orders from the government to treat the prisoner well; that his servant remained with him to the last; that he was well supplied with books, allowed the range of the fortress, and accustomed to pass his days in the house of the Commandant, playing cards in the evenings: that on the last night of his life he excused himself from the card-table on the plea of being unwell; that he refused to have his servant with him, though urged not to pass the night alone; that he was left with fire, fauteuil, flambeaux, and a book, and found dead in his chair in the morning; and that the physicians who examined the body declared his death to have been caused by the rupture of a blood-vessel in the heart. This last particular is known to be as incorrect as the first. As for the rest, this informant differs from all others in saying that Mars Plaisir remained with his master to the last day of his life; and we may ask why Toussaint's nights were to be passed in his horrible cell if his days were so favoured? and how it was that no research availed to discover to the eager curiosity of all Europe and the West Indies the retreat of L'Ouverture, if he, a negro, was daily present to the eyes of the garrison of the fortress, and to those of all the inhabitants of the village, and of all the travellers on that road who chose to raise their eyes to the walls? Our third informant was a boy, shrewd and communicative, who could tell us the traditions of the place; and, of course, young as he was, nothing more. It was he who shewed us where the additional stove was placed when winter came on. He pointed to a spot beside the fireplace, where he said the straw was spread on which Toussaint lay. He declared that Toussaint lived and died in solitude; and that he was found dead and cold, lying on that straw,—his wood fire, however, not being wholly extinguished. The dreary impressions of the place saddened our minds for long after we had left it; and, glad as we were, on rejoining our party at Lausanne, to report the complete success of our enterprise,

\* "I believe the term '*morne*' is peculiar to St. Domingo. A *morne* is a valley, whose bounding hills are themselves backed by mountains."

we cannot recur to it, to this day, without painful feelings. How the lot of Toussaint was regared by the generous spirits of the time is shewn in a sonnet of Wordsworth's, written during the disappearance of L'Ouverture. Every one knows this sonnet; but it may be read by others, as by me, with a fresh emotion of delight, after having dwelt on the particulars of the foregoing history.

'Toussaint, the most unhappy man of men!  
Whether the whistling rustic tend his plough  
Within thy hearing, or thy head be now  
Pillow'd in some deep dungeon's earless den:—  
O miserable chieftain! where and when  
Wilt thou find patience? Yet die not: do thou  
Wear rather in thy bonds a cheerful brow!  
Though fallen thyself, never to rise again,  
Live, and take comfort. Thou hast left behind  
Powers that will work for thee: air, earth, and skies.  
There's not a breathing of the common wind  
That will forget thee: thou hast great allies:  
Thy friends are exultations, agonies,  
And love, and man's unconquerable mind.'

The family of Toussaint were first sent to Bayonne, and afterwards to Agen, where one of the sons died of a decline. The two elder ones, endeavouring to escape from the surveillance under which they lived, were embarked for Belle Isle, and imprisoned in the citadel, where they were seen in 1803. On the restoration of the Bourbons, not only were they released, but a pension was settled on the family. Madame L'Ouverture died, I believe, in the south of France, in 1816, in the arms of Placide and Isaac (two of her sons)."

Having thus skimmed off the cream, we refrain from meddling with the romance further than to say that the characters are drawn with force, the situations are often striking, and the localities painted with graphic truth and effect, whether they belong to the appearance of the country or the habits of the natives. Though the results are foreknown, we think the three volumes will be perused with sufficient interest by a vast majority of readers.

*Sporting Scenes and Country Characters.* By Martingale. With numerous Illustrations on Wood. 8vo. pp. 332. London, 1840. Longman.

LIKE a fine horse, not a wooden one, though it shines in that way, the present volume appeals to the eye by the glancing of its skin or binding, and the vivacity of its properties. Martingale is a popular writer on such subjects in the "Doncaster Gazette," and has enlarged his papers into this handsome and handsomely illustrated tome; the chief attractions of which, however, he ingeniously ascribes, in his preface, to the efforts of the artists employed upon it, Mr. Thomas Landseer, Mr. Davis, Mr. Alken, Mr. Dickes, Mr. Branston, and others. The generality of the numerous cuts which adorn it certainly do honour to their talents, and are fine specimens of the art. Several of them remind us of the exquisite performances of Bewick—for be it remembered, that though the mechanical of wood-cutting has been most successfully cultivated since his day, no one has ever yet surpassed, or can surpass, the truth and nature of his productions; with him the oak was an oak, the thorn a thorn, the fern a fern, the rush a rush, the ploughman a rustic, and the fisher, or fowler, a rural figure. The former were not scratches for the imagination to make out: the latter were not Cockneys or dandies\* to be laughed at in every flood or field. The same may be said of his animals; and it is when we find authors like Mr. Low (see his "Domestic Breeds," No. I. to V., all reviewed in the *Literary Gazette*), and such

engravings as this volume displays, following in his footsteps, that we cheerfully award the highest degrees of praise to the execution of their undertakings. "Middleton, the winner of the Derby in 1825," from a portrait by Hancock, which is the title-page vignette, is a beautiful cut; "The Ripley Deer," by R. B. Davis, another; "The Rat-Catcher," T. Landseer (p. 311), not the wooden-legged Tallyrand humanity (p. 306), though he is unobjectionable; "Float-Fishing" (p. 300); "Wood-pigeon Shooting," a charming moonlight (p. 251); "Duck-Shooting" (p. 245), with the pony up to his knees in water; "Snipe-Shooting," all wintry (p. 236); "The Mole and Rabbit-Catchers," by Alken and Dickes, are all deserving of high commendation; but it is really invidious to particularise even the best where the general merits are so even. And of fifty there are not more than five to which we could urge a critical fault.

Of the letterpress, in as far as it is addressed to the various sports in hunting, shooting, and fishing, we shall only say that it is brief and *knowing*:—how knowing, our only example may suffice to indicate, whilst, at the same time, it illustrates the general tone and style of this work: the chapter is entitled "Tricks of Keepers and Poachers," and unbosoms the following:—

"It is said that there are tricks in every trade, and, assuredly, the keeper and the poacher, in pursuing each his respective calling, are not free from this imputation. There are, no doubt, many honest keepers, but it must be apparent, that the occupation of a keeper affords him innumerable opportunities for the commission of dishonest actions. He has the whole range of the estate; and, if he be mercenary, and has opened communications with the conveyancers, which he can do with perfect safety, particularly if the spot on which he resides be adjoining a turnpike road, he can carry on a secret trade in game to an almost unlimited extent. From his connexion with these *soi-disant* legal functionaries, the gamekeeper becomes somewhat learned in the law, and understands all its technicalities. He knows particularly what a *fence* is; nor is his capacity circumscribed; for he has such an acquaintance with horticulture, that he knows what a *peach* is. But, if you believe him, in all his proceedings he is perfectly disinterested. The practice of allowing the gamekeeper to carry a gun is one of the means which he can most readily turn to his own advantage. It has, no doubt, a very plausible appearance: for, are there not vermin on the estate to be destroyed?—and must not his master's table be supplied with game? But, alas! it too often happens, that the gamekeeper's eyes, from some cause or other, become confused to such a degree, that he is apt to mistake a hare for a weasel, and a pheasant for a hawk. In consequence of the prevalence of this unfortunate failing, many gentlemen will not allow their keepers to carry a gun; but still, if they are so disposed, there are a thousand other means at their command for killing an unlimited quantity of game, by nets, traps, and snares. But it is not only by the unlawful use of his gun that the gamekeeper seeks to augment his income; he has other means at his command, which, though perhaps not so nefarious in a moral point of view, are no less deserving of notice and reprehension. Should, for instance, a gentleman, who visits his master for the purpose of a day's shooting, be known to the keeper as rather chary of his cash, he takes him to that part of the estate where there is

the least game; or, if he has particular orders to take him to the best preserves, knowing him to be a dead shot, he contrives to give the dogs of the unsuspicious stranger a good draught or two of butter-milk before starting, which has the effect of spoiling their noses, and of making them point when there are no birds, to the great mortification of the visitor, who wonders what really can be the reason why his dogs are so much at fault; his worthy companion, at the same time, declaring they are not worth their keep, or that the mah who broke them knew nothing about his business. Besides this, there are other means to thwart the sport of the stranger, by marking wrong, or throwing the dogs off the immediate locality of the game. Of course, the conduct of the keeper is the reverse of this, when a gentleman pays well! There are two classes of poachers,—the day and the night poacher. The day poacher is usually solitary; night poachers, on the contrary, are gregarious. The solitary poacher, in most instances, displays more stratagem than those who go out in murderous gangs, clearing every thing before them, and braving, with a bold and determined front, every danger. The solitary poacher, for instance, perceives that a long drain, or a small rivulet, runs in a certain direction, separating field from field. The communication by the highway is over a bridge; and the hares, during the time of feeding, can only cross from one part to the other by the means of this bridge. Therefore, the poacher sets his net across the bridge, and waits in ambush. In the course of a short time, probably, a hare or two are caught in the net, when he is immediately at hand, and secures them. The same trick is resorted to at a gate which leads into a cover from an open field. The gate is thrown open, and the net fixed between the posts. A lurcher scours the whole field; the hares make for the wood immediately, and are entangled, and also secured. The same plan will likewise apply to rabbits, just at nightfall, or rather later. To these tricks may be added the fact, that the gun of the poacher is made to unscrew, so that he can put the breech in one pocket, and secrete the barrel on the other side of his jacket. The latter part of the gun can also be used, in case of danger, as a very formidable weapon of attack or defence. The poacher, besides, keeps two or three dogs of the lurcher breed; which answer his purpose best, as they hunt without giving mouth, possess a good nose, and are extremely sagacious animals. These dogs are kept in dark cellars, and are only taken out during the night, so that, in fact, they scarcely ever see the daylight. Nevertheless, they are as eager for the sport as their masters themselves, for whom they do good service in the destruction of game. In day poaching, a wet afternoon, a Sunday morning, or a market-day, are selected,—when the farmers are neither at home nor in the fields. Snares and nets are then set in every direction in the very heart of the preserves. A lurcher dog, properly trained for the purpose, that never barks, is then cast off by a motion of the hand to rouse the game, which is soon caught, and stowed away in sacks in some secret place, until the darkness of night prevails, when it is cautiously fetched away. If the poacher be detected in the cover, he motions his dog to leave the spot, which instantly obeys; he has nothing on him; he is not armed; and has a thousand excuses to make,—that he has lost his way,—is seeking for some stray cattle,—and is probably suffered to depart; not always, however, without a search; for, even under the simple garb of the

\* Upon this ground we would object to Inskipp's "Fly-fisher," page 275. He is in masquerade.

shepherd the poacher endeavours to conceal his real character, and his booty."

Other devices are related, and then we have a clever ruse:—

"Among the many tricks resorted to by the poacher for the purpose of deceiving the keeper, a favourite one is, to place a dead hare in a snare near the house of the keeper, or in any other situation suitable for the purpose. The keeper soon discovers this, and proceeds, with an assistant, to watch the hare, secreting himself at a short distance, in expectation that the setter of the snare will come to the spot to fetch his victim. Whilst the deluded keeper is thus employed, the poachers are busily at work in another direction with their snares; and whilst he is watching the dead hare, they are securing as many as they can conveniently carry home."

Of the wholesale night-work in the woods by combined gangs of desperate poachers, the account is fearful; and we are told:—

"Great destruction is also effected by the drag-partridge net; for, by its skilful application, all the coverts of an estate may be secured in the course of a few nights. This engine—if engine it may be called—is about forty yards in length, and twenty-five yards in width. It is composed of silk and hair twisted together, with meshes at the proper distance. It is rather an expensive article, but is very strong, and, when folded up, can be contained in a moderate-sized pocket, which is a matter of very great convenience. Through the meshes on one side of this net, a long and stout cord is passed, considerably longer, indeed, than the net itself. On the other side, a number of weights are attached, for the purpose of keeping it down, while it is dragged by two men, who have each hold of one end of the long cord. They know well where the coverts assemble during the night. If, after proceeding to the locality, they find that one covert is close at hand, and that others are not a long way off, they use a 'call,'—a close imitation of the cry of the male bird. By exercising a little dexterity in this respect, three or four coverts can be decoyed into one field. When this necessary preliminary is accomplished, then commences the work of destruction. The net is spread out at a short distance from the adjacent hedge. Each man takes hold of his own end of the cord, and the net, weighted, is dragged across the field. The first attempt may be a failure. The next breadth is tried. It proves successful. The net is drawn over, perhaps, the whole of two coverts of birds, which immediately begin to flutter. Each man then lets the net fall to the ground, and commences to walk on the cord till the spot is reached where the partridges are caught; they are then killed and bagged. There is no noise,—no report of a gun, as in the case of killing pheasants. On the least approach of danger, the net is pocketed; and the poachers make the best of their way to the nearest highroad, or take a route so circuitous as to elude all detection, and arrive at home before daybreak."

With this we dismiss a volume which bids fair to have a prominent birth wherever the sports of the field are entertained with the gusto that gives delight to all true sportsmen, health to the weakly, and enjoyment to the lovers of nature.

*Woman's Rights and Duties considered with relation to their Influence on Society, and on her own Condition.* By a Woman. 2 vols. 8vo. London, 1840. Parker.

This has become a favourite topic of late

among the many new views of society which the clash of opinions has caused to bubble up, and exercise the speculations of discontent, theory, and the benevolent desire of improvement. A jargon has been invented for it, as well as the rest of the novel questions on which shallow brains delight to revel, and when we take up any work or writing connected therewith from the pen of an adept, instead of clear reasoning in plain language, we are dumfounded with such a rumble of phraseology that it is utterly impossible to gather one lucid idea from the confused mass. "What do ye read?" asked Polonius, and Hamlet answered, "Words—words—words." But these words, as afterwards explained, were fine satire and common sense; not so the words of our would-be political economists and ponderous scribes, all about physicals and physiologicals, and antagonism, and idealism, and developments, and marches of mind and intellect, and objective and subjective conditions, and all the cant of bastard science lugged into coalition with the rubbish of metaphysical unintelligibility. It is most ludicrous to read many of these absurdities smothered in verbiage, to make the foolish wonder and admire the genius of the writer; the well-informed wonder and admire what can be meant. Why do we dislike the prick of a pin? Set one of your grandiloquent fellows to discuss this point, and he will suffocate you with prodigious periods; and then

"He'd talk!—ye Gods! how he would talk!" of physical interference with corporal ease being discovered by learning to be inconsistent with a due balance of physiological emotion, in which the consequent disturbance must of necessity generate a reactive principle subversive of individual happiness, and decidedly injurious to the gradual progression of the social system towards the desideratum of universal exemption from evil, and the perfect incarnation of prospective felicity! There is no subject so small but these philosophical grubbiasts can pour out all their tediousness upon it, and in the end leave the student exquisitely ignorant of the minute primary, and, if there be a grain of sense in the superabundant labour they have bestowed upon its illustration. What Shakspeare condemned in the romances, periwig-pated glories of the stage seems in our day to be transferred to the press; and we have every matter, however straightforward and simple, so densely obscured by these parrots of instruction, that, if not checked by timely contempt, we may look by and by for nothing but the chaff without the redeeming solid particle of wheat to excuse our search.

Now, the book before us is just the book to exercise talents, or want of talents, of the sort we have faintly indicated. Every opinion in it is liable to be dilated upon in the jargon we have described; and, when all is done, what the author has set down with great ability will only be rendered confused and mystical; for these volumes afford proof of much useful reading, a well-stored mind, an acuteness of perception, and a skilful application of the intelligence of "A Woman" to what is most important to her sex in the world in which we live. She writes fairly and dispassionately; urges no ridiculous hypotheses in mistaking petticoats for pantaloons; but gravely and wisely seeks to shew where amelioration might take place in the relative concerns of the male and female in civilised union. She contends not against the subordination, but the degradation, of women; yields the unquestionable doctrine that difference of organisation foreordains difference

of duties; and concludes by insisting on the superior education of women, and raising their condition, in order to correct existing defects in society, owing to luxury, frivolity, and ignorance.

"Their influence (she concludes) is far from being disputed, perhaps it is sometimes overrated: but still it exists, and must work good or evil. If neglected, it will scatter the seeds of evil far beyond the place of its own growth; but if it is to bring forth its best fruits, it demands more stirring motives than the feeble morality that contents itself with abstaining from direct criminality, and bolder guidance than an education that confines the views to the regulation of petty proprieties. If any thing urged in behalf of women tends to taking them out of their true sphere, I wish that it may be promptly and completely refuted; for nothing can be for the real good of society that is not built upon nature and reason; but it cannot be admitted that the interests of one part of society may, without any necessity, be lawfully sacrificed to those of another. Such a misfortune may occur, when the confusion of human affairs brings about a collision of interests; but it can never acquire the authority of a principle. The measure of the rights of women must be sought for in the real advantage of society at large; it must increase with their own intellectual and moral progress; for the influence of worth and intelligence is nearly irresistible. As the peculiar office of man is to govern and defend society, that of woman is to spread virtue, affection, and gentleness, through it: she has a direct interest in softening and humanising the other sex. Man is too rugged to be even just towards those whom he only loves, but does not respect; he is too powerful to be swayed by those whom he only respects, but does not love. The empire of woman must be won, not solely through his sense of justice, but by the grace and delicacy, the tenderness and purity, she diffuses through life; but her rights will neither add dignity to her social influence, nor bring practical security to her domestic station, except as they are found really to promote the virtue and happiness of society."

With this conclusion we entirely agree. We wish to see women possess the influence they now possess, by other and less worthy means, by such as our author advocates for them,—by their strength instead of their weakness,—by their sense instead of their follies,—by their innocence instead of their intrigues,—by directness instead of indirectness,—and by a high moral nature instead of caprice and subserviency to vicious inclinations: but, withal, still feminine; without that ingredient all the rest would be thrown away, and unproductive of good fruits. The history of the Amazons is a legend gone by, and we would cordially recommend in lieu thereof one of the sex clad in the panoply with which our Woman of these volumes has armed herself, for their sake, and the good of society, of which they must ever be the charm, the solace, the worship, and the glory.

*The Romance of Jewish History.* By the Misses C. and M. Moss. 3 vols. 12mo. London, 1840. Saunders and Otley.

ALLOWING for the ability displayed in this publication, and the laud-ability of the design, to picture the condition and manners of the Hebrew nation whilst yet in its great nascent and independent state, we must confess that the whole "mimikes us much." We can have no sympathy in the shape of Romance with the

mighty men—the princes, and princesses, and priests of Israel, who are known to us for good or for evil in the grand simplicity of the Books of Numbers, Chronicles, and Kings; and when we find them described in their councils and closets just like the heroes and heroines of chivalry or the later historical novel, we feel that invention has been thrown away upon an inappropriate subject. It is true that human nature is nearly the same in all ages and countries, being modified by circumstances, however, almost as strong and operative as Nature herself. And it is herein that writers, unless gifted with extraordinary talents, fail when they undertake tasks like the present. Their resemblances are too universal, instead of being drawn from individual and peculiar characteristics. King David and King Alfred are hardly different; and Joshua and the Duke of Wellington might, *mutatis mutandis*, change places without much incongruity. In short, the error lies in supposing it possible to throw a familiar or romantic interest about personages whose lineaments and deeds are already impressed upon the mind in the broad and bold sublimity of the sacred historians. The “Satan” of Michael Angelo could never be effectually represented as a painted devil by the cleverest artist of our time.

#### ORIGINAL CORRESPONDENCE.

##### MOUNT ARARAT.

St. Petersburg, November 10.

The following account of the earthquake which caused so much damage in Armenia during the last summer is derived from a perfectly authentic source:—

“On the 2d of July, towards sunset, the shock of an earthquake of one minute’s duration was felt in the province of Armenia. The village of Akhouna, situated in the district of Sourmala on the declivity of Mount Ararat, as well as the monastery of St. James, which overlooked it, and the house of the Sardar, were destroyed by a falling of earth, stones, and ice, which were loosened from the mountain. Torrents of melted snow mixing with them desolated the fields and gardens to the distance of ten wersts (nearly seven miles). On the same day, at seven o’clock in the evening, three thousand houses, with their dependencies, were thrown down in the district of Scharour by a violent shock, in which thirteen men, twenty women, and 250 horned cattle, perished. At the same moment a shock, which continued about a minute, was felt in the fortress of Schonscha, and in several other places in the province of Karabagh, which did no damage in the fortress, but threw down a church and 169 houses in the province. The church of the ancient Armenian monastery Taliff was cracked at the east end; pieces of hewn stone from the roof and cupola fell down. Rocks situated in the neighbourhood of Schirger were overturned, and in their fall crushed a man, two women, and a great number of cattle. The road leading to Schirger was rendered so entirely impassable that the inhabitants could not communicate with each other except by means of ropes. On the 2d of July, at seven in the evening, several shocks were felt, at intervals of a minute, in the Khanat of Taly-schine, but did no damage. The same shocks were felt, at the same hour, in the towns of Tiflis and Alexandropol, but without any ill effects. In the whole district of Sourmala, and particularly in the environs of Mount Ararat, slight shocks, which did not continue above two or three minutes, occurred several times a day till the 8th. But on the 6th there was

another fall of earth from Mount Ararat, which brought down immense masses of rocks, and melted snow, which, rushing with great noise and extraordinary rapidity, destroyed, in two minutes, every thing that was in its way; so that there remains no trace of the fields and gardens for the distance of twenty wersts. In the villages at the foot of Ararat, a great number of houses were damaged, and though the fall of earth did not reach them, their fields have suffered much from torrents of melted snow.”

St. Petersburg.—In the sitting of the Academy of Sciences on the 20th of September, Professor Parrot delivered the following address:—“The late fall of a considerable part of Mount Ararat is an event of such importance in the natural history of the earth, that I think it right to invite the especial attention of the Academy to it; and the more so, as the different accounts that have reached us respecting this dreadful phenomenon are very confused, and are at variance with each other. In ancient times, perhaps anterior to all history, a similar fall must have taken place. This is proved by an immense cavern, on the N.N.E. side of the mountain, which is called by the inhabitants “The Dark Cavern;” it begins above, in the regions of eternal snow, and extends downwards to the depth of 800 toises: the circumference must exceed 600 toises. The whole of the interior of this cavern presents almost perpendicular, uneven, and rent surfaces of lava, which give evidence of the operation of a prodigious power. The recent phenomenon seems to have been of a similar nature, but on a larger scale. An accurate examination will certainly procure us important information respecting the nature of volcanoes. The late catastrophe may, perhaps, allow the observer to examine this ancient volcano in its inmost recesses, or at least as far as the channel through which the masses of lava rose and were discharged: the lava must certainly still fill it up to its issue. Its direction upwards will be plainly marked by several indications, especially by little bladders which form furrows in the surface of the lava, and increase in extent as they are nearer to the summit. On these considerations, I propose to ask the consent of the government to the appointment of a scientific commission for the purpose of making an accurate examination of Ararat and the adjacent country. It will be very interesting and important to visit all the places covered with the fragments, and to observe the great detached masses, which will undoubtedly increase our knowledge of volcanic eruptions, their structure and composition. Perhaps the expedition may find large masses of sulphur, perhaps even openings in the sides, or at the bottom of the cavern, through which the volatilised sulphur escapes, and forms such kinds as in the Solfaterra, which would be highly important to Russia. The expedition must obtain as extensive information as possible respecting the various directions taken by the eruption; thus it will be able to discover the focus of these great convulsions, and, at the same time, that of the volcano. It will have to make an excursion into the lofty yet unexplored mountain-chain which bounds the rich and beautiful valley of the Araxes, to obtain a knowledge of its nature, which, perhaps, is also volcanic. If the Academy approves of my proposal, I will undertake to put together all the information I possess respecting volcanoes, for the purpose of drawing up the necessary instructions, and lay it before the Academy.”

In conclusion, the learned Professor regret

ted that he could not propose his son (Professor of Natural Philosophy in the University of Dorpat) to conduct this expedition, as he was then labouring under a severe and dangerous illness. The latter, it is well known, made an accurate survey of Ararat a short time before the late catastrophe, and is perfectly acquainted with the locality.

#### ARTS AND SCIENCES.

##### ROYAL GEOGRAPHICAL SOCIETY.

G. B. GREENOUGH, Esq. President in the chair. —1. An extract of a letter from Major Rawlinson, dated Cabúl, June 25th, was read, from which it appears that that gentleman was to proceed to Kandahar, from whence he thinks he shall be able to send home some information before the end of the year; he adds, that ere long we shall see the result of the geographical explorations of the last few years, in a grand map of Afghanistan, to be published by the India government. Major Rawlinson also states that he has collected materials for the comparative geography of Sindh and the Indus; and that he has discovered the position of the Arabian capital of Mansurah to be in the vicinity of the Manshur Lake, 180 miles from the position near Hyderabad, where it has hitherto been placed, to the serious distortion of all dependent sites. The letter also states that Mr. Edward Conolly (brother of the traveller) has lately made an interesting journey through Seistan. —2. A paper was then read from Mr. Ainsworth,\* being an account of an excursion from Mosul to Kalah-Shirkat and Al-Hadhar. The party, consisting of Mr. Ainsworth, Mr. Mitford, Mr. Layard, and Mr. Rassam, besides an Arab of Tunis, left Mosul on the 18th of April. They first traversed the alluvial plain south of the city, where they found barley in ear and beans in flower; fig, almond, and mulberry trees were in full bloom, but the pistachio as yet only budding. On the sandy deposits of the river the water-melon had put forth its cotyledons, and doves and quails had returned a few days before from their migrations. The river being high, they turned up the rocky uplands west of the ruinous building called El-kasr in Lieut. Lynch’s map, but better known at Mosul as El-Seramum. The Jubilah range of hills, consisting of gypsum and lacustrine and marine limestone, end near this spot, and were now clad with a beautiful vegetation. Crossing this range, and leaving the village of Bujiyari on their left, they descended upon another alluvial plain which was cultivated, and in which were situated the villages of Oraig and Kobil Aáid, inhabited by Arabs pasturing their flocks on the Jubilah hills. At the end of the plain are the village and baths of Hammam-Ali, much frequented by the better classes from Bagdad and Mosul; the spring is abundant, evolving hydro-sulphurous acid, and giving off much bitumen; the water is sapid, and its temperature 116½° Fahr. Leaving Hammam-Ali, they crossed an extensive plain, or Hawi, near the middle of which is the village of Saffatus, the Jeul of Lynch’s map. Turning thence to the right, they came to the ruined village of Jehaina; after which their route continued over verdant prairies, till they arrived at Wadil-Gasab, or the valley of reeds. They then approached the Tigris, a few miles below the tomb of Sultan Abdallah, which was the extreme point reached by the Euphrates steamer in 1839. They next

\* We learn with deep regret that Mr. Ainsworth has had the misfortune to lose his young and lovely wife in childbirth. The infant is also dead.

passed some bituminous springs, covering a space 100 yards in width and 500 long, leaving to the west the low hills called Tel-Gayara, which separate the Wadib-Gasab from the plains of the south. "This is the only case," says Mr. Ainsworth, "I know of springs of pure asphalt in Western Asia." The party halted for the night (the 19th) at the foot of a Tel on the banks of the Tigris, below the tomb of Haggi-Ali, from which it bore S. 30 W. Starting again on the morning (Monday, 20th), the party entered upon an extensive plain. The banks of the Tigris were well wooded and picturesque. The quantity of large wood is greater than on the Euphrates. After passing a brackish rivulet coming from the Wadil-Haekmar, some steep cliffs advancing upon the river forced them to turn inwards upon the uplands, where they came in sight of Kal-ah-Shirkat, situated in the midst of a beautiful meadow, well wooded, and watered by a small tributary of the Tigris. The sight of Kal-ah-Shirkat filled the travellers with wonder. The mound, which was in some places sixty feet high, and, at the sides, 909 yards in extent, was built up, in great part, of sunburnt bricks, but without intervening layers of reeds. On the northern face, which is the most perfect, as well as the highest, the travellers observed the remains of a wall of hewn stone, bevelled, and fitted with the greatest nicety. In a subterranean passage they found the head of a small urn. At the southern extremity they observed four round towers, built of burnt bricks, nine inches deep, and thirteen in width outwards, but only ten inwards, so as to adapt them for being built in a circle. These towers were probably wells connected with the Tigris. Over the whole surface were traces of stone edifices, with abundance of pottery: the whole is bounded by a ditch. After much search Mr. Rassam found a brick, on which were well-defined and indubitable arrow-headed characters. Mr. Ainsworth mentions the fact, interesting to travellers, that, although a fire may keep off the larger animals, it is no security against the smaller. A serpent, he says, found its way into the fire, though they were sitting round it; and, at Al-Hadhr, the same thing occurred with regard to a scorpion, while hundreds of coleopterous insects kept wandering round the verge of the ashes. On Tuesday the 21st, they left Kal-ah-Shirkat, keeping a little to the south of Wadil-Meheli, travelling over a continued prairie of grass and flowering plants; and having crossed the Ain-el-Thelieb, with a little stagnant water in it, they arrived at a range of limestone hills, whence they had an extensive view, but without yet discovering the ruins of Al-Hadhr. They, however, ascertained the termination of the Hamrûn range of hills, which has hitherto been incorrectly laid down. At length, after being cruelly disappointed in taking some craggy hills for the sought-for Al-Hadhr, the travellers discovered the ruins on the 22d. "They presented," says the narrator, "a magnificent appearance, and the distance at which the tall bastions appeared to rise as by enchantment out of the wilderness, excited our surprise. We were filled with wonder and admiration; no doubt in great part due, not only to the splendour of the ruins, but also to the strange place where the traveller meets with them—in *media solitudine*, as Ammianus so briefly but correctly expresses it." They found Arabs encamped here, seated by a spare camel-dung fire; they were of the Lamûd branch of the Shammar tribe, and were very troublesome to the travellers by their urgent inquiries as to where the treasure lay which

they came to seek for. They were, however, ultimately left to themselves, partly in consequence of Mr. Rassam explaining to them the real object of their visit, and partly in consequence of a report having spread among them that the travellers were being followed by an army. The ruins of Al-Hadhr were now examined in detail; and Mr. Ainsworth's party having more leisure for observation than Dr. Ross, who, it may be remembered, was, when he visited this place, stripped to his shirt by the Arabs, and narrowly escaped with his life; they have been enabled to see what had escaped Dr. Ross's observation, or what, from the continual change to which these ruins are subject, has been exposed since his visit. We cannot go at length into the detailed description of Al-Hadhr, nor abridge it without mutilation: we will merely observe that, from the variety in the character and dress of the sculptured heads, and from other circumstances, it seems difficult to determine by whom or when Al-Hadhr was built. On the face of the wall are two inscriptions, one in Chaldee, and the other in Arabic. On the 23d, the travellers turned back towards Mosûl, where they arrived after a journey of sixty English miles. The paper concluded with an enumeration of the plants found in the region traversed. Mr. Ainsworth remarks of the phanerogamous plants which he collected near Mosûl, that thirty out of forty were familiar British meadow, or wayside, plants.—3. An extract of a letter was read from Governor Gawler, dated June 25, stating that Mr. Eyre had left Adelaide on the 18th of that month, in the hope of being able to plant the British flag as near as possible on the tropic of Capricorn, in long. 135° or 136°.

## LINNEAN SOCIETY.

MR. FORSTER, V.P., in the chair.—Among the books presented were several volumes of the Transactions of the Royal Society of Berlin, and the first part of Mr. Gould's splendid work on the birds of Australia, containing figures of no less than twenty species. The descriptions include an account of the habits of the different species observed by him in his travels in New Holland and Van Diemen's Land. This subject is entirely new to European ornithologists.—There was exhibited the first part of Captain Harris's magnificent portraits of the game and wild animals of Southern Africa, delineated from life in their native haunts.—Read, a note, On a White Incrustation observed on Stones found in the river Annan, Dumfriesshire, by Dr. Lankester, F.L.S. The incrustation was determined by Dr. Lankester to be the *Diatoma fasciculatum*, which has hitherto been regarded as a vegetable, but which Eherenberg has determined to be an animal, named by him *Synedia ulna*.—Read, also, a paper, 'On the Anatomy of the *Fucus vesiculosus*,' by Professor Don, Libr. L.S. The object of the paper is to point out the general structure of this common species of sea-weed.—Read, likewise, 'Observations on the Genus *Derbe* of Fabricius,' by J. O. Westwood, Esq. F.L.S. This genus of homopterous insects is divided into several distinct subgenera. The paper contains descriptions of several new species, and is illustrated by drawings.

## BOTANICAL SOCIETY.

Nov. 30 (Anniversary Meeting).—Mr. J. E. Gray, President, in the chair.—The Report of the Council stated the number of members elected during the past session to be 23, making the total members of the Society 128.

The Report of the Curator announced the British Herbarium to contain 1155 species, including 20,022 specimens, which are in the course of arrangement to be distributed, in January next, to those contributing members (in proportion to their contributions) who are desirous of completing their several herbaria. The foreign specimens which have been presented to the Society by Dr. Von Martius, Dr. Gavin Watson, Dr. Krauss, and others, amount to between 13,000 and 14,000. The Reports were unanimously adopted.—The ballot for the Council for the ensuing year returned Mr. J. E. Gray (re-elected) as President, who thereupon nominated Mr. J. G. Children and Mr. Hewett C. Watson, Vice-presidents; Mr. J. Reynolds and Mr. D. Cooper were re-elected Treasurer and Curator; and Messrs. Samson and Woodward were appointed Assistants to the Curator.

## PARIS LETTER.

Academy of Sciences, Dec. 1, 1840.

SITTING of November 23.—*Machine for Resolving Equations of the Seventh Degree*.—M. Lalanne presented to the Academy a new calculating balance of his invention, or rather improvement. Numerical equations, M. Lalanne observed, of a degree superior to the second, are of such common occurrence in questions of natural philosophy and applied mechanics, that artifices for their resolution are of no small value. Certain problems of physical astronomy lead to equations of the seventh degree; and M. Poncelet, in his general solution of the problem of the stability of embankments, has come to an equation of the sixth degree. M. Poncelet, as well as M. Leverrier, had given various methods of arriving at the roots of such equations; but in most cases the composition of the coefficients is exceedingly complicated, and the calculating of them longer than the calculation of the roots themselves the moment the equation becomes a numerical one. The principle of the machine proposed by M. Lalanne was, he acknowledged, not his own, but had been developed in the mathematical opuscula of M. Bérard, Professor at Briançon. The theory, however, of that gentleman it was found impossible to reduce to practice; and M. Lalanne had at length so far simplified and improved it as to be able to solve with great facility numerical equations up to the seventh degree inclusive. The principle was this:—Every numerical equation may be considered as representing the conditions of equilibrium between two arms of a lever, acted on by forces proportional to the coefficients of that equation, and acting at fulcral distances represented by the different powers of the unknown quantity. If the equation is made = 0, then the positive and negative coefficients relate to opposite arms; and the new machine is arranged in such a manner that the forces always act together at fulcral distances, which are to each other as the integral powers of a quantity, which is easily read off on a graduated scale, and expresses one of the roots of the equation.

*Chemistry*.—M. Peligot read a paper on the salts of lead. M. Proust had observed that metallic lead was dissolved in considerable quantity when it was put in contact with a warm solution of nitrate of lead; and that the new salt so produced was deposited while the liquid was cooling in brilliant yellow flakes. He thought that in this experiment the oxide of lead was reduced to a degree of oxidation inferior to the protoxide. M. Berzelius had opposed this opinion in 1812, and showed that the dissolution of the lead is effected, not by a reduction of the degree of oxidation, but at the

expense of the nitric acid contained in the salt employed. At the same time M. Chevreul had arrived at similar results; but in a memoir on this subject, had shewn that his nitrates differed from those of M. Berzelius, since he had found water in his nitrite at the maximum, which M. Berzelius had not. M. Peligot had taken up the experiments of these chemists, and by pursuing them had found, 1. That there are three distinct combinations formed by the action of lead on the nitrate of lead; 2. That two of these combinations contain, not nitric acid, as hitherto supposed, but hyponitric acid. Thus this latter acid, composed of two volumes of azote and four of oxygen, appears susceptible, contrary to all hitherto received notions, of combining itself directly with its bases, at least so as to exist in combination with them.—M. Francy read a memoir 'On an Acid obtained from Palm Oil.' The researches of MM. Pelouse and Boudet, he observed, had shewn that palm-oil became spontaneously saponaceous; and the acid formed in that case had been examined, and found to possess great analogy with the margaric acid, although of a different composition; being represented by the formula  $C_{64}, H_{128}, O_8$ . When heated to  $250^\circ$ , the palmitic acid became crystallised in alcohol in small and very hard crystals; whereas it had previously crystallised in flakes. Its composition remained the same under either form, and it was volatile without decomposing itself. The examination of palmitate of silver and palmitate of ammoniac gave for anhydrous palmitic acid the formula  $C_{64}, H_{126}, O_6$ . M. Francy had succeeded in forming a series of chloritic acids, by acting on the palmitic acid; the chlorine in each case displaying an equivalent quantity of hydrogen.

**Refracting Powers of Liquids.**—M. Regnault read to the Academy a brief analysis of two memoirs on this subject: one by MM. E. Becquerel and Cahours; the other by M. Deville. The first memoir observed, that the indices of refraction applying for the most part to bodies the constitution of which is not fully established, it was judged necessary to refer them all to one fixed and pure substance, as Sir D. Brewster had done; and they had adopted for that purpose distilled water, with its refracting index fixed at 1.333, according to a method employed by the Duke de Chaunes. They had deduced thence the following results: 1. That bodies of the same composition, and the densities of which in the liquid state are represented by numbers differing little from each other, possess an index of refraction which varies within very small limits, whereas it increases with the state of condensation of the substance. 2. That the liquid carburets of hydrogen of nearly equal densities have a refractory power so much the greater as they contain more carbon. 3. That for liquids formed of carbon and oxygen, the index of refraction and the refracting powers are the more considerable according as the substance is more oxygenated; that is to say, when their densities are nearly equal. 4. That according as chlorine, bromine, or iodine, became accumulated in substances of the same family, the index of refraction became larger. And 5. That the viscosity of a substance had great influence on its refracting powers. M. Deville, as the second memoir stated, had used Babinet's goniometer, and had determined, with much precision, the refracting power of alcohol mixed in different degrees with water. He had then found the maximum to be for alcohol mixed with one atom of water, and that it then diminished according as more water was added.

Acetic acid had also proved to have its maximum when it was at a maximum of density. The isomeric substances, examined by M. Deville, had all presented the same indices of refraction; but it was necessary that they should have not only the same density, but also the same degree of viscosity, for this to be true. Thus, the greater part of the essential oils, represented by  $C_5, H_4$ , which was a formula isomeric with that of turpentine, and which were nearly all equally dense and equally viscous, were in this case.

**The Marquis de Jouffroy's Palmipede Steam-paddle.**—M. Darlu made an important observation to the Academy relative to a defect in the imitation of the action of palmipede birds in the water, upon the principle of which this invention was founded: viz. that in the drawing back of the foot towards the body after the impelling stroke had been given, not only was the resistance of the water diminished by the contracted form of the foot, but also by the smaller degree of velocity with which the drawing back took place. This difference of velocity in the two movements was to be observed, M. Darlu remarked, not only in the action of palmipede birds in the water, but in that of the wings of birds in the air. He thought that this principle might be applied at all events to mercantile steamers, when the concealing of the paddle below water was not so important, and that the paddle might be much helped in being folded and drawn back to the vessel by the action of the air alone.

The members of the African Scientific Commission have lately visited the small island of Galita, off the Tunisian coast; and have found it to be entirely of volcanic origin. The rocks are of compact lava, capable of being quarried for building purposes: a small quantity of spongy lava was also observed. On the summit of the volcano peak, the ruins of a *pharos*, or tower, were observed; and at the bottom of a ravine, down which a small water-course existed, the ruins of basins or docks were made out. Several medals were picked up on it; among them, three of Carthaginian, and one of Arabian, origin. Upon the elevated rocks, where considerable moisture is maintained by the clouds, a considerable quantity of lichens were collected. It was calculated that the island might support about forty families: three Italians were on it, believed to be smugglers, but ostensibly employed in collecting plants for dyeing purposes. The island supports a considerable number of wild goats, which browse upon all the young shoots of plants as they spring up, otherwise there was every reason to conclude that the island would be covered with timber.

M. Munck writes from Cairo that he has discovered there an ancient synagogue built previous to the siege of Jerusalem by Titus.

A new system of military bridges has been proposed to the Aulic Council of War at Vienna. The principle consists in reverting to the old Cæsarean method of piles, instead of pontoons. It is said to be highly thought of.

**Books.**—Professor F. Michel, of Bordeaux, is about to publish the "Cancionero" of Juan Alphonso de Baena, the MS. of which, formerly preserved in the library of the Escorial, is now in England. Baena lived at the commencement of the fifteenth century; he abjured Judaism and became secretary to Don Juan II.; he then collected all the poems he could find of the ancient Spanish troubadours, and formed the MS. in question, which he gave to the king, his master. A small number of fragments from this collection have been published by

Castro; but the edition of the learned Professor will be the first complete edition.—The Marquis de Salvo, whose "Voyage en Sicile" obtained him great credit, has published a small but interesting collection of literary anecdotes and essays under the modest title of "Papiers Détachés."—M. Alexander von Humboldt has lately completed the publication of his deceased brother's important work, "On the Kawi Language in the Island of Java." This work now forms three quarto volumes; and arrangements are making for a translation of it into French.—The learned work of Professor Von Huber of Marburg "On the Universities of England" is now in process of translation into English, by a member of the University of Cambridge, resident in Paris, and is very nearly finished. It is to be published next spring in London.

The telescopes of the Paris Observatory have been kept constantly on the look-out for the comet discovered by Dr. Bremiker of Berlin on the 27th of last October,—making the fourth discovered this year: but we have not heard whether its elements have yet been calculated. It was in the tail of *Draco* when first seen.

## LITERARY AND LEARNED.

### UNIVERSITY INTELLIGENCE.

Oxford, November 28th.—The following degrees were conferred:—

*Bachelor and Doctor in Divinity (by Accumulation).*—Rev. H. J. Knapp, Pembroke College.

*Bachelor in Divinity.*—Rev. F. Bailey, Fellow of Magdalen College.

*Masters of Arts.*—Hon. and Rev. W. Howard, Rev. C. J. Marsden, J. P. Severn, Christ Church; Rev. H. Highton, Queen's College; Rev. J. T. Ludlow, Oriel College.

*Bachelors of Arts.*—G. Roberts, Grand Compounder, W. H. Jones, E. Holland, Magdalen Hall; F. Dyson, New Inn Hall; J. Acres, Lincoln College; B. Chevallier, C. R. Hay, Brasenose College; B. Price, Pembroke College; J. H. Nicholls, H. G. Bunsen, Oriel College; J. Baker, Worcester College; W. G. Henderson, A. A. Barker, Magdalen College.

Cambridge, November 25th.—The following degrees were conferred:—

*Doctor in Physic.*—F. Branson, Caius College.

*Bachelor in Divinity.*—E. Thomson, Catherine Hall.

*Bachelor in the Civil Law.*—R. K. Longden, W. F. Dodson, Trinity Hall.

*Masters of Arts.*—C. A. Dashwood, Corpus Christi College; T. F. Stooks, Trinity College.

*Bachelors of Arts.*—E. E. Bowes, Trinity College; E. Antrobus, St. John's College; S. Moon, R. J. Hope, Catherine Hall; A. Leith, Trinity College; W. T. N. Billopp, Emmanuel College; B. Kidd, Queen's College; S. W. Hinkson, Catherine Hall; R. W. Stevens, C. H. Hooken, E. Whitley, T. B. Fonlkes, Queen's College; J. S. Forbes, Christ's College; J. A. Hatchard, Corpus Christi College.

### ROYAL SOCIETY.

The following medals were awarded at the anniversary meeting:—

One of the Royal Medals to Sir J. F. W. Herschel, Bart. V.P.R.S., for his paper entitled 'On the Chemical Action of the Rays of the Solar Spectrum on Preparations of Silver and other Substances, both metallic and non-metallic, and on some Photogenic Processes,' published in the Society's "Transactions" for 1840.

The other Royal Medal was awarded to C. Wheatstone, Esq., for his paper entitled 'Contributions to the Physiology of Vision,' published in the Society's "Transactions" for 1838.

The Rumford Medal was awarded to M. Blot, for his researches in, and connected with, the circular polarisation of light.

The Copley Medal for the present year was awarded to Prof. Liebig, for his discoveries in organic chemistry, and particularly for his development of the composition and theory of organic radicals.

Another Copley Medal was awarded to M. Sturm, for his 'Mémoire sur la Révolution des Equations,' &c., published in the "Mémoires des Savans Etrangers," for 1835.

Officers of the Royal Society for 1841:—

The Marquess of Northampton was re-elected President; Sir John William Lubbock, Bart. M.A. Vice-President and Treasurer; Peter Mark Roget, M.D. and Samuel Hunt & Christie, Esq. M.A., Secretaries; John Frederick Daniell, Esq. was elected Foreign Secretary. The other Members of the Council are—George Biddell Airy, Esq. M.A. A.R.; Sir John Barrow, Bart. V.P.; Thomas Bell, Esq.; Wil-

liam Thomas Brande, Esq.; Richard Bright, M.D.; Sir Benjamin Brodie, Bart.; The Earl of Burlington, V.P.; Bryan Donkin, Esq.; William Henry Fitton, M.D.; Edward Forster, Esq.; The Very Rev. George Peacock, D.D. V.P.; Richard Phillips, Esq.; The Rev. Baden Powell; Major Edward Sabine, R.A. V.P.; Lieut.-Col. William H. Sykes; Rev. Robert Willis, M.A.

#### THE SOCIETY OF ANTIQUARIES.

MR. HAMILTON, Vice-President, in the chair.—Mr. Halliwell communicated a copy of an unpublished MS. relative to the confiscation of the estates of Roger Bigot, earl of Norfolk, and the descent of the estates and earldom of Norfolk to the family of Mowbray.—Mr. C. R. Smith commenced an account of a very curious and singular oncle or broche in his possession, found in digging a sewer in Thames Street, nearly opposite Dowgate Lane:—in the centre is a crowned head, of which all the lines are shewn by a fine gold thread, the intermediate spaces being filled with enamel, and surrounded by a border of flagrees in gold, with four pearls. It was very difficult to guess at the age of this gem by any comparison, as it is almost *œvi generis*, but Mr. Smith considered it to be Saxon, of English workmanship, from a Byzantine model.

#### LITERARY AND SCIENTIFIC MEETINGS FOR THE ENSUING WEEK.

*Monday*.—Geographical, 9 P.M.; Medical, 8 P.M.  
*Tuesday*.—Medical-Chirurgical, 8½ P.M.; Zoological, 8½ P.M.; Society of Arts, 8 P.M.  
*Wednesday*.—Society of Arts, 7½ P.M.; Medico-Botanical, 8 P.M.  
*Thursday*.—Royal, 8½ P.M.; Antiquaries, 8 P.M.; Royal Society of Literature, 4 P.M.  
*Friday*.—Astronomical, 8 P.M.  
*Saturday*.—Westminster Medical, 8 P.M.; Mathematical, 8 P.M.; Guy's Hospital Physical, 8 P.M.

#### FINE ARTS.

##### NEW PUBLICATIONS.

*Picturesque Views on the River Niger, Sketched during Lander's last Visit in 1832-33.* By Commander William Allen, R.N. F.R.G.S. &c. &c. London, 1840. Murray; Hodgson and Graves; Ackermann.

ON the eve of departing on another toilsome expedition to the Niger, Captain Allen has laid before the public these interesting memorials of his former voyage. They are dedicated by permission to Prince Albert, and delineate some of the picturesque and remarkable scenery on the Quorra and greater Chadda, which joins it from the eastern parts of Sudan and Nigritia, about 270 miles from the sea. Of this junction Captain Allen says:—

“The most beautiful scenery on the banks of the Niger is in the neighbourhood of the confluence of this river with the Chadda. Although the Niger will always command the greater interest, the latter is to all appearance the more important; since, at its junction, it is about a mile and a half wide, while the Niger is scarcely half a mile. The mountains below the confluence are irregular in their outline, and about 3000 feet high:—a part of the Kong range, which was formerly supposed to turn the course of the Niger to the interior, cutting off its communication with the sea, and puzzling geographers of all ages. Those above the confluence, on both sides, are uniform tabular elevations of about 1200 feet, with a sloping talus covered with beautiful woods, and surmounted by perpendicular cliffs about thirty or forty feet high, creating them with the appearance of an immense fortification, where imagination might trace turrets and watch-towers without number:—

‘Buttress and rampire’s circling bound,  
 And mighty keep and tower.’

The sketch is a magnificent one, nearly three

feet in length. The other engravings are spirited representations of the features of the country, of the natives, and of their residences, palavers, processions, &c. &c. From the descriptive letterpress we learn that the vast Delta (160 miles square) is intersected in every direction by branches and creeks, and the whole flood is finally poured into the ocean by twenty-two estuaries. Here, as well as higher up, the population is swarming, and the vegetation enormous. What should we think of grasses fifteen feet in height?

At the present juncture, the annexed passage must be considered of much importance:—

“If (says Captain Allen) there be one thing which can more than another be pronounced as characteristic of the natives of the interior of Africa, it is the love of traffic. This is, indeed, their ruling passion. All are traders, from the king to the slave children who wander about the whole day, with their little baskets of sweetmeats on their heads. It is highly gratifying to find that this feeling, which is the first step in national advancement, has attained a systematic regularity, in the establishment of markets in all the towns and villages of any importance; which are there usually held every fourth day. Besides these, at some parts of the river commercial meetings or fairs are held, to which, as in more civilised countries, the merchants, or rather brokers—for all trade is carried on by their intervention—resort from all the towns situated within reach, on the banks of the river. The most important of these—indeed, the grand emporium of the commerce of all the nations below Rabba—is the Bokwèh, or Iccory Market, which Lander said was the same as that held at Kiri at the time of his capture; and, in consequence of that event, it was broken up by his old friend Abokko. To this centre flows the produce of the interior, to be exchanged for European merchandise—of very inferior quality,—which is brought from the coast. The neutrality of these reunions is professed to be held sacred, whatever wars may be in the land; and cheering, indeed, to humanity, would be the principle on which they are established, were it strictly acted upon. It would be beautiful in Africa—the hot-bed of violence and rapine—where every man’s hand is raised against his fellow to enslave him,—could we vouch for the existence of such a *trêve-dieu*, especially if sanctified to the exercise of peaceful and legitimate commercial intercourse; but their neutrality has been frequently violated by the avarice and tyranny of surrounding princes, and the staple commodity, alas, is man! A foundation is nevertheless already prepared, in the deeply-rooted practices and most favourite pursuits of the inhabitants, on which, if we can succeed in directing them to their true and inexhaustible resources, a noble superstructure may be raised. Every important consequence, therefore, which we can hope to attain,—whether it be the encouragement of industry, the extension of useful arts, or the propagation of true religion,—must attend our efforts, in proportion as we strike powerfully, but with judgment, on that chord which already vibrates so freely throughout Africa.”

As there is a warm discussion going on respecting the feasibility and prospects of the expedition about to depart for the Niger, it is somewhat satisfactory to read this unvarnished statement of a competent eye-witness, which puts the matter in an unexaggerated light, and fairly points at the sources and means on which hopes of success, and to what extent

may be founded. The beginning must be on a limited scale; and no immediate results of magnitude ought to be expected. But what was the commencement of our Indian empire? In good time the seed may become a tree and yield abundant fruits. What has caused the African Expedition to be assailed with such force, has been the far too sanguine and blindly enthusiastic terms in which some of its promoters have endeavoured to recommend it to the public patronage. There has been no measure to their visionary projects, and to listen to them it might be thought that an entire quarter of the habitable globe was to be transformed in a twinkling, as by the wand of a necromancer or harlequin. This excessive zeal has injured the cause, and afforded its opponents powerful handles to question its expediency and practicability—to impugn the judgment of its advocates, who have confessed to the utter failure of all their preceding attempts—and to demand that no more European lives and resources shall be lavished on what they denounce as a wild-goose scheme. But let the matter be moderately propounded and candidly considered, and we see no reason to despair of effects most acceptable to humanity. Do not let us puff ourselves up too much with Quixotic ideas of extinguishing the slave-trade and civilising millions of jealous barbarians by Utopian plans; yet, on the other hand, let us try the good work, let us begin and see how the experiment answers. Introduce, if only at one point, the finger of improvement, and with God’s blessing, and in His appointed time, the undertaking may prosper to His glory and the benefit of mankind. Let rational human principles be applied to its advancement, and not injudicious panegyric to bolster up preposterous expectations; and then neither its friends need be ashamed of it, nor its adversaries have the power to hurt it. Captain Allen’s practical notions are infinitely preferable to the high-flown and, it must be confessed, on several points, altogether incongruous doctrines laid down in the Society’s Prospectus, and the vague, yet mighty, inflations with which oratory has wounded this excellent design.

A chart of the stream navigated in 1832-3 is prefixed to these *Views*; and we take our leave of their author with the most heartfelt wishes for his happy return, after a prosperous issue to his present enterprise, and a hope that neither he nor any of his companions will meet with such misadventures as he uses a very whimsical word to describe, in his 16th page, where he says:—

“The King of Attah, or Iddah, had committed so many acts of *incivility*, as cutting off our provisions, *poisoning some of our people*, &c.” May Heaven preserve our brave countrymen from such *incivilities* in all time to come!

#### THE DRAMA.

*Drury Lane*.—On Monday a number of beautiful and interesting novelties were produced here, and performed with great applause. It is quite a treat to witness Musard leading his well-drilled band. He seems as if he were part of the music, and every motion an effect. The slow, the quick, the tender, the bold, the melancholy, the warlike, are all expressed in corresponding action, equal to any thing ever seen in dramatic pantomime or ballet. The arm uprising with measured gravity is suddenly checked, and down comes a burst of harmony. Anon, the eye and the hand move with rapidity, and the vibration of a hundred strings keep accurate time. Again the wand is elevated over head, and the wind instruments

evolve a rush of sounds to shake the wide theatre. The imagination is excited, and we behold, as it were, Apollo in the midst of Parnassus, controlling the elements, and leading mortals captive by the ear. Only the Muses are wanting; and we must endeavour to fancy them in nine of the prettiest and most likely girls in the centre-pit or dress circle around. And only two weeks more are promised of the present engagement; they ought not to be lost by the lovers of admirably selected instrumental music admirably played. The overture to *Cenerentola* opens the ball, and is followed by some pleasing valses by Launer, and the overture (Mehul) to *Le Jeune Henri*. A MS. military quadrille of Musard's introduces fine solos on the cornet-à-pistons by Herr Kœnig, and on the trombone by M. Dantonet. We are then treated with a historical *mélange* of old French airs, arranged by Musard, and belonging to the 12th, 14th, 15th, and 16th centuries. These are not only charming melodies, but curious as musical antiquities; they consist of:—1st. "La Clochette," a popular air in the time of Henry III., king of France (1500); 2d. Song, composed by Clement Marot (1400); 3d. "Choral, with Ritournelle," composed by Louis XIII., king of France (1600); 4th. "Sarabande," composed by Colin Muset (1240). We advise our friends to hear them. A fantasia from *Norma*, and a quadrille from Auber's *Zanetta*, embodied oboe, clarinet, horn, cornet-à-pistons, flageolet, trombone, piccolo, and ophicleide: solos by Barret, Lazarus, Jarrett, Kœnig, Collinet, Dantonet, Frish, and Prosper; and there are, also, a rich bassoon solo "La Melancholie," by Willent Bordogni, and an admirable, though rather long, concertante from *Il Pirati*, by Messrs. Pillet, violin, and Laffre, violoncello. In the opening of the second part, Lord Burghersh's overture, *Catherine*, is played with great precision and effect; and other pieces of various merit, fill up the measure of these very captivating evening promenades. It is impossible but that they must produce two important results—the cultivation of a more refined public taste for dramatic music, and a consequent improvement in all our theatrical orchestras and musical performances. After listening to a Drury Lane night such as we have described it is, the old poker-and-tongs noise is not endurable.

**Haymarket.**—During the absence of Macready, Mr. Wallack has been called upon to sustain characters in the highest walks of tragedy; and acquitted himself with great ability. It is a serious disadvantage to a performer to be popular in another line of acting, and against this Mr. Wallack has had to contend; but still, if we may judge from the applause he has received, he has shewed powers for the stage of a more varied and elevated description, to the entire satisfaction of the public.

**Prince's Theatre.**—The Olympic farce, *A Captain for a Day*, was brought out here on Monday, as Captain (Query?); and Mr. T. Lee performed the leading part, an impudent Irish footman, who adopts his master's uniform, and, as his *locum tenens*, gambles, fights, makes love, and kicks waiters. The character is bustling. Mrs. Selby, as an Irish washerwoman, and Mr. Lewis, as the quiet kickée waiter, have parts of no great consequence, but they make the most of them.

**Adelphi.**—It is always a satisfaction to write our notice of the new productions at the Adelphi, for Mr. Yates is a most indefatigable caterer for the public amusement, and the articles he caters for it are almost invariably of a

pleasant description. On Monday, nearly simultaneously with the completion of the work of Messrs. Ainsworth and Cruikshank,—the "Tower," with its fine illustrations, was placed on the Adelphi stage, and met with a deserved success; for no cost or care had been spared in making the play worthy of the novelist and artist from whose pen and pencil the materials for the drama are derived. The entire strength of the company was employed in embodying the characters; but, as we shall return to this subject in our next, we have only to recommend our readers to read the book and see the play.

#### VARIETIES.

**Schloss's English Bijou for 1841.**—We noticed the advent of this "small deer," which has now been a favourite fashionable food for half-a-dozen years. On the present occasion, Mrs. Norton is the "fairy midwife," and has done her spiriting gently, sweetly, and feelingly; and the little thing, in its pretty cradle-case of morocco or velvet, as it may be, looks just like a baby princess-royal enfolded in her silken cot. Both bid fair to be vastly popular. We have already mentioned the portraits which illustrate this minikin Annual, with its calendars, chronologies, and royal, ministerial, courtly lists; to be seen and read through a magnifying glass, so large that it almost needs another magnifying glass to see it; and it only remains for us to quote an example of Mrs. Norton's poetical contributions, for which purpose we select that difficult one which she was required to write on her own portrait:—

"This task was thine," whose noble part  
It was, with warm, unselfish heart,  
To coin thy talents to repay  
The kindness shewn in childhood's day!  
A life of struggles—death of pain;  
These were thy fate; but not in vain  
Thy earnest aspirations proved,  
Nor generous care for friends beloved.  
When o'er me rests the funeral stone;  
And great and little tasks are done,  
As kindly thought on let me be,  
As friends and strangers think of thee."

Need we add that a handsomer gift and remembrance of the season can hardly be presented to young or old, home or distant, friends? For the latter, its easy transmission is a grand recommendation.

**Murphy's Weather Almanack** for the ensuing year is equally firm in its meteorological predictions as ever. In several papers, not very clearly worded, Mr. Murphy ascribes any previous failures to comets and other disturbing causes; and, finally, enounces a new universal theory, opposed to Newton and all other philosophers, in which he declares the whole system to depend on meteoric action. In other respects the Almanack has its fair share of the usual referential matters.

**Pawsey's Ladies' Fashionable Repository for 1841.** (Pawsey, Ipswich; Longman and Co., London.)—We are annually called upon to notice with approbation this neat and well-conducted provincial pocket-book. Its local attractions are laudable, both in picture and poetry. The neighbouring and county gentry have their residences engraved for embellishments; and all the young and feminine talent round is exercised on those pleasing trifles which rejoice in the names of enigmas, charades, &c. &c. Prizes are given for the best; and it would puzzle us amazingly to decide the Helen for the golden apple. The usefulness and conveniences of a memorandum and house-book are not forgotten.

**The American Diver** has, during the week been edifying the public by leaping off the cen-

tre lamp-post on Southwark Bridge into the Thames, every afternoon. It is really an extraordinary feat. He darts down like an arrow, head foremost, and even speaks during his descent, so as to be distinctly heard announcing the repetition of his performance for the morrow.

**Mr. Willman**, to whose clarinet we and many of our readers have so often listened with delight, is mentioned in the newspapers to have died, after a long illness.

#### LITERARY NOVELTIES.

In the Press.

A Manual of British Algae (Seaweed). By the Hon. W. H. Harvey.—A Journal of a Winter at the Azores, and a Summer at the Baths of the Furnas. By Henry Bullar, Esq. and Dr. Joseph Bullar.—A History of Ludlow. By the Hon. Mr. Clive.—The Vicar of Wakefield, with Designs engraved by Thompson, from Drawings on the Wood by W. Mulready, R.A.

#### LIST OF NEW BOOKS.

Outlines of a New Plan for Tilling and Fertilizing Land, by T. Vaux, 8vo. 6s. 6d.—Elements of Chemistry, by R. Kane, M.D. Part I. 8vo. 6s.—Select Remains of the late Rev. J. Cooke, by the Rev. Dr. Redford, 2 vols. 12mo. 10s.—Dr. Traill's Outlines of Medical Jurisprudence, 2d edition, post 8vo. 3s.—Nichols's Cities and Towns of Scotland, Part I.: Aberdeen, folio, price 12s. 6d.—W. Hazlitt's Lectures on English Composition, 3d edition, 12mo. 6s.—Narrative of Three Months' March in India, by the Wife of an Officer, with Eight Plates, post 8vo. 12s.—E. Osler's Life of Lord Exmouth, new edition, fcap. 6s.—The Chief of Glen-Orchay: Highland Manner in the Middle Ages, fcap. 5s.—The Certainties of Geology, by W. S. Gibson, 8vo. 10s. 6d.—History of Great Britain and Ireland, by Miss Julia Corner, fcap. 10s.—Wild Flowers from the Glens, by E. L. L., 8vo. 10s. 6d.—Elementary Practice of the Courts, by W. Theobald, 12mo. 12s.—The Comic English Grammar, post 8vo. 8s.—The Life and Correspondence of S. Peypis, F.R.S., 2 vols. 8vo. 28s.—Chitty on the Law of Contracts, third edition, royal 8vo. 28s.—Pastoral Annals, by an Irish Clergyman, fcap. 6s.—Jowett's Christian Visitor: Genesis to Job: fcap. 3s. 6d.—Peace for the Christian Mourner; Select Extracts: Edited by Mrs. Drummond, fcap. 5s.—Sow on Partnership, third edition, royal 8vo. 2s.—Martin's Conveyancing, royal 8vo., by G. Davidson, Vol. IV. Part II. 14s.—Hutton's Recreations in Mathematics, a New Edition, by E. Riddle, 8vo. 16s.—Hutton's Course of Mathematics, by Rutherford, 8vo. 16s.—Stothard's Illustrations to the "Pilgrim's Progress," 4to. 15s.—Literary Leaves, by D. L. ## SCOTTISH (WIDOWS' FUND) LIFE ASSURANCE, founded on the original Basis of THE LONDON EQUITABLE.

THIS IS THE OLDEST AND MOST EXTENSIVE LIFE OFFICE IN SCOTLAND. Instituted A.D. 1815.

Accumulated Fund, NINE HUNDRED AND SEVENTY THOUSAND POUNDS

Annual Revenue, ONE HUNDRED AND SEVENTY THOUSAND POUNDS. Whole Profits belong to the Assured.

The Additions made by way of Bonus to the Policies of this Office vary from Ten per cent to upwards of Sixty per cent on the Capital Sum assured, according to the duration of the Policy.

Fraternal desires of insuring are reminded of the advantages which will arise to such as are affected within the current year, the Regulations of the Society requiring that, before additions can become absolutely vested, the Policies entitled thereto must have been in endurance at least five full and complete years. This condition, which forms part of the system of most of the Mutual Insurance Societies, will of course be satisfied in the next periodical investigation, on 31st December, 1845, in regard to all Policies opened within the year 1840.

Tabular View of the Amount of Additions, Retrospective or Vested and Contingent Prospective, declared at 1st January, 1839.

Year of Entry	Sum Assured.	Total Benefit with Vested Additions at 1st Jan. 1839.	Sum Payable if decease takes place after Payment of the Premium due in 1845.
1815	£1000	£1507 4 6	£1809 8 7
1820	1000	1345 4 0	1533 10 7
1825	1000	1259 14 6	1436 1 2
1830	1000	1174 4 0	1338 11 9
1835	1000	1080 0 0	1231 4 0

Every information may be readily obtained on application to the Manager in Edinburgh, or to any of the Society's Agencies throughout the country. Parties wishing to effect Assurances so as best to meet any particular contingency, or effect any specific object, will receive the requisite information, and have the suitable Form of Proposal transmitted to them; and all official communications of this nature are considered strictly confidential.

Annual Premium payable during Life for an Assurance of £100.

SCHOOL OF DESIGN, 6 Charlotte Street, Bloomsbury. Established for the Education of Artists, and Instruction of Amateurs in the Principles and Practice of Drawing, Painting, Modelling, &amp;c. &amp;c.; and possessing the most complete arrangements as a Probationary School to the Royal Academy.

The Gallery and Studio, an extensive collection of Casts from the Antique Paintings and Drawings, and in the Library, on Works of Art, and Folios of Prints from the Old Masters.

There is a separate Establishment for Ladies, and private Studio for those who may desire them. The Gallery is at all times open to inspection, and the Professor may be consulted, and Prospectuses obtained upon application at the above address, any day from twelve to three.

## UNDER the Sanction and Patronage of the

Masters of the Bench of the Honourable Societies of the Inner and Middle Temple.—Mr. R. H. Essex is about publishing, by Subscription, a Lithographic Print, from a Drawing he has just completed, of the Interior of the Temple Church, London. A List of the present Subscribers, with further particulars, may be had, upon application to Mr. R. H. Essex, 13 York Buildings, New Road, where the Drawing will shortly be exhibited.

## CHRISTMAS and NEW-YEAR'S GIFTS.

E. Churton, 36 Holles Street, has now ready for inspection a choice Collection of elegant Literary Presents, in both neat and superb bindings. It consists of the Works of Scott, Moore, Byron, Rogers, Southey, &amp;c., the Annals, the Italian Classics, Bibles and Prayer-Books, and all the more approved Modern Works for Youth.

## LONDON, EDINBURGH, and DUBLIN

LIFE ASSURANCE COMPANY.

21 Charlotte Row, Mansion-house, London; 21 St. Andrew Street, Edinburgh; 61 Fleet Street, Dublin.

Capital, 500,000l.

Directors.

Alex. Anderson, Esq.

John Atkins, Esq.

James Biddell, Esq.

Capt. P. Brandreth

Vice Admiral R. Honynman

Benjamin Hall, Esq.

John Johnston, Esq. Ald.

Kenneth Kingsford, Esq.

John M. Duffell, Esq.

John Maclean, Esq.

J. Marmaduke Rossiter, Esq.

Sir William White

Alexander Robertson, Esq. Managing Director.

Medical Adviser.—Marshall Hall, M.D. F.R.S.L. and E.

Board of Management for Scotland.

John Arnott, Esq. W.S.

Wm. H. Dunbar, Esq. Advocate

Alex. McNeill, Esq. Advocate

John Richardson, Esq. W.S.

Jas. Stuart, Esq. J.S.C.

Thos. Stevenson, Esq. merchant, Leith

J. Veitch, Esq. merchant, Leith

Wm. J. Wemyss, Esq. Deputy

Commissionary-General.

Medical Adviser.—John Argyll Robertson, M.D. F.R.S.

Bankers.—The Edinburgh and Leith Bank.

Agent and Secretary.—James Bennett, Esq. W.S.

Important and salutary improvements have been introduced into Life Assurance Practice by this Company. The policies are indisputable. All questions as to age, health, habits, employment, residence, health of retainers, or other matters deserving of inquiry, prior to the contract, are held as finally settled when the assured receives his policy, which is from its date a valid and unquestionable document of future debt against the Company, whether it shall remain with the assured or be transferred to others.

One-half of the premiums may remain unpaid for seven years, affording a greater facility, and more economical plan, for loan transactions and family provisions than any other which has been suggested, allowing a policy to be dropped at one-half of the usual sacrifice, and entitling the assured, at a future period, when loss of health may prevent him from obtaining a new assurance, to continue a policy for double the amount of the sum for which he has paid premiums.

Widows' Fund.—The Company grant jointures to widows, calculated upon the date of Carline mortality.

## SPECIMEN OF TABLE OF RATES.

Jointure of 50l. per annum, payable to a widow during her life, after the death of her husband.

Age.	Prem.	Age.	Prem.
Husband ..... 30	£ 11 7 6	Husband ..... 40	£ 13 8 4
Wife ..... 25	12 14 7	Wife ..... 35	15 3 0
Husband ..... 30	12 14 7	Husband ..... 40	15 3 0
Wife ..... 25	12 14 7	Wife ..... 35	15 3 0

Medical gentlemen in all cases remunerated for their reports; and a liberal commission allowed to solicitors.

For the convenience of parties residing at the west-end of London, a branch has been established under the charge of William Scott, Esq. 19 Regent Street; where assurances may be effected at the head office.

## BOOKS IN THE PRESS.

In a few days will be published, in 1 vol. royal 8vo.

CATTERMOLE'S HISTORICAL ANNUAL, Vol. I., being the History of the Civil Wars between Charles I. and the Parliament.

where, indeed, with brilliant epigram."—*Examiner*.

V.

The Three Peers; a Novel.

By Lady Steppeny.

In 3 vols. post 8vo.

VI.

Mr. Bentley's Collective Edition of the

Letters of Horace Walpole

(Earl of Orford).

Complete in Six vols. 8vo. handsomely bound, and embellished with numerous fine Portraits, engraved from original Pictures, and containing nearly Three Hundred Letters, now first published from the Originals.

\* \* \* Any Volume may be obtained separately, to complete Sets.

"As a book of reference, this edition of 'Walpole's Letters' must henceforth take its place among the memoirs and histories of the time. As a book of gossip, it is, perhaps, the completest of the kind in the English language."

Richard Bentley, New Burlington Street,

Publisher in Ordinary to Her Majesty.

## BOOKS PUBLISHED THIS DAY.

PROFESSOR DUNBAR'S GREEK LEXICON.

In 1 thick vol. royal 8vo. price 40s. cloth.

A NEW GREEK and ENGLISH, and ENGLISH and GREEK, LEXICON, with an Appendix, containing Terms of Botany, Mineralogy, Natural History, &amp;c. used by the Greek Classical Writers.

By GEORGE DUNBAR, A.M. F.R.S.E.

And Professor of Greek in the University of Edinburgh.

The greatest care has been taken to give both the primary and the secondary meanings of the Vocabularies, with numerous and apposite quotations in support of particular expressions; to point out the Derivation and Composition of Words, as far as they could be well ascertained; and to state the Tenses of Verbs, as used by Classical Authors. The English and Greek part will be found to contain, not merely an explanation of the Vocabularies, but also numerous quotations and idiomatic expressions explanatory of the various acceptions in which they are used, with the proper authorities subjoined.

The Appendix will be found very useful to Scientific Scholars, especially to the Botanist and the Natural Historist.

MacLachlan, Stewart, and Co. Edinburgh; and to be had

of all Booksellers.

The Third and concluding Volume, in 8vo. of

## LADY BLESSINGTON'S IDLER IN ITALY.

III.

## LEGENDARY TALES OF THE HIGHLANDS;

A SEQUEL TO HIGHLAND RAMBLES.

By Sir THOMAS DICK LAUDER, Bart.

With Engravings by Philz, Illustrator of "Nicholas Nickleby." 3 vols. post 8vo.

"It gives us pleasure to find one so well qualified as Sir Thomas Dick Lauder employed in preserving the legendary stories in which the Highlands have always been so rich. Traditions are the literature of a rude people, and the heroic deed, or fragment of ancient wisdom, is transmitted by them with less accuracy, but more vitality, than by the written letter. Considered in this view, a true collection of the traditions of the Highlands would show more of the real life of the people than the most correct chronicle of their political changes. For this purpose they should, perhaps, be recorded as nearly as possible in the language of their depositories. Sir Thomas Lauder has, however, preferred giving us his Legends dressed up with the skill of a practised writer, and flavoured with only such a tincture of Scottishism as the most fastidious purist might relish. As he performs for the public the part of an 'ancient seanchaidh,' he has thought himself entitled to the privileges of that venerated character, in giving increased poetical effect to his materials. His Legends are full of stirring interest, and contain passages of description which make us almost feel the keen air of the mountains and the elastic touch of the heather."—*Morning Chronicle*.

IV.

## PETER PRIGGINS, THE COLLEGE SCOUT.

Edited by THEODORE HOOK, Esq.

3 vols. with numerous Engravings by Philz (Just ready.)

V.

THE NEW ROMANCE OF MILITARY LIFE.

## THE CONSPIRATORS;

By CAPTAIN QUILLINAN.

3 vols. post 8vo.

"The most spirited and clever production of its class that has hitherto proceeded from the many-gifted men who have, in these piping times of peace, been tempted to exchange the sword for the pen. We know, indeed, nothing of the kind which more pleasantly blends the attractions of high romance with the force and truth of real life."—*Naval and Military Gazette*.

VI.

## POPULAR TRADITIONS OF ENGLAND.

First Series:—LANCASHIRE.

By JOHN ROBY, Esq. M.R.S.L. &c.

3 vols. post 8vo. with numerous Engravings on Wood.

(Just ready.)

"The taste which of late years has been so widely diffused for legends, illustrating at once both the history and manners of the different nations to which they belong, has created a necessity for the publication of those proper to our own country. Of these it is well known there are a great number, of remarkable interest, attached to families and places in the different counties of England, distinguished by having provided the actors and scenes of so many strange, of some wonderful, and of not a few amusing dramas still remembered in their different neighbourhoods. Mr. Roby has collected, with a skill and talent that prove his fitness for the task he has undertaken, the traditions of Lancashire, which we are glad to find he is about to embellish with every improvement of which they are capable, as a portion of the popular traditions of England. These will be found not less instructive to the antiquary than amusing to the lover of romance, while the student of historical literature cannot fail of deriving from them some of the most valuable illustrations of English history ever made public. A collection of the national traditions cannot but be regarded as a work of national interest."

HENRY COLBURN, PUBLISHER, 13 GREAT MARLBOROUGH STREET.

•• ORDERS RECEIVED BY ALL BOOKSELLERS.

VII.

## COMIC MISCELLANIES, IN PROSE AND VERSE.

By the late JAMES SMITH, Esq.

One of the Authors of "Rejected Addresses."

With a Selection from his Correspondence, and a Memoir of his Life.

By his Brother, HORACE SMITH, Esq.

2d edition, with Additions, 2 vols. post 8vo. with Portrait, bound.

(Just ready.)

"One of the most amusing books that have seen the light since the ever famous 'Rejected Addresses' themselves."—*Globe*.

VIII.

## SCENES AND SPORTS IN FOREIGN LANDS.

By Major E. NAPIER, 46th Regt.

2 vols. small 8vo. with Nineteen Illustrations, 21s. bound.

"Through the medium of these pages the sportsman in England may enjoy his leisure by becoming acquainted with the proceedings of his brother sportsmen abroad, in climes where the game sought, instead of being confined to hare, pheasant, partridge, and similar timid denizens of our stubbles and coverts, comprises tigers, wolves, bears, jackals, buffaloes, elks, and other dangerous inhabitants of the tropical wilderness. But whatever may be the risk attendant on their pursuit and death, our gallant adventurer will here be found seeking them in their desert and jungle retreats, eager to attack whatever might offer in the way of sport, from a snipe to an elephant; the result of which is, that the wide 'preserves' of the far East are thrown open for the reader, and he is shown the various methods pursued to bring down the game, while entertained with the amusing adventures of the daring hunter."—*Age*.

IX.

## MEMOIRS OF BEETHOVEN.

With a Selection from his Correspondence.

By his Friend, A. SCHINDLER.

Edited, with Notes, &c. by IGNACE MOSCHELES, Esq.

2 vols. post 8vo. with Portrait, &c. (Just ready.)

X.

## THE NEW VOLUME OF SIR E. L. BULWER'S WORKS

### THE DISOWNED.

Illustrated uniformly with the preceding Volumes.

XI.

## THE DREAM, AND OTHER POEMS.

By the Hon. MRS. NORTON.

2d and cheaper edition, in 1 vol. post 8vo. with fine Portrait of the Author, after a Drawing by E. Landseer, R.A. 10s. 6d. bound. (Just ready.)

"A very beautiful poem. This lady is the Byron of our modern poetesses; she has very much of that intense personal passion by which Byron's poetry is distinguished from the larger grasp and deeper communion of Wordsworth. She has also Byron's beautiful intervals of tenderness, his strong practical thought, and his forcible expression. It is not an artificial imitation, but a natural parallel; and we may add that it is this, her latest production, which especially induces, and seems to us to justify, our criticism."—*Quarterly Review*.

XII.

## THE NAVAL SURGEON.

By the Author of "Cavendish," "Gentleman Jack," &c. 3 vols.

(Just ready.)

XIII.

## THE HISTORY OF A FLIRT.

RELATED BY HERSELF.

2d edition, 3 vols. post 8vo.

"A very superior novel."—*Times*.  
"Among the best novels of its kind for many years given to the world by the English press."—*Athenaeum*.

XIV.

## OLIVER CROMWELL,

Edited by HORACE SMITH, Esq. Author of "Brambletye House," &c.

3 vols.

"The most powerful historical romance we have perused since the light of Scott's genius was extinguished in rayless night."—*Calcutta Mercury*.

### REVIEWS OF NEW BOOKS.

*The Egerton Papers. A Collection of Public and Private Documents, chiefly Illustrative of the Times of Elizabeth and James I., from the Original Manuscripts, the Property of the Right Hon. Lord Francis Egerton, M.P. President of the Camden Society. Edited by J. Payne Collier, Esq. F.S.A. London, 1840. Printed for the Camden Society.*

To have a single volume worth the year's subscription is what is not wanted—a feather in the cap of the Camden Society. It has published nothing yet that will not contribute to a very select and delightful antiquarian library; and when we put the whole together—why, we congratulate ourselves heartily on being members, and having these works on such easy terms. We say so, because we have heard literary friends say, when other associations of the same kind\* (with differences as regarded the different old treasures they would restore to light, such as ballad poetry and the drama, border antiquities, historical documents, family correspondences, &c.), there will soon be as many societies as buyers of books; but when we see that, by combination, every one of these new bodies issues, yearly, interesting and valuable publications at a very moderate price to their own subscribers, it seems to us that no literary man can do a wiser thing than belong to as many of them as he can, in order to form a peculiarly pleasant, and so far exclusive, library at an expense he would pay for a single work of no great merit among his ordinary purchases in collecting.

Be this as it may, with Percy's and Camden's, &c., Mr. Collier has fallen into a rich field, and full of pasture, among *The Egerton Papers*. They seem to be stored with abundant important materials, and the single volume before us is a valuable sample of their national interest. Queen Elizabeth's Lord Keeper, and James the First's Lord Chancellor Egerton, was a lawyer, and the muniments preserved in his repositories necessarily partake much of the legal character; and though they are often more dry than the usual intercommunications of ministers and high officers upon general subjects, they not only possess some curious records of that description, but among their official data others which throw a light upon public events hitherto very imperfectly appreciated. The history of the *Papers* is thus given by Mr. Collier, the able editor of this series:—

"Little need be said by way of preface to the following collection of public and private documents. By permission of Lord Francis Egerton, President of the Camden Society, they have been transcribed from a great body of miscellaneous original manuscripts preserved at Bridgewater House, accumulated by his lordship's ancestor, who, while Sir Thomas Egerton, was Keeper of the Great Seal to Queen Elizabeth, and who, having been created in the first instance Baron Ellesmere, and subsequently Viscount Brackley, filled the office of Lord Chancellor of England during considerably more than half the reign of James I.

\* The Percy, for example, already flourishing into the completion of its 500 subscribers, though only four of its monthly publications have appeared.—*Ed. L. G.*

"*The Egerton Papers* go back to a period considerably anterior to the date when Lord Ellesmere (for he is best known by that title) occupied any public situation: he was not appointed solicitor-general until 1581, whereas some of the documents in the ensuing series are not far from a century older, and they are brought down, in tolerably unbroken succession, nearly to the date of the death of his lordship in 1617."

In our illustrative selection from this voluminous mass we shall be guided by the wish to choose such instances as bear upon points of common interest, and exhibit pictures of celebrated men, or the manners of the age; and we commence with a remarkable paper respecting "*Queen Elizabeth and the Duke of Anjou*."

Mr. Collier thus introduces it:—

"The match between Elizabeth and the Duke of Alençon was first proposed when the French prince was about seventeen, and the queen not far from forty. The project was entertained in 1571-2, and a French alliance was not abandoned for many years. In 1579, Anjou visited England privately (Alençon having been elevated to that dukedom in 1576, although, as the subsequent document shews, he was still known in England by his former title); and in Murdin's State Papers, 319, *et seq.*, may be seen a variety of official documents on the subject. It seems from the following that the Earl of Sussex had written a special letter to her majesty, the original of which has not been preserved, but the following abstract of it is entirely in the handwriting of Sir Walter Mildmay, who took a deep interest in the question, and was importantly concerned in the discussions with Bacherville and Simier. It is to be observed that the letter of the Earl of Sussex to the Queen was dated in August 1578, when Bacherville was in England, and prior to any of the documents printed by Murdin. Camden mentions the Earl of Sussex as one of those directly instructed to treat with Simier.

—Vide 'Annals' in Kennett, 463.

"Fr. Marriage with Mons. D'Alanson, the French King's brother and heyre apparent.

—Notes taken out of a letter from the E. of Sussex, xxviii<sup>o</sup> Auguste, 1578, to the Q. Ma<sup>te</sup>.

"Comodities which he saith will follow.—

1. Alliance with the house of France, and the partie there by the Protestantes, so as the Fr. K. neither will nor shalbe liable to anoy the Q. 2. The Q. and hir husband shall protect the Protestantes in Fr. from proces. 3. The avoyding of practises, seditions, by competition or otherwise abroad or at home, by French assurance of the Q. person. 4. The Q., with the help of hir husband, shall constrayne the K. of Spayne to make reasonable peax with the Low Countreys, with preservation of his right and his libertyes, which wilbe suerty to the Q. and great honour. 5. The Q. may have, for more securite of this, some marytyme partes, to be kept at the K. of Sp. charge, and hir husband some frontier townes, in like sort, for some nombre of yeres, untill the peax be established. And thereby free from perilles by Spayne. 6. If the Q. like not this course, then she and her husband to joyne

and to possesse all the Low Countreys, and so anex them to England, yf she have a child by hym: if not, than to devyde the hole between Engl. and Fr.; but, in his opynion, the first is the better course. 7. The establishing the realme by children, and the avoyding of cyvill warres, to the Q. suretye and hir fame, with discharge of conscience before God, &c. So as, briefly, by the marriage the Q. shall give lawe to Fr., Spayne, the Low Countreys, England, Scotland, and in effect to all Christendome. She shall settle her state surely at home. She shalbe strongly guarded abroad. In estimation over all the world. To have a husband, as a servant and a defender of hir causes present. Like to have a child that shalbe feared, to be a revenger of hir injuries, and to settle her kingdom. She shalbe like a serpent in the sight of the devill, and as a dove in the sight of the good. She shalbe the peax maker over all Christendom. Hir fame shall excede all princes that ever were in Europe. And God shall blesse hir as his owne chosen vessel in this world and in the next. With the commodities that shall come by hir marriage,

"The inconveniences that are objected.—1. The Q. mislike of marriage, which might brede discontented liffe hereafter. 2. The difficultie in hir choyse to content hir. 3. The danger that a French prince might, by degrees, usurpe the state. 4. The danger if he shold be K. of Fr., than he to reside there and the Q. here, and so after, &c. 5. If the Q. have but one son, than England shold fall as a province to Fr., and so to be ruled by a Viceroy, him selfe never the greatest. 6. The difficultie of religion. 7. The charge to the realme for mayntenance of that husband. 8. The generall mislike that Engl. must have of straungers government. 9. The danger of the Q. person, if that husband shold fraudulently seek hir first, to possesse by treason an other after.

"Answers which he maketh to the Objections.—The ij first he leaveth to the Q. herself to judge as hir heart will direct hir. The iij is a perill that must have long tyme to frame, and can never be except the Q. and the State be bereft of all sense, a perill in talke but not in dede, as in the K. of Sp. were seen. The iiij<sup>th</sup>, if it shold happen, yet the Q. and he must come together, as K. Php. and Q. Marye did. To the v<sup>th</sup>, if yt shold come to passe, and the child born in Engl., than it wilbe honor, and no perill, if he be K. of Fr. and Engl., as heretofore hath been, as he saith. To the vi<sup>th</sup>, no danger, for the exercise of his religion shold be private to hym self and to a few of his nation. He shall accompany the Q. to hire; and this, he saith, can be no perill to the Q. nor her realme, but is only a quarrell piked by thadversaries of hir marriage, as hath been seen by proffe. The viij<sup>th</sup> shall bring gayne rather than losse, his patrymonye being so great. Example K. Philip. The viij<sup>th</sup> utterly untrew, for the realme is to be governed only by Engl. Example K. Philip; and so the people have no cause to feare, but be farr from all danger. The ix<sup>th</sup> inferreth a reasonable dealing not to be thought in a Christian prynce. "Touching the alienating the Low Countreys to the French.

"*Incommodities*.—1. Suertie to Engl. to have France and the basse contries in the handes of ij princes: the bringing of them all to Fr., an ille perill to Engl. 2. The encrease of the Fr. force both by land and sea. 3. Greate daunger to all Europe by the to greatnes of France. 4. The perilles, in perictle to the Q., by the Fr. mayntenance of competition, popery, and other factions at home, and withdrawing of Engl. from hir dewties. 5. The disturbing of the traffique of Engl. and neyghbonres at their willes. 6. The stoppe of vent of the inward commodities, and mutyning of the people who shall lack work. 7. Bringing of the realme into a perpetuall servitude, or worse, which no one commoditie can recom-pence.

"Touching the joyninge of Mounsieur with Don John against thies contries.

"*Incommodities*.—1. Either the tyrannising over thies contries by the Spaniardes, that will bring many perilles aforesaid; or ells the Q. to make hirself thording the warre for their defence, which, as he thinketh, she cannot endure, &c. The only remedy is a peax betweene the K. of Sp. and the States, such as may be sure, which he findeth difficult. If that cannot be, than he seeth not but that the States must cast them selves into the defeuse of the Q., or the French, wherupon dependeth the perilles aforesaid."

Our next relates to a

"*Grant to Sir Walter Raleigh*.

"[From what follows we gather that All Souls' College, Oxford, had granted to Queen Elizabeth leases of Stolney and Newland, which she subsequently conferred upon Sir Walter Raleigh or his appointee. Raleigh having 'bargained' with two persons for Stolney, requests, in the subsequent letter, the passing of the assignment to them. At this date (April, 1583) Sir Walter was accustomed to spell his name in a different manner to that which he employed afterwards (Vide 'Bridgewater Catalogue,' p. 248), but even later in life he was by no means uniform, judging from the few autographs that remain of him. The circumstance alluded to below is not adverted to by his biographers.]

"To my worshipfull frende Mr. Egerton, Esquier, Solycyter to her Highnes.

"Mr. Solycyter, yt hath pleased her Ma<sup>tie</sup> to bestowe the leases of Stolney and Newlande, lately granted vnto her from Al-Solne Colledge in Oxon, vpon me or any other that I shall agree withall. And for that of late I have bargaunde with Willm Touse and Clemente Stupney for the lease of Stolney, I ame to request you that the assignement maye passe by your good helpe from her Ma<sup>tie</sup> to them, they payenge all fees and chardges thereto belonging. And soe with hartie thanks for many other courtesyes, I byd you farewell: from the Courte, the x<sup>th</sup> of Aprile, 1583.

"Your very lovinge frende to commande,

"W. RAULEY."

On the next page we find the following:—

"*Licence to Sport*.—[Lord Ellesmere appears in early life to have been fond of the sports of the field, and the annexed 'Warrant' to the Lord Paget's keepers in Staffordshire affords evidence of this propensity. His biographers do not appear to have been in possession of any information tending to such a conclusion. He was also to be supplied with 'summer or winter deer' at any time, on directing his letters to the keepers.

"Indorsed 'The L. Pagettes Warrant.']

"These are to will and commaunde youe, and every of youe, that whensover my verie

good frend Mr. Thomas Egerton, Esquier, hir Ma<sup>tie</sup> Sollycitour General, shall come into any my parkes in Staffordshier within your severall chardges, that youe attend upon him and make him the best sporte that youe maie, geving him free libertie to hunt and kill within the same parkes at his pleasure. And, likewise, whensover he shall dyrect his letters to youe, or anie of youe, for the having off anie somer or wynter deare, that youe deliver the same unto such persons as he shall appointe, takinge care thatt he be verie well served thereof. And these letters shalbe a suffycient warrant, from tyme to tyme, to youe and euerie of youe in this behalfe. Fare youe well. From Draiton, this xxiiij<sup>th</sup> off Maie, 1583.

"Yo<sup>r</sup>. ma<sup>r</sup>."

"J. PAGET."

"To Richard Sneade, keeper of my parke at Beandesert. Willm Cripe, keeper of my parke att Seney. And to John Godwin, keeper of my great parke att Bromley Pagett. And to every of them, and in their absence, to the deputie and deputies, and to euerie of them."

As a picture of the times we take—

"*Dean Nowell's Lawsuit*.—[The subsequent letter is printed (though not quite accurately) in Churton's 'Life of Nowell,' App. 426; but the 'Casus,' as Lord Ellesmere calls it, to which it relates, and which is here sub-joined, is not found there. The letter is wholly in Nowell's hand-writing, and the 'Casus' is indorsed by him, 'Betweene the Deane of Pawles and Mr. Faryngton:' it is also corrected in several places by him. It is not usual now for counsel to give an opinion unless the case be sent through a solicitor.]

"Indorsed by Lord Ellesmere, 'From Mr. Deane of Powles—Casus.'

"To the right woorschypfull Mr. Thomas Egerton, Esquire, principall Sollicitor to the Queenes Ma<sup>tie</sup>, my speciall good frende.

"Right woorschypfull, I am verie hartely to pray you to be of my counsell in a matier the effekte wherof is conteyned in the articles inclosed. For I doe feare that the covetousnes of a tenant in pluckinge down and buyldynge for hys gayne wyll toorne me to greate losse: by whose offence I woote not howe muche may be demanded of myn exequutors for delapidations. Also, wheras Mr. Kempe, one of my lorde chancellors gent<sup>l</sup>, became bounden unto me for my lorde byshoppe of London in iij<sup>e</sup>, which bounde I thinke is forfeited by my said L. byshoppe's defalte, myght it please your woorschyppe also to be of counsell with me agaynst my sayde L. Byshoppe, who hath sundrie wayes injured me, rather than agaynst Mr. Kempe, whom my L. ought to save harmlesse: I shall be much bounden unto your woorschyppe, unto whom I am bolde to sende a poore token, for the antiquitie rather then for the value of the same. And so ceassynge further to trouble your woorschyppe, I commende the same unto the moste protection of all-mightie Godde. 7 Julij, 1590.

"Yo<sup>r</sup> Woorschyppe to my

"little habilitie

"ALEXANDER NOWELL."

[The following is the inclosure.]

"One howse in Carter lane in London joyninge close to the Deane of Paules howse by one common walle, was freele letten without takynge of any fyne by the Deane of Paules to a schollar in the Universitie of Cambridge, beinge hys kynsman, towards the mayntenance of hym at his studie, the rente beinge v<sup>l</sup>. iij<sup>s</sup>. iiij<sup>d</sup>. The sayd schollar parted with the sayd lease to one James Walton, a kynsman of hys, for the somme of x<sup>l</sup>. The

sayd James Walton parted with the sayd lease to one James Readfearne, for the somme of xx<sup>l</sup>. The said lease was made over by the said Readfearne to one James Farrington for a greate somme of money, as is reported. The said Farrington converted firste a parte of the said tenemente, next joyninge unto the said Deane of Paules howse by one common walle, and close to the cheeke poste of the said Deanes back gate, into a taverne: at the which the Deanes back gate the resorters unto the said taverne doo usuallie unloade them selves of all their drinke taken in the said taverne. Out of the which taverne, often after xi of the clocke in the night, outcries, filthye and blasphemous words are hearde by suche servantes of the Deane as doo lye neare unto yt. And for that the said tenement was inclosed with a mayne stone walle, beinge part of the bounders of the Churchyarde of Paules, granted by the Kinges of Englande unto the Deane and Chaptre of the same, it is covenanted in the said lease that the tenant, his executors, administrators and assigns at their owne propre costes and charges, all the said tenemente with the appurtenances shall mainteyne in all maner of reparations, as well in greate tymber, stone and leade, as in all other thinges necessarie: which mention of stone was speciallie made for the saynge of the sayd mayne stone walle, beinge the bounder of the churchyarde. Whiche clause notwithstandinge, the said Farrington hath cleane taken downe and caried awaye all the stone of the saide mayne walle, which was twoe foote and three inches thicke, and above tenne foote highe, and in lengthe above one hundrethe and fortie foote: notwithstandinge he was forbidden by the sayd Deanes servantes, and by the Deane hym selfe put in remembrance of the said covenante. By the takynge awaye of the which walle, beinge part of the bounders of the churchyarde, the said Deane may be charged for delapidations by hys successor, to the undooyng of his executors. And whereas even at this presente greate offences are taken with such as convert one tenemente into many small tenementes, the said Farrington hath notwithstandinge, besydes the foresaid taverne, made viij other smale tenementes, buylded with smale tymber, lathe, and some with soe many doores into; and besydes the open doore to the taverne, a privie doore is made to the same. Soe that wheras before there was but twoe doores in the mayne stone walle, one for the inne, and an other for the stable, now there be eleaven doores to those most weake walles, to the greate daunger of the sayd Deane and his howse, beinge severed from that multitude of entrees and weake buildinges only by one lowe bricke walle, over the which any man may easilie passe."

The following are interesting and characteristic:—

"*Death of the Lord Keeper's Son*.

"[The following is an exceedingly characteristic letter from Lord Essex to Lord Ellesmere, on the death of his eldest son, Thomas Egerton, who accompanied the earl into Ireland, in March 1599. The loss of so promising a young soldier, and so dear a friend, no doubt, contributed not a little to the disgust Lord Essex seems, at this period, to have felt towards the country.]

"To the right honorable my very good L., the L. Keeper of the greatt seale of England.

"Whatt can you reave from a cursed cuntry but unfortunate newes? whatt can be my stile (whom heaven and earth are agreed to make a stranger), butt a stile of mourning? nott for my self that I smart, for I wold I had in my

hart the sorrow of all my friends, butt I mourne thatt my destiny is to over live my deerest frendes. Of yur losse, yt is nether good for me to write, nor you to reede; but I protest I fealt myself sensibly dismembered when I lost my friend. Shew your strength in lyfe. Lett me, yf yt be Gods will, shew yt in taking leave of the world and hasting after my frends. Butt I will live and dye.

"From y<sup>r</sup> Lp's any man living,  
"ESSEX."

"Arbrachan, this last of August."

"Letter of Condolence."

"[The subsequent letter must have been sent to Lord Ellesmere very soon after the distressing news of the death of his son had reached him. It is to be observed that, although the body of the letter is written by Sir Robert Cecil, the superscription is in the hand-writing of Lord Bacon. It is possible that he had something to do with the composition of it, and some of the expressions resemble others in his 'Essays,' printed not long before.]

Indorsed by Lord Ellesmere, 'Mr. Secretarye.'  
"To the right honorable my very good Lord, the L. Keeper of the greatt scale of England."

"My good L. Discretion hath overruled my affectionate desire to have visited you er this time, knowing that the sight of freends do rather revive than suspend sorrowes. But, my L., I doubt not but your wisdom will abridge the time in which griefs are remedied, and your experience of the world make you compatible with these accidents, which are comon and unavoydable. It is not therefore (beyond Nature's tribute, which flesh and blood can not withhold in some proportion), fitt for your place and your person to mourn when the blow is past, and not to be prevented, and the arm that strook it powerfull and not contented if it be repined at; especially when he that made him hath him, and lent him you so long, till he had don honour to his country and to his howse. I pray your Lp., therefore, pay those debts in which the expectation and experience of your moderation in all things have tyed you more then others (that are compounded of humours and passions), and thogh this stile of mine be full of weaknes in respect of other your wiser frends, yet let my affection make, by these defects, from whom you may build surely to receive all effects of an honest man, and one that in this request, and all other, will yeld you the just account of him that hath vowed himself unfainely

"Your Lp's. trow fr. to com.,

"RO. CECYLL."

There is a singular record of the Rokeby family, on the death of Ralph Rokeby of Lincoln's Inn; but we can only find room for a few items of his funeral expenses:—

	£.	s.	d.
"The Churchwardens of St. Androes for the poore there .....	2	0	0
The Churchwardens of St. Dunstons for the lyke .....	2	0	0
The principall of Furnivalles Inne for a drinking for the gent. there in their halle .....	1	15	0
The principall of Thavyes Inne for the lyke there .....	0	17	6
The chelf Butler of Lincolnes Inne and others for the lyke there .....	10	0	11"

We conclude with one other interesting document:—

"Sir Walter Raleigh to the Commissioners."

"[The context respecting Durham House is not mentioned by the biographers of Raleigh. The subsequent letter from him to the Commissioners, who had required him to deliver possession to the bishop by the 24th June, is very characteristic. In it, Sir Walter asserts that he had held the house for nearly twenty years, and he also adverts to the number of his

retainers and horses who were suddenly to be expelled. Lord Ellesmere registers that it was received on the 9th June, two days after the date of the communication of the Bishop of Durham from Ware, but Sir Walter gives it no date.]

Indorsed by Lord Ellesmere, 'Sir Walter Raleigh's letter. Rec. 9 Junij, 1603.'

"To the right honorabell my very good Lords, the Lorde Keeper of the Great Seale, and my Lorde Chief Justice of Inglande, and to my very good frinde His Maiesties Atturnay Generall."

"I received a warrant from your Lordships, my L. Keeper, and my L. Cheife Justice, and signed also by Mr. Atturney Generall, requiringe me to deliver the possession of Derum howse to the Byshop of Derum, or to his atturney, before the xxiii<sup>th</sup> day of June next in-sewinge, and that the stabells and garden should be presently putt into his hands. And that I should not remove any selinge, glass, iron, &c. without warrant from your Lordships or any two of you. This letter semeth to mee very strange, seinge I have had the possession of the howse almost xx yeares, and have bestowed well nere 2000*l*. upon the same out of myne own purse. I am of opinion that if the King's Maiestye had recovered this howse, or the like, from the meanest gentelman and sarvant hee had in Inglande, that his Maiestye would have given six moneths tyme for the avoydance, and I do not know butt that the poorest artificer in London hath a quarter's warninge given hym by his land lord. I have made my provisions for 40 persons in the springe, and I have a [def. in MS.] of no less number [def. in MS.] and the like for almost xx horse. Now, to cast out my hay and oates into the streats att an howres warninge, and to remove my famly and stuff in 14 dayes after, is such a severe expulcion as hath not bynn offred to any man before this daye. But this I would have written to any that had not bynn of your Lordships plase and respect, that the course taken with mee is both contrary to honor, to custome, and to civillity, and therefore I pray your Lordships to pardon me till I have acquainted the King's Maiestye with this letter; and then, if his Maiestye shall thinck it reasonabell, I will obey it. But for the cummandment sent mee for the wenscote and other things, I do not finde that it pleased his Maiestye to geve your Lordships any suche direction, and if I do any thing contrary to law the Byshope may take his remedy, and I percave cannot want good frinds. And so I humbly take my leve, and rest your Lordships to cummande."

"W. RALEGH."

*The Life and Pontificate of Gregory the Seventh.*

By J. W. Bowden, M.A. 2 vols. 8vo. London, 1840. Rivingtons.

A LIFE of the redoubted Hildebrand is full of stirring matter; but the events are so well known to general history, that we shall rather devote the attention we give to this work to the introductory and preliminary chapters, which are, in fact, of more *authorly* importance than the biography. The Advertisement is dated the "Feast of All Saints, 1840," and seems to prepare us for some strange notions on the part of the writer. He accordingly sets out by telling us that—

"Gregory VII., and the churchmen of his school, will, in the following pages, be generally represented in the light which a careful study of all the contemporary sources of information accessible to me has induced me to believe the true one; in the light, that is, of sincere,

though imperfect, Christians; of men who, trained in a corrupt school of theology, could not acquire that purity of motive or consistency of practice which they might, under more favourable circumstances, have attained; but who, at the same time, devoted themselves, through life, to the service of God, and to what they considered the best interests of mankind; and who, while thus acting, became the favoured instruments of Heaven in reforming the church, and in warding off from Christianity one of the most fearful dangers to which she has ever been permitted to be exposed."

He adds:—

"And it is through their spiritual descent from this Roman bishop and his predecessors, that our primates and their suffragans derive their clearest title to govern the church of Christ in England at this very day. It is not, therefore, for us to look with jealousy or distaste upon the ancient glories of our nursing-mother in the faith. It is not for us to seek to pare away expressions, or to reduce to their minimum of meaning the glowing testimonies of antiquity to that mother's purity and honour. She, it is true, has since abandoned us; and, because we refuse to bow down before the idols whom she has in these later times set up, refuses to recognise us as her children. We, however, have not separated from her; we have formed ourselves into no new sect or party, but, by God's blessing, continue within the pale of that Catholic community to which she first admitted us. Nor can her recent tyranny prevent our eyes from reverting to the shining indications of her pristine worth, or our hearts from burning within us, as we gaze, with emotions of exalted pleasure akin to those with which an affectionate and duteous child delights to survey the cherished mementos of parental excellence."

Such being the case, it would appear to be difficult to decide whether the author were a Roman Catholic or a Protestant; and, indeed, if the doctrine in our first quotation be correct, it is very little matter what faith a man professes. As none is perfect, we have only to extend our liberal opinions to errors, and conclude like Mr. Bowden, that—

"No one can thoroughly and impartially investigate the records of his age, without deeply grieving to see how universally the foul weeds which had then sprung up in the church's vineyard had entwined themselves around its proper plants, to stunt and to disfigure them,—how in the case of Gregory VII. and of his contemporary school of churchmen, the assertion of the highest principles of faith was distorted by their amalgamation with misconceived dogmas and erroneous inventions,—and how, in defending religion, these high-principled men also became the defenders of a variety of growing and formidable corruptions. But these corruptions, it will be seen, were far from being the direct object of the great struggle which it was their lot to carry on. Professing a corrupted theology, they defended it, not against a purer system or a reformed creed, but against dangers which threatened the destruction of Christianity itself. Whatever might have been their doctrinal errors, such errors were the tenets of their adversaries as well as of themselves; and were, in effect, entirely beside the main purport or bearing of the contest which will form the most prominent subject of the following pages. In preserving and invigorating the church's constitution, they undoubtedly also preserved and cherished those seeds of evil which, modified as it had been by human interference, that constitution then contained; and

thus became, in a sense, indirectly responsible for their subsequent extensive and fatal germination. But, if so, it was only as he who preserves a diseased man from a violent and external danger may be said to be the cause of the disease afterwards reaching a fatal termination. Of course, such a preserver would render the patient a more complete service if he could also eradicate the seeds of malady; but if he have not the power, or be not in a position, to do this, it does not follow that his exertions should on this account be thought of no value, or, which would be still more absurd, censured for their indirect, unexpected, and distant consequences, in forgetfulness of those which were more direct, intended, and immediate."

And, fearing that this lax doctrine may stagger your people of more straight-looking and less refining views, the author goes on to say:—

"To some persons, the very notion of a combination, in the same schools, of high Christian principle and of corruptions so gross as were those of Rome, even in their nascent state, may appear absurd; we have, however, it should be recollected, as much evidence for the existence of the one, as for the influence of the other, during the period in question; and if, therefore, this circumstance appear to present us with an incredible inconsistency, it were quite as just, and far more charitable, to believe in the good which is borne witness to, and to doubt of the asserted evil."

As our page is no place for theological controversy, we simply lay these opinions before our readers as specimens of the author's modes of thinking and argument. They will not be surprised to learn further from him:—

"All contrary as they seem, the errors of our fathers may sometimes, even by our limited powers of observation, be traced to the same source with our own. It may, for instance, have been the same imperfection of belief, the same inadequate conception of the real nature and fullness of Christian privileges, which made men in the middle ages receive with unhesitating credence a host of miraculous narrations of the most childish kind; and which, at a later epoch, has taught them to yearn for palpable impressions of Regeneration, or for positive demonstrable tokens of the Almighty's operation on their souls."

And he adds:—

"Of course it is not meant to be asserted that during the middle ages the arm of the Almighty was never visibly outstretched in miracle. I will frankly avow my belief that the contrary is the truth. And still less, I should hope, will the above sentence be construed into a presumptuous limitation of the unseen ways of God's Providence in His present dealings with the soul. But to look habitually, and by system, for such manifestations of His power, of either kind, seems to betoken an imperfect comprehension of the truth, 'The just shall live by faith.'"

Believing in miracles, Mr. Bowden next apologises for other errors, which he apparently censures, in the papal church. Thus:—

"We sometimes hear this papal empire spoken of as though it had been the direct, the originating, cause of all those strange corruptions of doctrine and practice which during any portion of the middle ages arose to acceptance in the Church. But a very brief inquiry will suffice to convince us of the fallacy of this view of things, or to prove to us that those corruptions derived, for the most part, their origin from other sources. Image-worship, for instance, the most extraordinary,

perhaps, of all the errors into which the Church has at any time been permitted to fall, was, as we have seen, a product of the warm and excitable imagination of the East. Purgatory was first treated of, in a tangible way, by the great Augustine, bishop of the African city of Hippo. And transubstantiation, first set forth in form in the writings of a monk of Corbie, near Amiens, was, as the reader will learn during the course of this narration, only definitively adopted by the papal see, when it had been forced on a reluctant pontiff by the clamour of a council, which appeared to embody the popular feeling of the West. And though, as in the instance, already cited, of image-worship, the popes often took a prominent part in the defence of these errors, when they had once arisen and diffused themselves; yet it was as the representatives of public feeling, as the supporters of notions which had become general, that they did so. It was in allying themselves, as their new position often forced them to do, with the popular party, that they allied themselves with the popular corruptions. And however, therefore, we may censure them for having thus suffered themselves to be guided by the dictates of low secular policy rather than of strict uncompromising principle, it would be unreasonable, on this account, to condemn either them or their authority, for the actual origination of the corruptions thus laid to their charge. That there existed a sort of mysterious sympathy between the system of errors which, collectively taken, may be styled doctrinal popery, and the solitary elevation of the Roman patriarch's throne, may not be denied. But it were a more correct view of this connexion to regard the two as derived from one common source, than to consider the one as having been directly instrumental in the production of the other. As the temper of the times waxed gross, as the vision of spiritual religion faded before men's eyes, both Christianity and the Christian Church became to their regards, if the expression may be allowed, materialised; and the conversion of the unearthly system of the apostolic polity into a more worldly, a more tangible, scheme of monarchy, is to be traced to mental habits and modes of thought, very nearly allied to those which moulded a reverential and mysterious feeling towards the saints departed, into a systematic invocation of them, and which degraded the holy and ineffable mystery of the real presence in the eucharist, into the more definite and intelligible miracle of transubstantiation."

With this we close our illustrative extracts, which are longer than we usually allow to such subjects; but it is our duty and business to reflect all the literature of the day. We have only to add that Mr. Bowden's preliminary view of the popedom, for about three centuries previous to his hero's attaining the purple, is a frightful picture of depravity. Sometimes an Infallible of a dozen years of age, sometimes an Infallible to sell and another to buy the triple crown, sometimes two rival Infallibles, and at another time three Infallibles,\* all reigning, and praying, and absolving in Rome at the same moment, and almost all equally debauched and horribly vicious, offer, indeed, a shocking spectacle to the worshippers of a God whose ministers they assert themselves to be.

#### PEPYS'S CORRESPONDENCE, &c.

[Second notice: conclusion.]

UPON the revolution of 1688 the correspondence of the Secretary of the Admiralty does not throw much new light; but as confirmatory of

\* Benedict IX., Gregory VI., and Sylvester III.

history already written, and elucidating particular circumstances relating to the naval forces of the king, his letters to Lord Dartmouth are well deserving of attention; so late as November 10th, in the year mentioned, he writes to his lordship:—

"I have been endeavouring to make the most exact comparison I can of his Majesty's force now at sea under your lordship, with that of the Prince, under Admiral Herbert. The result, as containing somewhat no less welcome than surprising, I thought it my duty to represent to his Majesty (as I did this evening at the Cabinet), shewing that, contrary to the impressions universally received touching the inequality of the two fleets, greatly to the advantage of the Dutch, as superior both in number and force to yours, the odds in number is very considerable, and in quality (as much as there is any) appears to incline to his Majesty's side. For the credit of the list on which this comparison is founded, his Majesty and my lords do not find any reason for questioning it, as observing the same, together with the plan of the army, to have been sent under cover of the letter, which came together with them from your lordship to me, designed for the use of the Elector of Brandenburg. Which being so, his Majesty hath, with the advice of my lords, commanded me to give your lordship, by express (as I now do by the hand of Mr. Hodder), the same I have now mentioned; they deeming it of very great importance to his Majesty that your lordship should, without delay, have it before you, in order, first, to your satisfying yourself in the validity and justness of my calculation; and then, that your lordship, on considering all circumstances, may, according to the fullness of the power lodged in you from his Majesty on that behalf, proceed to make such use thereof as you shall conceive most conducing to his honour and service."

Of how little value these calculations were, the result of the opportune storm and the Prince of Orange's landing at Torbay was the immediate solution. With the change of government Pepys lost his official situation, and there is a blank in the correspondence for about ten years. The subsequent letters, from January, 1698-9, illustrate some of his later years, and are frequently addressed to literary and scientific subjects. The names of Sir Hans Sloane, Dryden, Mr. Wanley, and Evelyn, are the most prominent; and the notices of subjects of the day (since rendered less worthy of special remark) are not devoid of interest. They resemble the hundred important and interesting inquiries, &c. of 1840, which in 1940 will be laughed at by our grandchildren of a wiser generation. Thus, for instance, in a letter to Mr. Wanley, April 10th, 1701, Pepys says:—

"I greatly thank you for what you have been also so kind as to lodge with me this morning, and which shall lie very safe and undisturbed till you can have another half day's leisure to visit me as then; and I hope it won't be long first, for I shall long to see them opened, and will sequester myself from all other business and company when you shall, by any way, tell me I may expect you."

This refers to a proposition by Wanley, in connexion with the professors and heads of the University of Oxford, for "a general survey of all the public libraries of Europe, with our opinions of his own singular fitness for being intrusted with its execution." A plan revived within the last few years, and verifying the adage "there is nothing new under the sun."

And another of our old novelties may be

traced to theories for the better and more general education of the people, which are to be found recorded in these volumes. Sir W. Petty, writing from Dublin in 1683, says:—"I aim at nothing but the satisfaction to have meant well towards mankind."

And a note informs us:—

"To promote this laudable self-satisfaction, the Letter-writer had published, 'The Advice of W. P. to Mr. Samuel Hartlib, for the Advancement of some particular parts of Learning, A.D. 1643.'"

In pursuance of his project, the highly accomplished author of the 'Advice' would institute 'an office of common address, as recommended by Master Hartlib, where men may know what is already done, what is doing, and what is intended, that, by such a general communication and mutual assistance, the wits and endeavours of the world may be no longer as scattered fire-brands, soon quenched for want of union; whereas, laid together, they would yield a comfortable light and heat.' He proposes 'perusing books, and taking notice of mechanical inventions,' that 'out of all, one book or great work may be made, though consisting of many volumes;' adding, that 'the most artificial indices, tables, or other helps for the readily finding and well understanding all things contained in these books, must be contrived and put in practice.' The author, 'thus having taken the height whereunto arts and sciences are already come,' recommends that 'the ablest men in every faculty be engaged,' that 'there may never want men acquainted with the whole design, and able to carry it on with the help of others, admitted under them. Now,' he adds, 'we shall think of whetting our tools, and preparing sharp instruments for this hard work, by delivering our thoughts concerning education.'

He would erect '*Ergastula Literaria*—Literary Workhouses, where children may be taught as well to do something towards their living, as to read and write. That the business of education be not as now (1643) committed to the unworthiest of men, but seriously studied by the best and ablest. All children above seven years old,' he would have 'presented to this kind of education, none excluded by the poverty and inability of their parents; for hereby it hath come to pass, that many are now holding the plough, which might have been made fit to steer the state. Wherefore,' he adds, 'let such poor children be employed on works (whereby they may earn their living) equal to their strength and understanding, and such as they may perform as well as elder and abler persons, viz. attending engines, &c. And if they cannot get their whole living, and their parents can contribute nothing to make it up, let them stay somewhat longer in the workhouse. That, since few children have need of reading, before they can be acquainted with the things they read of, or writing, before their thoughts are worth recording, or they are able to put them into form (which we call inditing), much less of learning languages, when there be books enough for present use in their mother-tongue, our opinion is, that those things being withal above their capacity (as to be attained by judgment, which is weakest in children), be deferred awhile, and others more needful, and attainable by the help of memory (either most strong, or unpreoccupied in children), be studied before them. We wish, therefore, that the *educanda* be taught to observe and remember all sensible objects and actions, whether natural or artificial, which the educators must, on all occasions, expound to them. That they use such exercises in work, or for

recreation, as tend to the health, agility, and strength of their bodies. That they be taught to read by much more compendious means than are in common use—a thing very easy and feasible. That they be taught to write, not only according to our common way, but also swiftly, and in real characters; as likewise the dextrous use of the instruments for writing many copies of the same thing at once.\* That the artificial memory be thought upon. If the precepts thereof be not too far above children's capacities, we conceive it not improper for them also to learn that.† That the arts of drawing and design be, in no case, omitted, to what course of life soever those children are to be applied, since their use for expressing the conceptions of the mind seems (at least, to us) little inferior to writing, and, in many cases, performeth what by words is impossible. That the elements of arithmetic and geometry be studied by all, being not only of great and frequent use in all human affairs, but also sure guides and helps to reason, and especial remedies for a volatile and unsteady mind. That effectual courses be taken to try the abilities of the bodies and minds of children, their strength of memory, the inclination of their affections, either to vice or virtue, and to which in particular, withal to alter what is bad, and increase and improve what is good; applying all, good or bad, to the least inconvenience and most advantage. That such as need to learn foreign languages (the use whereof would be much lessened were the real and common characters brought into practice), may be taught them by ways incomparably more easy than are now usual. That no ignoble, unnecessary, or condemned part of learning be taught in those houses of education; so that if any man vainly fall upon them, he only may be blamed. That such as have any natural ability and fitness to music, be encouraged and instructed therein." To such advantages of general education, the author proposed that the children of the poorest class in society might have an undisputed access; and that 'all children, though of the highest rank, be taught in their minority some *gentile* manufacture,' naming a great variety of attainments, and concluding the list with 'anatomy, making skeletons, and excuriating bowels;' also, 'mariners' compasses, globes, and other magnetic devices.'

"Proceeding to the second and highly important part of his subject, the author would now provide 'for the advancement of all mechanical arts and manufactures,' by the erection of 'a *Gymnasium Mechanicum*, or a College of Tradesmen.' To 'the prime, most ingenious workman of every trade,' he would assign 'a handsome dwelling, rent-free.' Thus 'the very ablest mechanics may' be expected at length 'to desire a fellowship in this college,' and supply 'the most effectual opportunities for writing in perfection a History of Trades. What experiments,' he adds, 'would all those operations afford to active and philosophical heads, out of which to extract that interpretation of Nature, whereof there is so little, and that so bad, yet extant in the world! Within the walls of this *Gymnasium*, or college, should be a *Noocomium Academicum*, according to the most exact and perfect idea thereof; a complete *Theatrum Botanicum*, stalls and cages for all strange beasts and birds, with ponds and conservatories for all exotic fishes. Here, all animals, capable thereof, should be made fit for some kind of labour and employ-

\* A manifold writer: now so common, though it made no way at the time.—Ed. L. G.

† Another old-novelty or novel-antiquity of our day.—Ed. L. G.

ment, that they may be of use as well living as dead. Here should be a repository of all kinds of rarities, natural and artificial, pieces of antiquity, models of all great and noble engines, with designs and platforms of gardens and buildings, the most artificial fountains and water-works, a library of select books, an astronomical observatory for celestial bodies and meteors, large pieces of ground for several experiments of agriculture, galleries of the rarest paintings and statues, with the fairest globes, and geographical maps of the best descriptions; to become, as far as possible, the epitome or abstract of the whole world.' The author opines 'that a man conversant within those walls would certainly prove a greater scholar than the walking libraries (so called), though he could neither read nor write. Even 'a child in this college' (if encouraged to make observations), 'would afterwards understand easily all good books, and smell out the fopperies of bad ones.' Our author, therefore, specially desires 'that a society be instituted' who would be 'as careful to advance arts,' in such a college, 'as the Jesuits are to propagate their religion.'

To observe the number of these suggestions which have since been carried into effect, and most of them within the present century, is the most gratifying test we can apply to the progress of human improvement. Other institutions, publications, and arrangements, are recommended, but the foregoing are the most essential; and we need not go through the rest; but conclude with a remarkable letter of King James to his daughter, the Princess of Orange, stating his reasons for being converted and adhering to the Romish Faith. It is dated, Whitehall, November, 1687, and as follows:—

"Monsieur d'Albeville having told me you were desirous to know the chief motives of my conversion, I have sent you as many particulars as my leisure will permit. I must first tell you I was bred a strict Church-of-England man by Dr. Stuart, to whom the king, my father, gave particular instructions to do so. And I was so zealous that way, that when the Queen, my mother, designed to bring up my brother, the Duke of Gloucester, a Catholic, I, preserving still the respect due to her, did my part to keep him steady to his first principles; and, as young people often do, I made it a point of honour to stick to what we had been educated in, without examining whether we were right or wrong. Thus I did then, which shews how I stood affected in point of religion; and I can say, that in all the time I was beyond sea no Catholics said any thing to me to persuade me to change my religion; and so I continued for the most part I was abroad, without troubling myself about those concerns. The first thought that came into my head of any thing of that kind which moved me to a more serious consideration, was the great devotion I found among so many of the Catholics of all sorts whenever I had been among them; the great helps they had towards it; and that I found every day some one or other of my acquaintance, of that persuasion, leave off their loose way of living, and live as good Christians ought to do, though many of these continued still in the world. When I found this, and observed their decent way of serving God, their churches being so well adorned, and the great charities they did, it made me begin to have a better opinion of their religion, and moved me to inquire more narrowly into it; and then I soon found that both they and their religion had been very much misrepresented:

which made me begin to compare them and the Reformed churches together. When I had done this, I considered the reasons which were given by the several reformers for their separation, and more particularly by the Church-of-England men. I read over again the histories of those reigns in which it happened, written in the 'Chronicles.' I perused very carefully the 'History of the Reformation,' written by Dr. Heylin, and the preface of Hooker's 'Ecclesiastical Polity.' Which having done, I discoursed with men of that persuasion (I mean of the Church of England) upon the same subject, and found no satisfactory reasons for what they had done. I then began to inquire into the reasons given by the Catholics for the infallibility of their church, which I found could not be denied them without shaking the very fundamentals of Christianity. And being once satisfied in that point, which is the chief to be considered on, all the rest falls in, of course. Let any ingenious person, without being prepossessed, read what our Saviour said to St. Peter by name, Matthew, xvi. chapter, verses 18 and 19, and to his apostles in general, and it will manifestly appear that he left an Infallible Church, against which the gates of hell shall not prevail. Pursuing this point, I concluded that the apostles, and the whole congregation of the faithful assembled at Jerusalem, were all most manifestly of that opinion, otherwise they would not have used that phrase (Acts, xv. verse 28), 'for it seemed good to the Holy Ghost and to us,' in the decree they made at that meeting. Next, I inquired what authority there was, even for the Scripture itself, and found, upon strict examination, that it was declared canonical by the Church, some books offered being laid aside as not so, and only those allowed which were approved by the same. Now, none can be thought to be such proper interpreters of Scripture as those who declared the certainty of it. Besides, whether it is not likelier, reasonably speaking, that the church which hath had a constant succession from the very apostles' time to this day, should be in the right; or private men, who, upon pretence of reformation, broached new opinions, and had their heads fuller of temporal than spiritual concerns, as Luther, Calvin, and the reformers here in England? It would be too long for this paper, to make this out, though it were easy to do it, and it would satisfy any ingenious person that what they did was not inspired into them by the Holy Ghost. For, instead of endeavouring to reform manners, and to increase devotion, they did quite the contrary, by opening a way to liberty, indulging to men's appetites, lessening the reverence which is due to God in the manner of his worship, and letting Christianity loose. I may say, by encouraging every one to believe he is a competent judge of the Scripture, and, consequently, may interpret it according to his own fancy. 'Tis this that hath very much shaken the foundations of Christianity, and hath let in so many sects and dangerous opinions, and hath made Socinians and Latitudinarians increase so much among us here in England. Christianity, at first, gained credit by miracles and the powerful preaching of the Apostles. The blood of the Martyrs, the seed of the Church, rendered her most fruitful and glorious, by the wonderful examples of Christian fortitude. Lastly, an humble submission hath preserved it ever since; for, without submission, a man cannot be so much as a Christian. It was that consideration which chiefly made me embrace the communion of the Church of Rome, there being none that do,

or can pretend to infallibility, but she. For there must be an infallible Church, or else what our Saviour said is not so, and the gates of hell must prevail. The practice of the Church of England confirmed me in this belief, having acted, ever since the Reformation, as if they believed themselves infallible, though they will not own it. Otherwise, why have they been so severe against all dissenters from her, ever since the beginning of the Reformation, and made such severe laws against them, which, from time to time, have been more severely put in execution than is generally known, and as well against Protestant as against Popish dissenters? Now, I would willingly know how the Church of England can find fault with those who have fallen from her, when she herself shewed them the way, by quitting the communion of the Catholic Church, of which she herself was a member, having no more right to do it than any one county of England to separate itself from the rest, and govern itself by laws different from those established over the whole kingdom. To say more on this subject would exceed the bounds of a letter; and if to what I have here set down the King my brother's and the late Duchess's papers\* be added, I think it is sufficient, if not to convince an unbiased judgment, at least to create a more favourable opinion of the Catholic cause. A true copy of my letter to my daughter, the Princess of Orange, 1687.

"J. R."†

To the Editor of the Literary Gazette.

Baldock Rectory, Herts, December 8th, 1840.

SIR,—Having just seen, in your last Number, a review of 'The Life, Journals, and Correspondence of Samuel Pepys,' in which you take it for granted that I am the editor of that publication, and make some remarks on my discharge of that office; I beg leave to state that I am in no way or degree connected with the editing of these volumes. All my published labours on 'Pepys' have been confined to the deciphering from the original shorthand MSS., the 'Diary,' edited by Lord Braybrooke, and the Journals, Letters, &c., other papers that have now just appeared; for much has been deciphered by me that has not been given to the world. It is as the decipherer only that I am connected with these works: with the editing what has been published I have had nothing whatever to do, and, consequently, have no right either to the praise or dispraise resulting therefrom.—I particularly request the favour of you to insert this in your next Number; and I am, Sir, your very obedient Servant.

JOHN SMITH.

#### Mr. and Mrs. S. C. Hall's Ireland. Part II.

REFERRING to our review of the first Part, we have to speak in terms of equal praise of its successor; which, in our opinion, judiciously does not interweave so much of Irish tale (excellent in its place) among the sterling information, such as that respecting Teetotalism, and the lively descriptions of scenery, and racy anecdotes, which season the narrative. We are, indeed, much pleased with this continua-

\* "These papers are now before me, as they were annexed, in 1741, to the 'Fifty Reasons' which induced 'Prince Anthony Ulric to abjure Lutheranism.' At the close of the first paper is the following attestation: 'This is a true copy of a paper I found in the late King my brother's strong-box, written in his own hand.—JAMES R.' The second paper thus concludes: 'This is a true copy of a paper written by the late King, my brother, in his own hand, which I found in his closet.—JAMES R.' The third paper, dated St. James's, August 20, 1670, is entitled, 'A Copy of a Paper written by the late Duchess of York.'"

† "This last is writ in the King's own hand; and by him was put into mine, December 22, 1687, to read, telling me he had never shewn it to anybody but to me, saying that he did put it into the hands of a Father or two to overlook and look it over. But they brought it to him again without any the least alteration, telling him it run most naturally, coming just as it was, and like a letter of a father; and so he sent it, without the least alteration, just as he wrote it. Memorandum, that he put it into my hand to read, while he went to chapel. In which time I took a copy of it myself, at Mr. Bridgman's office, and gave the King back his original in the way as he came from chapel, asking me how I liked it? Telling me, again, as before, that it was just as it came from himself, without any alteration, &c. from any other hand.—MS."

tion; and select two or three passages to vouch for it. Of Blarney:—

"The Rev. Matthew Horgan, the parish priest of Blarney, informs us that 'the curious traveller will seek in vain for the real stone, unless he allows himself to be lowered from the northern angle of the lofty castle, when he will discover it about twenty feet from the top, with this inscription:—

CORMAC MC CARTHY PORTIS  
ME FIEMI FRUIT. A.D. 1446."

Of the Irish car:—

"This arrangement has been characterised as unsocial—but conversation is easily carried on by leaning across 'the well.' Its disadvantage is, that the eye can take in but the half of a landscape; a caustic friend likened it to the Irish character—which limits the vision to a one-sided view of every thing."

Of a car-driver:—

"Mogue was in the confidence of many a youth and maiden, for, as he said, the jaunting-car was the most convenient thing for 'coortin' that ever was invented. 'Ye see,' said the Rattler, 'I know at once when people are married or single; if they're keeping company, they tell me to balance the car by sitting on the other side—for the sake of the horse, to be sure!—if they're married, bedad! they let me keep my own sate, and balance it themselves!' A proud man was Mogue when the liberality of a gentleman—whose hand, while he had life, never closed upon his purse—enabled him to set up a car for, as he said, 'the convenience of the neighbours, and his own profit.' Mogue was a patriot, and had his car painted a bright green; and as he desired the country at large to be informed of his wealth, he had an inscription on the back of his vehicle, 'Mogue Furlong his car for the public and his friends laves home twice a week wind and weather permitting.—P.S. let on hire when not goin'.' Mogue sported a very loose, ill-fitting coat, a huge whip, with a lash long enough, as he said, 'to keep the childre and the pigs from under the horse's feet,' and his 'new' beaver was an 'ould' hat belonging to the coachman at the big house, a tributary offering to the Rattler's new 'vocation'; as, however, the coachman's head was large and Mogue's small, he was obliged to stuff it with a wisp of hay, or straw, or some such material, to render it 'a beautiful fit,' and he generally managed, by such means, to keep it off his eyes; he was a very tall, powerful man, but gentle and good-tempered, as powerful men usually are. During the summer he had abundant occupation in driving 'the bathers' (he lived in a sea-side village) to the sea. No matter how many crowded into his car; 'the more the merrier' was Mogue's constant observation ('three of a side and two in the well'), and he aided not a little to make them merry, for he was the very soul of sly and quiet humour. In those days the 'Flirting Cushion,' that well-stuffed, and most lounging appendage to a modern outside cur, was not known; and we have seen three or four children laughing in 'the well,' while mammas, grown-up sisters, and nurses, crowded the sides. Twice a-week Mogue repaired, 'wind and weather permitting,' to the county town, and certainly no one envied his occupation: every thing that the inventive faculties of a whole parish—in which were ten or a dozen rustic beauties—every thing, from a pennyworth of mixed hair-pins, up to a bonnet, from a 'quartern of tea' to a side of pork, was Mogue expected to convey for next to nothing—or pure love. 'Ah, thin, Mogue honey, don't forget the crooked comb; what'll

I do if you do, and the dance to be to-morrow evening?—Here's the money.' 'And for the carriage, Nelley?' 'Oh, I'll owe ye for that.'—'Ah, thin, Mither Mogue, don't forget the bit of a slate for the boy, this time anyhow, Sure he's loosing the figures for want of it intirely.'—'Mr. Mogue, sir,' whispers a tall, gawky lad, looking fitter to go to school than think of 'such things'—'here's the size of her finger, ye see; try it on yer own little one, will ye, for fear ye'd lose the measure?' 'Ah thin, don't bother us with such nonsense, ye grate bosthoon!' was Mogue's reply. 'Sure the key of the door served your father's turn, and it may yours.' 'The dickens a key to the door at all, at all,' answered the youth; 'but the priest is grown particular about a ring, and ye needn't dread the money, for here's the half of it; and don't be hinderin' us, Mogue, like a darlin' man, and it so nigh Lent. I'll pay ye honest, and if ye don't take my word, the little girl herself's outside—and will go bail—and you never misdoubted the word of one belonging to her.'"

Of the "ould" Irish nobility:—

"The melancholy conclusion of the history of Lord Roche's forfeiture we may illustrate by two anecdotes, for the truth of which we can vouch.—A Lady Roche was perfectly remembered by two or three old persons, who have described her to us as begging charity through the streets of Cork in a tattered and faded court-dress. She was then upwards of seventy, and was probably the lady whom Archbishop Boulter recommended by his letter of the 22d June, 1731, to the Duke of Dorset, as deserving a pension. Of the degraded state of the last Lord Roche, we have been told, that a gentleman, travelling on horseback in the early part of the present century, in the county of Tipperary, fell into the company of another gentleman, with whom he trotted for some miles along the road. Upon reaching the end of an avenue, the latter (a Mr. Croker) invited his fellow-traveller to his house, as it appeared probable that a storm, which had been gathering on the mountains, would burst in the course of a few minutes. The invitation was accepted; they rode up the avenue together, and, to save time, went direct to the stables. A tall, awkward fellow, half-menial half-sportsman in appearance, took their horses when they dismounted, and was addressed, more than once, by Mr. Croker, as 'my Lord.' On reaching the house Mr. Croker's guest inquired the reason, and was told that the stable-boy was an actual lord—Lord Roche, who hung about the place, where he made himself very useful among the dogs and horses and that he lived with the servants in the kitchen, but that his pride of birth would not allow him to receive any wages."

#### MISCELLANEOUS.

*A Catalogue of Books.* Henry G. Bohn, York Street, Covent Garden, 1841.

ONE of the sons of the elder Mr. Bohn, who, as well as his brothers (there being no fewer than three separate Bohn establishments), has succeeded to the business of that long-established and respectable firm; Mr. H. G. Bohn has, in this *Catalogue*, not only shewn how worthy he was to succeed, but outdone all former doings in the same line, and given us a literary curiosity of remarkable character. The volume is the squattest and the fattest we ever saw. It is alderman among books, and not a very tall one; and then, aldermanlike, its inside is so richly stuffed with a multitude of

good things. Why, there is a list of more than 23,000 articles, and the pages reach to 1948!

In a prefatory address Mr. Bohn states that, independently of his own labour, this *Catalogue* has cost him an outlay of upwards of 2000*l.*, and it describes 300,000 volumes; a stock which could hardly be valued at much less than a plum, though the prices are marked generally below the average of the market. It is, indeed, an extraordinary collection for an individual bookseller, and of great utility as a reference to booksellers and bookbuyers of every description. It also possesses a merit in refreshing the memory of students and scholars as to works which they may have overlooked or forgotten when engaged in any particular pursuit; and, altogether, we can truly say that it richly merits the public attention, and ought to ensure the public patronage to its spirited author.

Among the remarkable books of prints (many of them of great rarity and value) is one of unexampled magnificence—a truly royal work. It is the Coronation of George IV., July 19th, 1821, and made up from the works of Sir G. Naylor, and Mr. Whittaker of Westminster. The portraits on satin are unique; and the coronets, glittering with real jewels, have a remarkable effect. The cost is said to amount to several thousand pounds: it is marked at only two hundred and fifty!

*Mrs. Loudon's Ladies' Flower-Garden of Ornamental Bulbous Roots.* Nos. VII., VIII., IX. London, 1840. Smith.

It is three months since we noticed this beautiful work, and now that real flowers have almost entirely departed from us, it is quite refreshing to look upon such a collection of their mimic copies. The sweet scent only is wanting; and that even Hendrie's exquisitely perfumed soaps, oils, and essences, cannot supply. For we cannot throw his otto of roses on the Ixias of Mrs. Loudon, nor his millefleurs on her Morphixias, nor his jasmine on her Hesperanthas, or Melasphæras, or Geissorhizas. We must therefore be content with the fine blossoms as here represented. They are altogether a gay class of flowers, often beautiful in form, and generally rich in colour. Among them we have Spatanthus, Trichonema, Streptanthus, Crocus of various and mingled dyes, Wachendorfia, Hypoxis, Curculigo, Sceptanthus, Cooperia, Operanthus, Sternbergia, Haylockia, Zephyranthus, and Habranthus,—terribly hard and too oft unmeaning names, but a charming parterre, the cultivation of which will afford much gratification to the florist.

#### ORIGINAL CORRESPONDENCE.

##### DESTRUCTION OF THE ANCIENT HÔTEL DE LA TREMOILLE, AT PARIS.

Paris, December 8, 1840.

SIR,—The interest which you have ever shewn in the columns of your valuable Journal for all that concerns objects of art, whether ancient or modern, and the preservation of them, induces me to beg the space of a few lines, in order to make your readers acquainted with a circumstance that will be a subject of lively regret to all lovers of mediæval architecture.

Only three of the numerous Gothic mansions or hotels of the nobility which once adorned Paris have survived the disastrous times of the Revolution of 1792—the Hôtel de Cluny (the well-known residence of M. du Gommereard, and the locality of his invaluable museum); the Hôtel de Sens, now a wagon-office; and the Hôtel de la Tremoille, commonly called the Maison de la Couronne d'Or,

once the residence of a branch of the illustrious family whose name it bears, and since the middle of the last century tenanted by some wealthy silk-mercers and other traders. The two former mansions, and especially the first, are too well known to the antiquarian and architectural world to need any but a passing allusion to their extreme value as monuments of domestic architecture; the former of the fifteenth and sixteenth centuries, the latter of the fifteenth: but the Hôtel de la Tremoille, situated in the Rue des Bourdonnais, behind the church of St. Germain l'Auxerrois, though many British visitors have been to see it, is not commonly known, even to antiquarian travellers. It consists now of only three sides of a court, one of which forms the principal *corps de logis*; and another, being the side towards the street, contains the entrance, archway, &c. The principal part is of the end of the fifteenth century, and some portions are possibly a little later: but the whole is of the richest style of pointed domestic architecture, rivaling the Hôtel de Cluny, or the Hôtel de Bourgtherould at Rouen, and other equally well-known edifices. In one corner of the court is a turret, supported partly by the wall, partly by two exquisitely sculptured torsal shafts of early Italian work, with its whole surface covered with tracery of the most exquisite description. Round the court, and over the windows of the basement story, runs a beautiful piece of panelled gallery-work flat against the wall, but constituting what may be called a band of lace-work in stone; being a series of small compartments, each about two feet square filled with exceedingly rich Flamboyant tracery. The dormer windows, which rose high above the roof, are richly decorated with open battlements; but they have been mutilated, and only their pendants and corbels, sculptured as animals or groups of foliage, remain. The principal staircase is quite intact, and as fresh as if finished only a few years ago. Here, round a central nucleus, the stone steps of extraordinary size are set in for the height of about forty feet; and the nucleus, or central shaft itself, is covered with the most elaborate and intricate tracery up to the height of thirty feet; the design being a continuous series of interlacing arches running into each other all the way round from the top to the bottom. There is nothing of this kind in any other building in this part of France. All the bosses and corbels throughout the building, and there are some dozens of them, are little *chefs-d'œuvre* of the fifteenth century. The gateway to the street is a curious specimen of Italian work of the end of the fifteenth century, the half-classic, half-Gothic ornamentation of its surfaces and its mouldings being of the most highly-finished and beautiful description. The whole edifice is in tolerable repair, and might last for another 200 or 300 years.

Within a few months not a single stone of this venerable hôtel will be standing! The whole has been purchased by a linen-dealer on speculation, and is ordered for demolition as soon as the weather admits! *Some shops are to be erected on its site!*

The Municipal Council of Paris was at one time in treaty with the owner to purchase the edifice, and to make a *mairie* of it for the fourth *arrondissement*; but some of the opposition members, and especially M. Arago, made objections about the price, and the negotiation fell to the ground. The Minister of Public Instruction and the Minister of the Interior have been petitioned by the Comité Historique des Arts et Monuments to interfere, but they have done no-

thing further than to recommend the Municipal Council to buy it. The purchaser of the building, who is going to pull it down, not by *méchanceté*, but in pure ignorance of its worth, and simply with the desire of building a great staring set of Parisian houses seven or eight stories high, is willing to sell the materials; otherwise they will be used in the foundations of the new house, the sculptured parts as well as those that are plain.

My object, Mr. Editor, in troubling you with this detail, is to say that I believe any amateur might purchase all the best parts of the sculpture of this edifice for from 50*l.* to 100*l.*—that they are all of such a size and nature as to be easily detached, and might be transported to England with great ease. If the French are such Vandals as to destroy one of the most precious relics their capital contains, surely some one in England, where we know how to value the works of art of former days, will be glad of the opportunity to rescue the better portion of this interesting mansion from total destruction.

I have only to add, that the Comité Historique, several months ago, directed architects to make exact drawings and measurements of every detail of this building. This has been apparently forgotten to be done: but I had the private satisfaction, last summer, of having done so to a great extent for my own portfolio, and I was able to make nearly eighty admeasured drawings of this building and its sculptured details.

I have the honour to remain, Sir, your obedient Servant, and constant Reader,

H. L. J.

Corresponding Member of the Comité Historique des Arts et Monuments.

#### ARTS AND SCIENCES. GEOLOGICAL SOCIETY.

DECEMBER 2. The Rev. Dr. Buckland, President, in the chair.—The paper by Mr. Lyell, 'On the Geological Evidence of Glaciers in Forfarshire,' begun at the preceding meeting, was resumed and concluded. For several years Mr. Lyell had referred to the agency of ice, the transport of the vast erratic boulders which occur on the tops and sides of the Forfarshire hills, as well as in the valleys; also the want of stratification in the greater portion of the boulder formation, or till; and the contortions of the incoherent beds of gravel and clay resting upon it; and the manner in which he supposed drifting masses of ice produced these effects, he fully explained in a paper on the Norfolk drift (*Literary Gazette*, January 1839). When, however, he endeavoured to apply this theory to numerous facts which he had for years carefully observed in Forfarshire, he found considerable difficulty in accounting for the stratified deposits constantly overlying the unstratified; for the latter ascending to higher levels than the former; for the till often forming mounds which nearly block up the drainage of certain glens and straths, and constituting, with a capping of stratified materials, narrow ridges, which frequently surround lakes, swamps, or peat-mosses; and for the total absence of organic remains in the till. Many of these difficulties, Mr. Lyell states, have, however, been removed by M. Agassiz's application of the glacier theory to Scotland; and he has become convinced, by a re-examination of a considerable portion of Forfarshire, that glaciers not only existed for a long time in the Grampians, but extended into the low country. Nevertheless, there are still many facts connected with ridges of stratified sand and gravel

at various levels which he is unable to explain. Before he enters upon a description of the monuments of extinct glaciers, Mr. Lyell states that, though he had long advocated the theory of drift-ice, and had inferred from the tertiary fossils of Canada, that the cold in North America, in the latitude of Quebec, was formerly far more intense than now, his thoughts had been diverted from every hypothesis assuming a constant covering of snow on the mountains of Scotland, by the conviction that the climate was warmer in Great Britain than it is at present during the several tertiary periods. He is, however, now of opinion that, immediately antecedent to the existing epoch, there may have been great oscillations of climate in the northern hemisphere. The county of Forfar Mr. Lyell divides geologically into three principal districts:—that of the Grampians, formed of granite, gneiss, mica-slate, and clay-slate, flanked by a lower range of old red sandstone associated with trap; that of the Strathmore, composed of old red sandstone; and that of the Sidlaw Hills, constituted of the inferior beds of the same formation, usually accompanied by trap. And he adds, that the district may be considered to represent, on a small scale, both geologically and physically, that part of Switzerland where the phenomena of erratic blocks are most remarkable; for the Grampians, with their crystalline rocks, are comparable to the Alps; the Sidlaw Hills, with their secondary formations, to the Jura; and the Strathmore, to the great valley of Switzerland; and the masses of Grampian rocks in the Strath, and at considerable heights on the Sidlaw Hills, recall to mind the erratic blocks of the Pays de Vaud and the Jura. The detritus, spread over Forfarshire, Mr. Lyell divides into three deposits, presenting distinct characters. 1. The thin covering on the tops and sides of the Grampians, and derived from the disintegration of the subjacent formations, with a slight intermixture of pebbles traceable to rocks not far distant, and at higher levels. 2. The impervious till, and boulders, with other unstratified transported materials, disposed at various heights in the glens and the Strathmore. And, 3. The stratified gravels, sands, and clays, which overlie the unstratified. The accumulations belonging to the second division occur on both sides of every glen, frequently arranged in terraces with a nearly flat top, and sometimes with two taluses, one towards the river, and the other, of less height, towards the mountain: these terraces, or lateral mounds, generally increase in width and depth as they descend from the higher to the lower glens, attaining in the latter sometimes a thickness of 100 feet. In the inferior part they consist of large angular and rounded fragments, imbedded in unstratified mud and sand; the composition of the mass increasing in complexity as the mounds of the lateral glens unite with those of the main glen. In the higher part they are often composed of forty, and even eighty, feet of gravel and sand of the same nature, but stratified. These mounds acquire occasionally, as in the glen of South Esk, so great a volume as to block up the valley, leaving only space for the river to pass. The South Esk springs from a shallow lake, twenty miles from the Strathmore, and nearly 3000 feet above the level of the sea. For the first six miles the river flows through a region of granite or gneiss, and the fragments of rocks derived from it may be traced to Cortachie, a distance of twelve miles; the detritus, also, in this glen, and in all the others, composed of granite and gneiss, preserves, throughout, an

uniform grey colour. On entering, however, the zone of mica-slate, it is invariably tinged red in every glen, and this colour is imparted to the detritus in the lower portions of the glens, notwithstanding the intermixture of the pale brown materials obtained from the clay-slate district. Another proof of the downward course of the transported matter comprising the mounds, is the rare occurrence of fragments of quartz till the glens enter the mica schist region, where thick beds and veins of pure white quartz abound. The chief exception to this descending range is a boulder of conglomerate in the bed of the Proson, and evidently derived from hills two miles to the south, but considerably above the level of the glen. This distribution of the detritus, and its arrangement in mounds along the sides of the glens, Mr. Lyell says, agrees well with the hypothesis of glaciers and their lateral moraines; and is not reconcilable with the theory of submergence, and the subsequent removal by denudation of the central portion of a deposit supposed to have filled the bottom of the glens. The total want of stratification he also urges as a proof that the materials were not deposited from water. The glacier theory is further shewn to offer the only explanation of the phenomena presented by Lochs Brandy and Whorral, situated 1500 feet above the sea, and 600 above the Kirktown of Clova. Loch Brandy is surrounded on three sides by lofty precipices of gneiss; while on the south, it is bounded only by an enormous accumulation of sand, mud, and fragments of rocks, evidently derived from the cliffs which overhang the lake on the east, north, and west. "It is impossible," Mr. Lyell observes, "to conceive how these great masses could have been conveyed over a deep lake; but if it be supposed that the cavity occupied now by water was once filled with a body of ice, it is easy to account for the transport of large boulders from the northern to the southern side of the cavity, and their mode of distribution beyond it." Loch Whorral presents analogous phenomena; and the immense mass of detritus, which extends from its southern side, terminates, in the plain of Clova, in a multitude of hillocks and ridges, resembling in shape some of the terminal moraines of Switzerland. One of the features in the transported materials of the South Esk, formerly regarded by Mr. Lyell as very difficult of solution, is a great barrier at Glenairn, where the valley contracts to scarcely half-a-mile in width, and is flanked by steep mountains. Viewed from below, the barrier resembles an artificial dam 200 feet high, and divided along its summit into hillocks. On the east side it is cut through by the Esk, and its breadth is about half-a-mile. Behind it, is a flat plain, four or five miles long, and a mile and a half broad, through which the Esk meanders: and that it was once covered by a lake is proved by some deep drains, which exposed a succession of horizontal beds of sand, clay, and drift-peat. The lower part of the barrier, thirty feet in depth, laid open in the river cliff, consists of unstratified mud full of boulders; and the upper part, from 50 to 100 feet thick, of gravel and sand, inferred by Mr. Lyell from analogy to be stratified. If this barrier be supposed to be a large terminal moraine, accumulated by a retreating glacier, Mr. Lyell states that its origin is easy to be understood; and that the water produced by the melting of the ice may have overflowed the mound, and furrowed out the softer materials composing the upper part into ridges and hillocks: but he adds, it is difficult to comprehend how a capping of such

materials on the summit of a terminal moraine could have acquired a stratified structure. At Cortachie, four miles below the barrier of Glenairn, the Esk enters the lower country of old red sandstone, and a mile and a half farther down, it is joined by the Proson, and a mile yet lower by the Carity. In the district where these streams unite, there is a great amount of unstratified detritus, full of Grampian boulders, and covered, for the most part, with stratified gravel and sand, in some places from thirty to forty feet thick; and the beds have occasionally been so contorted mechanically, that a vertical shaft might cut through the same stratum three times. As the surface of the subjacent boulder clay has not been similarly affected, Mr. Lyell ascribed these contortions, when he first saw them in 1839, to the lateral pressure of large masses of drift-ice, repeatedly stranding on a shoal of soft materials. In making an excavation about ten years ago near the Proson, curved beds of detritus were exposed, overtopped by others perfectly horizontal. The phenomena exhibited by the till in that district, Mr. Lyell conceives, might be well accounted for by the union of three or four large glaciers; but he considers it difficult to find an explanation for the characters exhibited by the overlying stratified materials, the top of which must be 600 feet above the level of the sea, and facing the Strath. In following out the ridge of gravel between the Proson and the Carity towards Pearsie, during last October, in company with Dr. Buckland, the latter drew the author's attention to a spot recently laid bare, half-a-mile south-west of the house of Pearsie, where the surface of a porphyritic rock was polished, furrowed, and scratched; and the workmen, employed in quarrying in Forfarshire, state, as a general fact, that the surface of hard rocks when first uncovered is smooth, polished, and scored. Another general fact is, that the boulder till becomes gradually more and more impervious to water as it approaches the lower part of the Grampians, not in consequence of the influx of distinct materials, but, in Mr. Lyell's opinion, of the more finely triturated state of the mud, and due, probably, to a prolonged action of the ice. The author then proceeds to describe the phenomena presented by the Strathmore. This district is intersected by many longitudinal ridges, some of which are 200 or 300 feet above the adjacent valleys. They are generally covered with till and erratics, derived partly from the Grampians, and partly from the subjacent old red sandstone; and the covering is so prevalent in Strathmore that the subdivisions of the rocks *in situ* are difficult to trace. This boulder till, or mortar, as it is termed in Forfarshire, forms invariably the lowest part of the transported matter of the Strath. Mr. Blackadder has ascertained that it often fills hollows, which would become lakes or peat-mosses if the till were extracted; and Mr. Lyell observes, that if the cold period came on slowly, the action of the advancing glaciers would have pushed forward vast increasing masses of detritus, and spread them over the Strath, filling up, more or less, the hollows and cavities previously occupied by water. Along most of the river-courses, and in the lowest depressions of Strathmore, the till is covered with stratified sand and gravel. One of the most remarkable peculiarities of the transported detritus of Forfarshire and Perthshire, is a continuous deposit of boulders and pebbles, which may be traced about due west and east, from near Dunkeld to Lunan Bay, passing through the lowest

part of Strathmore, and then persistently through the lowest depressions of the Sidlaw hills, from Forfar to Lunan Bay. No great river, however, now follows this course; but the range of the band of detritus is marked every where by lakes and ponds containing shell-marls, and by swamps and peat-mosses. The lakes are commonly surrounded by ridges of transported matter from fifty to seventy feet high; the upper half consisting of stratified gravel, sand, loam, and clay; and the lower, of unstratified mud and boulders. The lakes and peat-mosses are sometimes oval, sometimes rectangular; and the finest and most numerous examples are in the lower tract, which has the Dean for its southern boundary, and the road from the bridge of Ruthven to the south of the grounds of Lindertis for its northern: but they exist throughout a district extending thirty-four miles in length, and from a mile and a half to three miles in width. The Grampian boulders are similar throughout, and may have all come from the valley of the Tay; and Mr. Blackadder pointed out to the author, that the portions of actinolite schist which abound in the gravel are not found in any other of the valleys connected with the region of marl lochs; but the secondary pebbles vary according to the district occupied by the gravel. Although no river follows the line of these lochs, yet the country is so low, that if the transported matter were removed, a very slight relative change of sea and land would convert the district into an estuary; and Mr. Lyell, therefore, formerly conceived that such a disposition of the surface might have existed, and that masses of ice, loaded with detritus, drifting from the Grampians and contiguous hills, might have deposited the till in quiet water, and that the overlying stratified ridges of sand and gravel might be bars formed progressively in the estuary. This view was confirmed, in Mr. Lyell's opinion, by an examination of the inland ridges of sand and rounded boulders in Sweden, undoubtedly of marine origin. These ridges are from fifty to several hundred yards broad, and from fifty to more than one hundred feet high; and they often extend many leagues in a north and south direction. Where they consist of gravel and sand, they are stratified; but where they are principally composed of rounded boulders, six or eight inches in diameter, there are no marks of stratification. After long search, Mr. Lyell found shells in only one instance, in a bed of marl belonging to a ridge in the suburbs of Upsala, above twelve feet below the top of the ridge, and eighty above the sea. The shells consisted of species most abundant in the Baltic. In his account of these phenomena in a memoir published in the "Philosophical Transactions," he states his belief that the ridges were thrown down at the bottom of the Gulf of Bothnia in lines parallel to the ancient coast, and during the successive rise of the land. Neither in Forfarshire nor in Sweden has Mr. Lyell observed a deposit full of marine shells constituting part of one of the ridges of sand; and he does not remember to have seen in Sweden any east and west, or transverse ridges. The glacier theory, the author observes, appears to offer a happy solution of the phenomena of the marl-loch gravels of Forfarshire, the longitudinal ridges, representing lateral and medial, and the transverse ridges, terminal moraines; and it accounts for the absence of organic remains. It has always appeared to Mr. Blackadder and Mr. Lyell a remarkable fact, that these loch-marl gravels at Forfar rise to a height of nearly 100 feet above the tract

of till which separates them from the valley of South Esk. In the present configuration of the country, water could not throw down the Forfar gravels without extending to the South Esk, the detritus of which is completely distinct, and separated by a low district of till, without gravel; and Mr. Lyell says, that the only method of explaining the phenomena is by supposing either that a glacier occupied the space now formed of till, or that a local change has taken place in the relative levels of land by which the stratified gravel of Forfar was uplifted, or the till northward depressed. Another line of stratified detritus, at a higher range, and about thirteen miles in extent, may be traced from the Loch of Lundie, along the Dichty Water, to the sea at Monyfrith; and there are many others. Mr. Lyell then alludes to the sea-shells of existing species, found to the east and west of Dundee, at heights varying from twenty to forty feet, as the only instance known to him of the occurrence of such remains in stratified clay and gravel; and as affording a proof of a certain amount of upheaval subsequent to the accumulation of the till, not only along the coast, but in the interior. He objects, however, to a general submergence of the country, since the till and erratic blocks were conveyed to their present position, on account of the partial distribution of the stratified gravel. With respect to the age of the superficial detritus of Forfarshire, whether stratified or not, Mr. Lyell says, that though the accumulations contain no marine remains, it may be affirmed that the till and gravel last deposited are of modern origin, because they constitute exclusively the dams of certain marl-lochs; and because all the remains, fresh-water or terrestrial, found in the marl, to the very bottom, belong to existing species; and he consequently infers, that these were the first beings which inhabited the water or neighbouring land, when it assumed its present configuration. The Sidlaw Hills, the highest point of which is 1500 feet above the sea, and the whole country between the Strathmore and the Tay, are overspread with an impervious boulder formation. The erratics, derived from the Grampians, are equal in size to those contained in the till of the glens and Strath, and are associated with fragments of the subjacent grey beds of the old red sandstone. One of the Grampian boulders, which lies within forty feet of the summit of Pitcomb Hill (700 feet above the sea), is a block of mica-slate, thirteen feet long, by seven feet broad, and it is seven feet high above the ground. The nearest point from which it could have been derived is fifteen miles to the north-west. In conclusion, Mr. Lyell observes, that though there are evidences of glaciers having once existed in the principal Highland valleys, and their tributary glens in Forfarshire, and though the Scottish mountains may have been covered with permanent ice, yet that, in consequence of the difference of latitude, Switzerland can present but an imperfect analogy of the state of things in Scotland during the glacier period. It is, he says, "to South Georgia in the fifty-fourth degree of south latitude, to Kerguelen's Land in the fiftieth, or to Sandwich Land in the fiftyninth, that the nearest approach to the supposed condition of Scotland, during the glacial epoch, must be looked for." In those regions the glaciers extend to the sea; and there are no warm valleys into which they can descend and melt; the temperature of summer and winter being also nearly equal. They, therefore, probably remain stationary. In the

Alps, on the contrary, the indefinite accumulation of snow is checked:—1. By evaporation, without melting; 2. By the descent of glaciers in consequence of gravitation, a cause considered by M. Agassiz not very influential; 3. By the descent of glaciers arising from the expansion which accompanies the alternate liquefaction and freezing of water. The last, which is the most powerful source of relief in Switzerland, must, Mr. Lyell states, be comparatively feeble in countries like South Georgia and Sandwich Land; and hence, that the accumulation of ice can be checked only by evaporation and the gravitation of the mass. As the study of the tertiary strata proves that a warm climate certainly preceded the assumed glacier period in the northern hemisphere, and as a milder climate has since prevailed, the author says, there are three distinct phases in the action of the supposed ice:—1. Its gradual coming on; 2. Its continuance in full intensity; and, 3. Its gradual retreat. During the first epoch, Mr. Lyell observes, only the higher mountains would send down glaciers to be melted in the plains, as in Switzerland; and the ice would be in constant motion, the lower boundaries sometimes advancing, sometimes retrograding; but that from century to century it would gradually extend its permanent limits, and would finally reach the sea. During the advance, he says, the terminal moraines would be pushed forward, and forced into the cavities previously occupied by lakes. While the second phase continued, he conceives, the snow accumulated to vast thicknesses, filling up the glens and plains, and leaving bare only the peaks and precipices of the loftier mountains; and that from these points the fragments were detached and progressively, but almost imperceptibly, conveyed, which are now found at great distances from the parent rock, and at high levels. To the third epoch, or that during which the snows and glaciers gradually disappeared, he assigns the deposition of the erratic blocks on the hills and in the plains, and the production of the terminal remains, or the existing transverse mounds, as well as the accumulation of the bodies of water from the melting of the ice, which have, in various localities, overflowed and modified the outline of the stratified detritus.—A paper 'On the Evidence of Glaciers in the North of England,' by Dr. Buckland, was also read, but we must defer our notice of it till next week.

#### BOTANICAL SOCIETY.

FRIDAY, 4th December. Mr. J. Reynolds in the chair.—Presented by Mr. Schomburgk the seed of *Victoria Regina*, the first brought to this country.—Exhibited specimens of the mosses, *Phascum Floribundum* (Schwarz), new to Britain, discovered by Mr. Bowman on the coast of Durham; and *Tortula enervis*, collected at Dalkeith by Mr. Starks.—Read a paper, in continuation, by Mr. Arthur Wallis, 'On the Flora of Essex,' comprising the natural order *Cruciferae*. Also a paper by Mr. D. Cooper, 'On Vegetable Wax;' it also contained a few remarks on vegetable tallow and oils. The junction of the wax in the form of the bloom on fruit, flowers, and leaves, was, however, the principal subject of this interesting communication. This finely delicate covering is uniformly supplied, more or less (though not always distinctly), to every fleshy fruit: it is visible in the cucumber, vegetable marrow, plum, grapes, &c. Its power to repel moisture counteracts the law established by Dutrochet, and termed Endomose, and prevents what would otherwise of necessity occur—the burst-

ing of the fruit. Glaucous plants have their leaves furnished with a waxy surface to obstruct absorption. Flowers inhabiting humid places are provided with this protection; for instance, on the bell-flower, the crown imperial, and others, the surface of the corolla will be found but lightly covered with wax, and in which, if water be applied, no direct contact appears to take place. In no part of the plant, however, Mr. Cooper observed, is the existence of a waxy secretion more manifest, and more beautifully and admirably adapted, than in the pollen: of which waxy covering were it devoid, it would probably rupture when exposed to the weather before its appointed time (by the engorgement of its coats from the principle of Endomose), even before the final perfection of the pollen grains. The whole subject was clearly treated.

#### SOCIETY OF ARTS.

ON Tuesday evening the second illustration took place: it was 'On the Crania of Different Nations,' by Mr. Deville. This illustration partook considerably of the character of a phrenological lecture. It was well explained by reference to numerous fine casts of heads from nearly all parts of the world. The execution of these casts was so superior, and time having shed its mellowing influence over them, that it was impossible, without minute examination, to detect them from natural skulls. Several of the latter were likewise exhibited: among these was the skull of Sir John Carr, Cromwell's minister—fine and quite intellectual. Among the casts were those of King Robert the Bruce and Edward the Second.

#### PARIS LETTER.

Academy of Sciences, Dec. 1, 1840.

SITTING of November 30.—M. Duvernoy read a paper, drawn up by himself and M. Lereboullet, 'On the Respiratory Organs of Isopodal Crustacea.' It appeared, from the result of examinations, made on a very extensive scale, that these organs were all of the same nature in animals of this class; that is to say, that they respire by means of branchiæ, like all aquatic animals (except the whale, &c.). The apparatus when in its most complete development consisted of two series of five pairs of laminae, or plates, attached symmetrically on the first five rings of the abdomen. Each pair of laminae has a pedicel, by the medium of which it is attached to the corresponding inferior segment of the abdomen. One of the two laminae is covered or internal, the other covers it, or is external, and in some cases is harder than the other, to which it acts as a kind of cover, or operculum. The interior lamina is much thinner in some instances, and contains blood-vessels; these again are sometimes replaced by one large vessel, containing the blood required for the purposes of respiration. Other external appendices to the abdominal segments exist in some cases, and add to the protection of these laminae.—M. Poncelet read a report on several communications from M. Passot, concerning the movement of gaseous and other fluids in cylindrical vessels, moving round vertical axes, and furnished on their circumferences with orifices for the evacuation or introduction of the fluids. The report, while it admitted the existence of many new facts as applicable to machinery, from M. Passot's experiments, stated that he had not sufficiently taken into account certain disturbing causes, and, therefore, that his experiments must be considered incomplete. It seemed that he had not considered the effects

of the liquids themselves receiving a rotatory motion from that of the cylinder.

M. Boucherie's Experiments on Dyeing and Preserving Wood.—A special commission of the Academy presented a long report on this gentleman's interesting experiments, for causing timber and living trees to imbibe pyroligneous and other chemical substances. We have had to mention many of the results of them on a former occasion; but we may add a few which were mentioned to the Academy, and are of some little interest. It appeared that after the wood, living or dead, had been made to absorb pyrolignite of iron, if a tanning matter were made to be absorbed by it, there would be a kind of dye produced in the interior, which imparted a blueish or grey tint. If pyrolignite of iron were first absorbed and then prussiate of potash, the wood became dyed of a beautiful Prussian blue. By introducing successively into the wood acetate of lead and chromate of potash, a yellow chromate of lead was formed, and dyed the wood a brilliant yellow. In the same way, by first causing the pyrolignite of iron to be absorbed, and then, by varying the proportions and the nature of the substances to be afterwards taken up, all sorts of tints and graduated colours might be produced. The application of the simple pyrolignite of iron had been found of great value at Bordeaux for the casks of wine-merchants, which had thereby been preserved sound for a great number of years. It was remarked, that the facility of producing pyrolignite of iron was no small recommendation in favour of the system; since in any forest where charcoal is made, there is only a mixture of old iron to be made with the charcoal to produce it: and this substance was found, besides, to contain creosote, a powerful preventive against all ravages of insects. M. Millet, of Aubenton, had put in claims to priority of discovery; but the committee had gone carefully into this part of the question, and decided that M. Boucherie had all the merit of having been the originator.

The Académie Française, at its last sitting, solemnly admitted M. Flourens to the chair, formerly filled by Mechaud, the historian of the Crusades: and the biographical eulogium of that eminent and amiable man formed the subject of M. Flourens' inaugural discourse.

M. Isabe, the great marine painter, has left Paris for Cherbourg, to be present at the setting out of the funeral flotilla with the remains of Napoleon, and to make a picture of the scene for next year's *salon* at the Louvre.—M. Granger, an historical painter of some note, died in Paris a few days ago.—Professor Rotteck, of Friburg, the great legist and historian, died there on the 26th of November.

M. Martin de Los Heros has been appointed Director of the Royal Library of Madrid.

The sale of the books of the Count de Bontourlin has been going on for more than a fortnight, at Silvestre's rooms; and the prices fetched have been reasonable. The collection was peculiarly rich in Aldine classics, and in early specimens of French and German typography.

#### LITERARY AND LEARNED.

##### UNIVERSITY INTELLIGENCE.

OXFORD, December 3.—The following degrees were conferred:—

*Masters of Arts*.—Rev. J. H. Sharwood, St. Edmund Hall; Rev. H. S. Eyre, Christ Church; Rev. C. Nevilson, Scholar of Wadham College; Rev. R. W. M. Neffield, University College; J. G. Lonsdale, Fellow, Rev. F. P. Seymour, Balliol College.

*Bachelors of Arts*.—J. W. Radcliffe, R. Ormsby, Exhibitioner, Lincoln College; G. D'Oyly Snow, St. Mary

Hall : R. Congreve, Scholar, W. S. Newman, W. G. Holmes, E. Reynolds, Wadham College; C. Sumner, Balliol College; J. Hannah, Scholar of Corpus Christi College; V. H. Hobart, Scholar of Trinity College.

#### ROYAL ASIATIC SOCIETY.

DECEMBER 5.—Professor H. H. Wilson in the chair.—George Smith, and George Francis Travers, Esq., were elected resident members.—The Secretary read a report by Captain Jacob, of the Bombay army, 'On the Iron Mines worked in Kattywar, in the Southern Part of the Peninsula of Gujerat.' There are six foundries usually at work in the province, and occasionally two or three more. The mines are merely circular holes, dug to the depth of from five to twenty feet, and excavated as far as can be reached by pickaxe and shovel. The ore is then sifted and washed, and sent to the foundry, either in carts, or on bullocks and donkeys. The smelting process is nearly as simple as that of excavation: long and narrow furnaces of brickwork, protected by a mere shed, receive the ore with the charcoal employed as fuel. The air is supplied by two pairs of bellows, formed by sewing buffalo hides on bamboo hoops. These bellows are pressed alternately by the chest and arms of the workmen; and a strong blast is sent through a pipe which enters the furnace at a hole closed round with clay. So powerful an action is effected by these rude means, that within ten minutes after its commencement, the Captain saw the scoria begin to exude. When the mass is taken out, it is carried to a second furnace, where it is again heated, split into equal portions by a wedge, and wrought into bars by hammering. The whole quantity thus manufactured in the province, Captain Jacob estimated at less than 150 tons annually; and to produce this, the workmen toil from morning till night with great industry and perseverance, which the superior skill and machinery of England are, unhappily for these poor people, rendering every year less available to procure a subsistence; the cheapness of European iron obtaining for it a preference over the native, even in the immediate site of its production. Captain Jacob found, from the information supplied by the workmen, that the produce of a foundry, while the wind was easterly, was greater than when the wind blew from the west, in the proportion of seven to five. This he accounted for in some manner by the very great dryness of the east wind; while that from the west is moist. The superintendent of the foundry, however, was of opinion that it might be attributed to climate. He said that metals were like men; one wind and climate agreed better with one, and another with another. He said, also, that more iron was made in cold than in hot weather; but this he accounted for in a more intelligible manner, in supposing the difference to arise from the greater strength of the men in cold weather. But Captain Jacob observes, that the east wind blows almost constantly during the cold weather, which would confirm his first opinion,—though, as he admits, scarcely to the degree of difference observed. The paper concludes, with the expression of an opinion, that the manufacture of the country, from the competition of foreign metal, runs a considerable risk of extirpation at no distant period.—The Director exhibited to the meeting a facsimile of an inscription on a copper-plate of the fifth and sixth centuries of the Christian era; and read an account of it, which, with a translation, was sent by Ball Shastree, a native of India. The original belongs to a person resident in the Northern Konkan, and has

been in the possession of his family from time immemorial. It merely records the grant of a village to certain devotees, but is interesting from the names of the rulers given in the introductory portion; and from the resemblance of its alphabet to that of the Allahabad pillar, deciphered by the lamented James Prinsep. The plate bears no date; but it records that the grant was made by *Nagavardhana*, nephew of *Pulakesi*, of the Chalukya dynasty, who, from an inscription quoted by Mr. Elliot in a paper in Vol. IV. of the Society's "Journal," was reigning A.D. 490. Its phraseology is in remarkable conformity with one given by Mr. Elliot in the same paper, and relating to the same *Pulakesi*, who is identified with the *Pulakesi* of the present inscription by the name of his horse, *Kantha Chetra*, given in both. The elegance and simplicity of the language of this inscription determines that it was written before the period when the taste of the Hindus was vitiated, and they became admirers of laboured rhymes, childish plays on words, and highly-wrought metaphors. Three additional names of the *Chalukya* kings are brought to light by this inscription; those of *Kirtvasma*, *Jaya Sinha*, and *Nagavardhana*, the father, the younger brother, and the nephew of *Pulakesi*.

#### ECLECTIC SOCIETY.

At a meeting held on Tuesday, Mr. W. W. Thwaites in the chair, the minutes of the last meeting were read and confirmed.—It was resolved unanimously, "That the committee established at the last meeting for carrying into execution Mr. Beale's plan of extending relief to the natives of the South Seas be designated the 'Polynesian Medical Relief Committee.' That the medical mission shall be under the local management of a president, who shall reside at New Zealand; and that three principals, with each two assistants, shall reside respectively at Friendly Islands, the Society Islands, and at the Marquesas. The mission to be composed of scientific young men, who, in addition to their medical duties, shall make observations in all the branches of science, and collect natural and artificial curiosities for the supply of a museum at home. The better to accomplish which objects the committee is to put itself into communication with the various learned societies, and cause the medical officers to receive instructions from them for carrying out their respective views. That Mr. Beale's paper be forthwith printed and distributed to the various societies in London, and to such persons as are likely to promote its beneficial objects."

#### LITERARY AND SCIENTIFIC MEETINGS FOR THE ENSUING WEEK.

*Monday*.—Statistical, 8 P.M.; British Architects, 8 P.M.; Medical, 8 P.M.  
*Tuesday*.—Linnean, 8 P.M.; Electrical, 8 P.M.; Architectural, 8 P.M.  
*Wednesday*.—Society of Arts, 7½ P.M.; Geological, 8½ P.M.  
*Thursday*.—Royal, 8½ P.M.; Antiquaries, 8 P.M.  
*Friday*.—Botanical, 8 P.M.  
*Saturday*.—Westminster Medical, 8 P.M.; Mathematical, 8 P.M.

#### FINE ARTS.

##### VALUABLE IMPROVEMENT IN DAGUERRÉOTYPE.

To the Editor of the Literary Gazette.

SIR,—Having been engaged for some time past in investigating the different means of preparing the plates for the action of light in photographic delineations of daguerréotype, in the hopes of being able to render them more sensitive, the result of my experiments

has been the valuable discovery, that when the bromide of iodine is used instead of the simple iodine, this very desirable object is attained in a most extraordinary degree. So delicately sensitive are the plates, when properly prepared, that the faintest lights act upon them; even on the dull, cloudy days of November, with a London atmosphere, if not too foggy, and there is sufficient light to produce a picture, it will, by a few minutes' exposure, be delineated. I have not had an opportunity of experimenting with bright solar light since I made the discovery; but from the experience I have had in the old process during the last summer, I have no doubt that with a clear summer sun in London the effects will be almost instantaneous. With the light of the ordinary gas a picture of a plaster bust may be obtained in three or four minutes.

I remain, Sir, yours, &c.

JOHN F. GODDARD.

Late Lecturer on Optics, &c. &c., at the Royal Adelaide Gallery.

#### GRAPHIC SOCIETY.

THE ninth session of this most agreeable conversation began on Wednesday evening last, and was well attended; numerous drawings and prints were laid before the visitors. Among the latter two novelties appeared—one, a proof of an electrotyping copperplate, taken from a large line engraving by Burnet, after Allan's picture of John Knox admonishing Mary, queen of Scots, and another from the original plate; it was impossible to detect any difference in the impressions from the plates. We are not among the anticipators of any valuable results to the art of engraving from this discovery; the repetition of old and worn plates would be worthless, and of new unnecessary in copper, since the adoption and use of engraved steel-plates. The other novelty was a new art just discovered and patented by Mr. Hullmandel, and called by him *Lithotint*; three specimens of it were exhibited, drawn by Mr. Harding, and they furnished abundant evidence of the great power of the new art over the best lithography, by the ordinary process of drawing on the stone with prepared chalk; they were evidently washed in, and shewed extraordinary capability in the means employed, though much may be due alone, in these examples, to Mr. Harding's acknowledged power with the brush.

#### THE GRANGER SOCIETY.

THE first meeting of the Council of this Society for the publication of ancient portraits and family pictures, was held on Thursday week, when, in the absence of the noble President, the Marquess of Salisbury, the chair was taken by W. R. Hamilton, Esq.; and it was decided, that the engraving of "Philip and Mary," from a picture by Sir Antonio More, should be delivered to the members in January; and that the fine whole-length of Sir Thomas Meautys, the faithful friend and secretary of Lord Bacon, should be immediately placed in the hands of the engraver. We may add, for the information of gentlemen interested in the subject, that the subscription to the Society is one guinea per annum.

#### THE DRAMA.

*Haymarket*.—On Tuesday, after many untoward accidents to retard it, Sir E. L. Bulwer's play of *Money* was produced at this theatre with a cast and in a style that did great credit to the theatre. In the bills it is called

an "Original Comedy," and we see and hear various opinions upon this appellation as applied to this production. "A rose by any other name would smell as sweet;" and of all the absurdities that we know, it is one of the foremost to attach an especial meaning to a name, and, as it were the bed of Procrustes, stretch all manner of analogous configurations to its four posts, length and ticking. The unities of tragedy have been laughed to scorn by the genius of England; and it is full time that we should like and acknowledge an excellent drama, though it may want some of the requisites of the critical definition of comedy. In truth, the strength of Sir E. Bulwer's play is not in plot—it is meagre; nor in actual and consequential circumstances, for there are some errors and improbabilities. The former consists entirely of a man being loved and courted, and the reverse, as the belief in his wealth or poverty prevails; and in one woman preferring him for himself, though he is convinced of the reverse; and in another whose preference is grounded on self-interest, being erroneously supposed to be guided by the most generous sentiments. Of course the *éclaircissement* sets all to rights. Of the latter, we shall only notice the improbability of a will being read without its important codicils, and what we think a mistake that ought to be rectified, viz. *Graves's* acquainting *Clara* that *Evelyn* had invented the bequest to her of 20,000*l.*, the knowledge of which fact quite destroys the grace of her conduct in returning a moiety of the sum to him when she fancies he is ruined. (Page 136 of the published play\* ought, in our judgment, to be omitted.) But the genuine power of this performance belongs to an ancient, recognised, and high order of the comic. The power of seizing the characters and manners of the age, and holding the mirror up to society; and that, too, after it has so long been asserted that the progress of civilisation had destroyed the materials for such a purpose. Sir Edward Bulwer has shewn us, on the contrary, that life is yet full of varieties, sufficiently marked for the most effective uses of the drama,—that there are men, distinct from the surrounding herd, whose individualities are admirably fit for the stage,—and that there are scenes in the commonest streets through which we daily walk, as amusing and rich as were offered to Congreve, or Farquhar, or any of the elder dramatists, before the social system was macadamised into a rather general level. His figures stand out well from the mass. *Dudley, alias Deadly Smooth* (Wrench), the cool, calculating gambler, who, when asked, "Can you keep a secret?" happily replies, "I have kept myself," is one instance; *Graves* (Webster), ever lamenting his lost shrew of a wife, and betrayed into laughable extravagances by his very griefs, winding up the whole by the witty hit, as he goes off with the widow (Mrs. Glover), "Sainted Maria! thank Heaven you are spared this affliction!" is another. *Stout* (D. Rees), a radical M.P., all for the enlightenment of the nation, is a third original and striking part. In *Sir John Vesey* (Strickland), also, there are several traits of much originality; and *Sir Frederick Blount* (Lacy), a fashionable coxcomb, is nearly as good. *Lord Rossmore* (Vining), as an aristocratic contrast to *Stout*, is well imagined; and the principal character, that of *Evelyn* (Macready), extremely forcible, both in the feeling, and apparently reckless and bitterly satirical situations in which he speaks and acts. There is, further, a dash of romance in this piece which removes it from the class of ordinary comedy; and the

\* Saunders and Otley, 8vo. pp. 136.

whole is rather a vivid panorama of existing life, than a concentrated effort to develop an insulated section. A better acting, or better acted, play has not been brought out in our time, and we remember *John Bull*. It often, by its sparkling allusions, recalled the *School for Scandal* to our minds, and the drop-scene certainly fell upon every act amid bursts of applause to the skill displayed in the construction of these pauses, giving each a scenic effect and interest which could not be improved. Before we conclude, we must mention Miss H. Faucit and Miss P. Horton, who, together with Mrs. Glover (looking the impersonation of *Thalia*), sustained the female characters with great talent; the one grave and sentimental, the other light and careless. We have already said, that the acting throughout was admirable, and it will not be deemed invidious if we especially designate Mr. D. Rees as having done much for *Stout*. It is the first original cast we have seen him in, and he has risen by it much in our estimation. Of the others, whose talents are familiar to the public, Macready's *Evelyn* claims our unqualified eulogy; bold, tender, and masculine, with a biting humour not far away from that of Pelham, in "The Adventures of a Gentleman."\* Webster's *Graves* and Wrench's *Smooth* had also fine opportunities, and they were capitally seized. The mysterious and significant hums and hahs of the latter were superb. We ought not to forget an old fellow in green spectacles at Crocky's; he caused much laughter. Need we add that *Money* is repeated every night to crowded houses; and will be money indeed to the manager, who has placed it before us in so liberal and unexceptionable a manner? *Bob Short* affords Wrench and Miss P. Horton a very farcical chance, and they make the most of it.

*Covent Garden*.—Here a lively little piece has been produced, called *Brother Ben*, and smartly sustained by a merry trio,—Bartley, Harley, and C. Mathews. It is a welcome interlude, performed with infinite spirit, and consequently quite successful.

*Adelphi*.—At the *Adelphi* an extravaganza, or burlesque, of the *Midas* order, has been added to the laughing stock.

*Prince's Theatre*.—This experiment has failed, and the theatre is shut. Our readers will have been prepared for such an event by the very concise way in which we spoke of the performances. And now—*de mortuis nil*—

#### VARIETIES.

*The Gannal Process*.—We beg leave to point to an advertisement in our columns to-day, relating to an interesting proof about to be made of this remarkable process, upon which we offered some remarks in the *Literary Gazette* several months ago. It is of much importance to science and humanity, and well deserves the attention of the public.

*Shakspeare Relic*.—At the late Baron Bolland's sale of books at Evans's, the first edition of Shakspeare's "Rape of Lucrece," printed in London, 1594, by Richard Field, for John Harris, was purchased by Mr. Henry Hering of Newman Street for 100 guineas. From the extreme rarity of this poem it is considered by many of the most celebrated collectors to be worth a still higher price. Only four other copies are known, of which two are in the Bodleian Library.

Professor Charles Lotlock, author of the

\* The volume, by the by, just published of Bulwer's collected works, and with a preface of great literary interest.

"General History of the World," died lately in Baden, at an advanced age.

Edmonton.

CHARLES HENRY ADAMS.

November Meteors.—We insert the subjoined remarkable notice of these meteors, with thanks to our correspondent.

"Dec. 7, 1840.

"Sir,—In reading a work entitled 'Journal d'un Dérégulé,' by M. le Comte de Barbé-Marbois, Pair de France, I have made the following extract from his Journal, which may interest some of your readers.

"Cayenne, 21st Brumaire, An. VII. (12th Nov. 1799.)

"This morning the negroes told us that, during the night, the heavens had appeared on fire towards the north.—This is the report of the hospital surgeon, a well-informed man, who had observed this phenomenon:—'About two o'clock in the morning, lights, as of fire, shone suddenly above us. These lights resembled stars, and traversed the firmament in all directions. These meteors seemed to set the heavens on fire, particularly towards the north. There were moments of such brilliancy that they could only be compared to the finest effects of the most splendid fireworks. This phenomenon lasted nearly an hour and a half. The atmosphere was pure and cloudless; there was no wind, no rain.'

#### TO CORRESPONDENTS.

Mr. Archer's letter did not reach us till after the matters to which it refers were past and gone.

We will endeavour to ascertain what "K" inquires of us.

Undertaker.

## SCOTTISH (WIDOWS' FUND) LIFE ASSURANCE, founded on the original Basis of THE LONDON EQUITABLE.

THIS IS THE OLDEST AND MOST EXTENSIVE  
LIFE OFFICE IN SCOTLAND.  
Instituted A.D. 1815.

Accumulated Fund, £  
NINE HUNDRED AND SEVENTY THOUSAND POUNDS.  
Annual Revenue,  
ONE HUNDRED AND SEVENTY THOUSAND POUNDS.  
Whole Profits belong to the Assured.

The Additions made by way of Bonus to the Policies of this Office vary from Ten per cent to upwards of Sixty per cent on the Capital Sums assured, according to the duration of the Policy.

Parties desirous of insuring are reminded of the advantages which will arise to such as are affected within the current year, the Regulations of the Society requiring that, before additions can become absolutely vested, the Policies entitled thereto must have been in endurance at least five full and complete years. This condition, which forms part of the system of most of the Mutual Insurance Societies, will, of course, be satisfied at the next periodical investigation, on 31st December, 1845, in regard to all Policies opened within the year 1840.

Tabular View of the Amount of Additions, Retrospective or Vested, and Contingent Premium, declared at 1st January, 1839.

Year of Entry	Sum Assured.	Total Benefit with Vested Additions at 1st Jan. 1839.	Sum Payable if decess takes place after Payment of the Premium due in 1845.
1815	£1000	£1357 4 6	£1809 8 7
1820	1000	1245 4 0	1533 10 7
1825	1000	1235 14 0	1496 1 2
1830	1000	1174 4 0	1348 11 9
1835	1000	1090 0 0	1231 4 0

Every information may be readily obtained on application to the Manager in Edinburgh, or to any of the Society's Agents throughout the country. Parties wishing to effect Assurances so as best to meet any particular contingency, or effect any specific object, will receive the requisite information, and have the suitable Form of Proposal transmitted to them; and all official communications of this nature are considered strictly confidential.

Annual Premium payable during Life for an Assurance of £100.

London: Printed for Thomas Tegg, Cheapside.

## THE MISSES MOSS'S NEW WORK.

In 3 vols. post 8vo.

## THE ROMANCE of JEWISH HISTORY.

By the MISSES MOSS.

Dedicated to Sir E. L. Bulwer, Bart.

"We find in this work the most gorgeous imagery and the most elevated sentiments. It contains tales of wonderful excitement, which strongly remind the reader, if not in matter, certainly in manner, of Sir Walter Scott. That the authorities will resume the inexhaustible subject that they have thus opened to the world we may safely predict; and as we gather from their preface that they are themselves of the singular race of the Hebrews, considering their high talents, it cannot be in better hands: conscious of their superior abilities, their position must be exciting."—*Metropolitan.*

Nearly Five Hundred Copies of this work have already been delivered to the Public.

Saunders and Otley, Publishers, Conduit Street.

Digitized by Google

**MR. MURRAY** has just published the following New Works and New Editions:—  
**Hallam's Literary History of Europe,**  
In the 15th, 16th, and 17th Centuries.  
4 vols. 8vo. 5s.

**Ranke's History of the Popes of Rome.**  
3 vols. 8vo. 36s.

**Milman's History of Christianity.**  
3 vols. 8vo. 36s.

**Lord Mahon's History of England.**  
2d edition, 3 vols. 8vo. 36s.

**Memoirs of Sir Samuel Romilly.**  
2d edition, 3 vols. 8vo. 36s.

**The Chatham Correspondence.**  
4 vols. 8vo. 18s. each.

**Milman's Poetical Works.**  
3 vols. fcap 8vo. 18s.

**Hope's Essay on Architecture.**  
3d edition, 3 vols. royal 8vo. 2l.

**Church Principles considered in their Results.**  
By W. E. Gladstone, M.P. 8vo. 12s.

**Milman's Edition of Gibbon's Rome.**  
12 vols. 8vo. 9s. each.

**The Court of Spain under Charles II.**  
By Lord Mahon. 8vo. 5s. 6d.

**Bishop Heber's Parish Sermons.**  
4th edition, 2 vols. post 8vo. 16s.

**Bunyan's Pilgrim's Progress.**  
With Life, by Southey. 2d edition, post 8vo. 10s. 6d.

**Lyell's Principles of Geology.**  
6th edition, 3 vols. 12mo. 24s.

**Somerville on the Physical Sciences.**  
5th edition, fcap 8vo. 10s. 6d.

**Abercrombie on the Intellectual Powers.**  
10th edition, post 8vo. 8s. 6d.

**NEW MEDICAL AND SURGICAL WORKS,**  
Printed for Longman, Orme, and Co.

**ELEMENTS of MATERIA MEDICA;**  
comprehending the Natural History, Preparation, Properties, Composition, Effects, and Uses of Medicines. Part I. contains the General Action and the Medication of Medicines, and the Mineral Materia Medica. Part II. contains the Vegetable and Animal Materia Medica. By JON. PEREIRA, F.R.S. &c. 2 vols. 8vo. numerous Wood Engravings, 40s.  
\*\*\* Part II. may be had separately, price 24s.

**HUMAN PHYSIOLOGY:** with which is incorporated much of the elementary part of the "Institutiones Physiologicae" of J. M. Humenbach, Professor in the University of Göttingen. By JOHN ELLIOTSON, M.D. Cantab. F.R.S. 5th Edition, complete in 1 thick vol. 8vo. of upwards of 1800 pages, with numerous Woodcuts, price 3s. 2s. cl.

**THE ELEMENTS of SURGERY.** By ROBERT LISTON, Surgeon to the North London Hospital. New Edition, almost entirely re-written, in a very thick vol. 8vo. with upwards of 150 Woodcuts, and 2 Copperplates, 25s.

**PRACTICAL and SURGICAL ANATOMY.** By W. J. ERASMUS WILSON, Teacher of Practical and Surgical Anatomy and Physiology. 1 vol. 12mo. with 50 Engravings on Wood by Hagg, 10s. 6d. cloth lettered.

**MEDICAL NOTES and REFLECTIONS.** By HENRY HOLLAND, M.D. F.R.S. &c. and Physician Extraordinary to the Queen. 2d Edition, 8vo. 12s. cloth.

**THE KNIGHTAGE of GREAT BRITAIN and IRELAND.**

"It is strange, passing strange, that our little bugle-horn should be the first to muster the Knighthood of England, although England boasts a body of chivalrie, as ancient as enduring, and as heroic as any in the world beside. The banner of St. George is as young to-day as it was five hundred years ago, and floats as triumphantly upon the battlements of Acre in 1840 as it did on the field of Cressay in 1266. Bolder, gallant or gentle, join in our fondest aspirations—our most fervent prayer, that it may be as brave and as buoyant a thousand years to come."  
K. Churton, 28 Hollis Street.

**THE FORTRESS; an Historical Tale of the Channel Islands.**

"It possesses power, talent, and very much originality, in its pages."  
—*Globe*.

"These volumes are calculated to give to the Channel Islands yet additional interest in the eye of the traveller, of the student of history, and of the reader of fiction."  
—*Naval and Military Gazette*.

"A most faithful portrayal of the usages, manners, and even languages, of days gone by."  
—*Court Journal*.

"This work is every way worthy of encouragement."  
—*Self's Weekly Messenger*.

"The whole story is got up in a manner worthy of Walter Scott."  
—*Age*.

"Possesses the merit of being able to delineate original character."  
—*Morning Herald*.

Bull, Hollis Street, Cavendish Square.

**MR. BENTLEY'S NEW PUBLICATIONS,** now ready.

**THE NEW ROMANCE,**  
By the Author of "The Pilot," "The Pathfinder," &c.  
**Mercedes of Castile;**  
A Romance of the Days of Columbus.  
By J. Fenimore Cooper, Esq.  
In 3 vols. post 8vo.

**The Life, Journals, and Correspondence, of Samuel Pepys, Esq. F.R.S.**  
Secretary to the Admiralty in the Reigns of Charles II. and James II.  
Including a Narrative of his Voyage to Tangier, and Journal of his Residence there, &c.  
The whole now first published from the Originals.  
In 3 vols. 8vo. with a Portrait from an Original Picture.  
"This work contains an abundance of historical and literary matter to reward the reader for the careful perusal. Few good librarians will not covet the immediate possession of it. Pepys's Journal of his Residence at Tangier contains many curious and interesting anecdotes; and the letters of Evelyn to him will be read with great gratification by all the literary world."  
—*Literary Gazette*.

**Elphinstone; a Novel.**  
In 3 vols. post 8vo.  
"This work will be read with universal interest. It is the production of one who has within him all the elements of good writing, and who possesses, moreover, the power to turn them to the best possible account. All his descriptions are natural, and his dialogue easy and dramatic."  
—*Morning Herald*.

**The Comic English Grammar.**  
By the Author of "The Comic Latin Grammar."  
In post 8vo. with upwards of Fifty characteristic Illustrations by Leech.

**Mr. Bentley's Collective Edition of the Letters of Horace Walpole**  
(Earl of Oxford),

Complete in Six vols. 8vo. handsomely bound, and embellished with numerous fine Portraits engraved from original Pictures, and containing nearly Three Hundred Letters, now first published from the Originals.

\*\*\* Any Volume may be obtained separately, to complete Sets.  
"As a book of reference, this edition of 'Walpole's Letters' must henceforth take its place among the memoirs and histories of the time. As a book of gossip, it is, perhaps, the completest of the kind in the English language."  
—*Times*.

New Works preparing for immediate publication:—

**MEMOIRS of THE Right Hon. Warren Hastings,**  
Late Governor-General of India.  
Including his Journals and Letters, now first published from the Originals in possession of the Family.  
By the Rev. G. R. Gleig.  
Author of "The Life of Sir Thomas Munro," "Traditions of Chelsea College," &c.  
In 3 vols. demy 8vo. with a Portrait from an original Picture.

**Tippoo Sultan; a Historical Romance.**  
By Captain Meadows Taylor,  
Of the Service of his Highness the Nizam, Author of "Confessions of a Thug."  
In 3 vols. post 8vo.

**THE NEW VOLUME of THE STANDARD NOVELS**  
will comprise  
Mrs. Gore's celebrated Romance,  
**The Soldier of Lyons;**  
Or, the Tuilleries.  
Richard Bentley, New Burlington Street,  
Publisher in Ordinary to Her Majesty.

2d edition, in fcap 8vo. price 6s.

**THE PHYSICAL THEORY of**

**ANOTHER LIFE.**  
By the Author of "Natural History of Enthusiasm."  
William Pickering, Publisher, Chancery Lane.

**A VALUABLE CHRISTMAS PRESENT!**

**FLETCHER'S FAMILY DEVOTION,**  
(the 20th edition of 1000 each). Containing the morning and evening service of a family for every day throughout the year. Embellished with a Portrait of the Author, and Fifteen elegant Engravings. Bound in cloth, gilt edges, price 1s. 6s. Also, a splendid Edition, in royal 4to., price 2s.

This Work is strongly recommended by the following Ministers:—

London: George Virtue, 25 Ivy Lane, and all Booksellers.

**MR. COLBURN** has just published the following NEW WORKS:—

**LETTERS ILLUSTRATIVE of THE Court and Times of William III.**  
Addressed to the Duke of Shrewsbury.  
By James Vernon, Esq. Secretary of State.  
Edited, with Introduction and Notes, by G. P. R. James, Esq.  
3 vols. 8vo. with Portraits.

**The Third Volume of Lady Blessington's Idler in Italy.**  
Completing the Work.

**The Comic Miscellanies of the late James Smith, Esq.**

One of the Authors of "Rejected Addresses." With a Selection from his Correspondence, and a Memoir of his Life.

By his Brother, Horace Smith, Esq.  
3d edition, with Additions, 2 vols. post 8vo. with Portrait, 21s. bound.

"One of the most amusing books that have seen the light since the famous 'Rejected Addresses' themselves."  
—*Globe*.

**IV. Legendary Tales of the Highlands.**  
By Sir Thomas Dick Lauder, Bart.  
3 vols. with numerous Engravings by Philz.

"Nothing since the days of Scott has been written on Highland scenery, customs, character, and superstitions, which can be at all compared to these volumes for truth and effect."  
—*Weekly Chronicle*.

Also, just ready,

**Peter Priggins, the College Scout.**  
Edited by Theodore Hook, Esq.  
3 vols. with numerous Illustrations by Philz.

**VI. The Naval Surgeon.**  
By the Author of "Cavendish," "The Flying Dutchman," &c.  
3 vols.  
Henry Colburn, Publisher, 13 Great Marlborough Street.

**EDUCATION of THE PEOPLE.**  
Price 1s. or 1s. 6d. free by post.

**REPORTS of the HOUSE of COMMONS**

on the Education and the Health of the Poorer Classes in large Towns, with some Suggestions for Improvements.

By ROBERT A. SLANEY, M.P.  
Chairman of both Committees.

London: Charles Knight and Co. 22 Ludgate Street; Longman and Co. Paternoster Row; and Hatchard and Son, Piccadilly.

(Uniform with the Bridgewater Treatises), price 10s. 6d. cloth, lettered.

**THE CERTAINITIES of GEOLOGY.**

By SIDNEY GIBSON, Esq. F.G.S.

The design of this Work is to defend the validity of the inferences deduced from Geological Discoveries; to maintain the importance of the science; and more especially to enforce its peculiar claims on account of the decisive testimonies of the Fossil World to the arguments for Design in Creation.

Smith, Elder, and Co. 65 Cornhill.

In small 8vo. with a Map, price 6s. 6d. in boards, the 5th edition of

**A MEMOIR of FELIX NEFF, Pastor of the High Alps; and of his Labours among the French Protestants of Dauphiné, a Remnant of the Primitive Christians of Gaul.**

By W. R. GILLY, D.D.  
Prebendary of Durham, and Vicar of Northam.  
Rivingtons, St. Paul's Churchyard, and Waterloo Place.

In 4 large vols. 8vo. price 37. 3s. in boards,

**ECCLESIASTICAL BIOGRAPHY; or, Lives of Eminent Men connected with the History of Religion in England; from the Commencement of the Reformation to the Revolution.** Selected and illustrated with Notes.

By the Rev. CHRISTOPHER WORDSWORTH, D.D.  
Master of Trinity College, Cambridge; and Rector of Buxton with Uckfield, Sussex.

3d edition, with a large Introduction, some new Lives, and many additional Notes. Printed uniformly with the "Christian Institutes," by the same Editor.

Rivingtons, St. Paul's Churchyard, and Waterloo Place.

**NEW VOLUME of SERMONS, BY Rev. J. H. NEWMAN.**  
In 8vo. price 10s. 6d. boards.

**PAROCHIAL SERMONS**  
for the WINTER QUARTER; being the Weeks between Advent Sunday and Lent. (Volume the Fifth.)

By JOHN HENRY NEWMAN, B.D.  
Vicar of St. Mary the Virgin, Oxford; and Fellow of Oriel College.

J. G., F., and J. Rivington, St. Paul's Churchyard, and Waterloo Place; and J. H. Parker, Oxford.

\*\*\* Lately published, new editions of Vols. I. to IV. each 10s. 6d.

**REV. DR. JAMES'S NEW WORK.**

In 12mo. price 12s. in cloth and lettered, or 18s. bound neatly in morocco, dedicated, by permission, to His Royal Highness Prince Albert.

**PROPER LESSONS to be Read at Morning and Evening Prayer, on the Sundays and other Holy-days throughout the Year.** With a short Practical Commentary, and Explanatory Notes.

By JOHN JAMES, D.D.  
Prebendary of Peterborough, and Author of "A Comment upon the Collects," and "Christian Watchfulness."

Rivingtons, St. Paul's Churchyard, and Waterloo Place.

Price 1s.

**THE PARLOUR TABLE-BOOK.**

Written and selected  
By R. A. WILLMOTT, Esq.  
Author of "Lives of the English Poets."  
"A more valuable present to the world has not been made for many years, and we from our hearts wish that it may find a welcome to every parlour-table in the empire."—*The Age*.  
"The work is one of the most meritorious of its kind, the taste displayed in selection being admirable. The pieces written by Mr. Willmott all bear marks of a richly cultivated mind. Its exterior is almost as elegant as its contents."—*Britannia*.  
Joseph Rickerby, Sherborne Lane, King William Street, City; and to be had, by order, of all Booksellers.

2 vols. 8vo. cloth lettered, price 1l. 1s.  
**LITERARY LEAVES; or, Prose and Verse.**

By D. L. RICHARDSON.  
Second edition, greatly enlarged, with additional Essays and Verse.  
"A collection of elegant and pleasing essays, published at Calcutta."—*Note to a quotation from "Literary Leaves," in Butler's "Alice."*  
"I have read the volume, I can say, with true pleasure. It is written, as few volumes in these days are, with fidelity, with successful care, with insight and conviction as to matter, with clearness and grateful precision as to manner; in a word, it is the impress of a mind gifted with an eye to see, and a heart to understand; a welcome, altogether recommendable, book."—*Thomas Carlyle*.  
London: Wm. H. Allen and Co. 7 Leadenhall Street.

Whittaker and Co. Ave Maria Lane.

Now ready at all the Libraries, in 3 vols. 18mo.  
**THE NEW ROMANCE of MILITARY LIFE.**

**THE CONSPIRATORS.**

By CAPTAIN QUILLINAN.  
"This highly exciting work is not one story, novel, or romance, but a series of stories having this single link of union, that they all present some phase of that Philadelphia conspiracy which existed against Napoleon in the ranks of the French army; and made him grow pale and tremble in the very zenith of his power. In the first story, the Philadelphia brother is a French colonel; and a strange mixture of the sentimentalist, the sensualist, the ruffian, and the hero, is Auguste Champelonde. The story in which he figures, 'The Sisters of the Douro,' is, in our judgment, the most exciting story of the day. We never laid down the volume until we had completed its perusal. The scene of the next story entitled 'The Royalist,' is laid in Switzerland. Hoffer, the Tyrolean patriot, is introduced, and the national peculiarities of the people of these mountain regions are excessively well portrayed. The third story, 'The Man without a Name,' is rather an historical sketch of the Philadelphia conspiracy than a tale; but it will be read with deep interest. It is full of curious, and to a majority of English readers, we suspect novel, information. We recommend 'The Conspirators' as the most agreeable series of tales that have appeared this season."—*Connoisseur*.  
Henry Colburn, Publisher, 13 Great Marlborough Street.

Conduit Street, December 12, 1840.

### REVIEWS OF NEW BOOKS.

*Poems.* By the Lady Flora Hastings. Edited by her Sister. 8vo. pp. 282. Edinburgh, 1841. Blackwood and Co.

A GREAT change has come over the spirit of our literature during the last twenty years; and in no department more than in that of poetry. We allude not here to the varieties of imaginative composition, but to the altered position in society of the great mass of the devotees of verse. Burns was enough to turn the heads of a whole generation to be sure, and he did so; and, from the Milkmaid of Bristol, and Robert Bloomfield in England, down to Tannahill and Willison Glass in Scotland, weavers wore couplets with their cloth, and cobblers hammered shoes to the rhyme of some popular stanza. *Tempora mutantur.* Thanks to Sir Walter Scott and Lord Byron, a mighty revolution has taken place in the republic of letters. The reins of Pegasus have been rescued from the hands of the *profanum vulgus*; and for a person of quality, nowadays, not to be able to say that he or she is guilty of some dear, sweet, little poem in one of the *Annals*, dedicated to morocco, gold leaf, and engravings, would be as sad a pulling down as black-balling at the Carlton to a gentleman, or banishment from Almack's to a lady.

The amusement is an honourable and an innocent one; but the truth must out for all that. *Poeta nascitur non fit*; numbers will not constitute excellence; and a score of rhymesters make not one true bard. Byron and Elliot come from the extreme quarters of society to meet each other on the brow of Parnassus; but what the "Verses, by a Person of Quality," were in the days of Pope, they are now, and will continue to be till the death of Omegarius, the last descendant of Adam.

As *lucus a non lucendo*, these remarks suggest themselves by the appearance of the volume before us. Lady Flora Hastings writes not like a person of quality. She has set aside all conventional forms and terms, "to look on nature with a poet's eye." With a fine eye and ear for the external world, her compositions evince an intellect cultivated by the study of the best models; and, had she been spared to literature, and been made to feel, by public approbation, a greater confidence in the powers which she assuredly possessed, it is not difficult to say to what degree of excellence it was within her reach to attain. As it has been,—*cheu! cheu!*

It would appear from the preface to these poems, written by the Lady Sophia Hastings, that the idea of publication had more than once suggested itself to her sister's mind, more especially as Lady Flora had been repeatedly urged by friends to give her writings to the world; but this step had been postponed from time to time, principally from the author's timidity and want of confidence in her own powers. She had at length, however, resolved upon the task, and also upon the time to perform it. This was when she should reach home—a time which Providence had decreed was never to come for her! These poems have now been given to the public by the pious care

of Lady Sophia, who, acting on this intention, as also on some death-bed instructions, has felt naturally proud to be able to rear such a monument to her sister's literary reputation.

The arrangement of the poems appears to be chronological, although this plan has not been rigidly adhered to; and the earlier specimens given are on this account certainly much inferior to what we find in the latter parts of the volume. It is with great propriety, nevertheless, that these are preserved; they exhibit the tone of thought peculiar in early life to the author; they shew on what models her compositions were formed; and from them we learn what particularities of style and diction she was subsequently led to discard or adopt.

The earliest specimens here given are from a tragedy meant to be entitled "Fiesco," and which were written when about fourteen. With abundance of juvenile faults, these fragments shew an occasional vigour somewhat remarkable, and the design itself was certainly a sufficiently bold one. Although one or two of the scenes are said to have been written at a later period, it is not known which. The following apostrophe to Genoa, although requiring condensation, is full of feeling and descriptive beauty:—

"My peerless Genoa! my Ocean Queen!  
Land of my earliest and my fondest love!  
Oh, it is bliss, after long wanderings past,  
After long years of travail and of pain,  
To tread again thy soil, to hail thy skies,  
To feel that thy maternal arms enfold me!  
That earth, air, sky, and sea—all, all is Genoa!  
Could but the spirit of my younger days  
Return with me—that welling spring of gladness  
Which water'd all the arid scenes of life,  
And made the desert bloom a paradise—  
That fragrant incense which, unseen, and known  
But by the bliss it scatter'd, gave the breeze  
A fre-her odour, and dispensed around  
A charm to the whole atmosphere. Alas!  
The radiance of life outlives not youth;  
The visionary bias in which I moved  
Has pass'd away, and even my loved Genoa  
Is but the phantom of her former self.  
A sad, a dim reality surrounds me;  
Still in her port proudly the galleys throng,  
Their white sails gleaming in the sunny ray,  
And their broad pennants dancing on the breeze;  
Still o'er her blue wave flits, before the wind,  
Her mimic fleet of butterfly-wing'd boats;  
Still rise her palaces as fair, or fairer  
Than when I view'd them last; and, on the hills,  
Her dazzling villas, with their terraced gardens,  
From granite columns, o'er the trellis'd walks,  
There hangs the vine, bending beneath its load;  
The roses bloom as brightly, and the gale,  
Lovesick, bears on its mingling store of riches,—  
Odours from flowers that sigh themselves away,  
Melting in sweetness—voices that, afar,  
Or join the busy haunt of social men,  
Or pour the chanted prayer and swelling hymn.  
The distant tolling of the convent bell,  
The nearer tinkling of the gay guitar,—  
All to my heart speak of my early days.  
The Alps as loftily their crested heads  
Raise in the distance, as when last I view'd them,  
Though many a lapsing year hath intervened;  
All is the same: I only—I am changed!"

The following stanzas, although in a style very different, were written at an almost equally early age, and are embued with a fine religious feeling. Even before this time she had made some translations from the Latin:—

#### "Thank-Offering."

In every place, in every hour,  
Whate'er my wayward lot may be;  
In joy or grief, in sun or shower,  
Father and Lord! I turn to Thee.  
Thee, when the incense-breathing flowers  
Pour forth the worship of the spring,

With the glad tenants of the bowers  
My trembling accents strive to sing.  
Thee, when upon the frozen strand  
Winter, begirt with storms, descends;  
Thee, Lord! I hail, whose gracious hand  
O'er all a guardian care extends.

Thee, when the golden harvests yield  
Their treasures to increase our store;  
Thee, when through ether's gloomy field  
The lightnings flash, the thunders roar.

Thee, when athwart the azure sky  
Thy starry hosts their mazes lead,  
And when Thou sheddest from on high  
Thy dewdrops on the flowery mead.

Thee, when my cup of bliss o'erflows—  
Thee, when my heart's best joys are fled;  
Thee, when my breast exulting glows—  
Thee, while I bend beside the dead.

Alike in joy and in distress,  
Oh! let me trace thy hand Divine;  
Righteous in chast'ning, prompt to bless,  
Still, Father! may Thy will be mine."

Having thus impd her poetical wings, our young aspirant meditated a composition in the Spenserian stanza, which is of higher aim and enterprise than any of her preceding attempts. The subject, however, "The Dying Sybil," is not a peculiarly happy one; and from the metaphysical way in which it is sketched is necessarily deficient in those salient points which give poetical interest. Although some of the stanzas are fine in themselves and indicate no common mastery over the measure in which they are composed, we prefer giving an extract from a poem in heroic verse which follows it, and is entitled "A Vision of the Sun." Is not the following picture of daybreak full of spirit and beauty?—

"Borne on the summer zephyr's balmy sigh,  
My spirit seeks the regions of the sky;  
For silent night she quits the twilight grey,  
And dim through space directs her doubtful way.  
Hark! 'midst the gloom, what voice melodious floats?  
From what blest sphere are breathed those airy notes?  
What dawning rays the drear abyss illumine?  
What day-spring brightens the chaotic gloom?  
She knows the beam—aspires with bolder flight,  
The Sun refulgent bursts upon her sight!  
World of the happy! she attains thy shore—  
Earth is forgotten, chaos is no more!  
Bright as when starting from primeval sleep,  
To run his course exulting through the deep;  
Young as when first, at the Supreme decree,  
He rose from nothing,—glorious, pure, and free,—  
To hymn his Maker's praise, and bid his ray  
Direct, and cheer, and rule the new-born day—  
First-born of light, eye of the starry frame,  
The Sun appears, the unsullied world of flame!  
Around the shores a golden ocean flows,  
With liquid fire the circling ether glows,  
High spread, the woods outstretch their giant shade,  
And emerald beauty carpets every glade,  
While whispering breezes through the bloomy bowers,  
Shed mingling odours from undying flowers."

Take, reader, another glimpse of nature as portrayed by the same pen. Poets numberless from the days of Noah have hymned "the rainbow." But even after Campbell's exquisite stanzas we can read the following:—

"Soft glowing in uncertain birth  
'Twixt Nature's smiles and tears,  
The Bow, O Lord! which Thou hast bent,  
Bright in the cloud appears.  
The portal of thy dwelling-place  
That pure arch seems to be,  
And, as I bless its mystic light,  
My spirit turns to Thee.

Thus, gleaming o'er a guilty world,  
We hail the ray of love:—  
Thus dawns upon the contrite soul  
Thy Mercy from above;  
And as Thy faithful promise speaks  
Repentant sin forgiven,  
In humble hope we bless the beam  
That points the way to Heaven."

Throughout the volume we have a variety of beautiful stanzas adapted to music. In this department of composition Lady Flora seems to have been eminently calculated to excel. Her mind was one of exquisite sensibility, and her ear was adapted to the softest and finest tones of harmony. In evidence of our opinion, we quote the three following little lyrics; and we would feel puzzled where to look for better. It should be remembered, that although Burns, Scott, and Moore, have succeeded in this field, names equally eminent have signally failed.

*"Maltese Evening Song."*

When the day and all its labours,  
All its hopes and fears, are o'er—  
Dearest land!  
Then I think upon the waters  
Dashing on thy rugged shore.  
Ah! the rocks those waves encircle  
I may never gaze on more—  
Dearest land! dearest land!  
Fare-thee-well!

When I hear the voice of even  
Whispering through the leafy trees—  
Dearest land!  
Then I think how soft the zephyrs  
Sporting o'er thy gemlike seas—  
Far from thee, from spring I wander,  
Ne'er again to hail that breeze—  
Dearest land! dearest land!  
Fare-thee-well!

When the shades of night descending,  
Spread still silence o'er the plain—  
Dearest land!  
Then I think how oft I listen'd  
To the wildly breathing strain—  
Still from voice to voice repeated,  
Better to swell for me again—  
Dearest land! dearest land!  
Fare-thee-well!

Dearest island! Ocean's treasure!  
Darling of the lonely sea!  
Dearest land!  
Bright thy shores, and fresh thy breezes,  
Fragrant may thy blossoms be!  
Still thine evening strains breathe wildly,  
Though, alas! unheard by me—  
Dearest land! dearest land!  
Fare-thee-well!"

"I call'd on the hopes of the years that are past  
To return to my spirit and glad me again;  
And a low voice replied, in the moan of the blast,  
'Canst thou call back the faded, or waken the slain?'"

Sound they sleep, they wake no more;  
Calm they rest, their toil is o'er.  
Deep, deep, deep, their bed is made  
'Neath the dark, dim yew-tree shade.  
Can they come, the hopes of yore?

I saw the green leaves of the summer grow sere,  
I have seen the bright day-star sink quench'd in the wave.

The dark days of Cambria's winter are near,  
For Cambria's best warriors are cold in the grave.

Sound they sleep, they wake no more;  
Calm they rest, their toil is o'er.  
Deep, deep, deep, their bed is made  
'Neath the dark, dim yew-tree shade.  
They are gone, the loved of yore!"

"I do not ask a brighter lot  
Than this—that through the day  
I still may wander by thy side,  
And cheer thee on thy way.  
I do not nurse a fonder hope  
Than this—that I may see,  
When thou art shedding smiles around,  
One kind glance fall on me.  
I do not breathe a wilder wish  
Than this—unseen, unknown,  
To linger near thee while thou sing'st,  
And catch each liquid tone.  
I frame no more aspiring prayer  
Than this—still unreprieved  
To breathe the air which thou dost breathe,  
And rove where thou hast roved.  
And when my weary course is run,  
And the green sod shroudeth me,  
Lady, I ask no elogy  
Save one brief sigh from thee!"

Equally fine are "The Fairy King," "I Think of Thee," "King Death," "The Norwegian National Song," and the stanzas entitled, "When First I met Thee."

Did our limits permit, we would gladly extract more from this volume, which is the reflected picture of a mind at once pious, pure,

amiable, and accomplished. Its accomplishment may be seen there in translations from the German, more especially in Schiller's "Lay of the Bell," from the Latin, from the French, and from the Italian; its amiability, from the general tone of philanthropy pervading every sentiment; its purity, from the Elysian sweetness of its pictures of fancy; and its piety, from many a high and holy strain which has evidently flowed from its deepest recesses. We must now have done; not, however, without wishing an extended popularity to this volume, and the more especially as, whatever profits may be derived from it, are destined to aid in the erection of a chapel or school in the parish of Loudoun, to be dedicated to the memory of the excellent and deeply injured Lady Flora Hastings.

A word as to the typography. It would be an injustice to the Ballantynes to lay aside this book without at least saying that a fairer one never issued from the Edinburgh press.

The last verses of Lady Flora Hastings were written in May 1839, shortly before her melancholy departure from among us. There is a dirgelike tone, even in their versification, which is sufficiently striking:—

"Break not by heedless word the spell  
With which that strain hath bound me;  
For the bright thoughts of former years  
Are thronging fast around me.  
Voices long hush'd are heard again,  
Smiles that have pass'd away  
Beam on my memory, as once  
They bless'd mine early day.  
Hopes that have melted into air,  
And sorrows that have slept—  
And bending from the spirits' land,  
The loved—the lost—the wept.  
My very heart is young again,  
As in the days of yore;  
I feel that I could trust—alas!  
As I may trust no more!"

*The Idler in Italy.* By the Countess of Blessington. Vol. III. 8vo. pp. 372. London, 1840. Colburn.

UNDER the unassuming title of the *Idler*, we are gratified with another volume of these pleasing sketches of modern, and recollections of ancient, Italy; its historical and family legends, its literary and pictorial glories, its strange events and remarkable characters, its remains, its *fuimus*. Throughout the work is graceful and natural, without effort or pretence, and displaying the intelligence of a cultivated mind, and a fine and right feeling (to borrow an epithet from itself) of a "woman's heart." With so slight a preface, we beg to introduce it to our readers; and conduct them at once to page 176, where, speaking of Lady Mary Wortley Montagu at Venice, &c. Lady Blessington says:—

"But here am I, after the lapse of a century, entering into a piece of gossip and forgotten scandal with all the honest indignation which a recent injury inflicted on some female friend would excite. But I never can help regarding those whose writings have charmed me—as friends." And this genuine sentiment streams through every part of the volume where the memories of Dante, Tasso, Ariosto, are conjured up, or where the yet more recent memories of Dodwell, Gell, Byron, are brought before us.

In the course of her travel, our author visits Rome, Ravenna, Padua, Verona, Vicenza, Milan, Ferrara, Bologna, Venice, and other places less familiar to tourists; and from all extracts some honey for her collected hive. We hardly know into which cells to dip for our illustrations and to justify our praise; but we can hardly go amiss, and begin with the notice

of her ladyship's departure from Rome, as being further recommended by literary anecdote:—

"Some one remarked on the pain of parting being always enhanced by the dread of never again meeting, when Mr. Dodwell, willing to give a more lively turn to the conversation, observed that the meeting of friends long separated was, perhaps, as much to be feared. 'They will be all so changed in looks,' said he, 'as to render recognition painful, if not difficult. The old will have fallen into dotage, the mature into senility, and the young will have lost the charms of youth, their dimples having undergone the fearful metamorphosis of being converted into wrinkles. But grant that the meeting should occur before the persons of the parties should have undergone any injurious alteration, who can answer for the changes that may take place in their minds?' continued he: 'Different scenes, pursuits, and trains of thought, new associations supplying the place of old attachments, the impossibility of recalling the feelings to the precise state in which they were, when daily habits of intimacy rendered the persons not only so agreeable, but almost necessary, to each other. Ah! here's the rub; and this certainty of change produced by time occasions a meeting after long absence to be rather more painful than pleasant. You ladies would exclaim,—'Poor dear Lady So-and-so, or Mrs. Such-a-one, how dreadfully changed she is!'—the lady making the remark being quite unconscious that she is as much changed as the friend on whose altered looks she comments. We men, too, would say,—'I used to think B. C. or D. a good-looking fellow, and very agreeable; but he is grown stout, and rather red-faced, and bores one to death about his health, and his schemes for amending it. Hang the fellow! he treats every man he ever chanced to know before, as if they were contemporaries.'" We all laughed at Mr. Dodwell's picture of the pains of meeting, but it did not diminish those of parting."

At Terni the narrative proceeds:—

"I visited the grave of Sir W. Drummond very early yesterday morning. A blue and cloudless sky canopied the spot, and the air was as fresh and balmy, and the scene as bright, as if no graves were there to remind one of the brief space allotted to us on earth. There stood the pyramid of Caius Sextus, the sunbeams gleaming on its massive walls, whose funeral character seems to consecrate this place of graves, where so many of our countrymen have found a last resting-place. There, too, I cast my eyes on the narrow homes of Shelley and Keats; Drummond, himself a poet, would not have disliked the neighbourhood, for he loved and revered genius, whether crowned by praise or persecuted by intolerance. Sir W. Gell and Count Paul Esterhazy came to see us depart; and never did the Palazzo Negroni present such sad faces as those assembled there when the heavily laden carriages drove round to the door. Poor Gell! I still seem to feel the pressure of his hand, and the tears that bedewed mine as he pressed it to his lips, and murmured his fears that we should meet no more. 'You have been visiting our friend Drummond's grave to-day,' said he, 'and if you ever come to Italy again, you will find me in mine.' I was tempted to be angry with our courier when I saw his smiling face, and heard the gay cracking of his whip as we drove away. He, in the excitement of resuming his wonted occupation, after a winter's repose, had little sympathy with our regrets, and probably anticipated with pleasurable emotions the *buona*

mana he may count on receiving at every inn where we stop for many days to come."

As a specimen of the general observations we copy the following at Ancona:—

"During our walk on the mole we encountered several pretty women, and were struck with a peculiarity generally observable in Italians, namely, the total absence of that coquetry, so visible in women with pretensions to beauty in France, and even in England. Italian women look as if deep passions would find them ready to obey their dictates, but that to the minor ones, such as vanity and coquetry, they were not disposed to yield. This peculiarity equally pervades women of all classes in Italy; for I have observed it in those of the highest rank as well as in the lowest. It is this concentration of passion which in the middle ages led the softer sex into the commission of crimes from which the heart of woman naturally recoils, originating incidents that fill the old chronicles with tales of horror. In our more civilised days, a similar disposition exhibits itself in attachments which, if not always blameless, are generally of long duration, and exclude the flirtations commenced through vanity, and continued through folly, so frequently witnessed in other countries. I have seen Italian women known to have attachments, the publicity of which in France or England would have called forth the severest censure, if not exclusion from society, absolutely shocked at beholding the flirtations of ladies of both these nations, though free from actual guilt, or even the thought of it. When the innocence of such flirtations has been explained to the Italians, they were not less shocked, and they have said:— 'What, then, can be the motive that induces these ladies to permit such marked attentions in public, and to receive them with such complacency, if no real attachment exists?' The motive assigned, namely, vanity, prompting the desire of exciting admiration, and the wish for its continuance leading to an apparent preference for the adulator, they could not understand, because vanity has so little influence over them."

For a pendant bearing upon the difference of manners we must go to Venice, where we read:—

"The house in which the celebrated Lady Mary Wortley Montagu resided at Venice was pointed out to me to-day. Her celebrity was neither defined nor understood here, until more recent years wasted her fame from England. The Venetians could not comprehend that her friendship with Algarotti was merely platonic, and tortured two or three letters of hers addressed to him into proofs that it was of a more tender and culpable nature. Not having seen these epistles, I cannot judge how far they justify the Venetian scandal, which, like that of all other places, may have been built on very slight or erroneous grounds. My conviction is, that Lady Mary Wortley Montagu's preference for Algarotti was a very innocent and natural one; springing out of the sympathy with which persons of superior minds and acquirements are drawn towards each other, and more especially at a time, and in a country, where such endowments as they possessed were not often to be met with in the classes in which both these remarkable individuals moved. To illustrate the assertion, of on what slight or erroneous grounds scandalous reports may be based, I know an Italian gentleman who, having received a note of invitation from an English lady of irreproachable morals, concluding

in the usual way, 'Truly yours,' took it to a friend, to whom he expressed his regret and embarrassment at having unwillingly and unintentionally achieved the conquest of Lady —'s heart. 'Impossible,' said the friend; 'why, Lady — is one of the most reserved and correct women in England.' 'Here is, however, the proof of my assertion,' replied the Italian, drawing forth a merely civil invitation to dinner, and exhibiting it with an air of triumph, 'What say you now? you cannot, surely, doubt her hand?' The friend could not resist laughing as he essayed to convince him that the letter was couched in the ordinary style of invitations. 'But look at this,' answered the Italian, pointing to the words 'truly yours'; 'What can be more tender, or less dubious? does she not assure me that she is truly mine?' and, though not more vain than the generality of mankind, his friend had much difficulty in convincing him that the prudent and reserved Lady — had not, in thus concluding her letter, made him an avowal."

Having thus got *per saltum* to the Silent City, we will venture to extract one further illustration of Lady Blessington's volume from her tasteful account of it, though we can only spare room for small portions:—

"The silence of Venice constitutes, in my opinion, one of its greatest charms. This absence of noise is peculiarly soothing to the mind, and disposes it to contemplation. I looked out from my balcony last night, when the grand canal reflected a thousand brilliant stars on its water, turbid though it be; and the lights streaming from the windows on each side, shewed like golden columns on its bosom. Gondola after gondola glided along, from some of which soft music stole on the ear, and sometimes their open windows revealed some youthful couple with their guitars, or some more matured ones partaking their light repast of fruit and cakes; while not unfrequently a solitary male figure was seen reclined on the seat, absorbed in the perusal of some book. The scene realised some of the descriptions of Venice read years ago; and except that the gondolas were small in number, and the lights from the houses few and far between, I could have fancied that no change had occurred since the descriptions I referred to were written. The morning light reveals the melancholy alteration; and as I stood on the same balcony to-day, and saw the muddy canal with a few straggling gondolas gliding over it, the defaced and mutilated palaces, and the reduced population, all brought out into distinctness by the bright beams of the sun, I could hardly believe it was the same scene that looked so well last night. Moonlight is a great beautifier, and especially of all that has been touched by the finger of decay, from a palace to—a woman. It softens what is harsh, renders fairer what is fair, and disposes the mind to a tender melancholy in harmony with all around."

Though the days are occupied with sight-seeing, an occupation which every where else had served to exhilarate my spirits, I feel a depression here that I cannot dispel; induced, I am persuaded, by the melancholy state of decay into which every object that meets my gaze is fast falling. In another century, little, if any, trace of the once proud Venice will remain, and our descendants will be disposed to doubt the details of its grandeur transmitted to them; not having, like us, beheld, even in its decadence, enough to prove what it must have been in its pristine state. There is something peculiarly saddening to the mind in witnessing the ravages of decay. We are never so forcibly

reminded of the instability of life, as when we see ruin and desolation spreading their dreary empire over scenes once remarkable for their riches and grandeur; and we invest inanimate objects undergoing this inevitable fate, with a large portion of that sympathy experienced for human beings exposed to it. I could no more be gay at Venice than I could smile over the death-bed of some poor creature retaining still enough of beauty to render my regret more acute."

The sea seems to encroach, by slow but sure degrees, on Venice. I remarked this to-day to our gondolier, who answered, 'No, signora; on the contrary, it is Venice that will at last sink into its arms, for the bride and bridegroom have both lost by their unnatural divorce. Ah, signora! time was when the Adriatic was wedded by our doge, and the nuptials were celebrated with all due pomp; but now, the wife, like many other wives, has forsaken her lord because he is in poverty. 'Tis the way of the world, signora;' and the man smiled at his own wit, though in a sort that indicated little real gaiety. I observe that the Venetian *cicerone* and gondoliers often refer to the past prosperity of Venice, and always in a tone that shews a knowledge of its history, and a pride of its ancient splendour not to be expected from persons of that class. There is something very touching in this sensibility, and it harmonises well with the character of the place, where so many objects remind one of past glory and present decay."

After describing other scenes:—

"Many customs and usages existed at Venice in former days, originating in less agreeable events than the one just recorded; and offering proofs of no ordinary degree of coarseness of mind in those who furnished them. Among these, the doge took part in a ludicrous ceremony which used to be enacted on the Giovedi Grasso, in La Sala del Piovego of the ducal palace. Scenery was arranged in that vast hall, representing the castles of those of the Lords of Friuli who had taken part with the Patriarch of Aquileia in his aggressions against the Venetians. The doge and his council vigorously attacked these pasteboard castles with clubs until scarcely a vestige of them remained, and then they retired victoriously to witness the still more absurd and barbarous exhibition that followed. A bull and twelve large pigs were furnished annually on the Giovedi Grasso, by the Patriarch of Aquileia, to Venice. This present was exacted as a sort of ransom for the liberty of the Patriarch, when taken prisoner by the Venetian fleet at the head of his churchmen. He was bearing away the spoil they had obtained forcible possession of at Grado, during the absence of the Venetians; who had gone to repel the attacks of Frederick Barbarossa, and who unexpectedly returned in time to recover the plunder. The extraordinary demand of a bull and twelve pigs was made with the intention of throwing contempt and ridicule on the Patriarch, who was supposed to be represented by the bull, as was his chapter by the pigs. These animals were marched slowly through the principal streets at Venice, amid jests and boisterous laughter, and were then slaughtered in presence of the doge, who ordered their remains to be distributed among the people."

Such, and so various, are the touches with which the *Idler* has so charmingly and instructively studded these pages; and, leaving all the remarks respecting Lord Byron to satisfy the curiosity of the public in their original site, we reluctantly bid adieu to our gentle

task by quoting a few lines from the sojourn at Parma:—

"Silent, gloomy, and deserted, Parma seems to offer a striking picture of the altered fortunes of its mistress. There still hangs around it the semblance of grandeur, but it is grandeur 'fallen from its high estate:' and on beholding its empty streets and decaying buildings, one cannot refrain from pitying her who was once empress of the gayest and most brilliant capital in the world, for being condemned to reside here, and support the mimic form of regal splendour shorn of all its dignity. The fate of Napoleon, chained Prometheus-like on his ocean rock, had a sublimity in it: but she who shared his throne, whose brow was encircled by a diadem, before which the proudest monarchs bowed, to be reduced to hold her state in this poor town. Oh! it is pitiful! and Maria Louisa must have less pride or more philosophy than falls to the share of most of her sex, to be enabled to support it with such equanimity. We went over the ducal palace to-day, which has nothing regal about it; and no greater number of apartments than generally appertain to the residence of a private individual. Its appearance is mean and commonplace, divested of dignity or good taste. The furniture is like that of a *Fermier-Général de France*, after long use, rich, tasteless, and faded. The carriage of Lord and Lady Burghersh was at the entrance, and the *custode* who shewed us over the apartments reverted with no little complacency to the fact, that 'the ambassador *Inglese*, and the niece of the great Wellington, were then sitting with Maria Louisa!' In a lumber-room was shewn us the toilette presented to the Empress of France, and the cradle given to the King of Rome, by the city of Paris! As ill did this mean and vulgar apartment seem fitted to enshrine these costly gifts, the wrecks of an empire unparalleled in history, as did the palace itself to be the residence of her who has been mistress of France! There was the subject of a whole epic poem, and more touching than most of such productions are, in the contemplation of these trophies of the former state of Maria Louisa. There was the toilette meant to adorn the person of her whom all France delighted to honour. Once lodged in a gilded chamber of the Thuilleries, with proud and titled dames surrounding it to deck their royal mistress, now, neglected and covered with dust, it was put aside in a lumber-room, and exhibited by a *custode*, who was little conscious that, by this venal display of it, he elicited observations far from favourable to its owner. And there stood the cradle given by the capital of France to him whose birth was hailed with such universal rejoicings;—the child whose coming into the world was looked upon as the security of that dynasty doomed so soon afterwards to be overthrown. That rich and gorgeous cradle in which slumbered, unconscious of the fate which awaited him, that fair boy over whose pillow Napoleon has bent in rapture, forgetting the fierceness of the warrior in the all-absorbing tenderness of the father,—there it stood tarnished and dimmed, to be scrutinised by strangers for the payment of a few francs! If the fallen empress, to gratify curiosity, or to enrich her menial, could allow the gift made to her in her palmy days to be thus exhibited, surely the heart of the mother ought to have protected from desecration the infant couch of her son; and over which the great, the wondrous, and the once fallen father of that ill-starred child had often stooped to impress the kiss of melting affection on the fair cheek of his sleeping oberub! Ought not this

cradle to have been placed in some chamber sacred to the memory of that father whose heart yearned with such tenderness towards the wife and child he knew he should never see again?—that husband whose lips never uttered a reproach at the desertion of her who, having shared his splendour, could leave him when fortune forsook his banners, to pine a prisoner on a desolate rock, without even a line to soothe his grief, or to tell that he was still remembered? I turned from these neglected trophies of departed glory with no increased respect for her who, having allowed them to be offered for sale, and finding no purchaser, now permits them to be shewn to all who desire to behold such mementos of the mutability of fortune, and to moralise on the fallen greatness of one whose name will ever remind posterity of the most signal example of mortal instability. Not greater the ascent than the downfall!"

And we are this day reading the details of Napoleon's gorgeous funeral!!!

*An Essay on the Impediments to Knowledge created by Logomachy; or, the Abuse of Words.* By the Rev. W. Fitzgerald, B.A. of T. C. D. 1840. Dublin: Curry and Co. London: Holdsworth. Oxford: Parker.

IN the course of the last year, Mr. Duncan, a Fellow of New College, Oxford, placed at the disposal of the Provost of Trinity College, Dublin, the sum of 50*l.* to be given to the author of the best essay on the above subject. The practice of proposing theses for prize-essays, now seemingly on the revival among us, was originally pursued to a great extent on the Continent. Nearly every city there of any importance had its learned Society or Academy, which used this method of bringing forward and encouraging the talent of youthful authors. The old opposition of theory and practice was strangely exemplified in the instances of some of these young essayists. Napoleon, when a lieutenant of artillery, carried off the prize offered by the Academy of Lyons on Raynal's question, "What are the principles and institutions by application of which mankind can be raised to the highest pitch of happiness?" And that proposed in 1785, by the Society of Metz, for the best essay against the Punishment of Death, was awarded to—Robespierre! However beneficial this custom may prove in occasionally introducing merit to public notice, much is seldom gained from the performances themselves. "A man," says the sage Dab-schelim, "should never read a book on any subject until he has thought himself hungry, nor write one until he has read himself full." Those who engage in such contests must necessarily violate the first clause of this precept. The appetite with which they begin their studies is a forced and unnatural one, and they are obliged, in consequence, as it is technically termed, to *cram*. Knowledge obtained in this way is difficult of digestion, and the satiety thus produced is very different from the healthy state of repletion to which our Oriental friend alludes. Nor are we likely to obtain many new ideas in this manner. Original thoughts must come spontaneously; an attempt to force them to make their appearance is sure to drive them away: hence the general run of even the best of such essays presents little more than the views supplied by preceding works, placed in a clear light, and conclusions legitimately drawn from premises derived elsewhere. This remark will apply to the essay before us. It is clearly, and, in general, logically written, displaying much ability on the part of the author; but it can lay

no claim to originality. To those who are already acquainted with the logic and rhetoric of Whately, it will bring but little that is new. The very quotations which the author employs to illustrate his reasoning, occasionally, as it were, prove too much by shewing the germ of the whole argument enclosed in themselves. This fault, however, ought to be considered as an inseparable accident of the system; and, perhaps, Mr. Duncan is more to be blamed for it than Mr. Fitzgerald.

We must offer a few remarks on that portion of the *Essay* in which the author treats of "Philosophical Language," and points out the danger arising from "the use of words whose ordinary signification differs from that which is assigned to them in some particular art or science, or by some particular writer, i.e. (in the language of the schoolmen) words whose first and second intentions vary." He might have gone on to shew how this danger is increased by the same word scarcely ever bearing the same meaning in the systems of different philosophers, independently of that assigned to it in common parlance.

"The dangers and inconveniences attending this species of logomachy, have induced some philosophers to endeavour its removal by wholly discarding the popular phraseology, and moulding a peculiar nomenclature for themselves, which should have no terms in common with the language of ordinary life. The old Stoics and modern Kantists have adopted this plan. But however plausible it may appear at first sight, it appears to me to labour under many and serious evils that might be derived from it."

Mr. Fitzgerald proceeds to state some of these evils, but, we think, fails to make out his case. The first is the necessity of the acquisition of a harsh and repulsive technology; at present there is such an analogy between the common and philosophical usage of words, that one is, as it were, a mere *dialectical* variety of the other, and thus the acquirement and retention of scientific terms are facilitated. But were this plan of a peculiar nomenclature introduced, "a student would have to encounter not a *cognate*, but a *foreign* language." This analogy of the usage of words, which Mr. Fitzgerald here accounts as an advantage, seems to us the evil of which he was just complaining. The "logomachy" which he attacks arises from the very *cognition* he defends; and in the *foreignness* of the new nomenclature consists its sole claim to introduction. Secondly, he thinks there is reason to fear that men "may be convinced themselves, and successfully persuade others, that they have made most gigantic advances, and reached the very penetralia of a science, when they have, in fact, only made themselves masters of its terms." But chemistry, botany, anatomy, and, in fact, nearly all sciences, in order to avoid this "logomachy," have already adopted a peculiar phraseology; although, as Coleridge says, "alike quarrelsome to the ear and to the tongue." Men have not been content there to stop on the threshold, and merely possess themselves of the technicalities; why should they in philosophy? Lastly, he says:—

"But I will not press these objections. Let us suppose the plan as unexceptionable, in theory, as its fondest admirers can believe. There still remains this hinderance in the way of its practical utility; that when once a philosophical nomenclature has become fixed and familiar, in sciences so generally interesting as to be, by their very nature, more or less popular always, the terms of it, in spite of

philosophers, will make their way into common language, and be used in it with all that laxity and incorrectness which is now so justly complained of."

Even if this be granted, surely we choose the lesser of two evils when society steals its terms from philosophy instead of philosophy from society? Whoever affixes a second meaning to a word diminishes the power of distinctness of expression, and thereby, to a certain extent, of distinctness of thought. Philosophy might certainly be spared this necessity. We should always, too, have a fixed standard to which to refer the word, and so discover the loss its weight may have sustained in circulation.

What Voltaire says of arguments on liberty is equally applicable to all other subjects:—"Dans toutes les disputes sur la liberté un argumentant entend presque toujours une chose, et son adversaire une autre; un troisième survient qui n'entend ni le premier ni le second, et qui n'en est pas entendu." We think an entertaining and instructive book might be written, which should give the history of the errors into which men in these later times have led themselves and others by the confusion and misapprehension of words. Where a philosopher, like Locke, can confound reason and reasoning, and an editor of Gilbert Wakefield's acumen comment learnedly on Pope's "Song by a Person of Quality," there can be no fear of want of materials. The course of reading necessary for such a work would be the same as that which should have been followed on the present occasion. Mr. Fitzgerald should have read the authors who make the mistakes, and not merely those who point them out. His degree would seem to shew that he is but a young man; we shall hope, ere long, to see his abilities display themselves in some other shape.

We ought not to close our article without the expression of our approbation of the liberal spirit evinced by Mr. Duncan. Whatever doubts may be entertained of the utility of such premiums, there can be none as to the goodness of their intention.

*Sketches of the Coal-Mines in Northumberland and Durham.* By T. H. Hair. Parts I. to V. Folio. London, 1839. Madden and Co. THE graphic portion of this clever work will be noticed in another part of our publication, but the "Preliminary Observations" contain so much interesting matter with respect to this most important subject, that we think our readers will be gratified if we make some extracts from them.

"All the gigantic discoveries in science and manufactures are rendered available only by means of coal. The metals, otherwise comparatively useless, are by it, with facility, transmuted and rendered available for their respective purposes. To it we are indebted for the utility of the forge and the foundry, where

\* Incessant, day and night each crater roars,  
Like the volcano on Sicilian shores,  
Their fiery womb each molten mass combine,  
Thence, lava-like, the boiling torrents shine;  
Down the treacherous sand the liquid metal holds,  
Shoots showers of stars and fills the hollow moulds."

The steam-engine, by its means, sets in motion masses of machinery which must be otherwise inert and motionless. The spinning-jenny, thus impelled, performs its Briarean manipulations; and thus are manufactures carried to an extent and perfection, which, if they had been propounded to our forefathers, would have been treated as the brainsick reveries of some luna-

tic, the realisation of which it would have been absurd to suppose.

"Much learned discussion has been brought to bear on the history of coal and of the coal-trade. The well-known description of this fossil by Theophrastus, the pupil of Aristotle, is the earliest known record of its existence; for the occasional use of the word in our translation of the Scriptures evidently refers to burning wood. The celt, found in a vein of coal at Craigy Pare, Monmouthshire, proves it to have been known by the ancient Britons; and the ashes discovered in the Roman stations at Lanchester, Elchester, and other places, bear conclusive testimony to the use of coal by the masters of the world. Some have argued that it was known to the Saxons by the name of *Grafen*. The total silence of the records, about the time of the Conquest, on the subject of coal, is easily accounted for by the turbulence of the period, when the north of England, in particular, was rendered a smoking wilderness by the Norman king. One of the earliest documents in which it is mentioned is the 'Baldon Book' of Bishop Pudsey, 1130, in which, though the term 'woddades' frequently occurs, we find the following notices of coal:—At Escomb, near Bishop Auckland, 'a collier holds a toft and croft, and four acres, providing coals for the cart-smith of Conndon.' At Bishopwearmouth, 'the smith has twelve acres for the iron work of the carts, and finds his own coal;' and at Sedgely, the smith has one oxgang upon similar conditions. At that period, probably, little more coal was worked than what could be found at or near the day. Delving would lead to perpendicular boring, which led again to horizontal working. What was the condition of the persons who actually worked the coal cannot now be ascertained. It is said that, in ancient times, the Scottish colliers had so little relish for their employment, and were, at the same time, in such a servile condition, that they were chained to the pits. Certain it is that, in the present day, in some countries of Europe, where the agricultural labourers, or serfs, are held in a state of thralldom approximating to that of the 'villains' named in the 'Baldon Book,' the mines are entirely worked by slaves and criminals. The charter of King Henry III. to the townsmen of Newcastle, to dig coal and stone in the Castle Field and the Forth, was granted in 1239. Some idea of the value of coal-mines at that era may be formed from the lease of the mines under the manors of Whickham and Gateshead, granted by Bishop Bury to Sir Thomas Gray, Knt., and John Pulhore, rector of Whickham, for twelve years, under 500 marks rent. This lease was renewed to the same parties by Bishop Hatfield in 1356. The struggle between utility and prejudice on the use of coal has already been detailed. The former prevailed, of course, and the coal-trade has continued to increase to the present day. It would be tedious to enumerate the various legislative enactments that have been passed for its regulation. The price of this essential article of trade has also often been enhanced by monopolies, one of the most important of which originated in the 'Grand Lease' of the manors and royalties of Gateshead and Whickham, which Queen Elizabeth obtained for ninety-nine years, at an annual rent of 90*l.*, and which she transferred to the Earl of Leicester. That nobleman assigned it to his secretary, Thomas Sutton, the founder of the Charter House, who sold it to the mayor and burgesses of Newcastle for 12,000*l.* On each of these transfers the price of coal advanced in London, until the

matter became a subject of complaint by the lord mayor. From the Hostmen's books, the following particulars have been collected. In 1602 there were twenty-eight members of the company, whose vend was 9080 tons of coals, by means of eighty-five keels. In 1615, 400 ships were employed in the coasting trade; besides French and Dutch vessels, for the supply of their respective countries. In the following year, 13,675 tons of coals were shipped; and in 1622, 14,420 tons. The civil wars (partly induced by the impolitic tampering of King Charles I. with the coal-trade) checked this stream of prosperity. The panic which occurred when the Scots entered Newcastle, after their victory at Newburn, has been described by Rushworth. In 1643, the Marquess of Newcastle ordered the coal-mines to be fired; but this catastrophe was prevented by General Leslie. After the capture of the town by the Scots in 1644, the parliament undertook the management of the trade in coals, the price of which had risen in London to 4*l.* per chaldron. Notwithstanding their efforts, however, much distress was occasionally experienced in the metropolis from the scarcity and dearth of fuel. The principal events in the subsequent history of the coal-trade, are the imposts laid upon it for the rebuilding of St. Paul's and other churches, and the 'Richmond shilling.' During the last century the export of coals gradually increased. From 1704 to 1710, the average annual export from Newcastle was 178,143 chaldrons. In the six years ending 1776, the average was 380,000 chaldrons, of which, 260,000 were sent to London, 90,000 to other British ports, 2000 to British colonies, and 27,000 to other foreign ports. From 1791 to 1799 inclusive, the average was 476,634 chaldrons. Since the year 1644, when Newcastle was defended by the Royalists, the importance of the coal-trade of Sunderland, then under the influence of the Lilburns and other Republicans, has continued to increase. From 1704 to 1710, the average annual export of coals from that port was 65,760 chaldrons. In 1750, the quantity exported had increased to 162,277 chaldrons. In 1770, the export was 213,645 chaldrons; and in 1790, it reached 293,677 chaldrons. The following table shews the number of chaldrons (Newcastle measure, or fifty-three cwt.) vended from the Tyne and the Wear in the specified years:—

YEARS.	Newcastle.		Sunderland.	
	Coastwise.	Foreign.	Coastwise.	Foreign.
1600	573,793	47,407	298,307	4,622
1605	552,897	49,572	313,307	5,554
1610	632,389	17,253	370,712	1,913
1615	650,269	42,434	337,903	16,989
1620	756,513	44,825	415,974	14,424
1625	627,029	51,444	521,796	15,531
1630	725,062	39,325	509,367	22,941

Until late years, coals were an article of import in the Tees. Now, however, by the formation of the Stockton, and Darlington, and the Clarence railways, a large extent of coal-field has been rendered available for exportation from thence, being transmitted to staiths at the mouth of that river. Improvements have likewise been made in the ancient harbour of Hartlepool, long neglected, but once the emporium of the fleets belonging to the prince bishops of the palatinate of Durham. Thither, and also to Seaham Harbour, opened in 1831, railways have been extended from the centre of the county. Hartlepool and Seaham are considered members of the port of Stockton. In 1831, their united export was 161,123 chaldrons. In a parliamentary document, just published, the number of tons of coals and cinders exported from the north is thus stated:—

Coastwise.—1837.			
Coals.	Cinders.	Total.	
Newcastle.... 2,365,192	7302	2,362,494	
Sunderland.... 951,944	191	952,135	
Stockton.... 1,145,827	10	1,145,837	
1838.			
Newcastle.... 2,453,235	6503	2,450,738	67,234
Sunderland.... 948,343	41	948,429	16,294
Stockton.... 1,219,938		1,219,938	74,101

Foreign.—1837.			
Coals.	Cinders.	Total.	
Newcastle.... 471,150	5007	476,157	
Sunderland.... 242,252	211	242,463	
Stockton.... 46,407	109	46,516	
1838.			
Newcastle.... 545,972	8203	554,175	78,018
Sunderland.... 307,328	340	308,161	65,706
Stockton.... 86,535	164	86,699	40,183

From the above it appears that the increase in the coal-trade in the last-named year, as compared with the preceding one, was 339,114 tons of coals, and 2421 tons of cinders."

After these, and other general remarks, the writer proceeds to enter into detailed descriptions of two of the principal collieries of Northumberland and Durham, *videlicet*, Wallsend and Willington; and will, no doubt, in the remainder of his undertaking, advert to the rest. But for these we must refer our readers to the publication itself.

*A History of British Star-Fishes, and other Animals of the Class Echinodermata.* By Edward Forbes, M.W.S., &c. Illustrated by a Woodcut of each Species, and Numerous Vignettes. London, 1840. Van Voorst.

THE commencement of a charming work; the offspring of a man of genius, to combine something of the starry brightness of his title with the minute science due to his interesting inquiry. The opening observations afford a proof of this, and we have much pleasure in quoting them:—

"One of the most remarkable phenomena displayed to us by the researches of the geologist is the evidence of the existence, in primeval times, of animals and plants, the analogies of which are now rare or wanting on our lands and in our seas. Among those tribes which have become all but extinct, but which once presented numerous generic modifications of form and structure, the order of Crinoid Star-fishes is most prominent. Now scarcely a dozen kinds of these beautiful animals live in the seas of our globe, and individuals of these kinds are comparatively rarely to be met with: formerly they were among the most numerous of the ocean's inhabitants,—so numerous, that the remains of their skeletons constitute great tracts of the dry land as it now appears. For miles and miles we may walk over the stony fragments of the Crinoidea; fragments which were once built up in animated forms, encased in living flesh, and obeying the will of creatures among the loveliest of the inhabitants of the ocean. Even in their present disjointed and petrified state they excite the admiration, not only of the naturalist, but of the common gazer; and the name of stone-lily, popularly applied to them, indicates a popular appreciation of their beauty. To the philosopher they have long been subjects of contemplation as well as of admiration. In him they raise up a vision of an early world,—a world, the potentates of which were not men but animals,—of seas, on whose tranquil surfaces myriads of convoluted nautili sported, and in whose depths millions of lily-stars waved wilfully on their slender stems. Now the lily-stars and the nautili are almost gone; a few lovely stragglers of those once-abounding tribes remain to evidence the wondrous forms and structures of their comrades. Other beings, not less wonder-

ful, and scarcely less graceful, have replaced them; while the seas in which they flourished have become lands, whereon man, in his columned cathedrals and mazy palaces, emulates the beauty and symmetry of their fluted stems and chambered shells."

And mark how the useful follows the beautiful:—

"Throughout the animal kingdom we find groups which, when compared with a neighbouring group of equal value, present higher affinities, and yet lower analogies. The order before us is a good example, and may serve as an explanation of this rather obscure-sounding doctrine. The crinoids, as analogues of the polypes, are lower than the asteroids, but as allies of the asteroids are their superiors. An encrinite is a polype-like starfish. Suppose, as Professor Jones has well-suggested, an ascidioid zoophyte strengthened by depositions of calcareous matter in its arms and stems, and you have a crinoid starfish. In that point of view, the latter is a link between the echinoderms and the polypes. But the link is, as it were, lateral—a link of analogy,—for the ascidioid polypes themselves are higher in their organisation than many echinoderms. Their digestive system is more developed than that of the star-fishes. In them we see, for the first time, echinoderms with two openings to their digestive canal. Their generative system is spread over the tegumentary covering of their body and arms; they have tentacular filaments like those of the ophiuræ; and the pinnae with which the arms are furnished have the skin so developed on their sides as to enable them to serve as fins, wherewith the animal can swim through the water in the manner of the medusæ, whence the name of *Pinnigrade Echinoderms* which I have applied to them, indicative of this mode of progression. It will be seen in the account of the *Comatula*, or feather-star, that we believe that animal to be fixed and stable, like one of the fossil encrinites, when it is young. At the same time it is very probable that there are crinoids which are stalked throughout life, and that most of the fossil species were of such a nature. Tribes which form a link between one mode of existence and another, generally present examples of both, and combinations of both. Thus, among the polypes, do we find in the family Tubulariadae the connecting link between the naked and clothed hydroid polypes, animals which are naked throughout life, others naked through a part of their existence, and others which are enclosed in a tube throughout their lives. In like manner may we expect to find in the order of Crinoidea, animals fixed throughout life, others fixed through a portion of their existence only, and others which are free almost from their birth. As yet, however, we know so little of the tropical species, that we cannot pronounce with certainty; and at present we can only recognise two families of crinoids as properly constituted,—such as are stalked, as the encrinites and the comatula; and such as are sessile, as the genus *Holopus* of M. d'Orbigny. This division can only be regarded as provisional."

The genus *Comatula* is the first figured, and the cuts are excellently executed. The rosy feather-star, and afterwards the sand-star (genus *Ophiura*), the grey brittle-star (genus *Ophiocoma*), and other brittle-stars, of which, *inter alia*, Mr. Forbes observes:—

"The stomachs of fishes are often zoological treasures. The haddock is a great conchologist. In his travels through the country of the mermaids, he picks up many curiosities in the

shell way. Not a few rare species have been discovered by him; and the ungrateful zoologist too frequently describes novelties without an allusion to the original discoverer. As haddocks are not in the habit of writing pamphlets or papers, the fraud remains undiscovered, greatly to the detriment of science; for, had the describer stated to whom he was indebted for his specimen, we could form some idea of its habitat and history, whether littoral or deep sea,—very important points in the economy of mollusca,—important not only to the malacologist, but also to the geologist. Like the haddock, the cod also is a great naturalist; and he, too, carries his devotion to our dear science so far as occasionally to die for its sake with a new species in his stomach, probably with a view to its being described and figured by some competent authority. The cod is not so much devoted to the mollusca as to the echinodermata; and, doubtless, his knowledge of the ophiuræ exceeds that of any biped. He has a great taste for that tribe. It was a cod that communicated the pretty little species I am about to describe to my friend, Mr. Henry Goodsir, at Anstruther; and, as far as that gentleman could learn, it would appear the industrious animal had observed and entrapped this new ophiocoma in the North Sea, near the Dogger Bank. The dotted ophiocoma is a very little species. Its body is only one-eighth of an inch in diameter; but its rays are very long, being seven times as long as the disk is broad. The disk is pentangular. The upper surface is imbricated with smooth scales, which are rosulated in the centre, the central scale round and large. Opposite the origin of each ray are two long wedge-shaped scales, the basal angles of which touch, but the apices diverge. Beneath, the scales which separate the origins of the rays are ovate, and rather large in proportion to the disk. The rays are long and narrow, six times as long as the disk is broad."

A little after, we are told,—

"Besides the creatures I have just mentioned, two beautiful radiate animals inhabit Rothsay Bay; both of them are unrecorded as members of the British *Fauna*. The one is a *Spatangus*, which I shall describe in its proper place; the other is the singular brittle-star described and figured by Müller under the appropriate name of *Asterias filiformis*. Of this most curious of ophiuræ, I first found one of the thread-like arms winding amongst the mud. Arm after arm occurred, but no body: at length, the skeleton of a body was found, and when I had almost begun to despair of finding any thing like a disk, an almost perfect specimen appeared. A few days after, dredging on similar ground in the Gair Loch, opposite Greenock, I was astonished by the sight of masses of interlacing arms of the same animal, as large as a man's fist, coming up in the dredge. They were all alive, and twisting in every direction; yet, strange to say, there were no more than seven or eight disks secured, although several hundreds of arms were taken. The fact is, the disk is extremely soft, especially when the animal is in egg, as was the case in the instance mentioned; and not being so well secured to its skeleton, as in the other brittle-stars, it was almost always rubbed away or destroyed by the rough usage it met with in the dredge on its way to the surface. The arms, however, seem to preserve their integrity much more patiently than those of the neighbouring species. The two localities mentioned are the only places in Britain where this ophiura has as yet been observed; it is probable, however, that it will be found in

similar situations in other loughs on the west coast of Scotland. In July 1840, it was taken for the first time in Ireland by Mr. Thompson, Mr. Ball, Mr. Hyndman, and myself, in the Killary and other marine loughs of Connemara. Müller first observed individuals in Norway, 'in sedimento argillaceo 1773, rarissime; postea in fundo argillaceo maritimo Norvegiæ occidentalis frequentam reperi;' so that its habitat appears to be always muddy."

With this we must dismiss Part I. of a production which promises to unfold to us a great deal of instructive natural history, in a fit companion, in every respect, for Bell's "British Quadrupeds and British Reptiles," and Yarrell's "British Birds and British Fishes."

*The Great Civil War of Charles I. and the Parliament.* By the Rev. Richard Cattermole, B.D. With Fifteen highly-finished Engravings, from Drawings by George Cattermole, Esq. Under the Superintendence of Mr. Charles Heath. 1841. London: Longman and Co. New York: Appleton and Co. Paris: Fisher and Son.

WE rejoice in an Annual of a new character, and from the pen and pencil of two brothers—the one doing honour to our literature, and the other to our fine arts. Most of the engravings, fifteen in number, are magnificent, representing some of the stirring and lamentable events of the civil war, with a degree of spirit in the persons and groups, and of skill and effect in the general treatment of the subjects, as regards high artistical qualities, such as can never be surpassed within the same compass and in the same species of embellishment. Several of the skies and distances are admirable, and belong not to the mechanical but to the poetry of painting. Turning from these to the letterpress, we find Mr. Richard Cattermole well entitled to share in the eulogy bestowed upon George. His narrative is perspicuous, and carries the reader along with it with a deep and increasing interest. In matter it is impartial, in the consultation of authorities sufficient, and in the mode of treatment honest and candid. Truly does the writer himself describe it, when he tells us what his object was, in these words:—

"In endeavouring to set before the reader History in action—in avoiding, as much as possible, all formal or dry detail, and giving prominence and amplitude only to those heroic deeds, those eloquent discussions, and those noble traits of personal character, which distinguish all great events or eras in the world—he has sought to avoid those extreme differences of opinion, and partisan views, that have unhappily entered so largely into most works respecting the Great Civil War of the Seventeenth Century. He cannot acknowledge indifference to any cause, which has inspired high achievements among mankind. He looks upon the great drama of human events as, in all its provinces, the work of ONE who assigns no prominent part whatever to minds undeserving of earnest regard. Great qualities still find a sanctuary in the heart, even though the ends to which they were devoted may be disapproved by the principles and the judgment; and history, in common with all true knowledge, promotes the noblest charities of our nature."

From a work of this class it is unnecessary for us to offer any quotation. We shall only repeat our unqualified praise, and gladly hail it as the first of a series which will do credit to its order, and rank with its most successful efforts.

## MISCELLANEOUS.

*Mercedes of Castile; a Romance of the Days of Columbus.* By J. F. Cooper, Esq., author of "The Pilot," &c. 3 vols. 12mo. London, 1840. Bentley.

THE difficulties of the great Columbus before he prevailed on the court of Spain to set him out on his wonderful undertaking, his voyage, discoveries, and return, form the theme of this romance, and are described with graphic fidelity. There is a preface which we hardly know whether to take in earnest or as facetious. A romantic interest is incorporated with the actual records of historical matter, by the loves of Don Luis de Bobadilla, a companion of Columbus, and Donna Mercedes, the heroine; over which a temporary cloud is passed from his bringing home with him the beautiful daughter of a Haytian Cacique. The story is altogether well told; but we do not feel any very strong interest in the parties.

*The Viceroys.* By John Fisher Murray, Esq. 3 vols. 12mo. London, 1841. Murray, Aldine Chambers.

A NOVEL, the object of which is to expose the sycophancy and corruption of Irish Government, and, in general, the evils which afflict the country. Soldiers and civilians figure in the story, with which, from the nature of its subject and its personal allusions, we are not inclined to meddle farther.

*Literary Leaves; or, Prose and Verse, chiefly written in India.* By D. Lister Richardson.

Second Edition, with considerable Additions. 2 vols. 8vo. London, 1840. Allen and Co.

A VOICE from Cossipore, though only announcing a second edition, deserves a second notice; though it need be but a brief one, as we have not leisure to seek out and mark Mr. Richardson's novelties. The author has written many pleasing things, and if perseverance could make a great poet, he would certainly be one. As it is, he crops away upon the lower regions of Parnassus with the assiduity of a sheep on a sweet pasturage, which never ceases nibbling, and if neither of them astonish us, yet the one makes good mutton, and the other a miscellany of a tasteful and agreeable kind.

*The Certainties of Geology.* By W. Sidney Gibson, F.G.S. 8vo. pp. 270. London, 1840. Smith, Elder, and Co.

AN able and elaborate treatise, to demonstrate that the science of geology is not inconsistent with Christian belief, though it may appear to clash with opinions entertained upon literal interpretations of the sacred Scriptural historians. Nearly the same grounds have been trod by Buckland, in his "Bridgewater Treatise," Lyell, Sedgwick, Phillips, and other eminent geologists; without, however, convincing the Dean of York, and those who adhere to his school, viz. that geological conclusions are heterodox, and at issue with the inspired writings, so that if they are sound the Bible must be untenable. So many questions are involved in this issue that it would require many of our sheets to discuss them all, and we must leave the contest in the hands of the voluminous disputants who occupy, or may occupy, the lists. Suffice it to say of Mr. Gibson, that he founds a strong analogical argument on the similar denunciations of the science of astronomy, as its immortal truths were explained by Newton or Galileo; and contends, that as these truths are now universally acknowledged, so hereafter will be the equally mighty and incontrovertible truths of geology. The Bible was meant to inculcate moral, not physical, knowledge,—religion, not natural history, and written to the apprehensions of men; Moses no

more intended six solar days of creation to be understood than that Joshua made the sun to stand still. On other points our author reconciles the facts of geology with the interpretations of Scripture; and curiously illustrates the theory of successive creations (all as miraculous and divine as any single creation), by reference to the "Hindoo Vedas." These very ancient writings seem to have anticipated European science, for they give an account of successive *Yugs*, lasting each many thousands of years, and each of them terminated by a deluge, which prepared the earth for its new inhabitants. Whence was this wisdom of the East derived?

*Tales from Shakespeare; designed for the Use of Young Persons.* by C. Lamb. Pp. 104. double cols. 8vo. (Moxon.)—Even with Charles Lamb's \* talent, these reductions of Shakespeare to the young palate are very like making pap for children from the staff of life. It was hardly possible to dilute the immortal pith into a *parade* of language suitable for the capacities addressed. Still they may interest the juvenile sort, and prepare them for stronger food.

*Reliques of Ancient English Poetry: consisting of Old Heroic Ballads, Songs, and other pieces of our earlier Poets; together with some few of a later date.* No. 1, 8vo. double cols. pp. 32. (Templeman.)—We very highly approve of this design. Percy's "Reliques," in a cheap form and generally read, must contribute much to a love of true poetry and pure and noble sentiment, whether ancient or modern. It is a taste most desirable to be cultivated at all times, and especially in our day, when mankind are running so entirely into the opposite extreme.

*The Cyclopædia of Domestic Medicine, intended for Popular Use, &c.* by Keith Murray, M.D. No. 1, 8vo. pp. 112. (Ball, Arnold, and Co.)—In this first Number we have got from "Abscess" to "Cancer," though ague, apoplexy, asthma, boils, bronchitis, bronchocele, bruises, burns, and many other ills that flesh is heir to within the first two letters of the alphabet. Dr. Murray has treated of them clearly and cleverly enough; but still the question recurs, Is it wise for people, ignorant alike of disease and medicine, to doctor themselves on the authority of a popular treatise? It may be true that physicians kill numbers of patients; but this is hardly an excuse for suicide, and suicide, to a very considerable extent, must be a certain result of self quacking.

*The Vicar of Wakefield.* Part I. pp. 32. (Willoughby and Co., Berger and Co.)—This is the age for illustrated editions, and who more worthy of the honour than the worthy Vicar of Wakefield. This first part is of fair promise, at the cheap rate of its issue.

## ORIGINAL CORRESPONDENCE.

JOURNEY OF DUKE PAUL OF WURTEMBERG TO THE GOLD TERRITORY.

"Alexandria, 3d July, 1840.  
"I TAKE it for granted that you have received my letter from Fazoglon. I stopped there and in the neighbouring negro countries about a month, and as all the necessary measures had been taken to visit the gold territory with safety, I accompanied the expedition commanded by Ferrad Bey to Fakarno and Sudé, south-west of Kassan, a hitherto wholly unknown part of the Dar Berta. If the result of this expedition did not fully realise the expectations that there seemed ground to entertain, the fault was not in the leader, or in want of goodwill in the troops, but in the superiority of the negroes, who had risen in a mass to their savage bravery, and to other circumstances which I shall speak of in the sequel. The torrents which fall into the Toumat, as well to the south of Singué as to the west of Kassan, contain very rich auriferous alluvium, and give reason to conclude that the mountains from which they come down may contain that precious metal in considerable quantities, probably in nests. This I perceived at the first sight, though not versed in the knowledge of inorganic nature, and it has certainly been already stated to the public by M. Russeger, since my departure from Germany. Hitherto, it is true, the gold-washing has not brought any profit, but loss, but this is not owing to the small quantity of gold contained in the sheets. The  
\* *Apropos*, fourteen are by his sister and only six by himself.

trials that were made in my presence with the auriferous sand of Khor Adi, Faschangoro. Khor el Bab, Khor Akantosch, Fadoga, &c., afforded the same results as those obtained by Messrs. Russegger and Boreani, as will be proved by the specimens which I bring with me.

"Some of the streams not visited by M. Russegger to the east and west of the Toumat, and one near Kassan, the name of which I could not learn, by no means afforded the same results as those in Khor Adi. On the other hand, the mines which the negroes of Fakarno and Sudé work are said to be as rich as those of Schebel Tul, which the natives say is the richest in gold of the mountains in all Berat or Kamamil.\* I, therefore, greatly regret that, after the taking of Fakarno, the little Egyptian army which I accompanied was obliged to retreat, being unable to withstand the repeated impetuous attacks of their black enemies. It is scarcely possible to penetrate by force of arms into the interiors of the groups of mountains, inhabited by numerous negro tribes, to the south of Beni Schongolo, or to the west of Fakarno, for instance, to the picturesque mountain-chain, from which the pointed summits of the two Radokat mountains rise like twins. We were unable, to my great regret, to attain the chief object of the expedition, which was to discover the Schebel Tul. I would willingly have borne, for a longer time, the dangers and fatigues of this expedition; for in this fine country, organic nature seems to have done every thing to indemnify the African Continent in some degree for what it takes from it in its boundless deserts. Our vanguard proceeded along the banks of the Toumat, which are thickly grown with high reeds, and shaded by groups of colossal trees, which are frequented by large herds of wild buffaloes, great antelopes (*Antelope bubalis*), and elephants, which come to those parts in great numbers in the rainy season, which had already set in.

"But the Europeans residing in Egypt seem to have made it their business to injure each other, and thereby to defeat the best plans of the viceroy. Thus, for instance, the proceedings of M. Russegger were made suspicious to the pacha, when, with the perseverance and energy of a young man, he visited Fazoglou last year and founded Mehemedalipolis. Doubts were even expressed whether the silver ore which Russegger found in Schebel Szegedi Moje contained any silver. M. Boreani, who returned with me from Fazoglou to Cairo, was treated in a similar manner. My return was made pretty rapidly. At Karloum I met with the expedition, which had proceeded up the Bahr el Abiad to the fourth degree of latitude, under the command of Selim Capitana, an able officer of the Egyptian army. From Karloum I continued my journey by land in order to visit the ruins of the temples at Naga, and Mazaurat (Mussanarat), and the groups of pyramids at Assur. In many places I found the name of the illustrious traveller carved, whose ingenious writings are universally known, and who is one of the most acute observers of our times, especially with respect to the spirit and the political concerns of the East. As for Dr. Ruppell, however violently, and by whomsoever he may be attacked, he is, however, eminently correct in the field of strictly scientific research. His astronomical observations

are made with the greatest exactness and the most persevering industry: as a naturalist, his admirable researches testify his merit. With inexpressible courage and perseverance he prosecuted his extensive plans, almost entirely destitute of all assistance, relying only on himself.

"With respect to the maps of Africa, it is a great merit even to correct the positions of some places; a still greater to determine new ones: but it is beyond the power of one man, in the whole course of his life, to make from his own observations a complete and accurate survey of the country bordering on the Nile, with the rivers that run into that gigantic stream, and the adjacent countries. Multifarious exertions are required for such a task, and hundreds of years might not complete it.

"I cannot join in the unfavourable opinions of late travellers of the Egyptian government, and of Mehemet Ali personally, especially in respect to the viceroy himself; because he is a sincere encourager of the sciences, and of all well-informed travellers, to whatever nation they belong.

"It is extremely difficult for any traveller, who is not perfectly acquainted with the Arabic and Barabia language, to give the names of places in Nubia and Egypt. No language with which I am acquainted is so difficult to be written according to the ear. Besides, there is no country where the traveller is more imposed on than the Soudan, and is more deceived by fables and false names of places.

"On my return through the desert I rode on horseback, which enabled me more easily to collect specimens of the rocks, which are extremely interesting in this desert. I therefore gladly confess, that I was able this time to make much more complete observations than when seated on the high back of the camel, which cut me off from all communication with the surface of the earth. M. Russegger has probably already described the geology of the desert. I collected, however, as much as I was able, and as my camels, weakened by the heat and thirst, could carry. The parts of this collection may be arranged in Europe. In the other departments of natural history with which I am better acquainted, I hope to give satisfaction; because, notwithstanding the great heat, and the very short stay which I was unfortunately obliged to make in many important places, I possessed means to collect many and valuable specimens."

#### ARTS AND SCIENCES.

##### THE GANNAL PROCESS.

A SHORT time ago (July 18th) we gave a brief account of this new process for the preservation of dead bodies, whether for purposes of science, the indulgence of natural affections, or the performance of many things connected with the wishes and conveniences of life. On Tuesday, as previously advertised, a corpse which had been submitted to injection two years ago by M. Gannal in the presence of Mr. Gregory Smith, was dissected by the latter in the Anatomical Theatre, Little Windmill Street; and the result of the experiment fairly and fully tested before a number of medical and scientific gentlemen who had assembled to witness it. That result was most satisfactory. The progress of decay had been stopped, and the body

\* We learn from good authority, that the great and important collections made by the Duke of Wurtemberg have already arrived in Germany, and will be arranged during this winter. His Highness is said to have many duplicates, and to intend to make presents of plants and minerals to the collections in Vienna and Petersburg.

was without offensive effluvia, the muscles firm and, in many parts of their natural texture and colour, the viscera sound as if the man had died the day before; and, with the exception of a division of the brain, which seemed to have been but slightly, if at all, visited by the preserving fluid, the whole in a condition to fulfil every expectation held out of the chemical properties of this composition.

Before offering a few remarks on the value of this discovery, we ought in justice to notice that the subject before us seemed not to have been the best for the trial. The person, Berry by name, was a sickly pauper with a badly wounded leg, and died of epilepsy, at the age of thirty-three, in the poorhouse. Thus, not only the limb and the brain (probably soft before death), but the entire body was unfavourable for the operation, which, nevertheless, had perfectly effected its object. It had also been covered with thin lead such as lines tea-chests; and which, by preventing evaporation and retaining any moisture, could not have been so well adapted to the end, as the common shrouding and confining of the dead. We should further observe, that the lecturer advanced no opinions of his own, but simply stated the facts, exposed the anatomy, and, perhaps, left the conclusions with too little of inference or assurance to the sense of a mixed and, consequently, in some instances, an incompetent audience.

Owing to mistaking this course, we have seen, in a respectable morning journal, a statement that Mr. Gregory Smith appeared to evade some questions put to him: whereas he merely modestly declined to lead the judgments of those to whom he addressed a straightforward explanation of the circumstances, and left them to form their own unbiassed decisions. As in all medical questions there are varieties of mind, one might think that something like the same effects had been produced before; another, that creosote, or some other agent, might be able to produce them; and a third, that they were not necessary at all. But these matters are for the people of the world to decide. No similar experiment, of two years' duration, was ever witnessed at any former period; no other substance has ever preserved a body, in like manner, during the coldest three weeks of winter; and in Paris, where M. Gannal practises, multitudes hasten to avail themselves of his valuable discovery. And there are many reasons why it should be largely employed and liberally patronised. We are not going to discuss the topic, whether it is advisable to preserve the dead in their bodies as they lived, or send them to

"Lie in cold obstruction, and to rot;"

to prolong the time of our intercourse with those we loved, till death lay us side by side, or at once to consign their remains to the charnel-house, to embalm or to burn. These must be resolved by individual feelings, and, to a certain extent, by the customs of countries.

But there can be no doubt of the expediency of an invention, which, by simply injecting a pint or two of liquid, the *accede of alumina*, into an artery in the neck, CLAY TO CLAY, shall preserve the body, which it is desirable to have brought from distant parts for interment,\* or till friends and relatives can arrive from distances to see and recognise it, or for medical inquiry in cases of doubtful disease, or for many other reasons which must suggest themselves to every reflective observer.

\* How different the decent ceremony from that of "tapping the admiral," or general, deposited in the rum cask for importation!

\* But the countries south of the tenth degree of latitude are very rich in gold. This is proved by the quantity of this precious metal which goes by means of barter from those countries, by way of Kordofan and Sennaar to Kurtoum, or by way of Fadasu to Abyssinia.

Again, in a scientific point of interest. We happened to sit beside one of the most distinguished authors of the age on the diseases of warm climates, and he informed us that he considered the process to be of infinite importance, both for the security of the living from the contagion of rapidly decomposing bodies in tropical regions, and for the study of anatomy. In the latter case it must be equally valuable during our summer, when the anxious student can hardly retain even a small separated member long enough to complete his investigations. It had been fancied that the dissector's knife would be injured by the hardness induced; but, in the instance before us, its edge was as fine as if the subject had been recent and untouched.

Let us look next at burial in the vaults of churches. Who has ever experienced the horrors of such places? The lowest and most ancient coffins crushed in with dry protruding bones and garments of the tomb, resting on a debris of indescribable awfulness; the next above, tattered, broken, and appalling to mortality; and, to crown the abhorrent ranges, a mixture rendered more revolting by the display of funereal ornaments, with the bursten receptacles too narrow for the enlargement of putrefaction; and all affecting the sense of smell, and of taste too, with an odour than which it is impossible to conceive any thing more disgusting to human nature! This is no exaggerated picture, as most of our metropolitan churches can testify; and all this may be avoided by the Gaiinal Process. The same reasoning applies to catacombs and cemeteries, now so properly superseding interment in these sacred edifices, where the living assemble to worship God.

And, again, besides our own race, there are gentle affections mixed up with our love of favourite animals; and great expense is often bestowed upon skinning, stuffing, and otherwise preserving them. This is, by skilful persons, beautifully and correctly done; but still nothing can so resemble the actual life as the creature preserved by means such as these. The animal preparations in the theatre were striking examples of this. Need we add that, in this respect, the art extends itself most accurately and advantageously into every branch of Natural History?

We might urge other arguments on behalf of this useful and valuable process; but we rather resign it to the eminent physicians and surgeons, whose attention we were glad to see so earnestly fixed upon the experiment, and to the public, whose interest in its success is so sensible and universal. We have no doubt but that its issue will reward the liberal exertions of Mr. George Smith (not the lecturer, though of nearly the same name), who has secured its exercise by patent to this country. By the Faculty generally, as far as we have been able to ascertain opinions, it is highly approved; and we are sure that, even in these short hints, we have said enough to shew how well it deserves the support of all other classes of society.

#### ROYAL GEOGRAPHICAL SOCIETY.

MONDAY, 14th. The President, G. B. Greenough Esq., in the chair.—1. Extracts of a Letter were read, from E. J. Eyre to Captain Grey, dated 13th June, 1840. Mr. Eyre says, "After leaving Albany, Munday and myself had an unpleasant and disastrous journey across to Swan river, losing many of our sheep and cattle from the poisonous herbage among the ranges. On our return to Adelaide I found,

to my great regret, that you had sailed for England, without being able to visit the Murray river, or the country to the north of Adelaide. I am sure you would have been much pleased with both these districts, and you would then have had a better idea of the character of the country, which is so totally opposite in its features to that of Western Australia. In the short ride to Mount Barker, you have to pass over so much hilly, heavily timbered, or stony and scrubby land, that although, when there the country is very pretty, and the soil and pasturage as good as can be, still it does not convey to you an idea of the general character of South Australia. You see nothing of the extensive downs and plains of the north, of the immense and rich alluvial flats of the Murray, or the large tracts of lightly wooded parklike forest-land to the south. These I was most anxious you should have seen, because I know that your opinion will be often asked in England, and have much weight with the people at home. When you were here, I think the colonists were entering into subscriptions for the purpose of sending an expedition overland to Western Australia, with the view of opening a line of route. This has been abandoned for the present, as the immense tracts of barren and scrubby country, almost wholly destitute of water, to the westward of Spencer's Gulf, would effectually prevent sheep being driven overland, even should a light party succeed in forcing their way along the coast on horseback. It is therefore judged most expedient to penetrate first into the northern interior, by which, perhaps, a better tract of country may be found, and which may possibly communicate with more than one of the other colonies. An expedition has just been got up for this purpose, of which I am to take charge. It is fitted out partly by the government, and partly by subscription. The governor gives 100*l.* and ten horses towards it. I find five horses, and the colonists have subscribed about 550*l.* towards the equipment; so that altogether we shall be well fitted out for a journey of the kind. The party will consist of an overseer, two men, two native boys, and Mr. Scott, the young gentleman who accompanied Munday to King George's Sound. We take two teams of three horses each, besides six saddle-horses, forty wethers, and provisions for three months. The governor is to send supplies to meet us at the head of Spencer's Gulf by water, so that that will be our point of departure; and when we leave it, we shall have provisions to supply us for six months or more: so that if we find the country practicable, we shall penetrate considerably beyond the centre of the continent, even should our supplies not enable us to reach the northern coast. I say if we find the country practicable, because, from the known dry and barren character of the country north of Spencer's Gulf, there is a possibility we might be driven back unsuccessful. However, I trust it will not be so, but that we shall, by God's blessing, succeed in penetrating the interior, and determining its hitherto unknown and mysterious character. I am deeply interested in this undertaking, and have sacrificed much to engage in it; you may therefore suppose that it will not be slightly abandoned. Aware of the very great difficulties I shall have to contend with, and conscious of the heavy responsibility attaching to myself, I cannot but feel most anxious for the results; still I go with hopes of success, and, at all events, with the fixed determination of accomplishing our object by some route or

other, if, indeed, it be possible for man to accomplish it. Should we succeed in an undertaking of such general interest and importance, I should envy no man's reputation. The governor takes much interest in the expedition, and is most kind and liberal in offering me supplies, or assistance of any kind in his power to render. In fact, every one is the same, and I am much indebted to my friends for very many useful things in a journey of this kind, and particularly for the loan of instruments and charts. The ladies, too, are not backward on the occasion, but are working for me the English flag to be planted in the centre of Australia, so that I shall be in duty bound to place it in its destined position.

"June 22, Light River.

"I am now sixty miles on my road. We left Adelaide the 18th of June for the interior, after a parting breakfast given us by the governor, at which I was duly presented with the British flag, worked by the ladies of the province, and destined to wave over the centre of this continent. For a few miles we were accompanied by many friends, both ladies and gentlemen; and if the kindness of friends or their earnest wishes could ensure success, we could not fail. At all events, they can, and will, I trust, stimulate us to every possible exertion."—2. A paper 'On the Plain of Troy,' which we must reserve for another *Gazette*.

#### GEOLOGICAL SOCIETY.

DEC. 2. The Rev. Dr. Buckland, President, in the chair.—The second part of a paper 'On the Evidence of Glaciers in Scotland and the North of England,' by Dr. Buckland, was read. At the conclusion of the former part of this paper, Dr. Buckland described the evidences of the action of glaciers in the neighbourhood of Edinburgh (*Lit. Gaz.* Nov. 28). Proceeding southward, he noticed between Edinburgh and Haddington, that a large portion of the low lands is composed of till, or the argillaceous detritus of glaciers, interspersed with pebbles. In the valley of the North Tyne, about one mile east of Haddington, he observed a distinct longitudinal moraine, midway between the river and the highroad, and ranging parallel to them; and he directs attention to the trap rocks which commence a little farther eastward, and are intersected by the North Tyne for four or five miles above Linton, as likely to afford scored and striated surfaces in the most contracted parts of the valley. About four miles west of Dunbar, another long and lofty ridge of gravel stretches along the valley parallel to the right bank of the river: and for three miles south-east of Dunbar is a series of lateral moraines modified into terraces by the action of water. At the eastern extremity of the Lammermuir Hills, in the high valleys through which the road passes from Cockburn's Path to Ayton, are traces of moraines disposed in terraces at various elevations on both sides of the river; and three miles north of Berwick the road passes near an insulated group of round and oblong mounds of gravel, lodged on the slope of a hill 300 or 400 feet above the sea. On many parts of the coasts of Northumberland, deposits of till repose on the carboniferous rocks, especially near Newcastle. At the village of North Charlton, between Belford and Alnwick, Mr. C. Trevelyan conducted the author in 1821 to an extraordinary ridge of gravel, then considered to be an inexplicable work of art; but which Dr. Buckland, after an examination of the upper glacier of Grindelwald and that of

Rosenlaui, in 1838, was convinced is a moraine. Immediately below the vomitories of the eastern valleys of the Cheviots, enormous moraines cover a tract extending four miles from north to south, and two miles from east to west, and the highroad winds among them from near Woller, through North and South Middleton, and by West and East Lillburn, to Rosedean and Wooperton; the height of these moraines varies from thirty to eighty feet; and their surfaces are seldom too steep to prevent the passage of the plough. On the left bank of the College Burn, immediately above a bridge at Kirknewton, Dr. Buckland discovered a moraine thirty feet high, only the summit of which, to the depth of a few feet, was stratified; the remainder consisting of unstratified gravel, enclosing, however, fragmentary portions of a stratified bed of sand, some of which were vertical, and others inclined; and in the greater number, the laminae were contorted in a manner explicable, he says, only on the theory of a bed of laminated sand having been severed into fragments, which had subsequently been moved and convoluted by the slow pressure of a glacier descending the deep trough of the College Burn, from the northern summit of the great Cheviot. The proofs of the action of glaciers in the mountain and lake districts of Cumberland and Westmoreland, Dr. Buckland states, are no less frequent than in Scotland and Northumberland. And he adds, — Assuming that during the glacial period every lake became a mass of solid ice, large lodgments of moraines might be expected to be found in those portions of the subjacent lowlands, in front of each of the vomitories by which the waters of the lakes are now discharged from this lofty group of mountains. Thus to the east of Penrith, near the junction of the Eden with the waters of the Eamont and the Lowther, are extensive moraines loaded with enormous blocks of porphyry and slate, brought down by glaciers from the high valleys, which, commencing on the east flanks of Helvellyn, and in the mountains around Patterdale, descend into the lake of Ulleswater, and from those by which the tributaries of the Lowther are conducted from the east flank of Martindale, and from Hallwater and Mardale. A remarkable group of these moraines is at Eden Hall, four miles east of Penrith. On the southern frontier of these mountains, in Westmoreland and Lancashire, are similar moraines on a most extensive scale. Thus, immediately below the gorge through which the waters of the Kenn descend from the mountains of Kenmuir and Long Sleddale, the valley of Kendal is covered with large insulated piles of gravel; whilst smaller moraines, and the detritus of moraines, nearly fill the valley from Kendal to Morecambe Bay. Five miles north-east of Kendal, in the highroad from Shap, and on the shoulder of the mountain immediately in front of the valley of Long Sleddale, is a group of conical and oblong moraines, distinguished by the superior fertility of their soil to that of the adjacent slate-rocks. South of Kendal, the highroads from Burton and Milthorpe to Lancaster pass, for the most part, over moraines or their detritus. Lancaster Castle, also, stands on a mixed mass of glacial detritus, probably derived chiefly from the outcroppings of the valley of the Lune. The districts of Furness, Ulverston, and Dalton, are extensively covered with deep deposits of moraines, formed from the wreck of mountains surrounding the upper end of Windermere and Conistone lakes: A bed or capping of till and gravel, thirty or forty feet thick, overlies

the great vein of hæmatite near Ulverstone. The south-west and west frontiers of Cumberland Dr. Buckland has not recently examined; but he is of opinion, that many of the conical hillocks marked on Fryer's large county map, in the valley of the Duddon, will prove to be moraines derived from the adjacent mountains; also, those on the right of the Esk, at the east and west extremities of Muncaster Fell; and those near the village of Wastdale. Dr. Buckland is further of opinion that, though no similar hillocks are given in Mr. Fryer's map on the north side of the Cumberland group, yet, that moraines exist near Church in the valley, which forms the outlet of the Ennérdale water; also between Crummock-water and Lorton, and near Isle in the valley by which the Derwent descends from Bassenthwaite Lake towards Cockermouth. Near the centre of the lake district are extensive moraines, on the shoulder of Braw-Top, immediately south-east of Keswick, and Dr. Buckland states that they must have been medial moraines, formed at the junction of the valley of the Greta with that of Derwentwater. The author was prevented from seeking for polished and striated surfaces on the rocks of Cumberland, but he noticed them on greywacke in Dr. Arnold's garden at Fashow near Ambleside, and near the slate quarry at Rydal; also, on recently exposed rocks by the side of the road ascending from Grassmere to the pass of Wythburn. The rounded and mammillated forms of many of the rocks at the bottom of the valley, descending from Helvellyn by Rydal and Ambleside to Windermere, he states, are also identical in character with those which occur beneath the glaciers of Switzerland. The remarkable Criffel granite boulders between Carlisle and Cockermouth, Dr. Buckland is of opinion, were transported across the Solway Firth on ice. The author then proceeds to describe the phenomena of the distribution of the well-known Shap granite boulders, in the valleys which lead down from the Fell northwards towards Shap and Penrith, and southwards towards Kendal and Morecambe Bay; and on the high table-land of Stainmoor Forest to the east, as well as in the same direction in the valley of the Tees, from Lartington and Barnard Castle to Darlington. It is impossible, Dr. Buckland observes, to explain satisfactorily the dispersion of these boulders northwards, southwards, and easterly by a great diluvial current; and still more so their transport from the valley of the Eden over the lofty summits of Stainmoor Forest, into the valley of the Tees. The glacial theory, he states, offers, on the contrary, a solution of the difficulties. A glacier descending to the north from Shap Fell, would convey the blocks to the village of Shap, and distribute them throughout the intervening space; another glacier ranging to the south, would deposit the boulders on the hills, and in the valleys descending by Highbrow Bridge to Kendal; whilst a third great glacier, proceeding eastwards betwixt Crossby, Ravensworth, and Orton, would traverse transversely the upper part of the valley of the Eden near Brough, and accumulate piles of ice against the opposite escarpment until they overtopped its lowest depression in Stainmoor Forest, and disgorged their moraines into the valleys of the Greta and the Tees. Of the existence of this glacier there are abundant proofs in large mud moraines, loaded with blocks of granite in the upper portions, over which the road passes in the ascent to the gorge between Shap Fell and Birbeck Fell; and the rocks on both sides of this gorge are furrowed in an east and west

direction, striated and mammillated, especially the granite on the northern side. Dr. Buckland also shews, that there are other conditions in the physical structure of the district to facilitate the accumulation of glaciers, — as the presence of lateral mountains more lofty than those immediately contiguous to the longitudinal valley into which the glacier is supposed to have descended; and he concludes by referring to the results at which Professor Agassiz arrived during an independent examination of the Shap Fell district, and which results completely accord with those given by Dr. Buckland in this paper.

#### LINNEAN SOCIETY.

MR. FORSTER in the chair. — Among the presents on the table were two collections of specimens of plants, one formed in New Zealand by the late Mr. Allan Cunningham, and the other in the Philippine Islands by Mr. Cuming. In the latter collection were fine specimens of *Matonia pectenata*, a remarkable fern. — Read an account of two new genera of plants allied to *Oleaceæ*, by George Benthall, Esq., F.L.S. Considerable difference of opinion has existed among botanists regarding the place of this family in the natural system. Mirbel and Decandolle placed it among the polypetalous orders near *Aurantiaceæ*, which Brown considered as allied to *Santalaceæ*. The author, however, considers it as being closely allied to *Humiriaceæ* and *Styracæ*. He divides the family into three tribes, namely, *Oleaceæ*, *Opilicæ*, and *Isacineæ*. The two new genera, described in the present paper, are *Apodytes*, founded on a plant from Port Natal, in Southern Africa, and *Pogopetalum*, consisting of two species discovered by Mr. Schomburgk, in Guiana.

#### PARIS LETTER.

Academy of Sciences, Dec. 15, 1840.

SITTING of December 7th. — M. Adolphe Brongniart communicated to the Academy the result of his examination of the tissue of the fossil plant *Sigillaria elegans*, by means of thin polished and transparent plates, according to the method of Professor Nicholls. The specimen came from the carboniferous formations of the neighbourhood of Autun; and shewed that its structure differed much from that of the tree-ferns, as well as the *lepidodendron* of the same formation: it was more nearly similar to that of the *Stigmaria* among fossil plants, or that of *Cicadeæ* among living species. — M. Seguiet brought up a report on a machine, invented by M. Carville, for making bricks. It consisted of a vertical cylinder, furnished with cutting irons inside, and made to revolve round its axis while the argillaceous materials were poured in at the top. The rotatory motion caused these materials to be completely cut and ground before reaching the bottom of the vessel; and as a supply of water was also kept up in it, the clay, sand, &c., flowed out from an aperture in a fit state to be immediately moulded. An ingenious apparatus knocked off the moulds, and transported the bricks to the kiln. By this method a single horse had furnished power enough to make 1500 bricks in an hour.

Chemistry. — M. Boussingault communicated the result of some new researches into the composition of sugar of gelatine and nitro-saccharic acid. The composition of the former he had determined to be as follows: — C 32, H 36, Az 8, O 14; it combined readily with oxide of silver, and produced colourless crystals not easily soluble in cold water: their composition was indicated by the formula, C 32, H 30,

Az 8, O 11 (AgO) 4. The sugar of gelatine also united easily with oxides of copper and lead, forming products very soluble in water. The form of the combination with copper was an azure-blue crystalline mass; and the combination with lead gave fine colourless needles. Much difficulty, M. Boussingault stated, had been found in obtaining this last combination in constant proportions, the proportion of the oxide of lead having often varied from 63.5 to 64.5; but, by adopting a long mode of treatment, a salt was obtained containing 64.9 of oxide, and this was adopted for the formula. The nitro-saccharic acid was obtained by dissolving sugar of gelatine in azotic acid; and the result was a substance with a highly acid and slightly sweet taste. Its composition he had determined to be C 32, H 42, Az 16, O 37. The nitro-saccharate of silver crystallises easily, and burns without detonation. Its composition is C 32, H 34, Az 16, O 33 (AgO) 4.

An extract from a paper by M. Kœppelin was read to the Academy relative to improvements in Marsh's apparatus for detecting the presence of arsenic in any substance. One of the defects of Marsh's apparatus is, that part of the arseniated hydrogen escapes almost immediately, before the apparatus can be got fully to act; and the principle of the remedy proposed is to make the tube thinner, and of such a length that no portion of the gas can escape without there being time to fire it, and so obtain traces of arsenic. According to this method, also, chlorhydric acid is used instead of sulphuric acid for the production of oxygen.

M. Troplong, the lawyer (*quel nom!*), has been elected a member of the Academy of Moral and Political Sciences, in the room of the late M. Daunou. The other candidates were M. Thiers and M. de Cormenin.

Professor Mickiewicz will commence his course of lectures on Slavonic literature, the first ever delivered in Paris, at the Collège de France, on the 22d instant.

M. Lepolterin, one of the most rising of the young artists of France, has been affected with a violent ophthalmia at Naples, and has nearly lost his sight. The oculists, however, entertain hopes of his recovery.—We understand that the *salon* next year will be a good one. We have been in several ateliers, and if all the eminent artists now at work "come to the scratch" in March, we shall have a great treat.

Dr. Esquirol, the celebrated mad doctor and writer on insanity, died a few days since, at an advanced age.—The eminent astronomer and Director of the Observatory at Vienna, Littrow, died there on the 30th ult., of gout in the stomach, aged sixty. His loss will be severely felt in the scientific world. Four sons survive him, one of whom is joint-director of the Observatory.—Another astronomer, the Abbatte Scarpellini, Professor of Sacred Physics at Rome, died there recently.

The following is the official return of the number of pupils in all the Colleges of the Academy of Paris, for the current academic year:—

"Collège Royal de Louis-le-Grand, 1076; viz. boursiers royaux, 27; boursiers communaux, 35; pensionnaires libres, 451; externes libres, 119; externes des institutions et pensions, 444.

"Collège Royal Henri IV., 820; viz. boursiers royaux, 48; boursiers communaux, 37; pensionnaires libres, 404; demi-pensionnaires, 4; externes libres, 50; externes des institutions et pensions, 237.

"Collège Royal Saint-Louis, 881; viz. boursiers royaux, 48; boursiers communaux, 43; pensionnaires libres, 213; demi-pensionnaire, 1; externes libres, 145; externes des institutions et pensions, 431.

"Collège Royal Charlemagne, 798; viz. externes libres, 72; externes des institutions et pensions, 726.

"Collège Royal Bourbon, 980; viz. externes libres, 250; externes des institutions et pensions, 730.

"Collège Stanislas, 275; viz. boursiers communaux, 30; pensionnaires libres, 109; demi-pensionnaires, 2; externes libres, 30; externes des pensions, 14.

"Collège Rollin, 389; viz. boursiers communaux, 47; pensionnaires libres, 342."

Total, 5219. Increase over last year, 103.

We see announced for publication,—indeed, the first *livraison* has appeared,—an illustrated edition of the "Mémorial de St. Hélène," by Las Cases. It will contain an immense number of views of the island, portraits, &c. The idea, at the present moment, is not a bad one.

#### LITERARY AND LEARNED.

##### UNIVERSITY INTELLIGENCE.

OXFORD, December 10.—The following degrees were conferred:—

*Bachelor in Divinity*.—Rev. W. J. Copeland, Fellow of Trinity College.

*Bachelors of Arts*.—W. Russell, New Inn Hall; A. Heslop, Queen's College; H. H. Methuen, Exeter College; J. L. Williams, Jesus College.

CAMBRIDGE, December 9.—The following degrees were conferred:—

*Doctor in Physic*.—J. B. Nelson, Trinity College.

*Masters of Arts*.—R. S. Drayton, Trinity College; H. Carrington, Caius College; A. R. Kirkpatrick, Trinity Hall; C. Temple, Magdalene College.

*Bachelor of Arts*.—T. B. L. Hall, Sidney College.

#### SOCIETY OF ANTIQUARIES.

DEC. 10th. Mr. Hamilton, V.P. in the chair.—Mr. Fitch communicated an account of the discovery of the remains of Sir Thomas Brown in the church of St. Peter Mancroft, Norwich, with a copy of the inscription on the coffin-plate.—A paper was read from Mr. Jardine, containing historical observations on the conspirators in the Gunpowder Plot and their congregating at Bath, and at Lippert, in Gloucestershire; and particularly with reference to a letter from Lord Mountague to Catesby, and another from Thomas Wintour, discovered and formerly communicated by Mr. Bruce: Mr. Jardine being of opinion that, however Lord Mountague was implicated in former conspiracies, those two letters did not, as Mr. Bruce considered, prove that he was compromised in that of the Gunpowder Plot.

Dec. 17th. Mr. Amyott, Treasurer, in the chair.—Mr. Feister exhibited an antique bronze figure of a horse's head.—A paper was read from Mr. Kempe, containing observations and copious illustrative extracts from a MS. book on grammar, astrology, and medicine, of the fifteenth century, in the possession of J. M. Molyneux, Esq., of Loseley House, Surrey.—Mr. Halliwell communicated a contemporary note of some events of the time of Henry VIII., from the Harleian MSS., No. 6047.

#### LITERARY AND SCIENTIFIC MEETINGS FOR THE ENSUING WEEK.

Tuesday.—Zoological, 8 p.m.

Thursday.—Numismatic, 7 p.m.

Saturday.—Westminster Medical, 8 p.m.; Mathematical, 8 p.m.; Physical, 8 p.m.

#### FINE ARTS.

##### PORTRAIT OF DANTE.

A VERY interesting discovery has been made at Florence of a portrait of this celebrated man, painted by his friend Giotto: it has been mentioned in some of the papers, but not with the justice due to a countryman of our own, Mr. Kirkup, whose long residence in Florence, deep interest in Dante, and reading and research, led him to conjecture that such a portrait might still exist beneath dirt and whitewash—the accumulation of centuries—in a room formerly a chapel in the public prison.

Mr. Kirkup, an excellent artist, had ascertained, from a record of Filippo Villani, a writer of the fourteenth century, that the walls had

formerly been painted by Giotto, and that the portrait of his friend Dante, then a remarkably handsome young man, had been introduced in one of the pictures. Acting upon this, with Signor Bezzi and an American gentleman, they agreed with a fresco painter that he should, for 240 francscent (about 60*l.*, to which they subscribed in equal proportions), remove the whitewash with the care which was necessary. Great difficulty existed with the government; but at length the desired permission was procured. They set to work, and three sides of the walls had already been removed without success, when the government—sure, if the portrait was to be found, that the fourth wall must furnish it—took the further proceedings into its own hands, and engaged to pay the person employed, and to proceed with the search. On the fourth wall it was found, and, though the pictures were greatly injured, the head of Dante was found to be in fine preservation: all copies, however, were forbidden, and those who had led to the discovery were refused the gratification of possessing one. Mr. Kirkup, however, after repeated visits, succeeded in making a drawing from memory; and it is stated that nothing can be more satisfactory than the identity of the head. The portrait known of Dante is made from the mask taken from his face after his death, and the authenticity of this establishes the identity of the portrait by Giotto. The lovers of the immortal poet will feel that a debt of gratitude is due to those gentlemen whose zeal has led to this interesting discovery.

#### BRITISH ARCHITECTS.

THE first meeting of the Royal Institute of British Architects (for the session) was held on Monday evening 7th inst., Earl de Grey in the chair.—Several distinguished scientific foreigners were elected honorary and corresponding members. Donations of books during the recess were announced by Charles Fowler, Esq., honorary secretary; and particular attention was called to a work by Vitruvius, published in Italy early in the sixteenth century, containing an account of the paddle-wheel and some motive engines, as a proof of the advance of mechanical science at that period.—Architectural drawings and plans were exhibited of a splendid palace in the north of Europe, deposited by C. Tottie, Esq.; and of an old manor-house still existing in England, supposed to have been built by Inigo Jones prior to the erection of the Banqueting-House, Whitehall. The latter were drawn and presented by C. J. Richardson, Esq., from whom a letter was read, adducing reasons for supposing it to be the work of that great master.—Mr. Poynder read a very interesting communication 'On Gothic Architecture,' illustrated by several drawings, shewing that many complications of the order, which have usually been considered unnecessary, were designed by the early masons to give greater support to the fabric.—Specimens of Potts's newly-invented picture rail moulding were exhibited; and Mr. Nottingham pointed out to the members its evident superiority over the ordinary rod as an architectural moulding to the room, its strength and utility for hanging pictures, and its ready adaptation as the bottom member of the cornice, were much admired and approved.—Thanks were voted to the respective contributors, and to the noble chairman, and the meeting adjourned.

#### NEW PUBLICATION.

*Hair's Sketches of the Coal Mines in Northumberland and Durham.* Madden and Co. REGARDED as a work of art, Mr. Hair's

*Sketches* are entitled to much commendation; far more, indeed, than the title of them may at first seem to warrant,—at least to those who are unacquainted with the magic of the pencil, and the charm it throws over whatever object comes within the range of its practice. The forms themselves, as they rise from the surface, are most of them highly picturesque, and, contrasted with the scenery in which they are found, have a light and lively effect. Every number contains three of these finished sketches, for such they may be called, from the care with which they are executed.

### THE DRAMA.

*Covent Garden.*—*The Castle of Otranto* is to be the subject of the Christmas pantomime. We anticipate great fun for our younger readers in the Giant Helmet.

*Haymarket.*—At a time when bankers' failures vex the public, it is gratifying to know that *Money* is drawing without stint at this house. All parties appear to be perfectly satisfied with the firm of Webster and Co., and nothing seems to be more agreeable to them than the general acceptances payable and duly paid every night.

*Adelphi.*—As Napoleon's remains were receiving homage in Paris, Mr. Yates produced a *Vision of St. Helena*. It is so much a *pièce de circonstance*, that we need only say it contains much beautiful and faithful scenery, and will run its course while its subject is the theme of all our newspapers.

### VARIETIES.

*H.B.* has given us three new Sketches, Nos. 662, 663, and 664. The first, a very clever group, John Bull peeping into a show-box exhibiting by Lord Palmerston, who is pointing attention to the capture of Acre and the bombardment of Pekin. O'Connell meanwhile is picking John's pocket of a handkerchief, marked Ireland; and on the other side, Lords Melbourne and Normanby are admiringly following a disappearing figure of the Queen. The next represents the "*New Pasha of Egypt*," Lord Palmerston, *en grand Turc*, on horseback, and Lord Ponsonby as Tartar. The third is the "*Wandering Minstrel*," Wellington, playing on the Union pipes, attended by Lords Morpeth and Ebrington, Mr. Shaw, &c., as ragged boys, whilst O'Connell, from a window, bids, "Go away, honest man; we do not want your music here." This is also well worthy the humour and art of *H.B.*

*Panorama of Damascus.*—No place in the world could offer a finer subject for a panorama than the city of Damascus, with its minarets, gardens, tombs, mosques, ancient walls and buildings, gates and khans; with its surrounding scenery of deserts, rivers, and mountains; and with its enlivening living groups of various Oriental costume, camels, processions, sheik, priests, Arabs, Christians, and merchants. Of all these Mr. Burford has made almost more than his usual picturesque and effective illusion in a panorama, of which we had yesterday a private view. It is a splendid production, and would at any time be of great public attraction; but at present, with so vivid an interest attached to the scene—an interest superadded to that which belongs to its Scriptural antiquities, we can imagine no effort of the pencil better calculated to gratify the public curiosity and feeling.

*Buonaparte MS.*—A statement of the political and military condition of his native Corsica in 1793, written by Napoleon when captain of the fourth artillery, is said to have

been found in the library of the late M. Hernandez, of Toulon. This holograph consists of fourteen pages, and is thought to be the first political effort of the future imperial writer.

*Burton's Anatomy of the Stage.* Ditto of *Grimace*. Chapman and Hall.—Two holiday toys which, by turning round a circle behind, likeness and caricatures to four open spaces in the front, and produces a variety of several hundred portraits. Some of them are amusing, but we need some instructions as to the mode of using them, and the appearances intended to be exhibited.

*A Christmas Carol, with Music* (Tilt and Bogue).—Another seasonable novelty, the words and music of the old style of carol, but surrounded by a lithographed border of much grace and fancy, designed and etched by W. B. Scott.

*Plan of the Town and Fortress of Acre* (J. Arrowsmith).—A correct view of the place and of its attack (similar to a private one we have seen prepared for the Admiralty). It is executed by M. Bretell, an engineer, long in the service of the Pasha, and supplies every needful information.

*Earthquakes.*—According to the latest accounts the earthquakes of Zante continue, but are not so violent as the earlier shocks.

*Winter.*—Immense flocks of wild-fowl, passing over the interior of our island, seem to indicate great severity of weather in more northern regions.

*Agriculture.*—At a late meeting of the Cambridge Philosophical Society, Professor Henslow delivered a lecture to the Society on the subject of certain diseases in corn. These were illustrated by large drawings, giving representations of seven distinct diseases; four of them occasioned by fungi, viz. *Uredo caries* (bunt), *Uredo segetum* (smut), *Uredo rubigo* (rust), and *Puccinia graminis* (mildew). Prof. H. observed, that he had completely satisfied himself that *Uredo rubigo* and *Puccinia graminis* were merely different states of the same species; and that he had also obtained ample proof that *Uredo rosea* and *Acregma mucronata* were similarly related. The other three diseases noticed and illustrated were the ergot, the ear cockle (occasioned by the *Vibris tritici*), and the abortion of the genners produced by the larva of the wheat-midge (*Cecidomyia tritici*). Prof. H. strongly recommended the use of the sulphate of copper as a protective against the bunt and smut, but considered that practical men had not yet obtained sufficient information of the precise conditions under which it should be applied. He particularly insisted upon the ravages of the wheat-midge being greater than was generally suspected, and suggested the propriety of invariably threshing out all corn before the end of May, as the most probable means of reducing the attacks of this destructive insect within narrow limits. He expressed his opinion that one of the most important steps to be made towards securing crops from certain disorders, as well as for growing unmixed samples, was to form a distinct branch of industry for the raising of seed-corn.—*Cambridge Chronicle*.

*The Fiddle-Faddle Fashion-Book, &c.*, is a humorous caricature of the ladylike fops of our day. The sham advertisements on the cover are happy pieces of drollery; and the lusty dame, surveying her small-waisted corsets, a Hogarthian *jeu d'esprit*. The letterpress is also very entertaining; and the whole a clever satire on fashionable periodicals.

*Bremicker's Comet.*—Its perihelion passage was on November 13, it has therefore retreated

a considerable distance from the sun; and although it still approaches the earth, it is not with sufficient rapidity to counteract in appearance its loss of light, for it has now become so faint as to be barely perceptible. Its places in the early parts of the evenings of Nov. 26, 27, and 28, were—

22	10	7			36	22
22	18	5			37	5

J. GLAISHER.

—*Cambridge Chronicle*.

*London.*—"Though London increases every day, and Mr. Herschel has just discovered a new square or circus somewhere by the New Road in the Via Lactea, where the cows, used to be fed, I believe you will think the town cannot hold all its inhabitants, so prodigiously the population is augmented. I have twice been going to stop my coach in Piccadilly (and the same has happened to Lady Ailesbury), thinking there was a mob; and it was only nymphs and swains sauntering or trudging. The other morning, i.e. at two o'clock, I went to see Mrs. Garrick and Miss Hannah More at the Adelphi, and was stopped five times before I reached Northumberland House; for the tides of coaches, chariots, curricles, phaetons, &c. are endless. Indeed, the town is so extended, that the breed of chairs is almost lost; for Hercules and Atlas could not carry anybody from one end of this enormous capital to the other. How magnified would be the error of the young woman at St. Helena, who, some years ago, said to a captain of an Indian, 'I suppose London is very empty when the India ships come out!'"—*Horace Walpole's Letters*.

### LITERARY NOVELTIES.

#### LIST OF NEW BOOKS.

Poor Jack, by Captain Marryat; with Illustrations by Clarkson Stanfield, 8vo. 14s. bound.—On the History and Natural Arrangement of Insects, by W. Swainson and W. E. Shuckard, 1 cap. 6s.—Dr. Keith on the Evidence of Prophecy, twenty-third edition, 12mo. 7s. 6d.—Jairah, and other Poems, by Lady E. S. Wortley, post 8vo. 7s.—Eva, or the Error; a Play, by Lady E. S. Wortley, 8vo. 5s.—Bishop Mant's History of the Church of Ireland, Vol. II. 8vo. 17s.—Illustrations of the Various Breeds of the Horse, by Professor Low (two Parts), Part I. atlas 4to., with four Coloured Plates, 21s.—My Home, my Country, and my Church, by J. Howe, M.D., 12mo. 6s. 6d.—The Sunday Lessons, with Bishop Mant and Dr. D'Oyley's Notes, 18mo. 6s.—Lessons on the Liturgy, 18mo. 2s.—The Police Guide, by R. Charnock, 12mo. 6s.—Naomé; or, the Last Days of Jerusalem, by Mrs. Webb, 12mo. 7s. 6d.—Pictorial Bible History: Old Testament, fcap. 4s. 6d.—The Knightage of Great Britain and Ireland, 18mo. 7s. 6d.—The Tower of London, by W. H. Ainsworth, 8vo. 15s.—The Forester's Offering, by S. T. Hall, fcap. 3s.—Griesbach's Greek Testament, new edition, 12mo. 7s. 6d.—(Edipus Tyrannus of Sophocles, with Notes by T. Mitchell, 8vo. 7s.—New Supplement to Euclid's Elements of Geometry, 8vo. 3s.—J. C. Burgess's Easy Introduction to Perspective, 8vo. 5s.—Mrs. Norton's Dream, and other Poems, new edition, post 8vo. 10s. 6d.—Popular Traditions of England: 1st series, Lancashire, by J. Roby, 3 vols. post 8vo. 11. 11s. 6d.—T. Webster on the Law of Patents, royal 8vo. 9s.—Rev. W. Gresley's Portrait of a Churchman, 6th edition, fcap. 4s.—Poems, by Lady Flora Hastings, post 8vo. 15s.—Oratory, a Lecture, by the Rev. R. Jones, D.D. 8vo. 1s.

## SCOTTISH (WIDOWS' FUND) LIFE ASSURANCE, founded on the original Basis of THE LONDON EQUITABLE.

THIS IS THE OLDEST AND MOST EXTENSIVE LIFE OFFICE IN SCOTLAND.

Instituted A.D. 1815.

Accumulated Fund, NINE HUNDRED AND SEVENTY THOUSAND POUNDS.

Annual Revenue, ONE HUNDRED AND SEVENTY THOUSAND POUNDS. Whole Profits belong to the Assured.

The Additions made by way of Bonus to the Policies of this Office vary from Ten per cent to upwards of Sixty per cent on the Capital Sums assured, according to the duration of the Policy.

Parties desirous of insuring are reminded of the advantages which will accrue to such as are effected within the current year. The Regulations of the Society requiring that, before additions can become absolutely vested, the Policies entitled thereto must have been in endurance at least five full and complete years. This condition, which forms part of the system of most of the Mutual Insurance Societies, will, of course, be satisfied at the next periodical investigation, on 31st December, 1845, in regard to all Policies opened within the year 1840.

Tabular View of the Amount of Additions, Retrospective or Vested, and Contingent Prospective, declared at 1st January, 1839.

Year of Entry	Sum Assured.	Total Benefit with Vested Additions at 1st Jan. 1839.	Sum Payable if decease takes place after Payment of the Premium due in 1845.
1815	£1000	£1587 4 6	£1899 8 7
1820	1000	1345 4 0	1533 10 7
1825	1000	1259 14	1436 1 2
1830	1000	1124 0 0	1334 11 9
1835	1000	1080 0 0	1231 4 0

Every information may be readily obtained on application to the Manager in Edinburgh, or to any of the Society's Agencies throughout the country. Parties wishing to effect Assurances so as best to meet any particular contingencies, or effect any specific object, will receive the requisite information, and have the suitable Form of Proposal transmitted to them; and all official communications of this nature are considered strictly confidential.

Annual Premium payable during Life for an Assurance of £100.

## ROYAL LACE QUILT. A beautiful

Facsimile of the splendid Lace Quilt, of British manufacture, presented to Her Majesty for the Gilt of the Princess Royal, will be given with the "Court Journal" of Saturday next, Dec. 19th. By remitting eight-pence in a penny-post letter to any bookseller or newsmen, or to the publisher, 19 Catherine Street, Strand, the paper containing this beautiful specimen of British Lace will be forwarded to all parts of the country, and on the Continent, postage-free. To prevent disappointment, early orders should be given.

W. Thomas, Publisher, 19 Catherine Street, Strand.

## THE RAISING OF LAZARUS.

Engraved by VENDRAMINI. From the celebrated Picture now in the National Gallery. Designed by Michael Angelo, and Painted by Sebastien del Piombo. Intended as a Companion to Morghen's celebrated Engraving of the Transfiguration, by Raphael.

This fine Engraving was produced about ten Years back; and the Journals of that period bear ample testimony to its merit. Seven Years were bestowed upon it by Signor Vendramini; a Memoir of whom will be found in the "Gentleman's Magazine" for March 1839, where this and other productions are referred to. This Engraving has never been advertised; and the few copies that have been disposed of are principally in the hands of the Engraver's private friends. He took no pains whatever in directing the publication, and, at his death, some copies of the Proof and other Impressions were found, which are at this time offered for Sale.

Price: £ s. d.  
 Prints ..... 3 3 0  
 Plain Paper Proofs ..... 4 4 0  
 Proofs on India Paper, with Letters ..... 5 5 0  
 Proofs before Letters ..... 8 8 0  
 Size of the Engraving, without letters or margin, 27 inches and a quarter, by 19 inches and a half.  
 London: Henry Wix, 41 New Bridge Street, Blackfriars; Charles Tilt, 95 Fleet Street; and J. Fraser, 215 Regent Street.

Now publishing, in Quarterly Parts, at the rate of Eight Sheets each, Imperial folio, in handsome cloth boards, price 12s. 6d.

## NICHOL'S CITIES AND TOWNS OF SCOTLAND ILLUSTRATED, in a Series of Views in Tinted Lithography, in the Style of the recent Works of Harding, Stanfield, Roberts, Vivian, &amp;c. With Plans and Topographical Details Corrected to the Date of Publication.

Now Ready,

The City of Aberdeen, in Eight Sheets, price 12s. 6d.

The City of Perth, in Eight Sheets, will be published January 1, 1841, price 12s. 6d.

The City of Glasgow, in Sixteen Sheets, will be published April 1, 1841, price 35s.

Falsley, Dumfries, Ayr, and Greenock, will immediately follow.

The following are in Preparation—Inverness and Elgin, Stirling, St. Andrew's, Dundee, Montrose, Arbroath, Kilmarnock, Lanark, Edinburgh, &amp;c.

Critical Notices.

"Nichol's Views of Aberdeen.—These form a portion of an extensive work projected by the Messrs. Nichol of Montrose; the object of which is to present, at a comparatively moderate price, and in a superior style of art, pictorial illustrations of the principal cities and towns of Scotland. The number before us affords a favourable specimen of the undertaking. It contains nine views of Aberdeen, and there are, interspersed throughout the work, views of some of the principal buildings in the city. The subjects are in general well chosen, and the engravings are executed with great fidelity and spirit. We are glad to understand that the work meets with encouragement commensurate with its merits. Should the subsequent parts prove as deserving of public patronage, the enterprising publishers may calculate on the success of their useful and elegant work."—*Aberdeen Journal*.

"This work will be one of the most splendid of its kind in existence."—*Aberdeen Bannet*.

"The whole of the views are remarkably correct, and lithographed with great ability and care."—*Aberdeen Herald*.  
 Published by Longman and Co. and Tilt and Bogue, London; J. and D. Nichol, Montrose; Oliver and Boyd, Edinburgh; Lumsden and Son, Glasgow.

## EDINBURGH REVIEW, No. 146.

Advertisements for the forthcoming Number of the "Edinburgh Review" are requested to be sent to the Publishers on or before Thursday, December 24; and Bills on or before Saturday, December 26.  
 30 Paternoster Row, Dec. 18, 1840.

## THE BRITISH CRITIC and QUARTERLY THEOLOGICAL REVIEW.—Advertisements

for the ensuing Number are requested to be sent on or before the 24th of this Month, or Catalogues and Bills by the 30th instant, to No. 42 St. Paul's Churchyard.

## BOOKS IN THE PRESS.

MESSRS. SAUNDERS and OTLEY have nearly ready the following New Publications:—

SIR E. L. BULWER'S NEW NOVEL.

In 3 vols. post 8vo.

## NIGHT and MORNING; a Novel.

By the Author of "Pelham," "Eugene Aram," &amp;c.

MR. JAMES'S NEW HISTORICAL WORK.

In 2 vols. 8vo.

Richard Cœur de Lion; his Life and Times.

By G. P. R. James, Esq. Author of "Edward the Black Prince," "Louis XIV.," &amp;c.

MRS. TROLLOPE'S NEW NOVEL,

The Blue Belles of England,

In "The Metropolitan Magazine," commencing with the Number for January.

LADY CHATTERTON'S NEW WORK.

Home Sketches and Foreign Recollections.

By Lady Chatterton.

In 3 vols. post 8vo. with Illustrations.

V.

The Romance of Jewish History.

By the Misses Moss.

In 3 vols. post 8vo.

VI.

Susan Hopley; or, Circumstantial Evidence.

A Novel. In 3 vols. post 8vo.

VII.

MAJOR MICHEL'S NEW WORK.

Henry of Monmouth; a Historical Novel.

In 3 vols. post 8vo.

VIII.

The Playfair Papers; or, Brother Jonathan.

In 3 vols. post 8vo.

Saunders and Otley, Publishers, Conduit Street.

On the 1st of January, No. 1. price 1s.

## THE SUBURBAN HORTICULTURIST.

By J. C. LOUDON, F.L.S. H.S. &amp;c.

To be completed in Twelve Octavo Numbers.

London: Published for the Author, by William Smith, 118 Fleet Street.

On the 9th will be published,

## DODSLEY'S and RIVINGTONS'

ANNUAL REGISTER, for the year 1839.

Rivingtons: Longman and Co.; Hamilton and Co.; Whitaker and Co.; Simpkin and Co.; Sherwood and Co.; and other Proprietors.

Lately published, the Volume for the Year 1838, price 16s.

GUIZOT'S NEWEST WORK.

In a few days will be published, fcap 8vo. cloth boards, WASHINGTON.

By M. GUIZOT.

Reprinted from the original French edition, accompanying the Correspondence and Works of Washington, but not obtainable in a detached form.

D. Nutt, Foreign Bookseller, 158 Fleet Street.

## MR. TEGG has just published for the

Christmas Holidays the following New Books, by MARY HOWITT, forming Part of a Series, entitled "Tales for the People and their Children," viz.:

Strive and Thrive; a Tale. Price, bound,

2s. 6d.

Hope on! Hope ever! a Tale. Price, bound,

2s. 6d.

Sowing and Reaping; a Tale. Price, bound,

2s. 6d.

Who shall be Greatest? a Tale. Price,

bound, 2s. 6d.

Also, by Mr. Wright,

Breakfast-Table Science, 2s. 6d.

London: Printed for Thomas Tegg, 73 Cheapside.

## On the 1st of January will be published,

## WILD SPORTS OF SOUTHERN AFRICA; being a Narrative of an Expedition through the Territories of the Chief Mosellestee up to the Tropic of Cancer.

By Capt. W. CORNWALLIS HARRIS.

Illustrated with Twenty-six coloured Prints, large 8vo. price

21. 2s.

William Pickering, Publisher, Chancery Lane.

## NAPOLEON and TITMARSH.

## MR. CUNNINGHAM begs to announce

that Mr. MICHAEL ANGELO TITMARSH is at this moment at Paris, preparing a Pictorial Account of the Funeral of Napoleon.

1 St. Martin's Place, Trafalgar Square.

## Just ready, in 1 thick vol. fcap 8vo. bound,

## THE LONDON ALMANAC, Official

Register, and County Calendar, for England and Wales, for the Year 1841.

Containing

The Calendar, with full and copious Tables; Lists of London and Country Bankers and Joint Stock Banks; all the Newspapers published in the United Kingdom; Railways; Post Office Regulations, &c.; the Royal Family of England, with their Households, the Ministry, and Privy Council; a complete

## EXISTING AND EXTINCT PEERAGE AND BARONETAGE;

Orders of Knighthood, &c.; the Imperial Parliament; all the Official Departments of Government, with the Officers, HOURS of Business, &c.; East India Company; &c.

## NAVY AND ARMY LIST;

The Superior and Inferior Courts of Law, Judges, and Legal Officers; the County Authorities, Lord and Deputy Lieutenants, High Sheriffs, Militia, &c. and the

## JUSTICES OF THE PEACE IN EACH COUNTY;

(taken from the Official Roll at the Crown Office, and corrected by the several Clerks of the Peace); a Clerical List, the Bishops, and Dignitaries; and a complete List of

## THE BENEFICED CLERGY OF ENGLAND AND WALES;

The Universities, Colleges, and Public Schools throughout the Kingdom;

## THE CORPORATION, &amp;c. OF THE CITY OF LONDON;

The Police; the Livery Companies, with the Date of their Charters, Expense of taking up Freedom and Livery in each; Life Assurance Companies, with the Date of their Establishment, Capital, and a Tabular View of the Premiums charged by each Office; other Public Companies; Learned and Scientific Societies and Institutions, Hospitals, Charitable and Benevolent Institutions, Religious Societies, &c.; and a mass of valuable Statistical Information, chiefly compiled from Parliamentary Returns.

The long-felt want of a comprehensive book of reference for England and Wales, of a similar character to those already existing for Scotland and Ireland, has induced the Publishers to undertake the present work, on which they have spared no labour or expense to render it both full and accurate. They have derived their information from the most authentic sources, having made express application to the authorities in the various departments; and they have met with such uniform willingness to afford the desired assistance, that they feel confident in saying the London Almanack will be found not only a much more comprehensive, but also a far more accurate Register, than any previously published.

London: Scott, Webster, and Geary, Charterhouse Square.

## CHRISTMAS AMUSEMENT.

Just ready, price 4s. each,

## PHYSIOGNOSCOGRAPHY.—No. I.

The Anatomy of Grimace. No. II. The Anatomy of the Stage. Each showing 880 characters of Faces and Costumes, beautifully coloured. Designed and engraved by Charles Burton. Chapman and Hall, 138 Strand.

## MONTHLY MAGAZINE AND REVIEW.

On January 1st, 1841, will appear No. 1. of the

## CHRISTIAN REMEMBRANCE. A

Monthly Magazine and Review.—This Magazine will henceforth be conducted on an enlarged and improved plan, combining as much as possible the features of the quarterly and monthly periodical. A considerable accession of literary talent has been secured; and it is hoped, that in its new form, the Remembrancer will be deemed worthy of extensive public support. Intending subscribers are requested to enter their names as soon as possible at their respective booksellers. There will be no increase of price.

James Burns, 17 Portman Street, Portman Square.

To whose care all Communications and Books for Review are to be addressed.

On Tuesday will be published, in 1 handsome vol. price 15s.

**THE LADIES' MAGAZINE of GARDENING.**

By MRS. LOUDON.  
In Monthly Numbers, royal 8vo. with Coloured Plates. The First Number will be published January 1st, 1841, price 1s. 6d. London: Published by William Smith, 114 Fleet Street. Edinburgh: Fraser and Crawford. Dublin: Curry and Co.

**CUVIER.**—On the 1st of January, 1841, will be published, a highly finished Portrait, in line, of the great Naturalist, from a Picture painted from express sittings at his residence in Paris, in 1831 (the year preceding his death), by W. H. Pickersgill, R.A., Engraved by George T. Doo. As the authenticity of an historical portrait should be unquestionable, in order to bespeak any degree of weight and interest in the minds of those who are admirers of the distinguished original, the following citations from the correspondence of La Baronne Cuvier, widow, and of Mademoiselle Duvaucel, step-daughter, of the great naturalist and philosopher, may be deemed satisfactory and sufficient for that object.

"Vous seul avez eu l'honneur, non seulement les traits, mais l'âme, et la haute et puissante intelligence, du grand homme que nous pleurons."—*Sophts Duvaucel to W. H. Pickersgill, Esq.*  
"Mon cher Monsieur, l'émotion profonde que j'ai ressentie à la vue de la noble et chère image que votre pinceau a retracé avec une si admirable vérité me m'a pas laissé la force de vous exprimer plus la vive reconnaissance dont je suis pénétré."—*Mme. Yve. Cuvier, to M. Pickersgill.*

The following was contained in a letter to Mrs. R. Lee (formerly Mrs. T. Edward Bowditch), author of the interesting "Memoirs of Cuvier," and communicated by that lady to Mr. Pickersgill:—"C'est lui, c'est sa pensée noble, pure, élevée, et souvent mélancolique, laquelle toujours bienveillante et calme, comme la vraie bonté. C'est son âme dans ses yeux. C'est le grand homme, passant sur la terre, et sachant qu'il y a quelque chose au-delà."

75 Proofs before Letters ..... 42 8 0  
100 Proofs on India Paper ..... 1 11 6  
100 Proofs ..... 1 1 0  
Prints, half-a-guinea.

The Bust and Background terminating in Vignette. The above Portrait may be bound up with the folio or quarto copies of the Works of Cuvier.

To be had of all respectable Printers and Booksellers.  
A list of the names of subscribers for Proof Impressions will be published.

MR. GEO. T. DOO,  
25 St. Peter's Square, Hammermith.

# MR. BENTLEY'S LIST OF NEW WORKS.

## MEMOIRS OF THE RIGHT HON. WARREN HASTINGS, LATE GOVERNOR-GENERAL OF INDIA;

Including his JOURNALS and LETTERS, now first published from the Originals, in possession of the Family.  
By the Rev. G. R. GLEIG, Author of "The Life of Sir Thomas Munro," "Traditions of Chelsea College," &c.  
In 2 vols. demy 8vo. with a Portrait from an original Picture. (On Wednesday next, the 23d instant.)

III.  
THE NEW ROMANCE BY THE AUTHOR OF "THE PILOT," "THE PATHFINDER," &c.

## MERCEDES OF CASTILE;

A ROMANCE OF THE DAYS OF COLUMBUS. By J. FENIMORE COOPER, Esq. In 3 vols. post 8vo.

IV.

## THE LIFE, JOURNALS, AND CORRESPONDENCE OF SAMUEL PEPYS, ESQ.

F.R.S. &c.

Secretary to the Admiralty in the Reigns of Charles II. and James II.

INCLUDING A NARRATIVE OF HIS VOYAGE TO TANGIER, AND JOURNAL OF HIS RESIDENCE THERE, &c.

The whole now first published from the Originals, in 2 vols. 8vo. with a Portrait from an original Picture.  
"An interesting and welcome addition to the unique diary of Pepys, rendering the picture of the wor-shipful secretary more complete and worthy of admiration. While not one of the whimsical and characteristic features of Pepys is effaced by this new work, intelligence and benevolence are added. From pages so rich it is not easy to decide where to begin the pleasant labour of extracting."—*Athenaeum*.

V.

## The Dowager;

Or, the Modern School for Scandal.

By Mrs. Gore.

Author of "Mothers and Daughters," &c.  
In 3 vols. post 8vo.

"Full of genuine comedy, which, if transferred to the stage, would be most effective. Mrs. Gore depends principally for success upon her powers of wit; and what she sees vividly she traces with vivacity. This is a work that forms a feature in the literature of the year."—*Athenaeum*.

VI.

## The Three Peers; a Novel.

By Lady Stepheny.

In 3 vols. post 8vo.

"The interest of this work is well kept up. It is written in a vigorous style, and the characters are sketched with considerable ability and talent."—*The Times*.  
"A story better knit together than is usually the case with novels of this class; the interest is maintained with considerable skill."—*Athenaeum*.

VII.

## Elphinstone; a Novel.

In 3 vols. post 8vo.

"This work will be read with universal interest. It is the production of one who has within him all the elements of good writing, and who possesses, moreover, the power to turn them to the best possible account. His characters act, speak, and think, as they are found on the stage of actual life. All his descriptions are natural, and his dialogue easy and dramatic."—*Morning Herald*.

VIII.

## MEMOIRS OF THE COURT OF ENGLAND DURING THE REIGN OF THE STUARTS.

By J. HENEAGE JESSE, Esq. In 4 vols. 8vo. with Engravings from original Paintings.

\* \* \* The First Two Volumes, or the Last Two Volumes, may be obtained separately, to complete Sets.

"The great mass of interesting matter to be found in these volumes makes them one of the leading publications of the season. We sincerely congratulate 'the reading public' on this addition to their stock of amusement and information, without which no library in the kingdom can be called complete."—*The Times*.

IX.

## The Thames and its Tributaries.

By Charles Mackay, Esq.

2 vols. 8vo. with numerous Illustrations.

"A most felicitous subject: such a book has long been wanted. The author has here made a valuable and graceful addition to the literature of the day."—*Morning Herald*.

X.

## The Comic English Grammar.

By the Author of "The Comic Latin Grammar."

In post 8vo. with upwards of Fifty characteristic Illustrations by Leech.

XI.

## A SUMMER AMONGST THE BOGAGES AND THE VINES.

By Miss Louisa Stuart Costello,

Author of "Specimens of the Early Poetry of France."  
In 2 vols. 8vo. with numerous Illustrations.

## CHEAP AND ELEGANT CHRISTMAS PRESENTS AND NEW YEAR'S GIFTS.

Now in course of publication. In neatly bound pocket vols. price 6s. each, embellished with Engravings.

## THE STANDARD NOVELS AND ROMANCES.

The following celebrated Works of Fiction are now, among many others, comprised in this Series:—

J. FENIMORE COOPER.—The Pilot, the Spy, the Last of the Mohicans, the Pioneers, the Prairie, Lionel Lincoln, the Borderers, Water Witch, the Bravo, the Red Rover, the Headman, Heidenmauer, Precaution.  
CAPTAIN MARRYAT.—Peter Simple, Jacob Faithful, Japhet in Search of a Father, King's Own, Mr. Midshipman Easy, Newton Forster, the Pasha of Many Tales.  
SIR E. L. BULWER.—Eugene Aram, Paul Clifford, Last Days of Pompeii.  
MISS AUSTEN.—Sense and Sensibility, Emma, Mansfield Park, Northanger Abbey and Persuasion (in 1 vol.), Pride and Prejudice.  
G. P. R. JAMES.—Darnley, De L'Orme, Philip Augustus, Henry Masterton.  
THEODORE HOOK.—Maxwell, the Parson's Daughter, Jack Brag.  
MORIER.—Hajji Baba of Ispahan, Hajji Baba in England, Zohrab.  
MAXWELL.—Stories of Waterloo, My Life, the Bivouac.  
MISS JANE PORTER.—Thaddeus of Warsaw, the Scottish Chiefs, the Pastor's Fireside.  
GALT.—Lawrie Todd.  
HOPE.—Anastasia.  
PEACOCK.—Headlong Hall, Nightmare Abbey, Maid Marian, Crotchet Castle.  
W. H. AINSWORTH.—Rookwood.  
LOVER.—Rory O'More.  
CAPTAIN CHAMIER.—Ben Brace.  
MRS. TROLLOPE.—Vicar of Wrexhill, Widow Barnaby.  
MRS. S. C. HALL.—The Buccaneer.  
MR. THOMAS HOOD.—Tynney Hall, &c.

The New Volume, to be published with the Magazines at the end of December, will comprise Mrs. Gore's Popular Romance,

## THE SOLDIER OF LYONS; or, the Tuilleries.

To be followed by those admirable Fictions, "Marriage," "The Inheritance," and "Destiny," each complete in 1 volume.

Now in course of publication, in neatly bound pocket vols. printed uniformly with "The Standard Novels," embellished with Engravings, price 6s. each.

## BENTLEY'S STANDARD LIBRARY OF POPULAR MODERN LITERATURE,

Which now comprises

WILD SPORTS OF THE WEST. By W. H. Maxwell, Esq. Author of "Stories of Waterloo," "The Bivouac," &c. Complete in 1 vol. with Fifteen Engravings, 6s.  
ASTORIA; or, Enterprise beyond the Rocky Mountains. By Washington Irving. Author of "The Sketch-Book," &c. Complete in 1 vol. with Portrait of the Author, 6s.  
THE TRADITIONS OF CHELSEA COLLEGE. By the Rev. G. R. Gleig, Author of "The Subaltern." Complete in 1 vol. with Portrait of the Author, 6s.  
THE DOMESTIC MANNERS OF THE AMERICANS. By Mrs. Trollope, Author of "One Fault," &c. Complete in 1 vol. revised, with Additions, and Fifteen Engravings (including a Portrait of Mrs. Trollope), 6s.  
THE LIFE OF A SAILOR. By Captain Chamier. Complete in 1 vol. with Engravings, 6s.  
ITALY; with Sketches of Spain and Portugal, and an Excursion to the Monasteries of Alcobaca and Batalha. By William Beckford, Esq. Author of "Vathek." Complete in 1 vol. embellished with a Portrait of Mr. Beckford, from the original Painting by Sir Joshua Reynolds. 6s.

The New Volume, just ready, will comprise

## LAMARTINE'S PILGRIMAGE TO THE HOLY LAND.

To be followed by

## GALT'S LIFE OF LORD BYRON, revised and corrected.

## HOWITT'S BOOK OF THE SEASONS;

Or, the CALENDAR OF NATURE.

New and improved edition, in a neatly bound pocket vol. embellished with Thirteen Engravings, price 7s. 6d.

"We recommend this delightful work to all lovers of nature. It is a jewel."—*Blackwood's Magazine*.

LONDON, SATURDAY, DECEMBER 26, 1840.

PRICE 8d.  
Stamped Edition, 9d.

### ADDRESS.

Our readers at home and abroad will be satisfied with a very short compliment from us at the close of our *twenty-fourth year*—very nearly a quarter of a century, during which, the *Literary Gazette* has endeavoured to fulfil its promise to the public, and had the gratification of feeling that its efforts were most liberally appreciated. The same diligence being exercised, it is hoped continues to make this journal an epitome of the arts, sciences, and literature of the time; so that nothing essential to either escapes due record and sufficient notice. The only new feature on which we have to congratulate ourselves is the weekly supply from our Paris correspondent, which, in so able and judicious a manner, brings us acquainted with proceedings on the Continent, in unison with our own in these several branches of human progress and improvement. Long and arduously did we try to accomplish this purpose, but, till now, never could succeed in realising our wishes to have a regular report of the kind, in which the writer should exercise a sound discretion, stating all interesting facts concisely, and only extending his remarks when the importance of the subject required more minute analysis or detail. We flatter ourselves that this object has been, at length, most advantageously attained.

### REVIEWS OF NEW BOOKS.

*The Tower of London, a Historical Romance.*  
By W. Harrison Ainsworth. Illustrated by George Cruikshank. 8vo. pp. 349. London, 1840. Bentley.

THIS publication, which all the reading world knows has been appearing in monthly parts, is in due time completed; and now comes before us in the shape of a finished and goodly volume. As such, it deserves our marked approbation. The spirit of the author has never relaxed; and the genius of his colleague, the illustrator, has kept pace with the demand upon it. Cruikshank has, indeed, walked into almost a new line, and added a series of compositions of profound depth and tragic power to those illuminations of fancy and humour with which he had previously enriched so many popular productions. Without derogating from the writers who have enjoyed the co-operation of his pencil, we must consider them to have been singularly fortunate in that union; for he has embodied their ideas in so striking a manner, and so palpably to the eye and sense, that a far more vivid impression was made upon the public mind than could have been effected even by the most graphic and real descriptions of the pen. The present volume is overflowing with these trophies; in which we know not whether most to admire the skill, accuracy, feeling, or invention, of the artist:—skill in execution,—accuracy, in delineating the scenes in the Tower, and the Tower itself, with which the story is throughout intimately connected,—feeling, in portraying the fearful and sanguinary events wherein the actors are involved,—and invention, in conceiving accessories of every kind, to heighten the whole of these very effective representations. There is an art worthy of the minute antiquary, and an art allied to the finest force of the imagination. Of the steel etchings, which represent all the great subjects, we are sorry we could give no example; but of the wood topographical cuts we might have made a few selections, to shew how much had been attained in this respect; but it is impossible to do jus-

tice to these finer productions of art in a sheet which has to be printed so rapidly as the *Literary Gazette*.

Having rather put the cart before the horse by these remarks, we must turn to Mr. Ainsworth's text. No writer of our day has been the object of so many and such various strictures as the author of "*Rookwood*," "*Jack Sheppard*," "*The Tower*," &c. Whether approving or condemning his performances, one fact is very clear, viz. that his influence upon the community has always been ranked at an enormous rate. Turpin was to, but did not, make us all highwaymen; this was prevented by the altered circumstances of the times, and travelling by railroad trains, which it might be inconvenient for robbers to stop. Jack Sheppard, on the contrary, is accused of having wonderfully recruited the "*Newgate Calendar*," and made burglary, pocket-picking, and thieving, quite fashionable among the lower orders. We are not slow to dispute the effect such a character might have upon youths imbued with an amiable predisposition that way; but only beg to observe that Jack was hanged, and so were all his companions. But if Mr. Ainsworth is potent for evil consequences, it must be conceded that he may be equally potent for good. And it is in this light that we are led so strongly to praise the present work. History is traced with extraordinary fidelity, and the lessons to be drawn from it are of the best as well as most useful kind. Let us then hope that the same hand which can incite a people may be as efficient in instructing a court. If so, we shall not need to fear in our day that despotic rule will ever attempt to trench on the lives and liberties of England; we need not fear the intrigues and falsehood of politicians; we need not fear trickery or deceit in foreign states or their ministers; we need not fear ambition or corruption in the upper circles that surround the throne; we need not fear slavishness or venality in dependants; we need not fear selfishness, nor want of principle, nor falsehood, any where in or near the precincts of government; for the author has placed all these in so gross a light, that it is but justice to attribute to him an ability to correct and amend as efficacious as an ability to inflame and mislead. Having thus settled the moral question of *The Tower*, we come to its literary pretensions; and here, we think, there will be little or no difference of opinion. It is a stirring and powerful narrative, consistent with the history of one of the most affecting tragedies ever acted upon loveliness, innocence, goodness, and royalty; and yet relieved by fancy and ingenuity equal to the most playful and grotesque invented characters and incidents. It is an episode of truth as relates to all its main points,—a genuine picture of the age,—and also, a tale of amusement and interest, which agree and never interfere with the pathos of the real drama. Lady Jane Grey, invited to the throne by the signature of a hundred and one of the most influential men in the kingdom (a document still preserved in the British Museum), in a few weeks perished on the scaffold. On these few weeks Mr. Ainsworth has constructed a romance which has added much new lustre to

his name, and deservedly classed him in the foremost rank of writers in this mingled species of history and fiction. One merit occurs to us to mention in this respect; he never confounds the two, and we can always perceive where the historical begins or ends, and where the fictitious is brought forward to vary the theme and increase the general effect. Altogether we have a book which elevates its writer very high in the ranks of contemporary literature, and fulfils every hope we entertained of him from his youthful and earliest promise.

*A Narrative of Events connected with the first Abdication of the Emperor Napoleon, Voyage to Elba, &c.* By Captain Sir T. Ussher, R.N. K.C.H. C.B. 8vo. pp. 100. 1841. Dublin: Grant and Bolton. London: Fraser.

FOR the present, we can only say of this curious narrative that it is full of personal anecdotes and particulars, which will not be read with less interest, on account of their appearance coinciding with the reappearance of all that remained of their memorable subject in Europe. His taking possession of his "*Empire*" of Elba, and of his tomb in Paris, may be contrasted with much effect:—we hastily select two or three brief passages relating to the former (reserving the rest of the volume for another notice):—

"When the man stationed at the mast-head hailed the deck that Elba was right a-head, he became exceedingly impatient, went forward to the fore-castle, and as soon as the land could be seen from the deck, was very particular in inquiring what colours were flying on the batteries. He seemed to doubt the garrison having given in their adhesion to the Bourbons, and it appears not without some reason, as they had, in fact, only done so during the preceding forty-eight hours, so that if we had had a fair wind I should have found the island in the hands of the enemy, and consequently must have taken my charge to the commander-in-chief, who would, no doubt, have ordered us to England. On nearing Elba, General Druot, with Comte Clam (aid-de-camp to Prince Schwartzberg), and Lieutenant Hastings, the first lieutenant of the Undaunted, were sent on shore, commissioned by Napoleon to take possession of the island. Colonel Campbell accompanied them. May 4th.—

Napoleon was on deck at daylight, and talked for two hours with the harbour-master, who had come on board to take charge of the ship as pilot, questioning him minutely about the anchorage, fortifications, &c. At six, we weighed and made sail into the harbour; anchored at half-past six near the mole-head, and moored ship, hoisted out all the boats, and sent some of the baggage on shore. At eight, the emperor asked me for a boat, as he intended to take a walk on the opposite side of the bay, and requested me to go with him. He wore a great coat and a round hat. Comte Bertrand, Colonel Campbell, and Colonel Vincent (chief engineer), went with us; Baron Koller declined doing so. When half-way, he re-

marked he was without a sword, and soon afterwards asked if the peasants of Tuscany were addicted to assassination. We walked for about two hours. The peasants, taking us for Englishmen, cried 'Viva,' which seemed to displease him; we returned on board to breakfast. He afterwards fixed upon a flag for Elba, requesting me to remain while he did so. He had a book with all the ancient and modern flags of Tuscany; he asked my opinion of that which he had chosen; it was a white flag, with a red band running diagonally through it, with three bees on the band (the bees were in his arms as Emperor of France). He then requested me to allow the ship's tailor to make two, one of them to be hoisted on the batteries at one o'clock.

"May 10th.—Napoleon rode to the top of the highest hill above Porto Ferraggio, from whence we could perceive the sea at four different points, and apparently not an English mile in a straight line in any direction from the spot where we stood. After surveying it for some time, he turned round and laughed, 'Eh! mon île est bien petite.' On the top of this hill is a small chapel and a house, where a hermit had resided until his death. Some one remarked that it would require more than common devotion to induce persons to attend service there. 'Oui, oui, le prêtre peut dire autant de bêtises qu'il veut.' On the evening of the 9th, after his return from Longone, he entered upon the subject of the armies and their operations at the close of the last campaign, and continued it for half-an-hour, until he rose from table. After passing into the presence-chamber, the conversation again turned on the campaign, his own policy, the Bourbons, &c.; and he continued talking with great animation till midnight, remaining for three hours on his legs. He described the operations against the Allies as always in his favour, while the numbers were in any sort of proportion; that in one affair against the Prussians, who were infinitely the best, he had only seven hundred infantry en tirailleurs, with two thousand cavalry and three battalions of his guards in reserve, against double their numbers. The instant those old soldiers shewed themselves, the affair was decided. He praised General Blücher; 'Le vieux diable m'a toujours attaqué avec la même vigueur, s'il étoit battu, un instant après il se montrait prêt pour le combat.' He then described his last march from Arcis to Brienne, said that he knew Swartzenberg would not stand to fight him, and that he hoped to destroy half his army."

After this, the return to Paris—Waterloo—St. Helena—and the resurrection!!

*The Poetical Works of Thomas Moore.* 12mo. Vols. I. and II. London, 1840. Longman and Co.

AFTER many indications and attempts to arrange and publish Moore's poetical works in a collected form, we are glad, at last, to see the object attained, and these volumes as the first-fruits of its accomplishment. By the green colour of his Emerald Isle, and with its harp (which he has tuned so sweetly) impressed upon the external form, we are invited to look within for the spirit, the sportiveness, and the feeling of his various songs. The inspirations of boyish loves; the youth's studies, redolent of classic allusions, and reproductive of ancient point and epigram; the more mature lyrics of many a dye; the warm or satirical effusions of patriotic and of party attachments and enmities; the higher efforts of imagination, and

purser emanations of poesy, will fill these pages with attractions adapted to the taste of every class of readers. From among the earlier productions, the most prurient have been expurgated; and upon others, the author has laid the hand of excision and improvement. We have not thought it requisite to compare these alterations; but even on a casual inspection, observe that some of them are odd enough; and still, though without absolute indelicacy, some of the juvenile themes retained, are sufficiently amorous; and, perhaps, out of a little, More without any loss might have been spared, for the sake of conciliating the fastidious and critical.

The volumes before us contain all the juvenile poems Mr. Moore thinks proper to preserve in this publication; and, also, those relating to America. The former, in particular, are so well known, that it would be a waste of space to quote any of them; but the preface by which they are heralded offers us some interesting personal matter for extract:—

"The whole of the poems (their writer informs us) contained in the first, as well as in the greater part of the second, volume of this collection, were written between the sixteenth and the twenty-third year of the author's age. But I had begun still earlier, not only to rhyme but to publish. A sonnet to my schoolmaster, Mr. Samuel Whyte, written in my fourteenth year, appeared at the time in a Dublin magazine, called the 'Anthologia,'—the first, and, I fear, almost only, creditable attempt in periodical literature of which Ireland has to boast. I had even at an earlier period (1793) sent to this magazine two short pieces of verse, prefaced by a note to the editor, requesting the insertion of the following attempts of a youthful muse; and the fear and trembling with which I ventured upon this step were agreeably dispelled, not only by the appearance of the contributions, but still more by my finding myself, a few months after, hailed as 'Our esteemed correspondent, T. M.'"

Mr. Moore describes school and private theatricals as among his youthful and successful pursuits; and continues:—

"With acting, indeed, is associated the very first attempt at verse-making to which my memory enables me to plead guilty. It was at a period, I think, even earlier than the date last mentioned, that, while passing the summer holidays, with a number of other young people, at one of those bathing-places, in the neighbourhood of Dublin, which afford such fresh and healthful retreats to its inhabitants, it was proposed among us that we should combine together in some theatrical performance, and the 'Poor Soldier' and a harlequin pantomime being the entertainments agreed upon, the parts of Patrick and the Motley hero fell to my share. I was also encouraged to write and recite an appropriate epilogue on the occasion; and the following lines, alluding to our speedy return to school, and remarkable only for their having lived so long in my memory, formed part of this juvenile effort:—

'Our Pantaloon, who did so aged look,  
Must now resume his youth, his task, his book:  
Our Harlequin, who skip'd, laugh'd, danced, and died,  
Must now stand trembling by his master's side.'

I have thus been led back, step by step, from an early date to one still earlier, with the view of ascertaining, for those who take any interest in literary biography, at what period I first shewed an aptitude for the now common craft of verse-making; and the result is—so far back in childhood lies the epoch, that I am really unable to say at what age I first began

to act, sing, and rhyme. To these different talents, such as they were, the gay and social habits prevailing in Dublin afforded frequent opportunities of display; while, at home, a most amiable father, and a mother such as in heart and head has rarely been equalled, furnished me with that purest stimulus to exertion—the desire to please those whom we at once most love and most respect. It was, I think, a year or two after my entrance into college, that a masque written by myself, and of which I had adapted one of the songs to the air of Hadyn's Spirit-Song, was acted, under our own humble roof in Aungier Street, by my elder sister, myself, and one or two other young persons. The little drawing-room over the shop was our grand place of representation, and young —, now an eminent professor of music in Dublin, enacted for us the part of orchestra at the piano-forte. It will be seen from all this, that, however imprudent and premature was my first appearance in the London world as an author, it is only lucky that I had not much earlier assumed that responsible character; in which case the public would probably have treated my nursery productions in much the same manner in which that sensible critic, my Uncle Toby, would have disposed of the 'work which the great Lipsius produced on the day he was born.'"

The author next adverts to the Papist disabilities existing in these days, and to his political satires, to which he was instigated by feeling the injustice of his and his co-religionists' position. His first efforts in this way were in 1794; and connected therewith a curious account is given of a convivial club at Dalkey, of which we are told:—

"Before public affairs had become too serious for such pastime, it was usual to celebrate, yearly, at Dalkey, the day of this sovereign's accession; and, among the gay scenes that still live in my memory there are few it recalls with more freshness than the celebration, on a fine Sunday in summer, of one of these anniversaries of King Stephen's coronation. The picturesque sea-views from that spot—the gay crowds along the shores—the innumerable boats, full of life, floating about—and, above all, that true spirit of mirth which the Irish temperament never fails to lend to such meetings, rendered the whole a scene not easily forgotten. The state ceremonies of the day were performed, with all due gravity, within the ruins of an ancient church that stands on the island, where his mock majesty bestowed the order of knighthood upon certain favoured personages, and among others, I recollect, upon Incedon, the celebrated singer, who arose from under the touch of the royal sword with the appropriate title of Sir Charles Melody. There was also selected, for the favours of the crown on that day, a lady of no ordinary poetic talent, Mrs. Battier, who had gained much fame by some spirited satires in the manner of Churchill, and whose kind encouragement of my early attempts in versification were to me a source of much pride. This lady, as was officially announced in the course of the day, had been appointed his majesty's poetess laureate, under the style and title of Henrietta, Countess of Laurel. There could hardly be devised a more apt vehicle for lively political satire than this gay travestie of monarchical power, and its showy appurtenances, so temptingly supplied. The very day, indeed, after this commemoration, there appeared, in the usual record of Dalkey state intelligence, an amusing proclamation from the king, offering a large reward in *cronebanes*,\* to the finder

\* Irish halpence, so called."

or finders of his majesty's crown, which, owing to his 'having measured both sides of the road' in his pedestrian progress from Dalkey on the preceding night, had unluckily fallen from the royal brow. It is not to be wondered at, that whatever natural turn I may have possessed for the lighter skirmishing of satire should have been called into play by so pleasant a field for its exercise as the state affairs of the Dalkey kingdom afforded; and, accordingly, my first attempt in this line was an 'Ode to His Majesty, King Stephen,' contrasting the happy state of security in which he lived among his merry lieges, with the 'metal coach,' and other such precautions against mob violence, said to have been adopted at that time by his royal brother of England. Some portions of this juvenile squib still live in my memory; but they fall far too short of the lively demands of the subject to be worth preserving, even as juvenilia. In college, the first circumstance that drew any attention to my rhyming powers was my giving in a theme, in English verse, at one of the quarterly examinations. As the sort of short essays required on those occasions were considered, in general, as a mere matter of form, and were written at that time, I believe, invariably, in Latin prose, the appearance of a theme in English verse could hardly fail to attract some notice. It was, therefore, with no small anxiety that, when the moment for judging of the themes arrived, I saw the examiners of the different divisions assemble, as usual, at the bottom of the hall for that purpose. Still more trying was it when I perceived that the reverend inquisitor, in whose hands was my fate, had left the rest of the awful group, and was bending his steps towards the table where I was seated. Leaning across to me, he asked, suspiciously, whether the verses which I had just given in were my own? and, on my answering in the affirmative, added these cheering words,—"They do you great credit; and I shall not fail to recommend them to the notice of the Board." This result of a step, ventured upon with some little fear and scruple, was of course very gratifying to me; and the premium I received from the Board was a well-bound copy of the 'Travels of Anacharsis,' together with a certificate, stating, in not very lofty Latin, that this reward had been conferred upon me, 'propter laudabilem in versibus compendiosis progressum.' The idea of attempting a version of some of the songs or odes of Anacreon had very early occurred to me; and a specimen of my first ventures in this undertaking may be found in the 'Dublin Magazine,' already referred to, where, in the number of that work for February 1794, appeared a 'Paraphrase of Anacreon's Fifth Ode, by T. Moore.' \* \* \* Early in the year 1799, while yet in my nineteenth year, I left Ireland, for the first time, and proceeded to London, with the two not very congenial objects, of keeping my terms at the Middle Temple, and publishing, by subscription, my 'Translation of Anacreon.' One of those persons to whom, through the active zeal of friends, some part of my manuscript had been submitted before it went to press, was Doctor Laurence, the able friend of Burke; and, as an instance, however slight, of that ready variety of learning, as well the lightest as the most solid, for which Laurence was so remarkable, the following extract from the letter written by him, in returning the manuscript to my friend Dr. Hume, may not be without some interest:—

"Dec. 20th, 1799.

"I return you the four odes which you

were so kind to communicate for my poor opinion. They are, in many parts, very elegant and poetical; and, in some passages, Mr. Moore has added a pretty turn, not to be found in the original. To confess the truth, however, they are, in not a few places rather more paraphrastic than suits my notion (perhaps an incorrect notion) of translation. In the fifty-third ode there is, in my judgment, a no less sound than beautiful emendation suggested—would you suppose it?—by a Dutch lawyer. Mr. M. possibly may not be aware of it. I have endeavoured to express the sense of it in a couplet interlined with pencil. Will you allow me to add, that I am not certain whether the translation has not missed the meaning, too, in the former part of that passage, which seems to me to intend a distinction and climax of pleasure:—"It is sweet even to prove it among the briary paths; it is sweet again, plucking, to cherish with tender hands, and carry to the fair, the flower of love." This is nearly literal, including the conjectural correction of Mynheer Medenbach. If this be right, instead of

"'Tis sweet to dare the tangled fence,"

I would propose something to this effect:—

"'Tis sweet the rich perfume to prove,

As by the dewy bush you rove;

"'Tis sweet to dare the tangled fence,

To cull the timid beauty thence,

To wipe with tender hands away

The tears that on its blushes lay;"

Then, to the bosom of the fair

The flower of love in triumph bear.

I would drop altogether the image of the stems 'dropping with gems.' I believe it is a confused and false metaphor, unless the painter should take the figure of Aurora from Mrs. Hastings. There is another emendation of the same critic, in the following line, which Mr. M. may seem, by accident, to have sufficiently expressed in the phrase of 'roses shed their light.' I scribble this in very great haste, but fear that you and Mr. Moore will find me too long, minute, and impertinent. Believe me to be, very sincerely, — Your obedient, humble Servant,

His American voyage and poems follow, and conclude the second volume; but we need not pursue the subject farther at present.

#### WALPOLE'S CORRESPONDENCE AND VOLS. V. VI. CONTINUED.

THE next letters we quote from the former of these volumes possess a fair proportion of literary and anecdotal interest:—

"To the Hon. H. S. Conway.

"Strawberry Hill, August 9, 1775.

"Well! I am going *tout de bon*, and heartily wish I was returned. It is a horrid exchange, the cleanness, and verdure, and tranquillity of Strawberry, for a beastly ship, worse inns, the pavé of the roads bordered with eternal rows of maimed trees, and the racket of an hôtel garni! I never doat on the months of August and September, enlivened by nothing but Lady Greenwich's speaking-trumpet—but I do not want to be amused—at least never at the expense of being put in motion. Madame du Deffand, I am sure, may be satisfied with the sacrifice I make to her! You have heard, to be sure, of the war between your brother and Foote; but probably not how far the latter has carried his impudence. Being asked, why Lord Hertford had refused to license his piece, he replied, 'Why, he asked me to make his youngest son a box-keeper, and because I would

\* "Query, if it ought not to be lie? The line might run,

'With tender hand the tears to brush,  
'That give new softness to its blush (or, its flush)."

not, he stopped my play.\* The Duchess of Kingston offered to buy it off, but Foote would not take her money, and swears he will act her in Lady Brumpton; which to be sure is very applicable. I am sorry to hear Lord Villiers is going to drag my lady through all the vile inns in Germany. I think he might go alone. George Onslow told me yesterday, that the American Congress had sent terms of accommodation, and that your brother told him so; but a strange fatality attends George's news, which is rarely canonical; and I doubt this intelligence is far from being so. I shall know more to-morrow, when I go to town to prepare for my journey on Tuesday. Pray let me hear from you, inclosed to M. Panchaud. I accept with great joy Lady Ailesbury's offer of coming hither in October, which will increase my joy in being at home again. I intend to set out on my return the 25th of next month. Sir Gregory Page has left Lord Howe eight thousand pounds at present, and twelve more after his aunt Mrs. Page's death.

"Thursday, 10th.

"I cannot find any grounds for believing that any proposals are come from the Congress. On the contrary, every thing looks as melancholy as possible. Adieu!"

"To Edward Gibbon, Esq.

"[February 1776.]

"Mr. Walpole cannot express how much he is obliged to Mr. Gibbon for the valuable present he has received; nor how great a comfort it is to him, in his present situation, in which he little expected to receive singular pleasure. Mr. Walpole does not say this at random, nor from mere confidence in the author's abilities, for he has already (all his weakness would permit) read the first chapter, and it is in the greatest admiration of the style, manner, method, clearness, and intelligence. Mr. Walpole's impatience to proceed will struggle with his disorder, and give him such spirits that he flatters himself he shall owe part of his recovery to Mr. Gibbon; whom, as soon as that is a little effected, he shall beg the honour of seeing."

"To Edward Gibbon, Esq.

"February 14, 1776.

"After the singular pleasure of reading you, sir, the next satisfaction is to declare my admiration. I have read great part of your volume, and cannot decide to which of its various merits I give the preference, though I have no doubt of assigning my partiality to one virtue of the author, which, seldom as I meet with it, always strikes me superiorly. Its quality will naturally prevent your guessing which I mean. It is your amiable modesty. How can you know so much, judge so well, possess your subject, and your knowledge, and your power of judicious reflection so thoroughly, and yet command yourself and betray no dictatorial arrogance of decision? How unlike very ancient and very modern authors! You have, unexpectedly, given the world a classic history. The fame it must acquire will tend every day to acquit this panegyric of flattery. The impressions it has made on me are very numerous. The strongest is the thirst of being better acquainted with you—but I reflect that I have been a trifling author, and am in no

\* "The piece was entitled 'The Trip to Calais.' In which the author having ridiculed, under the name of Kitty Crocodile, the eccentric Duchess of Kingston, she offered him a sum of money to strike out the part. A correspondence took place between the parties, which ended in the duchess making an application to Lord Hertford, at that time lord-chamberlain, who interdicted the performance. Foote, however, brought it out, with some alterations, in the following year, under the title of 'The Capuchin.'—E."

light profound enough to deserve your intimacy, except by confessing your superiority so frankly, that I assure you honestly, I already feel no envy, though I did for a moment. The best proof I can give you of my sincerity is to exhort you, warmly and earnestly, to go on with your noble work—the strongest, though a presumptuous mark of my friendship, is to warn you never to let your charming modesty be corrupted by the acclamations your talents will receive. The native qualities of the man should never be sacrificed to those of the author, however shining. I take this liberty as an older man, which reminds me how little I dare promise myself that I shall see your work completed! But I love posterity enough to contribute, if I can, to give them pleasure through you. I am too weak to say more, though I could talk for hours on your history. But one feeling I cannot suppress, though it is a sensation of vanity. I think, nay, I am sure I perceive, that your sentiments on government agree with my own. It is the only point on which I suspect myself of any partiality in my admiration. It is a reflection of a far inferior vanity that pleases me in your speaking with so much distinction of that, alas! wonderful period, in which the world saw five good monarchs succeed each other. I have often thought of treating that Elysian era. Happily it has fallen into better hands! I have been able to rise to-day, for the first time, and flatter myself that if I have no relapse, you will in two or three days more give me leave, sir, to ask the honour of seeing you. In the meantime, be just; and do not suspect me of flattering you. You will always hear that I say the same of you to every body.—I am, with the greatest regard, sir, &c.”

“To Robert Jephson, Esq.

“Strawberry Hill, July 13, 1777.

“You have perhaps, sir, paid too much regard to the observations I took the liberty to make, by your order, to a few passages in ‘Vitellia,’ and I must hope they were in consequence of your own judgment too. I do not doubt of its success on the stage, if well acted; but I confess I would answer for nothing with the present set of actors, who are not capable in tragedy of doing any justice to it. Mrs. Barry seems to me very unequal to the principal part, to which Mrs. Yates alone is suited. Were I the author, I should be very sorry to have my tragedy murdered, perhaps miscarry. Your reputation is established; you will never forfeit it yourself; and to give your works to unworthy performers is like sacrificing a daughter to a husband of bad character. As to my offering it to Mr. Colman, I could merely be the messenger. I am scarce known to him; have no right to ask a favour of him; and I hope you know me enough to think that I am too conscious of my own insignificance and private situation to give myself an air of protection, and more particularly to a work of yours, sir. What could I say that would carry greater weight than ‘This piece is by the author of ‘Braganza?’’ A tragedy can never suffer by delay: a comedy may, because the allusions or the manners represented in it may be temporary. I urge this, not to dissuade your presenting ‘Vitellia’ to the stage, but to console you if both theatres should be engaged next winter. My own interests, from my time of life, would make me with reason more impatient than you to see it represented; but I am jealous of the honour of your poetry, and I should grieve to see ‘Vitellia’ at Covent Garden: not that, except Mrs. Yates, I have any partiality to the tragic actors at Drury Lane,

though Smith did not miscarry in ‘Braganza;’ but I speak from experience. I attended ‘Cædactacus’ last winter, and was greatly interested, both from my friendship for Mr. Mason and from the excellence of the poetry. I was out of all patience; for though a young Lewis played a subordinate part very well, and Mrs. Hartley looked her part charmingly, the Druids were so massacred, and ‘Cædactacus’ so much worse, that I never saw a more barbarous exhibition. Instead of hurrying ‘The Law of Lombardy,’ which, however, I shall delight to see finished, I again wish you to try comedy. To my great astonishment, there were more parts performed admirably in ‘The School for Scandal’ than I almost ever saw in any play. Mrs. Abington was equal to the first of her profession, Yates, the husband, Parsons, Miss Pope, and Palmer, all shone. It seemed a marvellous resurrection of the stage. Indeed, the play had as much merit as the actors. I have seen no comedy that comes near it since the ‘Provoked Husband.’ I said I was jealous of your fame as a poet, and I truly am. The more rapid your genius is, labour will but the more improve it. I am very frank, but I am sure that my attention to your reputation will excuse it. Your facility in writing exquisite poetry may be a disadvantage; as it may not leave you time to study the other requisites of tragedy so much as is necessary. Your writings deserve to last for ages; but to make any work last, it must be finished in all parts to perfection. You have the first requisite to that perfection, for you can sacrifice charming lines when they do not tend to improve the whole. I admire this resignation so much, that I wish to turn it to your advantage. Strike out your sketches as suddenly as you please, but retouch and retouch them, that the best judges may for ever admire them. The works that have stood the test of ages, and been slowly approved at first, are not those that have dazzled contemporaries and borne away their applause, but those whose intrinsic and laboured merit have shone the brighter on examination. I would not curb your genius, sir, if I did not trust it would recoil with greater force for having obstacles presented to it. You will forgive my not having sent you the ‘Thoughts on Comedy,’ as I promised. I have had no time to look them over, and put them into shape. I have been and am involved in most unpleasant affairs of family, that take up my whole thoughts and attention. The melancholy situation of my nephew, Lord Orford, engages me particularly, and I am not young enough to excuse postponing business and duties for amusement. In truth, I am really too old not to have given up literary pleasures. Nobody will tell one when one grows dull, but one’s time of life ought to tell it one. I long ago determined to keep the archbishop in ‘Gil Blas’ in my eye, when I should advance to his caducity; but as dotage steals in at more doors than one, perhaps the sermon I have been preaching to you is a symptom of it. You must judge of that, sir. If I fancy I have been wise, and have only been peevish, throw my lecture into the fire. I am sure the liberties I have taken with you deserve no indulgence, if you do not discern true friendship at the bottom of them.”

But we now turn to the sixth and last volume, by which we have completed one of the very best works of its class, if not unique, in the English language; a work full of information, full of anecdote, and full of amusement, equally fit for the library of the scholar, the dilettante, the artist, the statesman, and the

general reader. It worthily winds up the editorial merits and novelties of the preceding five volumes, being enriched by a very interesting sketch of Walpole by his friend Miss M. Berry, above a hundred letters not hitherto published (most of them addressed to the Miss Berrys between 1789 and 1797), and a letter from the Right Hon. Sir Charles Grey, claiming for Lord Orford a share in the composition of the famous “Letters of Junius.” In the first of these introductions Miss Berry defends the character of Walpole from the diatribe in the “Edinburgh Review,” attributed to Mr. Macaulay. She truly and sensibly observes:—

“The mistaken opinions of the eloquent and accomplished author of that review are to be traced chiefly to the same causes which defeated the intentions of the two first biographers. In his case, these causes were increased, not only by no acquaintance with his subject, but by still further removal from the fashions, the social habits, the little minute details, of the age to which Horace Walpole belongs,—an age so essentially different from the business, the movement, the important struggles, of that which claims the critic as one of its most distinguished ornaments. A conviction that these reasons led to his having drawn up, from the supposed evidence of Walpole’s works alone, a character of their author so entirely and offensively unlike the original, has forced the pen into the feeble and failing hand of the writer of these pages,—has imposed the pious duty of attempting to rescue, by incontrovertible facts acquired in long intimacy, the memory of an old and beloved friend, from the giant grasp of an author and a critic, from whose judgment, when deliberately formed, few can hope to appeal with success. The candour, the good nature of this critic,—the inexhaustible stores of his literary acquirements, which place him in the first rank of those most distinguished for historical knowledge and critical acumen,—will allow him, I feel sure, to forgive this appeal from his hasty and general opinion, to the judgment of his better informed mind, on the peculiarities of a character often remarkably dissimilar from that of his works. Lord Dover has justly and forcibly remarked, ‘that what did the most honour both to the head and the heart of Horace Walpole, was the friendship which he bore to Marshal Conway; a man who, according to all the accounts of him that have come down to us, was so truly worthy of inspiring such a degree of affection.’ He then quotes the character given of him by the editor of Lord Orford’s works in 1798. This character of Marshal Conway was a portrait drawn from the life, and, as it proceeded from the same pen which now traces these lines, has some right to be inserted here. ‘It is only those who have had the opportunity of penetrating into the most secret motives of his public conduct, and into the inmost recesses of his private life, who can do real justice to the unsullied purity of his character;—who saw and knew him in the evening of his days, retired from the honourable activity of a soldier and of a statesman, to the calm enjoyments of private life; happy in the resources of his own mind, and in the cultivation of useful science, in the bosom of domestic peace—un enriched by pensions or places—undistinguished by titles or ribands—unsophisticated by public life, and unwearied by retirement.’ To this man Lord Orford’s attachment, from their boyish days at Eton school to the death of Marshal Conway in 1795, is already a circumstance of sufficiently rare occurrence among men of the world. Could such a man, of whom the fore-

going lines are an unvarnished sketch—of whose character, simplicity was one of the distinguished ornaments—could such a man have endured the intimacy of such an individual as the reviewer describes Lord Orford to have been? Could an intercourse of uninterrupted friendship and undiminished confidence have existed between them during a period of nearly sixty years, undisturbed by the business and bustle of middle life, so apt to cool, and often to terminate, youthful friendships? Could such an intercourse ever have existed, with the supposed selfish indifference, and artificial coldness and conceit of Lord Orford's character? The last correspondence included in the present publication will, it is presumed, furnish no less convincing proof, that the warmth of his feelings, and his capacity for sincere affection, continued unenfeebled by age. It is with this view, and this alone, that the correspondence alluded to is now, for the first time, given to the public. It can add nothing to the already established epistolary fame of Lord Orford, and the public can be as little interested in his sentiments for the two individuals addressed. But, in forming a just estimate of his character, the reader will hardly fail to observe that those sentiments were entertained at a time of life when, for the most part, the heart is too little capable of expansion to open to new attachments. The whole tone of these letters must prove the unimpaired warmth of his feelings, and form a striking contrast to the cold harshness of which he has been accused, in his intercourse with Madame du Deffand, at an earlier period of his life. This harshness, as was noticed by the editor of Madame du Deffand's letters, in the preface to that publication, proceeded solely from a dread of ridicule, which formed a principal feature of Mr. Walpole's character, and which, carried, as in his case, to excess, must be called a principal weakness. 'This accounts for the ungracious language in which he so often replies to the importunities of her anxious affection,—a language so foreign to his heart, and so contrary to his own habits in friendship.' Is this, then, the man who is supposed to be 'the most eccentric, the most artificial, the most fastidious, the most capricious of mortals; his mind a bundle of inconsistent whims and affectations; his features covered with mask within mask, which, when the outer disguise of obvious affectation was removed, you were still as far as ever from seeing the real man.' \* \* \* Affectation is the essence of the man. It pervades all his thoughts, and all his expressions. If it were taken away, nothing would be left.' He affected nothing; he played no part; he was what he appeared to be. Aware that he was ill qualified for politics, for public life, for parliamentary business, or indeed for business of any sort, the whole tenour of his life was consistent with this opinion of himself. Had he attempted to effect what belongs only to characters of another stamp—had he endeavoured to take a lead in the House of Commons—had he sought for place, dignity, or office—had he aimed at intrigue, or attempted to be a tool for others—then, indeed, he might have deserved the appellation of artificial, eccentric, and capricious. From the retreat of his father, which happened the year after he entered parliament, the only real interest he took in politics was when their events happened immediately to concern the objects of his private friendships. He occupied himself with what really amused him. If he had affected any thing, it would certainly not have been a taste for the trifling occupations with which he is reproached. Of no person can it

be less truly said, that 'affectation was the essence of the man.' What man, or even what woman, ever affected to be the frivolous being he is described? When his critic says, that he had 'the soul of a gentleman-usher,' he was little aware that he only repeated what Lord Orford often said of himself—that from his knowledge of old ceremonials and etiquettes, he was sure that in a former state of existence he must have been a gentleman-usher about the time of Elizabeth. In politics, he was what he professed to be, a Whig, in the sense which that denomination bore in his younger days,—never a Republican. In his old and enfeebled age, the horrors of the first French Revolution made him a Tory; while he always lamented, as one of the worst effects of its excesses, that they must necessarily retard to a distant period the progress and establishment of civil liberty."

We need not go into the other points of this animated and sincere defence, in which strong arguments are urged in the most courteous and complimentary manner, but pass to the notice of Sir Charles Grey's opinion that Walpole had a hand in Junius's letters. This he founds on remarkable coincidences of style and sentiment in the letters and Walpole's memoirs and correspondence—to similar mistakes on legal points—to the absence of all remarks upon Junius in a writer who writes upon every other topic of the times—to like animosities against the Dukes of Bedford and Grafton, and Lord Mansfield—and other circumstances of considerable weight. We can, however, only indicate them for those who feel an interest in this much litigated controversy.

We now come to the new Correspondence, and shall select such specimens as we think may be most agreeable to the public, not yet in possession of the volume before us, and most congenial to the columns of a literary periodical. In a letter to Lord Buchan, of December, 1778, we fall in with an account of Stuart portraits worthy of remark:—

"At the Duke of Devonshire's at Hardwicke, there is a valuable, though poorly-painted, picture of James V. and Mary of Guise, his second queen. It is remarkable from the great resemblance of Mary Queen of Scots to her father; I mean in Lord Morton's picture of her, and in the image of her on her tomb at Westminster, which agree together, and which I take to be the genuine likeness. I have doubts on Lord Burlington's picture, and on Dr. Mend's. The nose in both is thicker, and also fuller at bottom than on the tomb; though it is a little supported by her coins."

Again:—

"P.S. It has this moment started into my mind, my lord, that I have heard that at the old castle at Aubigny, belonging and adjoining to the Duke of Richmond's house, there are historic paintings or portraits of the ancient house of Lennox. I recollect, too, that Father Gordon, superior of the Scots College at Paris, shewed me a whole-length of Queen Mary, young, and which, he believed, was painted while she was Queen of France. He shewed me, too, the original letter she wrote the night before her execution, some deeds of Scottish kings, and one of King (I think Robert) Bruce, remarkable for having no seal appendent, which, Father Gordon said, was executed in the time of his so great distress, that he was not possessed of a seal."

In a letter to Gibbon about the same date, upon an attack on his "Decline and Fall," he speaks very sneeringly,—thus:—

"\* \* \* An Examination of the Fifteenth and Sixteenth

"I will make but one remark on such divine champions, Davis and his prototypes tell you Middleton, &c. have used the same objections, and they have been confuted: answering, in the theologic dictionary, signifying confuting; no matter whether there is sense, argument, truth, in the answer or not. Upon the whole, I think ridicule is the only answer such a work is entitled to. The ablest answer which you can make (which would be the ablest answer that could be made) would never have any authority with the cabal, yet would allow a sort of dignity to the author. His patrons will always maintain that he vanquished you, unless you made him too ridiculous for them to dare to revive his name. You might divert yourself, too, with Alma Mater, the church, employing a *goujat* to defend the citadel, while the generals repose in their tents. If Irenæus, St Augustine, &c. did not set apprentices and proselytes to combat Celsus and the adversaries of the new religion—but early bishops had not five or six thousand pounds a-year. In short, dear sir, I wish you not to lose your time; that is, either not reply, or set your mark on your answer, that it may always be read with the rest of your works."

Of course he warmly approves of Gibbon's "Vindication," published early in 1779.

[To be continued.]

*Satan in Love. A Dramatic Poem.* By Mrs. Harriet Downing, author of "Remembrances of a Monthly Nurse," "Touched in the Head," &c. &c. 12mo. pp. 218. London, 1840. Bell.

THE Devil, we have been told, is not so black as he is painted, nor does he appear to be so destitute of friends as may have been imagined; for here has Mrs. Harriet Downing, author of "Touched in the Head," espoused his cause as a very agreeable love-maker, and Prince Albert has permitted the poem to be dedicated to him. Burns of old shewed a sneaking kindness for him, but did not make him a devilish fine fellow: he was only

Woe to think upon you den

Even for his sake,

and hinted something about the possibility of his reflecting thereupon and amending his weary life. This idea, Mrs. Downing, with finer sympathy, has carried out, and restored the repentant "Clotey" to his lofty estate among the heavenly hosts. In fact, Love quite reforms him, and he adheres to his good resolutions, not as hitherto,

When the devil was sick, the devil a monk would be!  
When the devil was well, the devil a monk was he!

There is a great kindness of disposition in this production. Like the worst of men, Mrs. D. will not think Satan himself to be *nulla virtute redemptum*; but argues that even he must have a germ of goodness of him, which, being touched, would reclaim him to the fold. He accordingly falls in love with a certain angelic German girl called Agnes, and she strongly reciprocates the fancy, struck by the superiority of his manner, and, perhaps, by the *recherché* nature of his dress: for he relates to us, when he is going a-courting,—

"I must be dressed;  
I have a wardrobe ever at command:  
What shall it be? A suit of comely brown?  
No, that looks old and stuffy.—Lincoln-green?  
That is gone out of date—it shall be black;  
'There is no lie in black; 'tis my own hue!—  
My linen shall be of most snowy whiteness."

Chapters of Mr. Gibbon's History of the Decline and Fall of the Roman Empire." By Henry Edward Davis, B.A. of Balliol College, Oxford. He was born in 1756, and died in 1784, at the early age of twenty-seven. He was a native of Windsor, and is believed to have received a present from George the Third for this production.—E."

And fine as cobwebs; 't will attract her eye,  
For women like a hand and linen fair—  
As for my features, they will serve my turn;  
The outline perfect, dark, and rather sad;  
With somewhat of the devil in the eyes!  
Teeth white with charcoal (my sole dentifrice),  
And hair—'t is rather crisp'd, I own,  
With the brain-fever—I'll moisten it with oil;  
Here's some, I see, at hand.

*He regards himself in the mirror of Agnes.*  
Methinks I have rather a taking air!  
Something that women like—a Werter look;  
As if pale Melancholy gave me birth  
After a surfeit.—Prone to suicide!  
Causing compassion, but too proud to ask it!  
So Ruggantino look'd, who won all hearts,  
The dark, mysterious bravo of fair Venice!—  
Yes, I shall do—  
Now I'll be visible; flash on her sight  
As doth the meteor from the sullen cloud!"

No wonder that he makes an impression in spite of his Club foot, such as was never seen entering Crookford's, and a rather unpleasant sulphury smell, such as might be supposed in the English tourist following the distich advice,—

All you that go to Scotland,  
And leave your native home,  
Provide yourself with brimstone  
And a curry-comb.

We ought also to notice that there was an exceeding degree of warmth about him; but ladies may be partial to warmth in their lovers. Thus:—

*"Lucifer, presenting his arm to Agnes.*  
We'll lead the way; I know the road to church,  
And often sit me in churchwarden's pew,  
Or parson's chair, to hear the sermon out;  
Or walk unseen, throughout the crowded aisles,  
Filling the ladies' minds with other thoughts  
Than what he preaches,—feathers, flowers, brocades;  
The pressure of a hand, a look, a sigh!—  
Agnes, we'll lead the way!

*Agnes, taking his arm, and aside.*  
The day is cold; this arm of yours is hot!  
It will impart to mine a kindly warmth;  
You'll let me change it when it chafes pain!  
No one shall guess the reason why!"

Lucifer appears to think that Agnes might be conscience-smitten at keeping company with a person of his notoriously bad character; but she is not afraid, and reassures him in these words:—

*"Agnes. For what? I am alone, 't is true, with thee,  
And thou hast got a very dreadful name! What then?  
Me thou wouldst never harm, and so to me  
Thou art not evil. I would do thee good,  
So evil cannot be 'twixt thee and me.*

Here, take this rose;—'t is very fresh and sweet.  
I would not pluck it from its parent tree  
For mine own breast, but 't will refresh thy sense.—  
Alas! 't is faded only by thy touch!"

*Lucifer, mournfully.* All things that come in contact with me perish;

That is my curse. I must not tarry here,  
Or thou, the sweetest rose in Nature's garden,  
Wilt hang thy head and die. I will away!  
I will not breathe a pestilence upon thee;  
Adieu!

*Agnes, fervently.* Die, saidst thou! Perish like this rose!—

Not if this outward form of mine were torn  
By savage hands into ten thousand parts,  
And trampled into dust!—Not if the booming winds  
Scatter'd each atom through each clime of earth,  
Or mix'd them with the sands beneath the ocean!—  
I am a deathless spirit like to thee,  
And each are clothed in elements not ours,  
More than this silken robe, that insects wove,  
And I have borrow'd!

*Lucifer, tenderly regarding her.* But Death will take away those love-lit eyes!  
That lip of rose! those fair and rounded arms!  
That pure and pearl-like bosom, where now breathes life!

All change to Agnes must to her be wrong,  
Since she as Agnes by aught that alters her!

*Agnes, compassionately.* Now mark how well I'll answer this fair speech;

So stay awhile. Suppose this spirit fled,—  
(The real Agnes shrined within this clay),  
And sitting here beside thee, like to now,  
Was left this compound of the elements,  
That late encompass'd my immortal part,  
The empty casket thou so late hast praised;  
Say, wouldst thou love as now to hold this hand,  
And gaze upon the beauty of these eyes,  
That fix'd their inexpressive, changeless glance,  
Upon thine own? No! thou wouldst leave this form  
Inanimate—a statue—still to sit,  
As do the carved ones by sculptor's hand;

Then waste not words, like man, in empty praise,  
Of what is but my clothing for a day?  
Such are the phrases, palling to my sense,  
The courtly Lindorf uses, but in vain,  
To win me to his love.

*Lucifer, starting up vehemently.* Presumptuous, daring man! Bid him aspire  
To wed with Lyra, fairest star of heaven,  
He may succeed;—but, Agnes, not with thee!  
*Agnes, calmly.* Thou sayest well;—but wherefore with such heat?

Lord Lindorf might as well address the winds,  
Or praise the lustre of the parting sun;  
They heed him not."

Our readers will observe that there is some real mind and poetry in the foregoing extract; though the design of the whole subject is strange, and its treatment most incongruous. The account of the Last Day is as ready an example of this as we could select; and the thought of calling a coach on such an occasion is, to us, the sublime of the ridiculous.

*Mr. Müller (a worthy priest):—*

Hope every thing, my child;—  
Is that a flame I see on yonder hill?  
*Agnes.* How the earth trembles! Yes; there mounts on high,  
A pyramid of fire, wreathed in smoke:  
The scroll speaks truth—this world will quickly end!  
[Enter Paulo and Margaret, followed by Ursula, who carries the Infant.

*Paulo, alarmed.* There is a frightful earthquake all around;

And a wide rent, just by our cottage door.  
Which swallowed up the cow, and both the goats!

*Margaret, trembling.* And through each crevice fire is rushing out!

Already it has caught the old elm-tree,  
Which crackles as it burns.

*Ursula.* I've brought the child, and both the precious Bibles—

The old one, and the new. Paulo, take this:  
If we must die, have it within your hands.

*Mr. Müller, solemnly.* It is ordain'd that all must yield their breath;—

Then why not now? Have fortitude;  
I will come back, but now must take my leave;

Remember, nought can hurt the eternal soul!  
[Mr. Müller goes out.

*Agnes.* It is our duty to protect our lives  
All in our power. Paulo, go bring the coach;

The crazy vehicle my father used  
When first he married; seek a pair of horses,  
And you shall drive us all towards the sea;

It will be safer there, at least a while.  
*Margaret, weeping.* Oh, what a smell of sulphur!

What blue flame  
Is rising now! O lady, save us all!

Run, Paulo, fetch the coach, and let's be gone!  
[Paulo goes out.

*Margaret.* Another hill's on fire! what can it mean?  
*Ursula, solemnly.* The end of all is come! Thy pretty boy

Must close his beauteous orbs, blue as the skies,  
And not in sleep! I've known it many years.

That the great change was nigh; signs have appear'd  
To me—tenet full fourscore seasons, (nay 'tis more),  
Of this old world, that long it could not last.

*Margaret.* Oft have you said so; but I deem'd it then

Nought but the dream of age, for ever mournful.  
Have you, dear lady, seen portentous signs

As well as our good grandame?  
*Agnes, abstractedly.* Signs, said'st thou? Yes, I have

had a sign,  
Certain and sure; and yet I could not see

What it portended. Margaret, thy child  
Has had a sponsor, one thou couldst not dream

Would take that office, save in bitterest scorn:  
Satan has been his godfather, and is

Again an angel, near the throne of God?  
*Ursula.* That man with the splay foot? I told

you so!  
*Margaret.* You told us not

That Satan was restored to paradise.  
Oh, what a blast of sulphur passes by,  
It takes away my breath!

*Agnes.* Alas! I saw thy infant gasp and die,  
Inhaling that foul air! Yes, he is gone!

*Margaret, with anguish.* O God! my child, my  
beauteous babe, has perish'd!

*Enter Paulo.*  
The horses are all restive with affright:

What see I there? Dead is my first-born boy?  
Then wherefore fly? Let us all perish here!

*Agnes.* We have no right to throw our lives away  
Before the appointed time. Away then to the heights,  
Above the sea!

*Paulo, weeping.* Say, did the lightning strike our  
darling dead?

O grandame! these are fearful times, indeed!  
*Agnes, encouragingly.* We shall but close our eyes

like this sweet babe,  
And open them in heaven. He now is there

A winged cherub! Shall we inter him here,  
Before we go?

*Margaret, weeping.* No, dearest lady, no! henna, at  
my breast,  
Still let him lie—one grave will serve us all!  
*Agnes, looking out.* Well, be it so: I hear the  
lumbering coach;  
Quick, let us enter it, and haste away;  
Well may the horses rear;—the wood's a-blast!  
And see your cottage, Paulo, has caught fire,  
And all your garden trees. Quick, to the heights!  
[They all depart, Margaret carrying the dead  
body of the infant."

The other dramatic persons die in succession, and there is a wild description of some of the appearances in the world's wreck. It is very tragic-comic, laughy-cry-able:—

*"Mr. Müller.* Mark how that sea-snake leaps and coils about!

Vain are its struggles—on the whale it dies!  
What shoals of sharks blacken the foaming sea,  
Which now begins to boil!

Oh, what a sight to see!—My head swims round—  
I faint with terror!

[Mr. Müller staggers near the edge of the rock."

[Delivers a lecture on geology, which settles the Huttonian theory.]

"Gone, are they?—swallowed up?—engulph'd in fires  
That have been burning from this world's creation,  
Devouring all beneath! raging, increasing,  
Until this orb, grown hollow like a cup,  
With nought substantial save a slender crust  
Just at the surface, soon must lose its form,  
And sink into a vast irregular heap  
Of burning ashes!"

Lucifer appears, and the dénouement ensues:—

*"Agnes.* Lend me thine hand!

Fain would I die upon thy friendly breast,  
Supported by thine arms. There—that will do!

Draw up my blister'd feet! I cannot breathe  
This hot, sulphureous vapour! Yet I'm blest  
That thou art saved! Dear Lucifer, farewell!

[Agnes dies in the arms of Lucifer, and he rises with her upon a golden cloud, supported by angels, who sing the following:—

Earth is 'vanish'd like a scroll!'  
Soon another will arise;  
But the everlasting soul

Liveth, though the body dies!  
The mission is ended; the victory won!

The love-task is finish'd; the errand is done;  
Triumphant we rise to the place of our birth;  
Whilst crash sinks the last burning fragment of earth!

[They ascend; and the Earth, blazing, is opposed by the boiling waters of the deep. Dreadful is the antagonism—the hissing, belching sound; at length the Ocean is dried up, and the fire is quenched; nothing but a speck remains—the nucleus of another world."

Then follows the conclusion, which, however well meant, grates upon our sense so like blasphemy that we dare scarcely quote any part of it:—

"Some the last. Lucifer arrives in heaven, and lays the glorified, but inanimate, body of Agnes at the feet of the overruling Redeemer, the manifestation of the Father, who is ineffable and unapproachable but through the Son. The glory of the Holy Spirit shines around the person of the Son, far more brilliant than can be conceived by mortal, and darts its rays through all the universe. Myriads of angels; the stars and planets slaying their course to witness the scene.

*Lucifer, kneeling.* My Saviour and my God,  
Behold my sister! messenger from thee:  
I knew her not on earth, and she had lost,  
Whilst clothed in frail humanity below,  
All memory of her pure primeval state;

Nor is it yet awaken'd. Son of God!  
Him I have tempted, mock'd, and sore blasphem'd,—  
Receive my humble homage—grateful thanks.

O wondrous love! that for a wretch like me,  
Could leave the bosom of thy holy Father,  
To be the sacrifice.

*The Son of God.* Love has no bounds!  
It is eternal, infinite, unchanging.

Witness this bright-eyed seraph at my feet!  
After thy fall, unwearied did she plead  
For God's permission to attend thy steps.

E'en down to lowest hell, to win thee back  
To that Redemption purchased by me  
Thou hast accepted—free, full, and for eternity!

This darling child of heaven,  
Thy better half, since love made all her being,  
And self she sacrificed for good of one

Treading my footsteps, who gave up my life,  
Whilst in the flesh, for all who'er had sinn'd—  
This yet unconscious daughter of the skies,  
Bear her within thine arms to that bright bower

Where she and thee, the first-born stars of heaven,  
First open'd your refulgent eyes to bliss;  
There let her wake to happiness renew'd."

[Lucifer, accompanied by a shining host of angels, conveys Agnes to the bower where she first unfurled her pinions in his company. She is laid down upon the sunny slope,

within the rainbow arch. Soft music. The angels enter not the lower, but crowd around it.

The Voice of the Son of God, he himself invisible.  
Receive again, dear pardon'd Lucifer,  
Thy brilliant wings; now hover o'er this seraph,  
And I will give again the immortal spark  
To her fair form.

I've breathed the breath of life  
Into her nostrils. Now, Lucifer, address her.  
Lucifer. Why sleeps my glorious sister such long  
while?

I miss her presence, and would soar aloft!  
[Agnes opening her eyes, and receiving at the same time  
her white silvery plumes again.]

She unfolds her "pearly pinions," and we  
lay down our pen.

*The History and Antiquities of Leath Ward, in the County of Cumberland: with Biographical Notices and Memoirs.* By Samuel Jefferson. Illustrated with numerous Plates and Engravings. 8vo. pp. 515. 1840. Carlisle: Jefferson. London: Nichols and Son; and Whittaker and Co. Newcastle: Charnley.

To illustrate a portion of the interesting county of Cumberland is a laudable undertaking; and Mr. Jefferson deserves our praise for the pains and industry he has bestowed on the Ward (or hundred) of Leath, which comprises the south-eastern portion of the shire; is about thirty-five miles in length, and of irregular breadth, nowhere exceeding fourteen miles from north to south. There are genealogies of the Dacre, Musgrave, and other ancient warrior families, some of them now extinct, and others vanished into several faint points in female lines, but some still represented by manly heirs. In other respects the local and provincial information is valuable to northern England; and there are some matters of greater general nationality to be found among the more limited details. Thus, from the painted windows of the old church of Penrith we have portraits of Richard Plantagenet, Duke of York, and his wife, Cicely Nevill, the parents of Edward IV. and Richard III. and said to be the only likenesses of them extant. The etchings of these heads enrich the embellishments. We select an extract as a specimen of the things of more diffused interest:—

"The great north road through Carlisle to Edinburgh and Glasgow traverses the parish and passes over Wragmire Moss, of which part of the road we have the following notice in Bishop Nicolson's MSS.: 'In 1364, a grant was made of forty days' indulgence to any that should contribute to the repairs of the high-way through Wragmire; and to the support of John de Corbrig, a poor hermit living in that part.' On Wragmire Moss, until the year 1823, there was a well-known oak, known as the last tree of Inglewood Forest, which had survived the blasts of 700 or 800 winters. This 'time-honoured' oak was remarkable, not only for the beauty of the wood, which was marked in a similar manner to satin-wood, but as being a boundary mark between the manors of the Duke of Devonshire and the Dean and Chapter of Carlisle, as also between the parishes of Hesket and St. Cuthbert's Carlisle; and was noticed as such for upwards of 600 years. This 'gnarled and knotted oak,' which had weathered so many hundred stormy winters, was become considerably decayed in its trunk. It fell not, however, by the tempest or the axe, but from sheer old age: this happened on the 13th of June, 1823. If not of late years, as beautiful in its foliage, nor presenting such a goodly assemblage of wide-spreading and umbrageous branches, as some other celebrated oaks, yet it was an object of great interest, being the veritable last tree of Ingle-

wood Forest. Xerxes, who cared not for the sacrifice of human life, would not suffer his army to destroy trees, and halted his mighty host for three days that he might repose beneath the Phrygian plane; and yet, probably, that tree had not numbered half the years of this relic of Inglewood, under whose spreading branches may have reposed the victorious Edward I., who is said to have killed 200 bucks in this ancient forest; and perhaps, at a later period, 'John de Corbrig, the poor hermit' of Wragmire, has counted his beads beneath its shade."

The Druidical remains called Long Meg and her Daughters, and other antiquities, whether British, Roman, Danish, or Saxon, which occur in this district, are specifically described; and the description of the churches is well done. The biographies are in keeping with the other merits of the volume; and one of "Father Hudleston," contributed by Dr. Lugard, asserts some curious and questionable facts. Speaking of the escape of Charles II., he states:—

"After consultation with Lord Wilmot, Charles was conducted the same night to Moseley; Wilmot met him there, and left him in the morning to make further arrangements. The king spent most of his time on that day and the next in conversation with Hudleston, and in reading the books in Hudleston's room, among which he found a treatise in manuscript, written by Richard Hudleston, the uncle of the priest, and a monk of the celebrated monastery of Monte Cassino, in Italy, who had spent the last thirty years of his life as a missionary in Yorkshire and Lancashire. It was entitled 'A Short and Plain Way to the Truth and Church;' and Charles, having read it, said to Hudleston, 'I have never seen any thing more plain and clear upon this subject. The arguments here drawn from succession are so conclusive that I do not conceive how they can be denied.' These words were not forgotten: when the king afterwards became a Catholic on his death-bed, Hudleston attributed it to the impression made on his mind by the reading of this tract; and under that persuasion he published it in the beginning of 1688."

*Wang Keou Lwan Pih Nien Chang Hân; or, The Lasting Resentment of Miss Keou Lwan Wang. A Chinese Tale, founded on fact.* Translated from the Original by Robert Thom, Esq., Resident in Canton. Canton, 1839. Printed at the "Canton Press" Office. London, 1840. Ball, Arnold, and Co.

It is no shame to confess that we are not competent judges of the fidelity or spirit of this translation: in fact, we must take the translator's word for it; and the preface tells us—

"The following tale is extracted from the eleventh volume of the 'Kin koo ke kwan,'—'Remarkable Observations of Ancient and Modern Times,' in twelve volumes. An abridgment of the same story is found in the 'Tsing she,' or 'History of the Passions' (ten volumes), in the seventh volume, sixteenth division (being that of the passion of revenge), under the head of 'Chow Ting chang.' The story was at first translated quite literally, but, on re-perusing it, the translator, fearing lest, from its remarkable brevity and abruptness, it would be most unpalatable to an English reader, besides being in many passages absolutely unintelligible, wrote it out afresh, when a great many liberties were taken with the original text, especially in giving the most decent interpretation to certain expressions, which, however cus-

tomary among the Chinese, would be offensive to Europeans; and one passage which would not admit of being so handled has been entirely suppressed. \* \* \*

"That the foreign missionaries who resided at Peking (he continues to state) possessed every facility for studying the language and literature of the country, that the most educated natives themselves possessed, I believe to be the case; that we who live in Canton stand upon a very much more favourable footing for prosecuting our researches than the forlorn student, confined to his own chamber in Paris or Berlin, with no one to whom he can look for assistance, I very readily admit; still is our situation not quite so favourable as the learned and able sinologue seems to think it. We are not surrounded by the *gens de lettres* as were the missionaries at Peking, we have not free access to their stores of knowledge as these able men had, nor are we looked up to with that profound respect which they, for a season at least, exacted from the throne itself. Oh no! our Chinese associates are hong-merchants, linguists, compradores, and coolies—people who make no pretensions to literary merit—people who cannot if they would, and who dare not if they could, convey to us any literary instruction; and who, while they eat our bread, most commonly hate and despise us! Such is the case, less or more, of every foreigner who sets his foot in China! The writer, during a residence of nearly five years, has only three times (and that by mere accident) conversed with persons who can properly be called by profession literary men (*lettrés Chinois*). Two of these occasions being upon business, no familiar conversation was permitted. The third occasion was at a hong-merchant's, where a Han lin (*académicien*) was visiting as a friend. This *lettré Chinois* condescended to ask a few questions, but smiled with incredulity on being told that the English had their poetry as well as the Chinese had theirs, and appeared actually to sicken with disgust when assured that it was quite possible in our barbarous tongue to compose a *wên chang*! (thesis or homily.) It is worthy of note that this gentleman, on meeting the writer, gave himself out as a merchant, most probably from the idea that it was beneath the dignity of a *lettré* to pollute his lips by conversing familiarly with a despised foreigner! In one word, then (and the truth must be told even though with a blush), the Chinese men of letters look upon us, upon our pursuits, and upon every thing connected with us, with the most utter contempt!"

No matter whether with or without good reason, perhaps the Chinese will know us better by and by; but whether they will think better of us remains to be seen when one or other of the parties sing *Tea Deum*. A pretty characteristic frontispiece, lithographed at Canton, affords us an idea of some of the characters, and particularly of the bright-tartar-eyed, weefooted heroine, whose garden sports led to the amour and catastrophe so well painted by the dramatist. For the incidents are well told, and the *dénouement* is affecting. There is no difference in the hearts and passions of men and women; and it is only their modification by custom that makes the difference. Custom is, indeed, most powerful. It prescribes rules of action and modes of expression. It promotes virtue or facilitates vice; and it plays handy-dandy in so strange a style, that the virtues and vices of countries interchange their nature—vice being esteemed virtue, and virtue vice.

The introduction to our tale may confound them a little, for it is as follows:—

"It is related that in the province of Keangse, the Foo district of Jaouchow, the Heen district of Yu tseen, and the village of Changlo, there lived a man of the common people called Chang yih. This man dealt in miscellaneous articles, and, one day, in the way of business, he had occasion to go to the chief city of the Heen district, and the night being already far gone ere his little matters were all arranged, he went to sleep at a lodging-house outside of the town. This lodging-house, being already full of people, could yield him no accommodation. There happened, however, in a partition wall to be an empty apartment fast locked, in which no man dwelt; and Chang yih, addressing the landlord, said to him, 'Mine host! why not open this empty room and let me have it?' The landlord replied, 'In this room, sir, are ghosts or devils, and I dare not lodge guests in it.' Chang yih again said to him, 'Well, even if there should be ghosts or devils, what should I be afraid of them for?' The landlord, having not a word more to say, could only comply; so he unlocked the door, and taking a lamp and a sweeping-broom, handed them over to Chang yih. This person then entered the room, and taking the lamp, placed it steadily on the ground, where he trimmed it quite brightly. In the centre of the room was a broken bedstead, literally piled up with dust; so he made use of his broom and swept it clean, spread open the bed-clothes, called for a little rice and wine, on which he supped, threw the door to again, undressed himself, and went to sleep. In a dream he saw a very beautiful woman, in rich and gaudy attire, step forward and recommend herself to his pillow. While dreaming he embraced her, and when he awoke, strange to say, this woman was still as before at his side! Chang yih asked her who she was? When she replied, 'I am the wife of a neighbour, and because my husband has gone abroad, I feel afraid to sleep alone, so we must just mutually accommodate matters. Do not, at present, speak any more; afterwards you will know all!' Chang yih did not again ask her, and when it was bright daylight, this woman took her departure; at night she again came, when both parties were as pleased as at first. Thus it continued for three successive nights, and the landlord seeing that his guest, Mr. Chang, the merchant, was at leisure, by chance said, in relation to this circumstance, that formerly in that room a woman had hanged herself, and that strange things frequently happened there; 'Only,' added he, 'all seems to be quite quiet at present.' Chang yih treasured what he heard in his breast, and when night came, and that same woman came with it, he put the question to her, saying, 'To-day the landlord told me that in this room was the ghost of a woman who had hanged herself: I presume that this must be you?' The lady, without betraying the least symptom of shame, or shewing any desire to conceal the truth, replied promptly, 'It is indeed myself, and no other! But you, sir, may be under no apprehension, as I have not the slightest intention to injure you.' Chang yih begged her to favour him with the particulars of her history, which she did in these words:—'In my previous state of existence I was a girl of the town, and my family name was Muh. My rank in the stews was number twenty-two, and for this reason people used to call me Miss Neen urh. I had a *liaison* with a man of Yu tseen district, called Yang chuen, and we were very intimate indeed. He promised to marry me, and take me home with him; so on the faith of this I assisted him with my little private stock of money, which consisted of a hundred pieces of gold.

My false lover went off, and in three years not returning, the old lady at the head of our establishment wished to constrain my affections, and urged me to admit another suitor; so having no plan to get rid of her importunities, and being unable to bear up against the vexation that weighed me down, I hanged myself, and died! The place where my brothers dwelt in was sold to another person, who nowadays uses it as a lodging-house. In former times this was my room, and my spirit, not being extinguished, continues to haunt it as before. Yang chuen is from the same district as yourself, perhaps you may know him?' Chang yih replied, that he knew him very well. 'And where is he now, and what is he about?' asked the woman. Chang yih replied, 'Last year he removed his dwelling to the south gate of the city of Jaouchow, where he has married a wife, and opened a shop. Moreover, his business is in a very flourishing way.' The woman gave a long sigh, but at that time made no further observation. After two days more, when Chang yih was about to return home, she said to him, 'I have a strong desire, sir, to follow you, and live with you altogether, but I do not know whether you will consent or not?' Chang yih replied, 'Why, if you are able to accompany me, pray what objection should I have?' Upon this the woman rejoined, 'Then, sir, would you be good enough to get ready a small wooden tablet, and have written upon it, 'This is the spirit's tablet of Miss Neen urh,' which you can put in your clothes-basket. If at any time you take it out and call me, I will on that instant come forth.' Our friend Chang promised that he would do so. His companion further said to him, 'I have still fifty taels of silver buried beneath this bed, which no one knows of; you may take it and use it as you list, sir.' Chang yih dug up the ground, and in reality found a pitcher containing fifty taels of silver, at which his heart was full well pleased, and thus the night passed. Next day he had the spirit's tablet written out, which he stowed away carefully, and bidding the landlord good-by, set out on his way home. When he had got to his house, he recounted all these circumstances to his wife. This lady was not at first too well pleased with the adventure, but on seeing the fifty taels of silver she recovered her good humour, and expressed no dissatisfaction. Chang yih having set up Miss Neen urh's spirit's tablet by the eastern wall, his wife, by way of sport, took it and called upon her, when lo! in broad daylight Miss Neen urh came walking forth, and made the good lady of the house a profound obeisance. This personage was at first a good deal startled, but afterwards getting familiar to the sight of the spectre, she made no work about it. At night, when Chang yih and his rib retired to rest, the stranger slept beside them, and, strange to say, neither was the bed in any way observed to be cramped nor narrow! After some ten days and more the spectre lady said to Chang yih, 'There is an old outstanding debt due me at the principal city of the district; perhaps, sir, you would like to go along with me to recover it?' Our friend Chang, hoping to turn the affair to his own advantage, at once promised. He then forthwith hired a vessel, and taking the spirit's tablet, placed it carefully in the centre of the boat. The stranger lady travelled with him by day, and slept with him at night; indeed, she seemed not at all to shun the intercourse of people of flesh and blood. After travelling a few days, they arrived at the south gate of Jaouchow city, when the woman said, 'I am now going to Yang chuen's house to claim the old debt due me.' Chang yih

wished to ask her what she meant, but, in a moment, she was already ashore. He followed her, and saw her distinctly enter a shop, which, on inspecting narrowly, he found to be in very deed the house of Yang chuen. Having waited for some time, he did not see her come forth; but he saw the whole of Yang chuen's establishment in a state of fright and alarm, and, in a brief space of time, the sound of weeping seemed to shake the very ground. He inquired the reason of a person in the shop, who thus accounted for it: 'Why,' said he, 'my master, Yang chuen, was well enough; hitherto there had been nothing the matter with him, when, all of a sudden, he met some wicked devil or other, for the blood spouted out of the nine orifices of his body, and he died!' Chang yih knew within his heart that it was Miss Neen urh who had done the deed: so, quietly stealing down to his vessel, he took the spirit's tablet, and earnestly called upon her, but she was never seen to come forth more! Chang yih then comprehended, that the old outstanding debt due her at the chief city was a debt of vengeance to be recovered from Yang chuen for his unjust conduct towards her when a being of this world! There is a verse of poetry which says feelingly in relation to this:—

'Wang Kwei turned his back upon every sense of goodness, and drew down upon himself the deadly vengeance of the gods!  
 Le yih also sinned against his conscience, and for doing so his nature was changed!  
 Please read this little story of Yang chuen's cruel conduct, and the fate he met for it.  
 And you will find that Imperial Heaven protects not the heartless lover!'

We have just now been relating how that Miss Neen urh, even although dead, managed to exact a deadly vengeance for her wrongs: but then it is said that her spirit came forth to avenge her; which is a very strange, and by no means a certain, circumstance."

This leads to the more certain story of Miss Keaou Lwan Wang, who, being seen swinging in her garden by a fine young gentleman in mulberry-coloured clothes, and euphoniouly named Ting Chang, the matter led to a love-affair of genuine Chinese construction, and highly illustrative of the feelings and manners of the people. It would occupy too much of our space to follow the thread of the courtship, but we will give a sample.

"We may again remind the reader, that it was thinking too much about her lover, the young student Chow, which had at first led to Keaou Lwan falling sick; but having had her pulse felt by him, and being now permitted to ramble through the garden *ad libitum*, attended only by people in whom she had implicit confidence, she felt so delighted, that fully half of her complaint left her in a moment. She was now continually coming to the pavilion in the garden, where she and Ting Chang saw each other frequently; they walked together, they sat together, and even sometimes would she be prevailed on to join him in a cup of tea at his studies, until at length, little by little, they paid no attention to the strict barrier which law and custom have placed between the sexes in China, for they sat side by side, they clasped each other's hands, and gave numerous, though hitherto innocent, tokens of their burning love. Ting Chang at length seized an opportunity, when no one was present, to urge his suit, and earnestly implored for a glance at the fragrant chamber. Keaou Lwan stole a look towards the spot where Aunt Tean stood, and answered in a low whisper, 'The key is in her possession, my brother must himself beg it of her!' Ting Chang in an instant comprehended her mean-

ing; and next day, having purchased two pieces of the finest silks and a pair of gold bracelets, he employed Minghea to lay them before Aunt Tsaou. This good lady forthwith lied away to her niece, and said to her, 'Young master Chow has been sending me a very handsome present. I'm sure I don't know what his meaning can be by so doing.' 'Why,' said Keaou Lwan, 'he is a young and thoughtless student, and not without his faults: I presume he means by his present to solicit my kind aunt's indulgence.' Aunt Tsaou replied, 'What is most at heart with you two young folks I know perfectly, but whatever intercourse you may have, I will never, never disclose it!' Saying these words, she took the key, and handed it over to Minghea. Lwan's heart was delighted, and she instantly wrote the following stanza to Ting Chang:—

'In secret I take these words and send them to my lord,  
But do not inconsiderately open your lips to other people!  
This night the door of the fragrant apartment will not be locked,  
And when the moon changes the shadows of the flowers,  
Let my lover come.'

On receiving these lines, Ting Chang's joy was without bounds. That night, when it was already dusk, and the watchman's first drum had sounded, he, with slow and stealthy steps, bent his way to the inner section of the house; and, the back door being ajar, he sideways slipped himself through. From that day when he felt her pulse in her bedroom, and returned by the back garden, he had but a slender recollection of the passage, so he moved along slowly; but at length, seeing the rays of a lamp, and Minghea standing waiting for him at the door, he quickened his pace, and walked straight into the young lady's chamber. Ting Chang made her a low bow, and wished to clasp her in his arms, but Lwan pushed him off, and desired Minghea to call Aunt Tsaou to come and sit with her. At this the student's hopes were greatly balked, and all the bitterness of disappointed love rising up before his eyes, he upbraided her with change of mind, and his tears were about to flow. Lwan, seeing him in this state, observed, 'I am a virtuous maiden, and you, sir, are, I believe, no rake. Alas! it is only because the youth possesses talent, and the fair one beauty, that we thus love, thus compassionate each other. I, having clandestinely admitted you to my apartment, now hold myself yours for ever. And you, sir, were you now to cast me off, would not this be a poor return for the implicit confidence I repose in you? No, you must here, in the presence of the all-seeing gods, swear to live with me as man and wife till both our heads are white with age. If you aim at any irregularity beyond this, though you slay me, yet will I not consent!' She spoke these words with great earnestness, and had scarce finished when Aunt Tsaou arrived. This lady, in the first instance, thanked Ting Chang for the handsome present he had sent her during the day; and the young gentleman, in return, implored her to play the part of a go-between and marry them. He swore to be a most faithful and loving husband; and his imprecations, if false, flowed from his mouth like a torrent. Under these circumstances, Aunt Tsaou thus addressed them both: 'My beloved nephew and niece, since you wish that I play the go-between, you must begin by writing out conjointly four copies of a marriage-contract. The first copy we shall take and burn before heaven and earth, so as to call the good and evil spirits to witness what we are now about. Another copy you will leave with me, the go-between, as proof, if at some future

day your love towards each other should wax cold; and each of you should preserve a copy, as a pledge that, one day or another, you will join the bridal cups and go through the other forms of a regular marriage. If the woman deceive the man, may the swift lightning strike her dead! If the man deceive the woman, may unnumbered arrows slay his body; and further, may he or she again receive the punishment of their crime in the City of the Dead, by sinking into the hell of darkness for ever and ever!' Aunt Tsaou pronounced the curse in a most solemn and touching manner, that struck awe for a moment into the hearts of both the student and Lwan; with mutual fondness, however, they set about writing out the several copies of the marriage-contract, which being solemnly sworn to, they knelt in humble worship before heaven and earth, and afterwards returned their hearty thanks to Aunt Tsaou. This lady, then producing rich fruits and mellow wine, pledged each of them in a cup, and wished them joy as man and wife. This continued until the third drum (midnight), when Aunt Tsaou taking her leave, the student, hand in hand with Lwan, ascended the nuptial couch, and the pleasures of matrimony are too well known to require further amplification. At the fifth drum (three to five in the morning) Lwan urged the student to rise, and laid the following strong injunction upon him: 'As I have now given my person to you for life, you must never, never turn your back upon my goodness. Remember that the all-seeing gods are above us; it is indeed hard to escape their piercing glance. After this, when I have leisure, I shall send Minghea to wait upon you and receive you. Do not, upon any account, act giddily; you will thereby provoke the slanderous remarks of other people.' Ting Chang, word for word, promised to do as she had commanded him, and he still lingering about, loath to depart, she hastily called Minghea, and desired her to conduct him out by the garden."

After a while the husband departed for a distant part, where his parents demanded his presence, and—alas, for Chinese constancy!—forsook his love. A scented gauze handkerchief, returned to her, reveals this sad news, and "in a moment rage choked her woman's breast, while indignation flushed her lovely countenance; she begged that her aunt might wait upon her in the fragrant apartment, where she made her a complete narration of the whole. Aunt Tsaou exhorted and admonished her to bear her hard lot with patience, but Lwan gave no heed to her friendly counsel. Three entire days, and as many nights, she spent in tears; she took out the little gauze napkin, and turned it over again and again. Ah! how many recollections of her once happy moments did that now bring to her broken heart! She even sought an opportunity of destroying herself; but, upon reflection, said,—"I, Keaou Lwan, am the beloved daughter of a family of note; I was not without beauty, and the world said that I possessed some little talent: were I thus silently and obscurely to pass into oblivion, would I not thereby be conferring a great favour on my heartless lover?" With that she drew up thirty-two stanzas of poetry, intimating that she was about to take away her own life, and an ode or ballad of eternal resentment directed against Ting Chang. The following is a verse of the poetry alluded to:—

'As I lean against my door-post, and in grief and silence meditate on bygone scenes,  
I sigh; alas! my dream of wedded bliss has now vanished like a smile!  
Love in early life stirred up the rambling fibres of

passion, and dragged the green and tender buds of my heart astray,—  
Rage now follows like a torrent, and shrinks these green buds to the withered red of resentment!  
Then, I said, My lord will return true to his promise, as Spring to her reviving period;—  
But now, alas! I full well know that 'all is vanity'!  
I turn my head, and lean against the railing, the painful spot of our long farewell,—  
And all my sorrows, for ten thousand years, I lay at the door of the false and cruel east wind!"

We will not treat our readers with the ode of resentment, but hasten to the catastrophe. Having put together every paper and document relating to their vows and marriage, together with the poetry the treachery of her lover had wrung from her despairing breast, she addressed the packet to the military governor of the district where the faithless Ting Chang resided; and "that very night Keaou Lwan washed her person with the utmost care, and, having changed her clothes, she desired Minghea to go and boil her some tea, using this deceit to get Minghea out of the room. No sooner was her maid gone than, having first fastened the door, she made use of a stool to support her feet; then taking a white sash, she threw it over a beam and tied it; next, having made fast the scented gauze napkin, the first cause of all her woes, round her throat, she joined it to the white sash in a dead knot; and finally, kicking away the stool, her feet swung in mid air, and in a moment her spirit dissolved in ether, while her soul sought the habitations of the dead, at the early age of twenty-one years! Old Mr. Wang was not long in hearing the dismal tale, and in an instant he repaired to the spot. It were needless to relate the scene of sorrow that ensued; neither the old gentleman nor his lady knew for what reason their beloved daughter had committed this rash act. But it was necessary to take some steps for the interment of the body, and a coffin being procured, what was once the lovely and accomplished Lwan was, amid the tears and lamentations of the whole household, consigned to the silent grave. Let us now, however, relate how that his worship Keuë, the chief magistrate of Woo Keang district, received the public document from the military station of Nanyang. Having perused it, great was his surprise indeed; for times of old until then he had never heard of so extraordinary a case. It so happened, that at that very time his worship Chaou, the tui kwan, in the train of the imperial censor, Fan che (who was traversing that part of the country inspecting and reforming abuses), had come to the very district of Woo Keang. Now Keuë, the che heen, had obtained the honours of tsin sze the same year that Chaou, the tui kwan, had; and being very intimate together, his worship Keuë communicated this singular occurrence to his fellow-student Chaou. This gentleman, having viewed the matter carefully, conceived it such a strange occurrence, that it ought to be brought to the notice of the censor himself. His excellency Fan took the poetry, the ballad, and the marriage-contract, and turned them and revolved them again and again, so as to make himself thoroughly acquainted with, and get at the very marrow of, this strange piece of business. He deeply lamented the talent of Keaou Lwan, worthy of a better fate, while he viewed with no less abhorrence the cruelty of Chow Ting Chang. He commanded his worship Chaou to make secret inquiries about the gentleman, and next day had him apprehended, and brought up to the censor's public court for examination. His excellency Fan interrogated him himself. Ting Chang at first persisted obstinately in saying that the whole was not true; but the marriage-contract being pro-

duced as evidence, he did not dare open his mouth. His excellency the censor, in great wrath, commanded the lictors to give him fifty severe blows of the bamboo, and conduct him to the public prison. In the meantime he despatched a letter to the military station of Nan yang, to inquire if Keau Lwan had in very deed strangled himself or not. After not many days a reply came containing the particulars of poor Lwan's untimely end; upon which the imperial censor, Fan, had Ting Chang taken out of prison, and brought up a second time to his tribunal. The censor, in a voice of wrath, thus addressed him:— 'To treat with levity or insult the daughter of a mandarin of rank is one crime. Being already betrothed to one wife, marrying another is a second crime. Having had adulterous intercourse, leading to the death of a party concerned, is a third crime. In your marriage-contract it is written, 'If the man deceive the woman, may unnumbered arrows slay his body!' I have now no arrows here to slay thee, but,' added he, raising his voice, 'thou shalt be beat to death with staves like a dog, so that thou mayest serve as a warning to all cold-blooded villains in future!' With that he shouted with a loud voice as a signal to the bailiffs and lictors who were in waiting: these, grasping their clubs of bamboo, rushed forward in a body and tumultuously struck the wretched culprit, pieces of whose body flew about the hall in all directions, and in a moment a bloody and hideous mass marked the corpse of the betrayer of Lwan! Within the city there was not one man who did not approve of this punishment as well merited by his former heartless cruelty. His father, Professor Chow, on hearing of this news, suddenly died of grief and indignation; and not long after, the daughter of Wei, whom Ting Chang had married, gave her hand to another."

So be all false-hearted traitors punished in every land under the sun!

"Some of the Chinese follow a superstitious custom, when betrothing a boy and girl of tender years, to cut a lock of hair from the head of each, and cast it into a tub of water. If the two locks of hair are mutually attracted and speedily entwine, it is considered a good omen; and if they repel each other, the contrary."

Poor Miss Wang's must have been a very repulsive experiment—worse than a Rape of the Lock!

*Lines for the Newmarket Bazaar, October 27. 1840. Addressed to his Grace the Duke of Rutland.* By the Rev. John Calthrop, M.A. Curate of Isleham, Cambridgeshire. Soham, 1840.

THIS is a very local poem, and on a very local subject, so much so that we would hardly allude to it but for a certain feeling, beauty, and benevolence of purpose, which recommend it to our notice. The whole is not more than a hundred and twenty or thirty lines; and after an able exordium there are some pretty allusions to the allegorical lessons of flowers, such as:—

"The moralist may here a lesson see,  
And in our orange flowers read 'Chastity.'  
Pure 'Faith,' though stern and bitter be our lot,  
Is seen in thy blue leaves—Forget-me-Not.  
Bright Amaranths, unknowing how to die,  
Instruct the soul for 'Immortality.'"

But we overpass the rest to quote the poetical and grateful conclusion, which embalms one of the many acts of a nobleman whose life is one continued ornament to his high station, and an example to all others who possess rank, wealth, and power, at this season of pinching want to the poor:—

"To point these morals and adorn a tale,  
Kind woman's hands and tender heart avail.  
Look in her face, and scan her beaming eye,—  
In every line and glance there's charity:  
And all the elegance this scene commands  
Sprung from sweet woman's heart and woman's hands.  
To heal the sick; to teach the child to raise  
Its infant hands and voice in prayer and praise;  
'To pour the fresh instruction o'er the mind—'  
With inward light to bless the mental blind—  
Are her designs. Your generous aid will give  
Her plans success, and bid her hopes survive.  
The Grecian Sage, with sear'd and jaundiced eye,  
Near such a scene as this on passing by,  
With self-complacent, philosophic cant,  
Exclaim'd, 'What things are here I do not want.'  
Had his cold heart with charity been warm'd,  
A fancy-fair his melting breast had charm'd.  
And though philosophy, with stoic pride,  
Had taught him pomp and pleasure to deride;  
His rigid rule had vanish'd from his mind—  
The man had felt the wants of all mankind.  
Patron and Friend! the virtuous and the great!  
Whose kindly heart adorns thy high estate—  
Friend of the poor! whom Belvoir's splendid halls  
Detain not when the voice of duty calls;  
The blessing of the poor shall rest on thee—  
The meet reward of genuine charity!  
And if the spirits of the loved and lost  
Still hover near the forms they prized the most;—  
If, with unfolded wing and guardian eye,  
And voice attuned to seraph minstrelsy,  
They take their station in the ambient air,  
And make the loved ones their angelic care—  
She is not lost to those who strew'd with flowers  
Thy path of life, and charm'd the fleeting hours.  
And if, as sages teach, the souls in bliss  
May still an interest take in worlds like this,  
Her angel ear may catch the loud acclaim,  
With which we celebrate her Rutland's name;  
And one pure, thrilling transport fill her heart,  
Till ye shall meet—shall meet—and never part."

#### KENNEDY'S ARMY OF THE INDUS.

[Third notice: conclusion.]

IN making a diversion a few weeks since in favour of Captain Havelock's Bengal narrative, we gave a respite to Dr. Kennedy's Bombay, though the second volume cannot be dismissed without further attention. Indeed it ought not; for though these Indian works fall somewhat thick upon us, the events to which they relate (with the future consequences they involve) are so momentous, that there are not many topics of greater consequence to demand a fair record at the time they occur when these seeds of futurity are sown. The extension of our eastern empire to Cabool—its boundaries already grating upon Ava, China, and Persia—is a most important epoch in its history; and a few of our pages cannot be better bestowed than in tracing the accounts of those who have been actors in and eye-witnesses of the drama of Shah Soojah's restoration. Yet our selections must be of a very miscellaneous character, and more in unison with a literary and scientific than a political journal. Thus, to begin with natural history:—

"On the 9th, at Nouruk (says Dr. K.), the Rev. G. Pigott and myself were witnesses of a very singular natural phenomenon. For this and the next few days we found the bushes near the bank of the river covered with clouds of a large-sized bright-brown insect of the dragon-fly tribe, buzzing about and merrily enjoying their brief existence. Whilst sitting together, we observed a scaled reptile creeping up the tent wall; at a certain height it stuck, and appeared shortly to be undergoing sundry throes and convulsions, which were sufficiently marked to attract our attention: finally, the scaly coat of the creature burst, and an enclosed winged insect very slowly extricated itself from its husky tenement, and gradually developed its gauzy wings, a very different figure from the reptile on whose filmy transparent shell it remained perched. It was one of the merry, noisy dragon-flies, and this appeared to be their winging time. How long it remained ere it took flight we did not observe; but the period that elapsed betwixt its being a creeping

thing on the tent wall, and its shaking of its earthly coil to expand its transparent wings for the regions of air, was less than two hours. Who would not envy such a translation from earth to heaven? These brown insects appeared, however, to have little that was enviable in their lot: they were falling by thousands into the river, and shoals of fish were busy devouring them. Our anglers had much amusement, as our camp was always on the bank of the river. Two of them whilst pursuing their sports, either at the stage last mentioned or the next, observing two native Ghiljies standing knee-deep in water in a somewhat unusual manner, approached them to satisfy their curiosity: their movement not suiting the parties alluded to, they fled precipitately; and, on their moving, the body of one of our followers, whom they had murdered, and on which they were standing to keep it out of sight until the gentlemen should have passed, rose to the surface, and was rolled over by the stream. The murderers, I believe, escaped."

At Cabool, we are told:—

"Many thousand Greek relics have been dug up in the ruins of Bughrahy, supposed, by Burnes, to be the Alexandria ad Caucasm, about twenty miles north and east of Kaubool: so singular an abundance indicates a long-continued Greek influence and dynasty; but we are yet ignorant of their history, and the fame of their heroes sleeps with that of 'the brave who lived before Agamemnon.' But where were the dominions of Antiochus the Greek, named in the Gurneer and Cuttack inscription? Were they Sind and Kutch, or this Bactrian colony? We visited the Cashmerian looms, worked by fugitives from that valley of shawls; and saw their rude process of the most accomplished handicraft. A Paisley 'wabster' would have looked aghast if required to produce such work with such tools; the task of making bricks without straw would seem a jest to such an operation with such an apology for machinery. I am not possessed of the technicals, and cannot describe the process; but instead of one man, half sitting, half standing, driving the nimble shuttle to and fro through the web, six men were squatted on the ground twisting and twining different-coloured threads on a multiplicity of balls in and out, and creating a pattern of brilliant colours and complicated design, apparently by chance, for it seemed difficult to trace design in the confusion of the operation. The shawls exported from Kaubool to Russia are generally square handkerchiefs of a great thickness and weight, rough and heavy with their rich and ponderous embroideries: the best we saw were priced from a thousand to fifteen hundred rupees each. \* \* \* To one so situated as myself, with no official helps to obtain information, and with abundant occupation from my own departmental duties, there would fall little opportunity to speak of the statistics or markets of Kaubool. Only two points need be mentioned as worthy of special notice. The book of Genesis describes the river Pison as 'it which compasseth the whole land of Havilah, where there is gold, and the gold of that land is good:' if we seek the Pison in the Oxus, that river and its tributary streams are not changed, and still yield gold dust to such an extent that gold is cheaper here than in any other accessible part of the world that we know of; being sold, it is said, at only twelve times its weight of silver in Koolum and Koondooz, or about twenty per cent below the market price in India and England. This must eventually change, but in the meanwhile it is the

advantage gained by the Russian traders. The second I learnt professionally, by endeavouring to purchase opium in the bazar for the hospitals: I found that there was an opium trade in its infancy across the Chinese frontier of Tartary. Both are points that should be attended to, as likely to lead to important results. Tea from China, and white loaf-sugar from Russia, are plentiful in the Kaubool market: the gold of the Oxus procures the one; and opium from Turkey, brought through Russia, is exchanged for the other.

"It was at this place we saw the root growing which is dried for exportation, and sold under the name of salop misrig. It is of the size of a small white turnip, and, when dried, resembles a small light-coloured prune: it boils down to a finer jelly than arrow-root, and is a very valuable light diet for invalids. On the 18th we had reached the summit of the Toba mountain. The thermometer in my tent was found at 19° at daybreak, hard frost every night, and the cold very painful to bear. Our poor Indian servants and followers suffered dreadfully from chapt hands and feet, and were as nearly as possible disabled: the mortality among our camels was very great, upwards of one thousand five hundred of the public cattle died. When in Kaubool, an attempt had been made to ascertain the number of camels that perished, and the replies to official queries had shewn that upwards of sixteen thousand had then died. One caravan alone, which had started from Sukkur on May 16th with four thousand seven hundred camels, had reached Daudur with only one thousand and seventy; exemplifying the danger of setting the season at defiance, and contending against the opposition of nature. Of thirteen Europeans with that caravan, seven died; the pecuniary loss to government was estimated at seven lakhs of rupees,—a small item, no doubt, in the campaign, but how much good might have been done in India with the money!"

The extracts we have given afford a fair example of Dr. Kennedy's volumes, of which, with only other two quotations, we shall take our leave:—

"Our policy is clear and imperative, to work through what has been begun; for let it be distinctly understood that Lord Auckland's policy is not the end, but a beginning only. Herat must be subdued, and annexed to Kaubool for its own security; and our hold on Kaubool must be, after compelling or bribing Runjit Sing's successor to restore Peshawer and the Derajat, the maintenance of such a frontier force as shall shew the Kaubool court that the first moment of a rupture with the British government will be the certain loss of those valuable districts on the bank of the Indus, accessible at once to, and utterly indefensible from, British hostility. But Herat is not yet annexed to Kaubool, and the Seik government still holds Peshawer and the Derajat; and the strife and the outlay yet to be prepared for, are neither trifling in themselves, nor in what may result from them."

#### Conclusion:—

"On the evening of the 3d of February, I was close to Diu, and that night our course was directed south. The following day no land was in sight till evening, when lofty mountains, dimly seen through the haze, indicated Salsette. The fog on the morning of the 4th concealed the land; and, without a breath in the air, the sea was like a lake. We reached the fishing-stakes at Mahim, which, at five or six miles out at sea, are

driven into the mud in six or seven fathoms water. I counted from one line of these stakes no less than sixty-three boats; and, as each was manned by eight, ten, or more men,—and there are very many of these fishing stations, some idea may be formed of the Bombay fisheries for a population on the island exceeding three hundred thousand. At noon the sea-breeze sprang up, and, dissipating the haze, shewed the old familiar scenes of the island of Bombay. My little bark soon bounded over the dancing billows. At three o'clock we bore up to round the lighthouse, and enter the harbour; at five o'clock I landed. My heart swelled as I thought of all that I have seen and borne, since, a young adventurer on the sea of fortune, I landed on that spot in 1811:—the many better men than myself who are now no more, and by whose removal I have become what I am in my humble walk in life, but at the head of it,—the many friends whose place knows them no more, and all the chances and changes of twenty-nine years. As respected the past year, I had marched with the Bombay division of the army of the Indus upwards of one thousand miles from the Hujamry to Kaubool, and upwards of seven hundred on the return from Kaubool to Sukkur Bakkur, where I was relieved on my promotion: and I may conclude by stating, that the summary of the history of the nineteen hospitals of the force, during the fourteen months from November 1st, 1838, to December 31st, 1839, gives, in the European hospital, cases treated, 4648; deaths, 273; and in the native hospital, cases treated, 7041; deaths, 135;—which sufficiently indicates the hardships endured when compared with the strength of the division, and proves, also, that every branch of the hospital department was efficient."

#### MISCELLANEOUS.

*Publications of the Season.*—We have already noticed many varieties which the year's ending and the year's beginning always call forth; but we have still a number on our table.

1. *The British Almanack and Companion*, 1841 (Knight), is really so full of useful information of every kind, that we hardly could devise a reference without finding what we wanted. The mercantile and statistical matter in the *Companion* is of much public importance, and bears upon the most interesting topics of the times.

2. *The Naval and Military Almanack for 1841* (Baily and Co.), with portraits and biographies of renowned naval and military commanders. This publication, in addition to an ample store of the usual information which belongs to its class, contains army-lists and other data of special interest to the United Services, and to all who are engaged therein.

3. *The Comic English Grammar; a New and Facetious Introduction to the English Tongue.* By the Author of "The Comic Latin Grammar." Embellished with upwards of Fifty Characteristic Illustrations by J. Leech (pp. 228, Bentley). A very clever *jeu d'esprit*, and both in text and embellishments replete with laughable matters. He would be a cynic, indeed, who would not con his grammar by this little volume, and find learning his task about as entertaining a piece of amusement as could be devised even for play.

4. *Maxims of Kit Larrosse, the Lord Mayor's Fool* (pp. 74, Tyas). An antique concern, with a good deal of humour and good sense too. Many of Larrosse's sayings would reflect honour on the Lord Mayor himself, and the

quaint language is well bestowed on the ancient manners.

5. *The Comet of Many Tales; a Comic Kalendar for 1841.* By W. H. Harrison. Designs by Lee. (Pp. 108, Ball, Arnold, and Co.) George Cruikshank has spoilt us for these sort of things, and imitations of him always appear stale and flat. This is no exception, but "*vice versa*."

6. *D. O'Connell's Weather Almanack* (Patle). A title *ad captandum*, and nothing else.

7. *An Almanack of the British Stamped Press, including all Stamped Newspapers, Literary or Scientific Journals, &c.* (Reid and Co.) A very useful list, and, we should suppose, giving a pretty shrewd approximation to the average politics of the press and its circulation; though in cases (like ours of the *Literary Gazette*) where the stamped edition is the mere vehicle for immediate postage, and the great sale is in unstamped numbers and parts through booksellers, the estimate is of necessity altogether erroneous.

#### ARTS AND SCIENCES.

##### SMALL POX.

ALL recent statistics and official returns on the subject of health and disease have staggered us with distressing accounts of the number of deaths from small-pox, the victims to which have increased, and are greatly increasing. Under such circumstances every light that can be thrown upon the subject, and every suggestion that can be offered for lessening the extent of the calamity, must be eminently deserving of medical and public consideration. It is for these reasons that we direct attention to the essential statements in papers, given to the "Edinburgh Medical and Surgical Journal," by a very intelligent provincial surgeon, Mr. John Stuart, of Kelso. That gentleman, from long and various practice and experience of disease both abroad and at home, expresses his conviction that vaccination (which he otherwise highly estimates) does not possess a permanent protective power, and consequently that those who presume on its possessing that permanency must be exposed to danger and death. We believe that Dr. Gregory, who, as physician to the London Small-Pox Hospital, has so wide a field for observation, entertains the same opinion; and that a pretty general change has taken place in regard to the entire confidence to be placed in the lasting efficacy of the cow-pox. It is therefore truly desirable that the exact value of Jenner's important discovery should be ascertained; and surely the Vaccination Act, passed last session of parliament, is calculated to embarrass the question, and if there be a lurking evil in the system, to establish and perpetuate it on a very perilous basis. Whether the repetition of vaccination at certain periods will be sufficient, is an inquiry of infinite moment to families; and that ought to have been certain, before inoculation for the small-pox under any circumstances had been prohibited as penal. There appears to be little philosophy in extinguishing a modified disorder, till sure that it cannot occur in the worst possible form of an epidemic and plague, as it seems to be doing at this hour. At all events, we would earnestly solicit the attention of the faculty to this most national business, which comes home with fearful anxiety to every domestic bosom.

#### ROYAL GEOGRAPHICAL SOCIETY.

[Conclusion of last week's Report.]

THE President, G. B. Greenough, Esq. in the

chair.—Read, a paper 'On the Plain of Troy.' The Secretary (Col. Jackson) premised a few words. He said the subject was one of considerable interest. It was the topographical description of the theatre of events said to have happened three thousand years ago,—events, doubted by some, with Bryant at their head, but which, even if they had really occurred, would in all probability have, centuries since, been buried in oblivion but for the immortal poem in which they are detailed, and which has caused them to be as fresh in the minds of all as though they had happened in our own times. All who have read Homer—and who is there that has not?—must have been excited by the brilliant valour of Achilles—must have been moved by the tender adieu of Andromache—must have admired the perseverance of the Greeks, and the no less obstinate resistance of the Trojans—must have pitied old Priam and deplored the fate of Troy, and unwilling to have had his sympathies thus powerfully awakened for a mere fictitious tale, naturally asks, How far there is truth in the "Iliad" of Homer? hence the interest of the present paper, which is destined to answer the question. Many persons, continued the Secretary, have visited the Troad—have examined and described it. Wood, Le Chevalier, Choiseul Gouffier, Sir William Gell, Col. Leake, Dr. Cramer, Jacob Bryant, Major Rennell, Chandler, Clarke, Hobhouse, Morritt, Acland, and, though last, not least, Dr. P. W. Forchhammer. The plain of Troy, says this gentleman, resembles in many points of view the larger maritime plains of Greece and Asia Minor. It is surrounded by mountains, except on one side open to the sea. In the middle of it runs the Menderes, in a direction parallel to the general outline of the mountain-ridge. This river falls into the Hellespont at Koomkali, the ancient Sigæan promontory. Besides the Menderes, there are two other rivers; first, the Scamander, or Bournabashi Sou, on the left of the Menderes. It rises from a number of springs under the hill of Bournabashi (the site of Troy), flows along the upper edge of the plain in a westerly direction, and then turns off to the south-west through a small valley which separates the range on which Bournabashi stands from the ridge of Yenicher, into the *Ægean* Sea by an artificial canal which existed before the time of Homer. The other river is the Kalifatli Osmak, on the right of the Menderes. It rises in a marshy lake called Djudan Ghul, or water that never vanishes, at the foot of a spur of the Tchiblak range, on the opposite side of the plain, over against Bournabashi. This river, in the upper part of its course, that is as far as the village of Kalifatli, flows in a direction parallel to the Menderes, after which it turns northward, runs along the foot of the hill on which stands Hissarjik, the Ilium Novum, and, joining at Koom Keui the Doombrek Sou, coming from the east, it diverges to the north-west, and falls into the Hellespont by different mouths, the most westerly of which approaches close to the Menderes. At Koom Keui, there is an artificial canal by which a part of the waters of the Kalifatli Osmak and the Doombrek are continued in a due north direction to the sea into which they fall close under the Rhætan promontory. Of these streams none is navigable at all times but the Scamander; the others are either quite dry in the summer or have their beds only partially filled with water, on which account they are called *Osmaks*, whereas the term *Sou* or *Tchai* is applied only to constantly flowing streams. In

the winter these streams all overflow their banks, and the plain is inundated in many places; they form at their mouths brackish lagoons. The rocks which bound the plain are of a sandy limestone, for the most part rising gradually from the plain, and having flat summits covered by a deep and fertile, though uncultivated, soil. The hills on the side of the Kamar, a river coming from the north-east, and falling into the Menderes a little below Bournabashi, are decidedly of volcanic character. The soil of the plain is throughout a very rich clay, intersected here and there with hillocks of sand. Through this plain the Menderes flows in a large, deep, and well-defined bed the whole way down to Koom Kali, which not only shews the difference (says Dr. Forchhammer) between the Menderes and the rivers of many other plains, but must convince every person who looks at it with a view to the question in point, that this river never had any other bed than its actual one in any part of the plain: the bed is from two to three hundred feet broad. It has banks of a considerable height, commonly from eight to twelve feet, which are partially covered with willows and other trees: the bed is of sand, though the plain is of clay. In the month of August the course of the water was, on an average, from thirty to forty feet broad, and less than a foot deep. With regard to the warm and cold sources of the Scamander, mentioned by Homer, the difference of temperature is imaginary, not real; that of both springs being constantly between sixty-three and sixty-four. As for the Kalifatli Osmak, already mentioned as rising in the Djudan Ghul, it is accompanied by another small Osmak, rising in the same marshy lake, and which joins the Kalifatli near the village of that name. This lesser Osmak, which Dr. Forchhammer calls the Pasha Tepe Osmak, is crossed by a bridge of three arches, owing to which it is called by the Turks Kamar, or Kimar,—a circumstance that has caused it to be confounded with the real Kamar. According to Dr. Forchhammer, the Kalifatli never flows into the Menderes, as some travellers have asserted; nor do these rivers ever join, except, perhaps, in the time of inundation, when it is the waters of the Menderes which flow over the plain into the Kalifatli, and not those of the Kalifatli into the Menderes. It is true the slope of the Rhætan ridge forces the Kalifatli to approach very near the Menderes, but not even the smallest branch of the Osmak falls into the Menderes. The Kaimar, or Kamara, is a river which, in former days, considerably puzzled travellers, and has caused much confusion in the topography of Troy; and it is astonishing that no one has endeavoured to elucidate this point. Mr. Turner, for instance, evidently called the Pasha Tepe Osmak, Kimar. The name Kamara Sou is applied by Dr. Hunt to the Kalifatli Osmak. It becomes the most remarkable river in the map of the route of Dr. Carlisle, when, at the same time, its name is altered into Haimar; to which may be added a fourth name, Simores, which name the antiquarian owes to Lady Montagu and Dr. Sandys. Lastly, that river which Count Choiseul Gouffier calls Kimar, or Kamara, does not exist at all; but the river next to it, which he calls Thymbrus, is the very Kimar. The fact is this, the Greeks in the country used to call an arch of a bridge, or an aqueduct Kamara, which means arch. The Turks have adopted the word, which they pronounce Kimar, and consequently they call a river with such an arch Kimar Sou, or, as the Greeks would pronounce it, Kamara Sou.

There is, no doubt, commonly speaking, that the inhabitants mean by the name Kamar, or Kamara, that river which is the south-easternmost tributary of the Menderes in the plain. It had its name from a magnificent arch of an aqueduct which crosses the river higher up. The junction of the Kamar with the Menderes is very close to the narrow pass by which the latter river issues into the plain of Troy. The plain itself, besides the rivers which have been mentioned as flowing through it, abounds in swamps and marshes; and, indeed, there is not a plain in all Asia Minor so extensively subject to the influence of water, to carry off a part of which the wealthy inhabitants of the Trojan plains in former times undertook a work of as much utility as difficulty. Through the high cliffs of the promontory of Sigæum, between the modern village of Yeni Keui and the Tumulus in the middle of that promontory, they have cut a deep channel, which still exists, but is now so obstructed as to be of no use. This is not the only channel cut by the ancients. The artificial channel of the Scamander was evidently made for the same purpose; as also the smaller ones in different parts of the plain. Salt lakes, or lagoons, have been mentioned as existing at the lower edge of the plain. During summer, when there is little water in the Menderes, and no water at all running in the Osmaks, the lowest part of these rivers is filled with salt water. The mouth of the Menderes forms a large lake with a small outlet, which, by the current of the Hellespont, is turned to the left. The next lagoon, receiving no water from the streams, is obstructed by a low sandy bank: it is very deep, and on a level with the sea. If an opening were made in the bank, the lagoon would form a good harbour for small vessels. The sea-water runs up the bed of the Kalifatli for more than half-a-mile. At certain seasons the sea breaks through the channel, and the water rushes into the lake with great velocity. Along the shore of the plain, the waters of the Hellespont flow back in a counter current from west to east. The beds of the rivers, or Osmaks, which fall into these lakes are a little above their junction with them, but are so deep, and their banks so high and steep, that the supposed formation of this part of the plain by alluvium during the last four thousand years, is so far from being true, says Dr. Forchhammer, that it is much more probable that during that time the bed of the river may have been deepened; and that land, instead of having increased, may have been taken away. The annual inundations are very extensive; and the plain in winter is often covered with ice so strong as to allow the passage of horses over it. In short, there is not a country either in Greece or Asia where the war of the powers of nature is carried on with such variety, and to such an extent, as in the plains of Troy. Besides the immense annual alteration of the plains, spoken of as constantly taking place within the last three thousand years, it is said, that since the time of the Trojan war, a very large bay has been filled up by the accumulation of earth brought down from the mountains; and not only that the plain has advanced more than two miles in length, and nearly as much in breadth, but the main river, also, is supposed to have altered its course, having formerly entered the sea, not at Koomkali, but near Rhæteum. Dr. Forchhammer endeavours to prove these assertions to be wholly without foundation, but we cannot give his arguments on account of their length, and his reasonings would be destroyed by any attempt at abridgement. We may nevertheless

mention one of his arguments:—"How is it," says the writer, "that the lakes existing at the extremity of the plain have not been filled up, and that no alteration takes place in them?" Dr. Forchhammer admits that the plain is alluvial, and that it may increase in height, though not in a horizontal direction, but that this increase in height should not be overrated. He also advances two singular propositions:—1. That the accumulation of the alluvial plain took place long before Mount Ida had risen from the sea. 2. That whatever accumulation of the plain may have taken place, must have been lost again by the produce of the land, high winds, &c. He further says, that all the erroneous suppositions that have been formed regarding the plain of Troy, may be traced to the misunderstanding of Homer, and the war he describes. The writer then quotes many passages from the "Iliad" to prove that nowhere does Homer mention a harbour or bay; after which, he describes the ten tumuli and other vestiges found round the plain. With regard to Ilium Recens, he says Strabo's account of it, as far as distances are concerned, is quite false; and that there is no way of making his statements agree with each other. The town, according to the Doctor, is, and always was, twenty-five stadia from the seashore, as is proved by the words of Scylax, a geographer anterior to Strabo by six centuries. Among the ruins of Ilium Recens, the acropolis, the theatre, the foundation of a bath, of an aqueduct, and the walls which surrounded the town, may easily be recognised. The most considerable ruins besides those of Ilium Novum are the remains of an acropolis on the height of Bounarbaschi. This is universally considered the site of Priam's capital; and there are a sufficient quantity of ruins of walls, buildings, &c., to prove that the place was extensive. But as these ruins have been often described, we shall forbear giving the details of them. Having thus described the plains of Troy and its ruins as they now exist, the author of the paper enters into an examination of the Homeric topography of Troy, which, as every reader of the "Iliad" can do this for himself, we need not go into. According to Dr. Forchhammer, every epithet of Homer coincides exactly with the present state of things. He says the Menderes is certainly the Simois, and the Kinar perhaps the Andrias. He also is of opinion that the Doombrek is the Thymbria. When the town of Thymbria was at Doombrek, and the Rhesus was the Thymbria, the mythologist will readily understand why king Rhesus (who is none other than the river-god of the Rhesus) had his station towards Thymbria; and in the account given by Dolon in the tenth book of the "Iliad," he will find new proofs of the just application of these names. The paper gave rise to various observations from the President, from Mr. W. R. Hamilton, Mr. W. J. Hamilton, Captain Washington, and Colonel Jackson. We understood the President to say, that more than a hundred persons had written on the plain of Troy.

## STATISTICAL SOCIETY.

COLONEL SYKES, V.P. in the chair.—Fourteen new fellows were elected. The communication read was an important one, being an inquiry into the condition of criminal offenders in England and Wales with respect to education; or statistics of instruction among the criminal and general population of England, and other countries, by Rawson W. Rawson, Esq. Hon. Sec. The author, after calling attention

to his analysis of the tables of criminal offenders in England and Wales, which was brought before the Statistical Section of the British Association at Birmingham, in 1839, proceeds to state, that since the year 1835 the degree of instruction possessed by criminal offenders in England and Wales has been recorded in annual tables, a system introduced, he believes, at the instance of Mr. Porter, who took his idea and the form of classification from the French criminal tables, in which, as well as in the Belgian tables, the same information has been annually published since 1828. It is the result of the information afforded by the English returns, compared with those of the other parts of the United Kingdom, and of other countries, which Mr. Rawson investigates in the paper before us. For a valid reason he excludes the year 1836 (the parties making the returns then not being sufficiently versed in the matter), and takes the three years from 1837 to 1839, which appear to embrace a sufficiently long period and an adequate number of cases to afford a fair average. In these three years, 69,517 persons of both sexes were committed for trial, or 23,172 annually. Of this annual average,—

8,201 could neither read nor write,  
12,567 could read and write imperfectly,  
2,318 could read and write well.

86 had acquired a superior degree of instruction.

The percentage proportions of these numbers are respectively as follows:—

35.4 could neither read nor write;  
54.2 could read and write imperfectly,  
10.9 could read and write well,  
4 had acquired a superior degree of instruction.

Thus, on the average of the triennial period, out of 100 persons charged with criminal offences, thirty-five were wholly destitute of instruction, and fifty-four possessed the lowest degree of elementary instruction, being able to read and write imperfectly. After some acute remarks, for which we are sorry we have not room, Mr. Rawson goes on to observe, that it follows upon the evidence of his tables, that the proportion of criminal offenders among the educated portions of society is very much less than that which is found among the ill-instructed and ignorant. Yet there is abundant evidence to prove that want is not the usual instigator to crime even among the poor. One numerical proof, and the evidence of one competent witness, will be sufficient on the present occasion to establish this point. Out of 1000 persons confined in the gaol at Preston, Mr. Clay, the chaplain, ascertained from the individuals themselves, that only seventy-six were induced by want to commit the crimes for which they were imprisoned. Mr. Clay shews that intoxication—in itself a vice—is by far the most prevailing cause of crime, as 445 out of the 1000 cases were immediately attributable to that single vice: and this is confirmed by the Inspector of Prisons for Scotland, whose wide experience adds great weight to his testimony, that nearly three-fourths of the crimes for which persons are brought to justice in Scotland are committed during the intoxication of the offender or of the injured party. The author next contrasts the results of the triennial period from 1836 to 1838 in Ireland, with the single year 1835 in England, when the classification was the same in both countries. It is thus:—

In Ireland.	In England.
Per cent.	Per cent.
46.1	35.4 could neither read nor write.
21.1	54.2 read only.
39.8	43.6 read and write.

Thus, while the class who could only read bore the same proportion in both countries, the other

two classes were exactly reversed. One-third more could read and write in England than in Ireland, and one-third less were wholly uninstructed. The only comparison which can be instituted with regard to Scotland is between the proportions of those who can neither read nor write; and the result is, that in Ireland 46.1 per cent, or nearly one-half belong to that class; while in Scotland the proportion is only 20.2 per cent, or one-fifth. The author concludes by recapitulating the principal results which have been ascertained by his inquiry. 1. That only 10.4 in 100 of the criminal offenders committed for trial in England and Wales are able to read and write well; and only four in 1000 have received such amount of instruction as may be entitled to the name of education, and that these proportions are greatly below the average standard of instruction among the general population. 2. That these proportions are considerably higher in Scotland and lower in Ireland; and the evidence appears to establish that the degree of instruction possessed by criminal offenders is an indication of that possessed by the general population in the same districts. 3. That about one-third of the adult male population of England cannot sign their own names; and that from one-fifth to one-fourth can neither read nor write. 4. That these proportions are much more favourable than in France or Belgium, where one-half of the youths at the age of eighteen could neither read nor write. The proportion of wholly ignorant criminals in those countries is comparatively great. 5. That in England instruction is twice as prevalent among males as among female criminals, and one-half more prevalent among males in the general population than among females. That in Scotland and Ireland it is three times as prevalent among the male criminals. 6. That this unfavourable condition of females in these two countries is farther confirmed by the fact that the proportion of female to male criminals is greater than in England; and it may be traced to the circumstance of the number of girls at school in those two countries being very small in comparison with the number at school in England. In comparing the three countries, the number of female criminals is found to be exact in the inverse ratio to the proportion of females at school. 7. That education has a greater influence among females than among males in restraining them from the commission of crime. And, 8. That instruction prevails, upon an average, to a greater extent among the agricultural than among the manufacturing counties of England; but that the agricultural counties in the east, east-midland, and south-east, are greatly below the average. We have been obliged to omit several of Mr. Rawson's valuable tables, from which the above results are drawn.

## ENTOMOLOGICAL SOCIETY.

OCTOBER 5, 1840.—J. Walton, Esq., V.P. in the chair.—A variety of exhibitions, illustrations of the economy of different species of insects, were made by several of the members present, including a series of native species of ants with their nests, by Mr. Smith, who had discovered several distinct species inhabiting the same ant-hills, and had also ascertained the existence of two kinds of neuter in the sanguinary ant.—Mr. Sells communicated a great number of illustrations of different species, including specimens of the wheat-fly, a small two-winged insect, by which a great portion of the rye crop near Kingston had been destroyed.—Mr. Stephens mentioned a

remarkable instance of the autumnal disease of flies observed in *Cheilosia gracilis*, myriads of which were found dead and dying upon the blades of *Sesleria cœrulea*.—Other exhibitions were made by Mr. Ingpen and Mr. Westwood; the latter of whom also read the commencement of a memoir 'On the Linnean Species of *Staphylinus*,' and exhibited drawings in illustration of the peculiarities in the direction of the veins of the wings of the genera of British butterflies.

November 2.—J. Walton, Esq. V.P. in the chair.—Numerous donations of entomological works presented by the Natural History Society of Boston, U.S., Professor Von Siebold, Mr. McClelland, &c., were announced, and thanks ordered to be given to the donors.—The Rev. F. W. Hope, President, communicated a mode of capturing wasps and other insects obnoxious to wall-fruit, by placing one hand-glass on the top of another, and making an aperture in the top of the lower glass, by which means the insects ascend into the upper glass, and are easily destroyed.—Mr. Westwood communicated some observations on the gradual development of the *Myriapoda*, and exhibited specimens of the young of *Lithobius foripatus*, in which the number of the pairs of feet varied considerably. He also read a continuation of his paper 'On the Linnean Species of *Staphylinus*.'—The Secretary announced that a new part of the Society's "Transactions," completing the second volume, was ready for delivery.

December 7th.—The Rev. F. W. Hope, President, in the chair.—Numerous donations to the library, presented by the Imperial Society of Naturalists of Moscow, &c., were announced.—Mr. Evans exhibited several rare coleopterous insects from the Cape of Good Hope, including the remarkable *Pausus Burmeisteri*, no other specimens of which exist in English collections.—Dr. J. Calvert presented specimens of the larvæ of one of the *Noctruæ*, which have proved very destructive to his wheat crops in Yorkshire, by devouring the grain in the field.—A paper by the Chevalier Schomburgk, containing an account of the migrations of a large species of sulphur-coloured butterfly, in British Guiana, and descriptions of some new exotic hymenopterous insects, by Mr. Westwood, were read.

#### NATURAL HISTORY.

*The Nautilus Pompilius*.—The Museum of Natural History at Leyden has just been most unexpectedly enriched by the receipt of a specimen of that very rare animal, the *Nautilus Pompilius*, described by Rumphius, and lately most admirably described and illustrated by Professor Owen at London. All the pains that have been taken to procure this rare *Nautilus* for the Museum had till now proved fruitless; and though it was known that the animal is found in the Indian Seas about the Molucca Island, the zeal of the Dutch naturalists, who travelled in those countries, failed in procuring this much-wished-for object. It was reserved for Mr. J. C. Meder, Director of the Batavian Society of Arts and Sciences at Batavia, to enrich not only our Museum, but likewise that of Paris, each with a specimen of this animal. As a proof of the rarity of this *Nautilus*, and the scientific value attached to it, it may suffice to say, that Mr. Meder, a zealous friend to conchology, had for several years spared neither pains nor expense to procure it; till at length, at the beginning of this year, he chanced to meet with two specimens, which he has so generously disposed of for the advantage of the science. The Dutch Academy of Sciences at Haarlem

thought fit in its programme for this year, to offer a reward of 500 florins to whoever should bring the first specimen, and 200 florins to him who should bring the second specimen, in good condition, for its collection.

#### LOCAL MUSEUMS, &c.

THE statistical account of Scotland, now publishing by Messrs. Blackwood (a work full of valuable information), often describes the establishment and progress of libraries, museums, reading-rooms, and other adjuncts to knowledge, in various localities throughout that generally educated portion of our island. And it is always with pleasure that we read or hear of such institutions, for they have a very strong influence on the mass of the people; not only in their more obvious effects upon their supporters and habitual attenders, but in their almost imperceptible effect upon the young and lowly—the casual visitors from among the mass who are wisely and liberally permitted to inspect and become acquainted with their contents. Among others lately brought to our notice by the provincial press is the *Tweedside Physical and Antiquarian Society*, which, from the names of its patrons and the features of success which it already presents, seems to be rising into useful distinction in a part of the country rich in treasures of antiquity and science. The Duke of Roxburgh, Sir T. Macdougall Brisbane (of high scientific eminence), Mr. Selby of Twizell (the distinguished naturalist), and other gentlemen of superior attainments, are among its warmest friends; and we see, from a Report just published ("Kelso Mail"), that its collection is rapidly augmenting in mineralogy and geology, zoology and botany, numismatics, antiquities, &c. With such assistance, we would advise attention to be especially directed to Border relics, and to a complete system of Tweedside natural history. The site is in the very centre of interest, where Scott located his novel and breathed his song. The ancient abbeys of Melrose, Jedburgh, Kelso, and Dryburgh, are at hand in splendid ruins; the Roman tremontium marks the whereabouts of these gigantic invaders; there is hardly a spot from Roxburgh Castle to Wark that is not illustrated with historical memories, not to speak of Flodden Field, nor the hundreds of border-keeps, and desperate wars of marchers and marauders, which stud the country round, and give names to many a nook now crowned with agricultural and pastoral wealth. All these may supply most interesting food for this establishment; and, under its present auspices, we have no doubt it will rapidly realise these hopes, and shew a good example to other places.

#### PARIS LETTER.

Academy of Sciences, Dec. 15, 1840.

SITTING of December 14.—M. Cauchy read a report to the Academy on the methods followed by Henri Mondeux, the young shepherd whose mental powers of calculation had been recently brought to its notice. Most of them, as had been already stated, are purely algebraical. His favourite method of solving two equations with two unknown quantities of the first degree is by subtracting one from the other. As an instance of his method, the following may be taken. The subjoined problem was proposed to him:—"Find a number such that its cube increased by 84 may equal the product of that number multiplied by 37." Mondeux gave as the solution the numbers 3 and 4. He commenced by transforming the equation to be resolved by dividing the two given numbers by

the unknown number sought. This reduced the question to the finding of a number, such that its square, augmented by the quotient of 84 divided by this number, may equal 37. By means of this transformation, it becomes evident that the number is less than the square root of 36—that is than 6, and the solution of the question follows immediately. Questions of indeterminate analysis are also resolved by the young shepherd with great facility. Thus, on one of the commissioners asking him for two numbers, the difference of whose squares should be 133, he immediately replied 66 and 67; and on being pressed for a more simple solution, gave 13 and 6. The commissioners being desirous of ascertaining what time this boy would require for learning and remembering a number composed of 24 digits divided in four parts, so as to be able to enunciate the six figures comprised in any one part, mentioned a number of the kind to him. He took only five minutes to do what they required. It was stated by M. Cauchy that this boy owed much of his faculties of calculation to M. Jacoby, the gentleman who had taken him by the hand, and who had taught him to read and write; for when he first found him, Henri Mondeux knew nothing but figures. The Academy resolved on recommending government to aid M. Jacoby in carrying on the instruction of this extraordinary lad.

M. Poiseuille read a paper on certain new experiments made by him on the movement of liquids in tubes of small diameter. It resulted from 300 experiments made with tubes of various lengths, and of diameters from .013 of a millimetre to .65 of a millimetre. That for the passage of the same quantity of liquid the times were in the inverse ratio of the pressures; and this, too, independently of the temperatures.

M. Clement submitted to the Academy a new instrument for ascertaining the rate of a ship's motion, instead of the old log, and for registering the rate upon a dial-plate like a clock; as also a thermometer which might be attached to the submerged surface of the hull of a vessel, indicating the temperature by means of an apparatus in the captain's cabin; together with a third instrument attached to the keel, and shewing the angle which the keel might be at any time making with the direction of the water.

A curious geological discovery has been made by some French residents at Pensacola, and verified by the commander of the French brig-of-war on that station. It consists of a kind of submarine causeway about 100 feet wide, traversing the whole bay of Pensacola for more than three miles in length, and disappearing under the argillaceous hills on either side of the bay. We have not heard whether the rock be of volcanic or crustaceous origin.

The decorative part of the funeral of Napoleon was got up much too hastily, and therefore will not bear criticism. The general *coup d'œil* of the esplanade of the Invalides, and of the *arc de triomphe*, was good; but the most striking portion of the ceremony was that within the Church of the Invalides, where the splendour of the dome was all that was befitting to the memory of the great man. Victor Hugo made an impromptu of the following verses on the coldness of the day, but he is not much to be complimented on them:—

"Ceil glacé : soleil pur ! oh ! brille dans l'histoire  
Du funebre triomphe imperial flambeau :  
Que le peuple a jamais te garde en sa memoire !  
Jour beau comme la gloire,  
Froid comme le tombeau !"

We have had in our hands the original MS. of an account of Corsica, written by Napoleon in 1793. The style is remarkably clear and

vigorous: his observations are valuable, and his character of Paoli acute and biting. The writing is small and with the signature much more legible than it was in future times. It consists of fourteen small folio pages, and the proprietor wishes to sell it for 400*l*.

There is a beautiful engraving just out, by Calamatta, of Georges, and from a drawing by himself, which he exhibited two years ago. It makes the face of the celebrated authoress rather too heavy.

#### LITERARY AND LEARNED. UNIVERSITY INTELLIGENCE.

OXFORD, December 17.—The following degrees were conferred:—

*Masters of Arts*.—D. W. Turner, Demy of Magdalen; Rev. G. J. Tancock, Wadham; Rev. F. W. Cresswell, Scholar of Pembroke.

*Bachelors of Arts*.—H. A. Littledale, Brasenose, Grand Compounder; N. Woodard, Magdalen Hall; G. G. Perry, Scholar of Corpus.

CAMBRIDGE.—Prizes.—I. The Vice-Chancellor has issued notice that his Grace the Duke of Northumberland, Chancellor of the University, has been pleased to signify his intention of giving a gold medal, to such resident Undergraduate as shall compose the best Ode or the best Poem in heroic verse; on "the death of the Marquess Camden, the late Chancellor of the University."

II. The Representatives in Parliament for the University. 1. Two prizes of fifteen guineas each, for the encouragement of Latin Prose Composition: open to all Bachelors of Arts. 2. And two other prizes, of fifteen guineas each, to be open to all Undergraduates, who shall have resided not less than seven Terms. The subjects for the present year are: 1. For the Bachelors, "In legibus ferendis, quid propositi habere debeat qui pœnas peccatis irrogat; et quænam sit adhibenda suppliciorum mensura?" 2. For the Undergraduates: "Poetis ea maxima laus est, si summis ingenii dotibus ita utantur, ut virtutis amorem alant."

III. Sir William Browne's three gold medals, of the value of five guineas each, to such resident Undergraduates as shall compose—1. The Best Greek Ode in imitation of Sappho; 2. The best Latin Ode in imitation of Horace; 3. The best Greek Epigram after the model of the "Anthologia," and the best Latin Epigram after the model of Martial.

The subjects for the present year are: 1. For the Greek Ode, "Principissa faustis auspiciis recens nata;" 2. For the Latin Ode, "Annus exactis completur mensibus orbis;" 3. For the Greek Epigram, "Hoc est Vivere bis, vita posse priore frui;" 4. For the Latin Epigram, "Vehicula vi vaporis impulsæ."

IV. The Porson Prize (the interest of 400*l*. stock, to be annually employed in the purchase of one or more Greek books) to be given to such resident Undergraduate as shall make the best translation of a proposed passage in Shakspeare, Ben Jonson, Massinger, or Beaumont and Fletcher, into Greek verse.

The subject for the present year is—Shakspeare, *Tempest*, act iv. scene 1, beginning "This is most strange,"

and ending "To still my beating mind."

N.B.—The metre to be "Tragicum Iambicum Trimeter Acatalecticum." These Exercises are to be accentuated, and accompanied by a literal Latin Prose Version.

#### LITERARY AND SCIENTIFIC MEETINGS FOR THE ENSUING WEEK.

Thursday.—Zoological, 3 P.M.

Friday.—Botanical, 8 P.M.

Saturday.—Astetic, 2 P.M.; Westminster Medical, 8 P.M.

#### FINE ARTS.

##### RESTORATION OF THE TEMPLE CHURCH.

WE have this week had an opportunity of inspecting the work of restoration, which is in progress in the fine ancient church of the Temple; and highly have we been delighted with what we saw. After two imperfect and unsatisfactory alterations within the last twenty or thirty years, the benchers have at length wisely resolved on restoring the interior of this interesting structure to its pristine condition, removing Vandalic encroachments and more Vandalic beautifications, and completely opening to view the conjoined harmony of the round and square divisions of the building. The body is wealthy, and a better use of their funds could not be made. Intrusted to Mr. Savage as the architect, we have a sure guarantee that their

munificence will be employed with skill and judgment; and we were not sorry to observe that that gentleman had also invited the taste and experience of Mr. Cottingham to confirm his opinion on points of doubtful antiquity.

The Temple Church is one of the four round churches now standing in England, the others being at Cambridge, Northampton, and Mapleston in Essex; and it is much the finest of them all. The architecture is a striking mixture of the early pointed and first transition styles. The lower circle of the tower is surrounded by single niches for the monks' seats, pointed, with the Norman billet in the mouldings, and curiously adorned with fantastical heads in high relief. Above, the arches are interlaced, but still in the pointed manner; and over the entrance is a splendid circular window, resembling the wheel of a Roman chariot, or *quadriga*. The tombs of the knights are below; and it is supposed that in clearing away the accumulated rubbish of centuries, some valuable remains will be discovered near these receptacles of the first warriors in England that ever quartered arms upon their shields (circ. 1130). The clustered pillars are of elegant proportions, and of Purbeck marble, hitherto covered with a thick coating of whitewash and paint!! Between the round and the square church is an admirable screen of three arches, from the centre one of which the organ has happily been removed, so that the view is perfect from the west door to the east window. That window is, we were told, to be filled with richly-painted glass, by Mr. Williment, instead of the mean, common, transparent glass at present in use. The pillars here are also wonderfully light and graceful, though they support a massive roof of heavy oak. On the north side a little chapel is being built for the organ; a most decided improvement, and deserving of imitation in every place of worship. To witness the mechanism of music-making is always a disturbance to the devotional feelings, and its effect is infinitely better when it bursts or steals upon us, we know not whence, from some unseen location, and fixes the mind without attracting the eye and distracting the sense. The font is a curious example, and the removal of some lumbering erections against the walls has revealed other peculiar and interesting features of the original. But the greatest novelty of the whole is in the revival of the roof, covered with arms, devices, symbols, and ornaments, chivalrous and religious, in the brightest tints of red, blue, yellow, and all the colours of the spectrum. That this is consistent with all antiquity we have not a doubt, and that its effect will be very striking is evident even through the poles and scaffolds that, as yet, intercept it. But it will be a novelty in English churches; and it is, therefore, probable will be exposed to criticism. For ourselves, we can truly state that the whole we have witnessed of this restoration, and especially the ancient character of the roof, affords us very great satisfaction; and we most heartily thank the pursebearers and rulers of the modern Temple for the expense they are bestowing, the pains they are taking, and the learning and intelligence they are displaying in the manner in which they are authorising the work to be executed. When finished, the church will be a chief "lion" in London; and, indeed, travellers may go far and near without having it in their power to see so unique a fabric.

#### BIOGRAPHY.

THOMAS HILL, ESQ.

On Sunday, after a short illness, at his resi-

dence in the Adelphi, aged eighty years, died Thomas Hill, Esq., an individual more intimately known in the literary circles of London than any other person, perhaps, that ever existed. For the last half century his connexion with the press in all its branches; with authors, actors, artists, and publishers, has been familiar and confidential; the social companion of all whose rank or talents gave them station in society; and generally the adviser and peacemaker where difficulties arose, or clashing interests led to misunderstandings and quarrels. Originally in trade as a drysalter, Mr. Hill's bent of mind was always literary. He made a valuable collection of books, inasmuch that, when misfortune befell his mercantile speculations, it was valued at above 5000*l*.—a noble library for his position in life, and shewing how much he was attached to superior pursuits. In the "Monthly Mirror," one of the most pleasant of our miscellanies belonging to that class, he was a principal; and his close intercourse with the late Mr. Perry and "The Morning Chronicle" afforded him opportunities of being acquainted and working with very important matters, both in politics and literature. In politics, he was ever moderate and liberal; in letters, ever warm and encouraging. Full of anecdote, Mr. Hill was a welcome guest in every quarter; and few men were, if ever any man was, more sought and invited to the genial board, where the choice spirits of the age, the wits, the distinguished in every art and profession, the popular writer and those who loved and courted such society, were assembled together. We have met him and been merry and happy in his company, and heard and seen much that deserved to be remembered for centuries, a thousand and a thousand times; and now dear Tom Hill, the good-humoured and the kind-hearted, is gone for ever. If he has preserved a journal of his daily remarks, and the conversations he has heard, and the circumstances in which he took part, we will venture to say that a more singular and interesting record was never offered to the public notice. We have been told that he did keep such a diary.

Though at the advanced age of fourscore Mr. Hill would hardly have been supposed above sixty, and till within a very few weeks of his decease he was as lively and entertaining as he was forty years ago. His own little innocent foible of curiosity, which, we believe, caused him to be set for the portrait of Poole's humorous "Paul Pry," often amused his laughing friends at his expense, and never injured a human being. He "*happened to know*" so many people, and so many things, that listeners were often jocular, if not sceptical, upon his statements; but the real truth was, that he had been so widely and so confidentially trusted, that his information was almost incredible. It is a melancholy reflection at this merry season, when his body lies cold and inanimate, to think how many a festive hour his very existence was the subject of laughing banter and harmless joke. His age, which he affected to conceal, was attenuated to hundreds of years, and a Theodore Hook, or James Smith, or some other wag, would sing or descant upon his adventures in the reign of Queen Anne or Queen Elizabeth. His own imperturbable gaiety upon such occasions, his round and rosy countenance beaming with satisfaction, and the hilarity which abounded on every side, have made these by-gone feasts of reason and flows of soul memories, indeed, of sweet and bitter fancies to those who most enjoyed them.

In what is called the convivial, social, or friendly association of this busy capital, it is but too certain that men fall out of it and are speedily forgotten as a dream. Their hearty *convives*, their sworn friends, their "very brothers," soon mingle in the noise and throng, and the place which they occupied is filled by another, without a passing thought of them. But in the midst of this common oblivion we will take it upon us to say that, during years to come, many a fond regret will be breathed for the loss of Torp Hill; of whom, from a cordial acquaintance of no brief duration, we are free to declare that we never knew him guilty of an ill-natured action, but, on the contrary, always ready to put the fairest construction upon every word and deed, and by his good offices to reconcile differences and promote the well-being of all with whom he lived on terms of agreeable courtesy and amicable fellowship.

HENRY BRANDRETH, ESQ., F.S.A.

It is with feelings of deep sorrow that we record the death of this estimable gentleman, at his lodgings in Norfolk Street, Strand, on the night of Thursday the 17th instant. As a member of the Society of Antiquaries, Mr. Brandreth was distinguished for his assiduous investigation and knowledge of Anglo-Roman antiquities. As a poet he was sweet and playful, and his published productions were justly prized by all the lovers of grace, tenderness, and nature, in the poetic art. Many of his compositions have appeared in our columns, and it saddens us now to refer to their variety and jocund spirit, and to the occasions which called them forth. Possessed of great susceptibility of mind, our departed friend was extremely sensible to the impressions of circumstances that would have been slight to less imaginative temperaments. He was a poet by birth and nature; and his sympathies were all attuned to that glowing and, for its owner's repose and happiness, alas! very dangerous character. Honourable, fervent, and sincere, he was not well suited to the every-day world; but give his fancy wing and his energy was wonderful. He wrote off verses with extraordinary facility; and only this time twelvemonths gave proof of this by producing a pleasing and sportive masque for a private Christmas party, in which he himself sustained the part of *Comus*, within a few hours of the idea being started. Mr. Brandreth was in the very prime of life, of good family, and warmly esteemed by all who knew him.

### ORIGINAL POETRY.

#### BALLAD OF THE EVE OF SAINT JOHN.

By C. Swain.

SHE waiteth by the forest stream,—  
She sitteth on the ground;—  
While the moonlight, like a mantle,  
Wraps her tenderly around!—  
She sitteth through the cold, cold night,—  
But not a step draws near;  
Though his name is on her trembling lips,  
His voice meets not her ear!  
HIT! was't the haunted stream that spoke?  
What droning sound swept there?  
She listens!—still no human tone  
O'erhears she any where!—  
Oh!—was't the forest bough that took  
That sad and spectral mien?  
She looketh round distractedly,  
But nothing there is seen!  
Dark, in the quiet moonlight,  
Her shadowy form is thrown;  
With a strange and lonely mournfulness,—  
It seems not like her own!—  
She glanceth o'er her shoulder fair,—  
The moon is gleaming wide;  
She turneth—Jesu! what is there  
Pale sitting by her side!  
She paueth for a single breath—  
She hearkens for a tone;  
And terror pains her chilling veins  
For breath or sound—is none!

The silence—oh, it racks her brain,  
It binds it like a chord!  
She'd given worlds though but to hear  
The chirping of a bird!  
The shadow rose before her,—  
It stood upon the stream:—  
"Oh blessed shadow, ease my soul,  
And tell me 'tis a dream!  
Thou tak'st the form of one they vow'd  
Mine eyes should see no more!"—  
The shadow stood across the stream,  
And beckon'd pale before.  
The shadow beckon'd on before,  
Yet deign'd her no reply:  
The lady rose, and straight the stream  
To its pebbly breast was dry!  
It pass'd the wood—it cross'd the court—  
The gate flew from its chain:  
The gentle lady knew she stood  
Within her own domain!  
And still the awful shadow glid,  
Without or breath or tone,  
Until it came to a hidden stream  
'Neath the mossy alders lone!  
And the boughs fell, dropping one by one,  
Like leaves when winds blow high:  
Till they shew'd the dead on a waveless bed,  
For again the stream was dry!  
They shew'd the dead on its pebbly bed,  
And the lady knew it well!  
She kiss'd its cheek with a piercing shriek,  
With a woe no tongue may tell.  
The gory shadow beckon'd on,  
And still her steps implored;  
But she follow'd not, for on that spot  
She found a silver'd sword.  
She grasp'd the hilt—its silken thread  
Her own fair skill had wove;  
A brother's hand had struck the dead—  
His sword had slain her love!  
She took the corpse upon her knees,  
Its cheek lay next her own;  
Like sculpture fair, in the moonlight there,  
Like misery turn'd to stone!  
No food to seek for the raven's beak,  
The gibbet serves them true,  
With young, and sweet, and dainty meat,  
As e'er the ravens knew.  
And few they see near the gibbet-tree,  
For a bleeding form glides on,  
From the haunted stream, in the moon's cold beam,  
On the eve of good Saint John!

### THE DRAMA.

*Drury Lane*.—Mr. Eliason has resumed his position as leader of the band here with undiminished effect, and has had crowded houses to thank him for the fine selections of music with which he has treated them.

The *Adelphi* has sounded the note of preparation for its Christmas gambols, and we are to have *Harlequin and the Enchanted Fish* for the pantomime.

*Musio*.—A prospectus has been issued for forming a "London Professional Choral Society;" the want of which in "this great metropolis, possessing as it does all the elements for distinguished choral excellence, and a public ever ready to encourage and liberally remunerate what is eminent in art," it observes, "seems almost incredible." The conductor named is Mr. G. F. Harris, whose experience as choral director is well known and appreciated, and the Society is to consist of one hundred professional members. They are to meet for practice every Tuesday and Friday morning, from ten till twelve o'clock, at the Hanover Square Rooms; and have announced as their first performance on a grand scale, in March next, Haydn's last Oratorio, *The Seasons*, translated from the German by Professor Taylor.

### VARIETIES.

*Solar Spots*.—Three large spots are at present observable on the sun's disc. It has often been remarked that the earth's weather is affected by these phenomena.

*Fine Arts*.—To obviate inconveniences in the hitherto common plan of enclosing oil colours for painting in the skins of animals, a very neat invention has been patented by

Messrs. Winsor and Newton. The colour is enclosed in a glass tube hermetically sealed, having a plug at one end, and an air-tight piston at the other; so that, by the withdrawal of the plug, and the slight pressure of the piston, it exudes upon the pallet for use. Other advantages attend this cleanly process.

*Troyes*.—The old cathedral of Troyes is stated to be nodding to its fall.

*For Holiday Time*.—Why is a little woman with a petticoat of the reigning fashion, like the railroad to Blackwall? Because she's a short fare, with a long train.

Why is Sir Edward Bulwer a poor dramatist? Because his Money's out.

Why have our forces in Syria become pot-boys? Because they carried Beyr-out.

Why is a policeman like a balloon? Because he takes people up.

Why are our sailors in the Chinese seas likely to be married? Because they have gone to choose Anne (Chusan).

Why is Lady Blessington most subject to toothache, headache, heartache, &c.? Because she is the greatest at keepsakes.

Why is a duck, disliked by a drake, like a well-taught person? Because its a-duck-hated.

What is the slight difference between a brewer and a flea? Because one buys and the other takes hops.

Why is a lover like tea? Because he's a beau-he!!

### LITERARY NOVELTIES.

In the Press.

London as it Was and Is: Poems, by A. Mahon.—The Thakoorine, a Tale of Maandoo.—A Poem; by Captain Abbott, Bengal Artillery, whose detention at Khiva was recently a subject of speculation.—Slavery and the Slave-Trade in the United States of North America.—Egypt and Mohammed Ali, his Slaves and his Subjects, by Dr. Madden.

Griffith, 18mo. 2s. 6d.—Memoirs of the Right Hon. Warren Hastings, by the Rev. G. W. Gleig, 2 vols. 8vo. 30s.—The Art of Engraving and Modes of Operation, by T. W. Fielding, royal 8vo. 12s.—Encyclopædia Britannica; a New Publication, Vol. II. 4to. half-bound russet, 2l.—Notes on the Gospel and Epistles of St. John, by the Rev. R. Shepherd, D.D. new edition, royal 8vo. 15s.—Memoir of the Countries about the Caspian and Aral Seas, 8vo. 7s. 6d.

### TO CORRESPONDENTS.

To our correspondent Mr. J. we would observe that there is no rule for the pronunciation of proper names. If there were, the double consonant would decide his question, but we believe it is also decided by usage in the same way, and that the correct emphasis is on the last syllable of Trafalgar. Admiral Nelson so pronounced it (and he must be an authority in the case), and we have heard good Spanish scholars do the same. An ode, "after the manner of Béranger," won't do for us.

ERRATUM.—Last week, in our observations on the Gannal Process, p. 813, col. 3, third line from the bottom, for "decense," read "deccense."

## SCOTTISH (WIDOWS' FUND) LIFE ASSURANCE, founded on the original Basis of THE LONDON EQUITABLE.

THIS IS THE OLDEST AND MOST EXTENSIVE LIFE OFFICE IN SCOTLAND. Instituted A.D. 1815.

Accumulated Fund.  
NINE HUNDRED AND SEVENTY THOUSAND POUNDS.  
Annual Revenue,  
ONE HUNDRED AND SEVENTY THOUSAND POUNDS.  
Whole Profits belong to the Assured.

The Additions made by way of Bonus to the Policies of this Office vary from Ten per cent upwards of Sixty per cent on the Capital Sum assured, according to the duration of the Policy. Parties desirous of insuring are reminded of the advantages which will arise to such as are affected within the current year, the Regulations of the Society requiring that, before additions can become absolutely vested, the Policies entitled thereto must have been in endurance at least five full and complete years. This condition, which forms part of the system of most of the Mutual Insurance Societies, will, of course, be satisfied at the next periodical investigation, on 31st December, 1845, in regard to all Policies opened within the year 1840.

Tabular View of the Amount of Additions, Retrospective or Vested, and Contingent Prospective, declared at 1st January, 1839.

Year of Entry	Sum Assured.	Total Benefit with Vested Additions at 1st Jan. 1839.	Sum Payable if decrease takes place after Payment of the Premium due in 1845.
1815	£1000	£1587 4 6	£1069 8 7
1820	1000	1345 4 0	1523 10 7
1825	1000	1259 14 0	1436 1 3
1830	1000	1174 4 0	1318 11 9
1835	1000	1080 0 0	1231 4 0

Every information may be readily obtained on application to the Manager in Edinburgh, or to any of the Society's Agencies throughout the country. Parties wishing to effect Assurances so as best to meet any particular contingency, or effect any specific object, will receive the requisite information, and have the suitable Form of Proposal transmitted to them; and all official communications of this nature are considered strictly confidential.

Annual Premium payable during Life for an Assurance of £100.

Just ready, in 3 vols. post 8vo.

## NIGHT and MORNING;

a Novel.  
By the Author of "Pelham," "Eugene Aram," &c.  
Saunders and Otley, Publishers, Conduit Street.

## BOOKS PUBLISHED THIS DAY.

GRIFFIN'S SCIENTIFIC MISCELLANY.  
The following Works are now ready, uniformly printed in 8vo., and illustrated by numerous Engravings.

**INSTRUCTIONS for the CHEMICAL ANALYSIS of ORGANIC BODIES.** By Professor Liebig, translated by Professor Gregory, 2s. 6d.

**2. and 3. A System of Crystallography,** with its Application to Mineralogy. By John Joseph Griffin. 16s. bound in cloth.

This Work contains a New System of Crystallographic Notation, a Popular Account of the Use of Trigonometry in Crystallography, and a Complete Catalogue of the Forms of Crystallised Minerals.

**4. Electrophory: Instructions for the Multiplication of Works of Art in Metal by Voltaic Electricity.** By Thomas Spencer. Many cuts, 3s.  
Printed for Thomas Tegg, London; and Richard Griffin and Co., Glasgow.

Of the latter of whom may be had,  
**Griffin's Models of Crystals: very accurately made in creased coloured bisulphate of soda, 120 in a set, price 2l. 15s. 6d. Also, Apparatus for Organic Analysis, and for Electrophory.**

Books published by William Blackwood and Sons, 45 George Street, Edinburgh, and Pall Mall, London.

## THE HISTORY OF EUROPE, from the Commencement of the French Revolution to the Restoration of the Bourbons.

By ARCHIBALD ALISON, F.R.S.E. Advocate.  
A third edition of the First and Second Volumes, price 1l. 10s. A Third Edition of the Third and Fourth Volumes, price 1l. 10s.

A Second Edition of the Fifth and Sixth, which, with the Seventh and Eighth Volumes, may be had separately, price 15s. each.

The Ninth Volume is in the press, and will conclude the work. **The Principles of Population, and their Connection with Human Happiness.** By Archibald Alison, Esq. F.R.S.E. Advocate, Sheriff of Lanarkshire. Author of "The History of Europe during the French Revolution." In 2 vols. 8vo. price 30s.

"Increase and multiply, and replenish the earth, and subdue it."

"Thou shalt do justice and love mercy."

**Lectures on the History of Literature, Ancient and Modern.** From the German of Frederick Schlegel. In 4cap 8vo. price 7s. A new edition.

**A Memoir of the Political Life of the Right Hon. Edmund Burke.** By Rev. George Croly, LL.D. Rector of St. Stephen's, Walbrook, London. In 2 vols. post 8vo. price 15s. in cloth.

"Burke, the greatest of political philosophers."—Sir J. Mackintosh.

**McCrie's Life of John Knox; containing Illustrations of the History of the Reformation in Scotland.** With Biographical Notices of the principal Reformers, and Sketches of the Progress of Literature in Scotland during the Sixteenth Century. In one handsome 8vo. volume, with new portraits of Knox and Regent Murray, price 7s. 6d., bound in cloth, lettered.

**The Quarterly Journal of Agriculture, and Prize Essays and Transactions of the Highland and Agricultural Society of Scotland.** Subscription One Pound per annum. Fifty Numbers are published. Each Number contains, on average, two engravings, besides woodcuts; and the Series of surveys of the Geology and Mineral Products of various districts, now in course of publication in the "Prize Essays," is profusely illustrated by coloured geological maps and sections.

Nos. 1. to XLIV., forming fifteen large volumes, comprising nearly the whole of the "Prize Essays," may be had for Six Pounds, strongly and handsomely bound in cloth.

13 Great Marlborough Street.

MRS. TROLLOPE'S NEW WORK.

**CHARLES CHESTERFIELD, the Youth of Genius.**

The Publisher of Colburn's "New Monthly Magazine and Humourist," edited by Theodore Hook, Esq., begs leave to announce that Mrs. Trollope's new story "Charles Chesterfield" is in regular course of monthly appearance in that periodical, with Illustrations by G. M. Smith.

The New Year being a favourable opportunity for commencing a periodical, those who may desire to become Subscribers to Colburn's "New Monthly Magazine and Humourist" are requested to give their orders immediately to the respective Booksellers for the January Number, which will also comprise the following Papers by Distinguished Writers:—

Fathers and Sons. By Theodore. An Evening with M. Thiers. Hook, Esq. The Equipages of the Day. By A. Dugman.

Plausible People. By Mrs. Gore. Some Account of the late Mr. Dodge. By Laman Blanchard, Esq.

Rhymes for the Times. By Thomas Hood, Esq. Ambitious Men, &c. &c.

Foreign Sporting. By Nimrod. Shakespeare.

Henry Colburn, Publisher, 13 Great Marlborough Street.

Longman and Co., and H. Baillière, London; and at the Society's Rooms, 17 Old Broad Street.

In royal 8vo. price 12s. in cloth and lettered.  
**THE PHONATHRON; or, Natural System of the Sounds of Speech: a Test of Pronunciation for all Languages.** Also, the Phonathron, and the Phonodion. To which is added, a Practical Application of the Phonathron to English and French Pronunciation, and to the Reading of Hebrew, &c.

By the Rev. WILLIAM HENRY HENLOWE, M.A. Perpetual Curate of Wormegay, near Lynn, Norfolk; formerly of Jesus College, Cambridge; and Author of "Sermons addressed to the Royal Regiment of Artillery, in the Barrack Chapel at Woolwich."  
Rivingtons, St. Paul's Churchyard, and Waterloo Place.

## LITERARY PRESENTS.

**THE WORKS OF MRS. HEMANS,** a complete and uniform edition, with a Memoir by her Sister. In 7 vols. fcap 8vo. with Portraits and Vignettes, price 35s. neatly bound in cloth; or elegantly bound in morocco, 5l. 3s.

The following are published separately, price 5s. each, in cloth, or 9s. in morocco:—

1. **Memoir of Mrs. Hemans,** from the pen of her Sister, together with a Selection from her Correspondence and unpublished Writings.

2. **Tales and Historic Scenes.—The Restoration of the Works of Art to Italy;** with other Poems and Translations.

3. **The Siege of Valencia.—The Sceptic.—The Last Constantine—Greek Songs—Welsh Melodies—A Tale of the Secret Tribunal—Sebastian of Portugal, &c.**

4. **Records of Woman.—Vespers of Palermo—Songs of the Cid; and Miscellaneous Poems.**

5. **The Forest Sanctuary.—De Chatillon; a Tragedy—Hymns for Childhood—Lays of Many Lands; and other Poems.**

6. **Songs of the Affections—Lyrics and Songs for Music; and other Poems.**

7. **Songs and Lyrics—Scenes and Hymns of Life—Despondency and Aspiration—Thoughts during Sickness; and other Poems.**

## II.

**Solitary Hours.** By Caroline (Bowles) Southey. A new edition. In fcap 8vo. price 5s. bound in cloth.

By the same Author.

**The Birthday, and other Poems.**

Uniform with the above, price 7s.

"All who read thy writings must be thy friends; and all lovers of nature must feel, as they peruse them, that few have painted its beauties with a more delicate hand of truth."—*Blackwood's Magazine.*

"We do not remember any recent author whose poetry is so unmixedly native; and this English complexion constitutes one of its characteristic charms. No purer models of our genuine home feeling and language could be placed in a young foreigner's hands than Mrs. Southey's works. Moreover, her versification, especially in her two latter volumes, is not only generally correct, but in several instances of very great beauty and perfection. In her latest poem, 'The Birthday,' she has attained to a still higher excellence of style."—*Quarterly Review*, Oct. 1830.

**Chapters on Churchyards.**

8 vols. fcap 8vo. price 12s.

## III.

**Pollock's Course of Time; a Poem, in Ten Books.** A new edition, being the Fifteenth, with a Portrait of the Author, engraved by Robinson. In fcap 8vo. bound in cloth, price 7s. 6d.

"No Christian library can be complete without a copy of this really great work, whose production and success are alike equally honourable to the religious feelings of the days in which we live."—*Christian Herald.*

## IV.

**Poems.** By John Wilson. Containing the Isle of Palms, the City of the Plague, and Miscellaneous Poems. In 2 vols. post 8vo. price One Guinea.

## V.

**Lights and Shadows of Scottish Life.** A new edition, in 1 vol. fcap 8vo. price 6s. bound in cloth.

By the same Author.

**The Trials of Margaret Lindsay.**

A new edition, in fcap 8vo. price 6s.

By the same Author.

**The Foresters.**

A new edition, in fcap 8vo. price 6s.

## VI.

**Pages from the Diary of a late Physician.**

By Samuel Warren, F.R.S.

"What is nearest us touches us most. The passions rise higher at domestic than at imperial tragedies."—*Dr. Johnson.*

A new edition (with Preface), in 3 vols. fcap 8vo. price 12s.

The Third Volume, with the Preface, may be had separately, to complete former editions, price 6s.

## VII.

**The Subaltern.** Originally published in "Blackwood's Magazine." A new edition, in fcap 8vo. price 6s. bound in cloth.

Printed for W. Blackwood and Sons, 45 George Street, Edinburgh, and 25 Pall Mall, London; and sold by all Booksellers.

In 1 vol. 8vo. price 8s. in cloth.  
**A NARRATIVE OF EVENTS connected with the First Abdication of the Emperor Napoleon, his Embarkation at Fréjus, and Voyage to Elba, on board His Majesty's Ship Undaunted.**

By Capt. Sir THOMAS UNSHERR, R.N. K.C.H. C.B. His Embarkation at Elba, and a Journal of his extraordinary March to Paris, as narrated by Col. Leborne, who accompanied the Emperor on that occasion.

Dublin: Grant and Bolton; and James Fraser, Regent Street, London.

## NEW WORKS.

Published by Longman, Orme, and Co.

**THOMAS MOORE'S POETICAL WORKS**, collected and edited by Himself, with New Prefaces, &c. To be completed in Ten Monthly Volumes. Vol. VII. with Frontispiece and Vignette Title, price 5s. cloth, fcap 8vo. (On January 1st.)

**M'CULLOCH'S DICTIONARY**, Geographical, Statistical, and Historical, of the various Countries, Places, and principal Natural Objects in the World. With Maps. Vol. I. price 40s. cloth. (On January 1st.) To be completed in another Volume.

**THE REV. SYDNEY SMITH'S WORKS.** New edition, in 8 vols. 8vo. with Portrait, price 35s. cloth, lettered.

**LOITERINGS OF TRAVEL.** By N. P. Willis, Esq. Author of "Pencilings by the Way." 8 vols. post 8vo. 1l. 11s. 6d.

**THE POETICAL WORKS OF LETITIA ELIZABETH LANDON** (L. E. L.). 4 vols. fcap 8vo. with Illustrations by Howard, price 38s.

 cloth, lettered.

**THE CERTAINTIES of GEOLOGY.**  
 By SIDNEY GIBSON, Esq. F.G.S.  
 The design of this Work is to defend the validity of the infer-  
 ences deduced from Geological Discoveries; to maintain the im-  
 portance of the science; and more especially to enforce its pecu-  
 liar claims on account of the decisive testimonies of the Fossil  
 World to the arguments for Design in Creation.

"This is a work calculated to arrest the serious attention of  
 every Christian reader."—*Britannia*.  
 Smith, Elder, and Co. 65 Cornhill.

On Saturday, January 2, will be published, price Sixpence stamped, the First Number of

## THE GARDENERS' CHRONICLE;

STAMPED NEWSPAPER OF RURAL ECONOMY AND GENERAL NEWS.

### THE HORTICULTURAL PART

Edited by PROFESSOR LINDLEY.

The Plan proposed to be followed in the management of The Gardeners' Chronicle is, in the first place, to make it a weekly record of every thing that bears upon Horticulture or Garden Botany, and to introduce such Natural History as has a relation to Gardening, together with Notices and Criticisms of every work of importance on the subject which may appear. Connected with this part of the plan will be a Weekly Calendar of Gardening Operations, given in great detail, and so adapted to the varying seasons as to form a constant assistance to the memory; Foreign and Domestic Correspondence upon Horticultural Subjects; Reports of Horticultural Exhibitions and Proceedings; Notices of Novelties and Improvements; in short, every thing that can tend to benefit the Workman, or which may conduce to the pleasure of his Employer. Thus the Gardener, the Forester, the Rural Architect, the Drainer, the Roadmaker, and the Cottager, will all have the Improvements in their respective pursuits recorded.

In the second place, that description of Domestic and Political News will be introduced which is usually found in a Weekly Paper. It is unnecessary to dwell on this head further than to say, that the Proprietors do not intend to range themselves under the banners of any party; on the contrary, their earnest endeavours will be to make The Gardeners' Chronicle a full and comprehensive Record of Facts only, leaving the reader to form his own conclusion and opinions—their object being the elucidation and discussion of the Laws of Nature, not of Man. The reader will thus be provided, in addition to the feature of the Journal, with such a variety of Information concerning the events of the day, as will supersede the necessity of his providing himself with any other Weekly Journal.

The Proprietors of The Gardeners' Chronicle are happy to announce that they have already received promises of Contributions from great numbers of their friends, among whom the following may be more particularly named:—

Dr. Daubeny, Professor of Botany in the University of Oxford.  
Dr. Graham, Professor of Botany in the University of Edinburgh.  
Professor Royle, of King's College, London.
